

## 5.0 Shelter Analysis

---

### 5.1 Purpose

The Behavioral Analysis provides data on where evacuees intend to stay when they leave their homes to seek shelter elsewhere. One destination sought is public shelters. Therefore the purpose of the shelter analysis is to estimate the number of evacuees that will be seeking public shelter and determine the number of shelter spaces available. State and County emergency management offices then use this information to anticipate sheltering needs and to develop plans to insure that evacuees seeking public shelter will have adequate and safe shelter space.

### 5.2 General

The shelter analysis, performed by the United States Army Corps of Engineers (USACE), considers shelter locations, vulnerability to storm surge, capacities for each location, demand for shelter spaces, and shelter inventories. Data developed in the hazards, vulnerability and behavioral analyses is also used to perform the shelter evaluation. It is important to note that the identification of a shelter in this report does not indicate that the facility will be open and available for every hurricane evacuation event. The choice of public shelters for a specific evacuation is a state and local emergency management decision. Local authorities will open shelters based on a variety of circumstances including storm intensity, storm direction, and availability of qualified shelter operators. Furthermore, shelter designation may change based on new construction, structure modifications, ownership changes or other factors impacting shelter selection. This chapter will discuss shelter vulnerability, shelter demand (number of evacuees seeking public shelter) and shelter inventories and capacities.

### 5.3 Shelter Vulnerability

Criteria contained in American Red Cross (ARC) publication 4496, Guidelines for Hurricane Evacuation Shelter Selection, are considered when evaluating shelters. The standards were developed from hurricane studies, hazard information, and research into the structural soundness of potential public shelters. The ARC, in coordination with local emergency management officials, only opens shelters as necessary. It is vitally important that any government or private entity intending to operate a public hurricane shelter carefully consider the ARC guidelines and the Americans with Disabilities Act (ADA) Checklist for Emergency Shelters to ensure the public's safety. Hazards such as rainfall flooding and high winds are also evaluated for the safety of evacuees seeking shelter. Additionally, hurricane evacuation shelters should be located in areas above any potential storm surge elevations.

Nonetheless, in preparing this shelter analysis, the USACE, as well as the other parties involved with this specific study, did not conduct any ARC 4496 type inspection of shelter facilities, and did not assess shelter facilities to determine if they were accessible based on ADA guidelines.

## 5.0 Shelter Analysis

---

Therefore any public shelter listed in the inventories below, or included in the shelter capacity figures does not necessarily reflect that the facility is in compliance with those guidelines.

### 5.4 Shelter Demand

Public shelter demand is the number of evacuees expected to seek public shelter. Based on the behavioral data received and discussed in Chapter 4 of this report, shelter demand was assigned to various populations based on the evacuation scenarios (A, B and C) during low and high tourist occupancy periods. This demand has been estimated for each level of hurricane evacuation for each community. Storm intensity-based evacuation zones are discussed in Chapter 3. The percent of permanent resident evacuees planning to use public shelters was varied from five to ten percent depending on the evacuation zone; generally five percent was assigned to the surge vulnerable zones and 10 percent to the inland areas, which encompass mostly mobile home evacuees. Again based on behavioral results, those percentages and their distributions did not vary between response category or community.

For tourist populations, again there was consistency from community to community and from storm intensity response category to response category, but the percentages going to public shelter did vary based on evacuation zones. In similar fashion as for permanent residents, the coastal zones had slightly lower shelter use percentages than the inland ones. Also the population associated with seasonal and vacation units was slightly higher than those for hotels and motels. Given that the former types of tourist units were usually leased for a longer period (i.e., a week or more) the assumption was that those occupants would be slightly less likely to totally abandon their units in favor of evacuating back to their home once an evacuation of their area was ordered.

Tables 5-1 through 5-9 shows the shelter demand for each evacuation zone by community aggregated alphabetically by county. These tables also show the total shelter capacities for each community as provided by the American Red Cross (ARC) National Shelter System (NSS), regardless of category. These figures reflect the capacities for those facilities outside the surge evacuation zones (A, B and C) with a planning shelter space allocation of 20 square feet per person.

Please note shelter demand figures do not take into account the number of individuals with disabilities and others with access and functional needs living independently in the community, with and without services in place. The demand for emergency shelter may be greater among vulnerable populations as they may not have the means, supports or services in place to safely evacuate and seek alternative shelter elsewhere. The majority of these individuals can be

## 5.0 Shelter Analysis

accommodated in a public shelter setting with supports and services in place to meet their function based needs.

## 5.0 Shelter Analysis

---

### 5.5 Shelter Capacities and Inventories

Tables 5-10 and 5-11 provide an inventory of potential hurricane evacuation shelters and capacities throughout the study area that might be used during an evacuation. The table shows the shelter name, community, the Hurricane Evacuation Zone in which each facility is located (A, B, C or Inland), along with any other information that was provided in the source tables. The source of the data in Table 5-10 is the ARC National Shelter Survey (NSS) database. Data for Table 5-11 was provided by Massachusetts Emergency Management Agency (MEMA).

Table 5-12 through 5-20 are an assessment of sheltering capabilities by community and by county. The tables provide an overview of shelter capacities from the NSS relative to the shelter demand figures derived from the behavioral survey data. Basically, the figures reflect the difference between the predicted shelter demand and the shelter capacity. The numbers in black reflect those communities where shelter capacity exceeds local shelter demand. The red figures in parentheses indicate those communities with shelter shortfalls (i.e., shelter demand > shelter capacity).

Figures 5-1 through 5-10 displays the location of all identified shelters and the location of the evacuating population seeking public shelter resulting from worst case storm with high tourist occupancy.
