Notes:
AOC = area of concern
FOE = frequency with which the screening level was exceeded versus the number of samples in the dataset
LOQ = limit of quantitation
NA = not applicable

Notes:
AOC = area of concern
FOE = frequency with which the screening level was exceeded versus the number of samples in the dataset
LOQ = limit of quantitation
NA = not applicable

| AOC 5 | Possible Dump | PCB-1268 (Aroclor 1268) | 0/10 |

Notes:
AOC = area of concern
FOE = frequency with which the screening level was exceeded versus the number of samples in the dataset
LOQ = limit of quantitation
NA = not applicable

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
ft bgs = feet below gound surface
J = Estimated Concentration (+/- indicates a positive/negative bias)
LOD = Limit of Detection
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
(1) Summary statistics were only evaluated for chemicals with at least two distinct detects.

Table F.1-2
Summary Statistics - Background and Site Data, Subsurface Soil (1 - 5 ft bgs)
Phase 1 Risk Screening and Data Gaps Analysis
Former New York Ordnance Works, Baldwinsville, NY

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Soil
Exposure Point: Subsurface Soil (1 - 5 ft bgs)

Notes:

% = Percent
CASRN = Chemical Abstracts Service Registry Number
ft bgs = feet below gound surface
J = Estimated Concentration (+/- indicates a positive/negative bias)
LOD = Limit of Detection
MDC = Maximum Detected Concentration
mg/kg = milligram per kilogram
N/A = Not Applicable
ND = Non-Detect or Not Detected
(1) Summary statistics were only evaluated for chemicals with at least two distinct detects.

Table F.1-3
Summary Statistics - Background and Site Data, Subsurface Soil (5 - 10 ft bgs)
Phase 1 Risk Screening and Data Gaps Analysis
Former New York Ordnance Works, Baldwinsville, NY

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Soil
Exposure Point: Subsurface Soil (5 - 10 ft bgs)

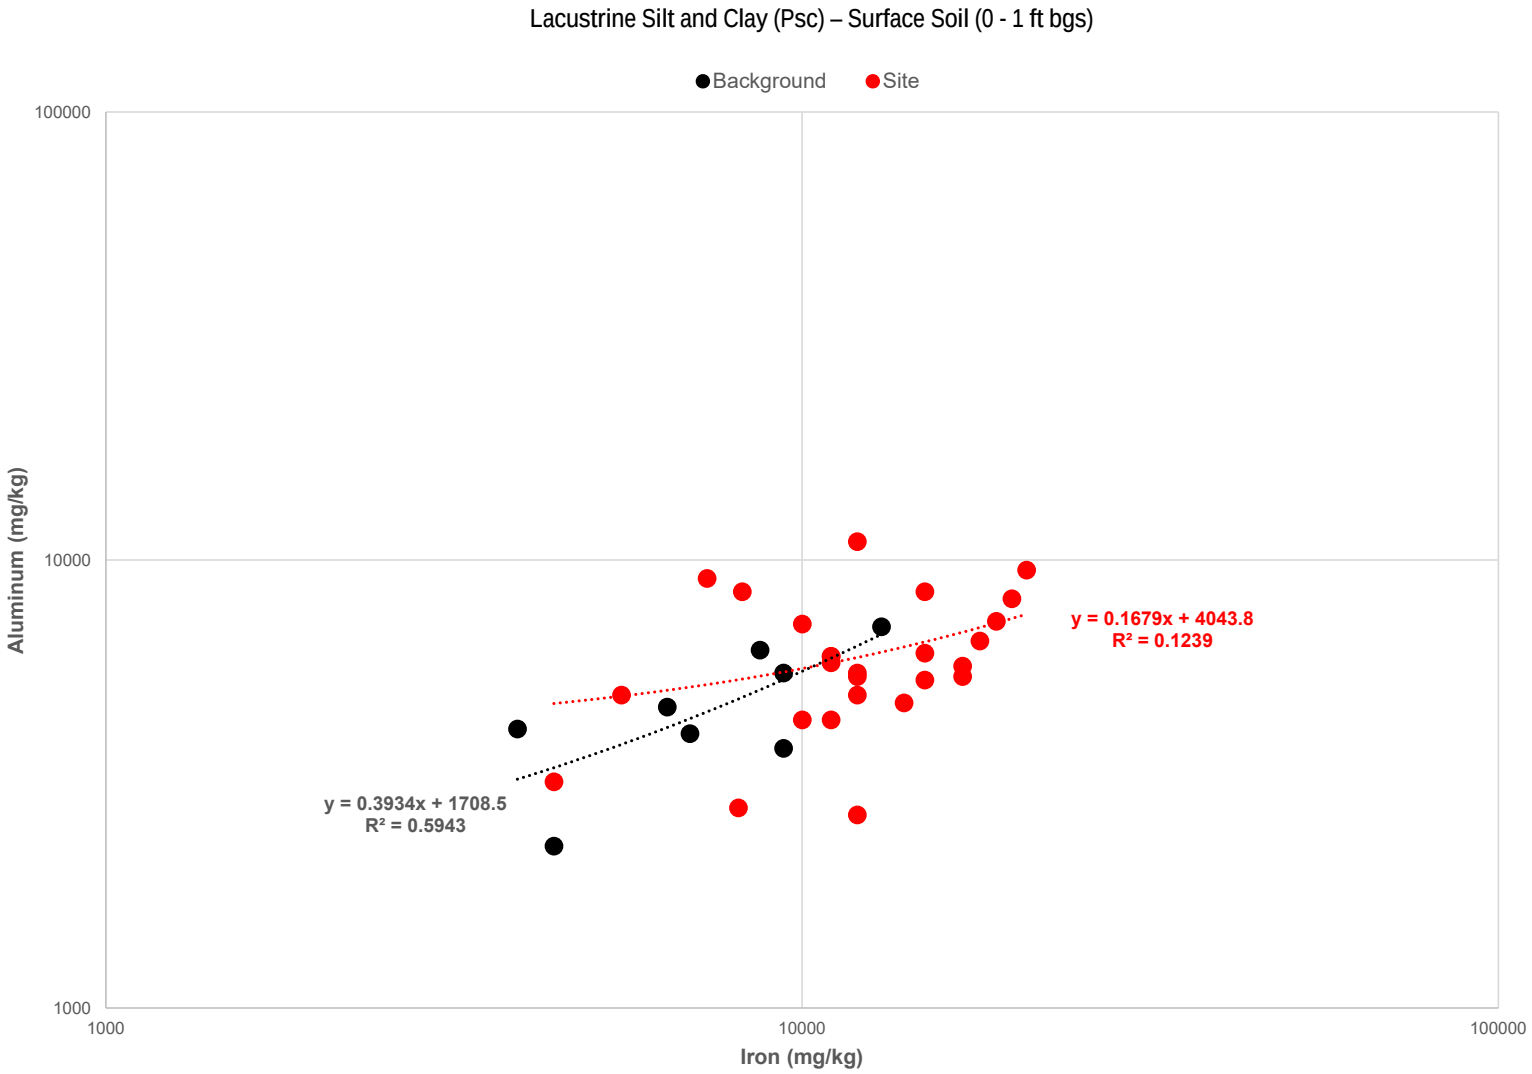
# Geochemical Analysis

*This page intentionally left blank.*

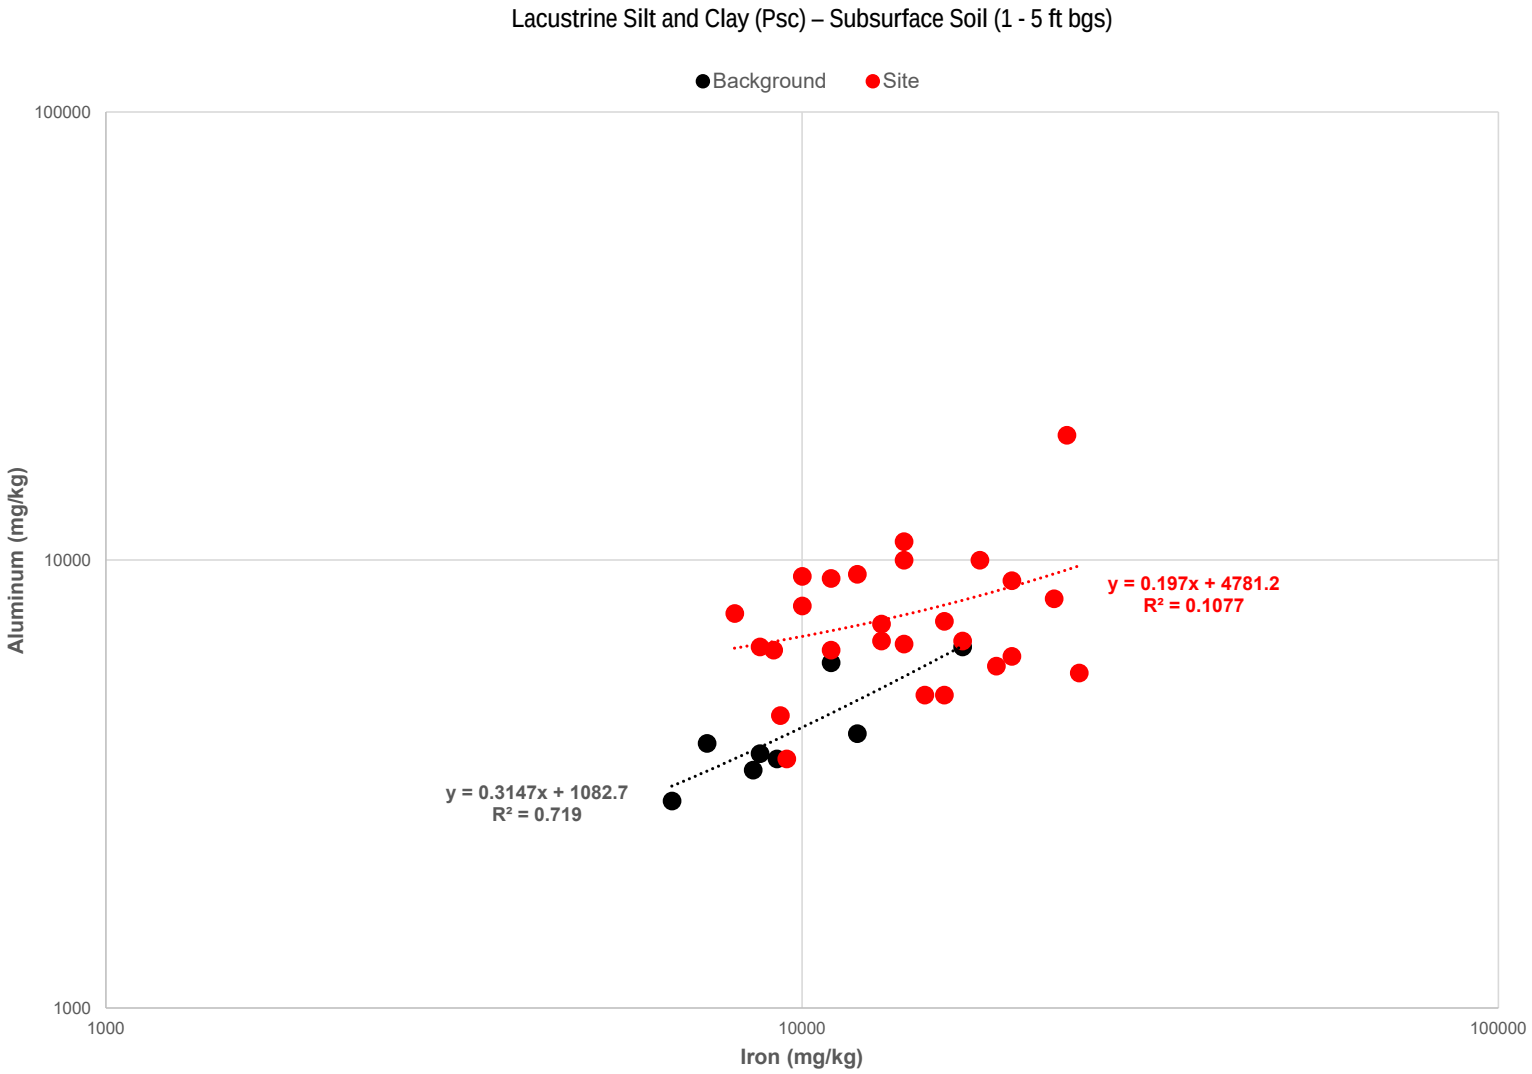
Figure F.5-1
Geochemical Analysis - Background and Site Data, Surface Soil (0 - 1 ft bgs, Psc)
Phase 1 Risk Screening and Data Gaps Analysis
Former New York Ordnance Works, Baldwinsville, NY



| *ANCOVA Summary ([a] significant difference noted at p-values ≤ 0.05)* | |
|---|---|
| Are the slopes of the regression lines considered separately approximately the same? | Homogeneity of Regressions p-value [a] = 0.36 |
| Are differences in mean iron concentrations for background and site significant when excluding effect of covariate? | Adjusted Means p-value [a] = 0.59 |

(1) ANCOVA for Two Independent Samples performed using the online analytical tool available through Vassar College (http://vassarstats.net/ancova2L.html).

Figure F.5-1
Geochemical Analysis - Background and Site Data, Surface Soil (0 - 1 ft bgs, Psc)
Phase 1 Risk Screening and Data Gaps Analysis
Former New York Ordnance Works, Baldwinsville, NY



*ANCOVA Summary ([a] significant difference noted at p-values ≤ 0.05)*

| | |
|---|---|
| Are the slopes of the regression lines considered separately approximately the same? | Homogeneity of Regressions p-value [a] = 0.71 |
| Are differences in mean iron concentrations for background and site significant when excluding effect of covariate? | Adjusted Means p-value [a] = 0.036 |

Phase 1 Risk Screening and Data Gaps Analysis
Former New York Ordnance Works, Baldwinsville, NY

| *ANCOVA Summary ([a] significant difference noted at p-values ≤ 0.05)* | |
|---|---|
| Are the slopes of the regression lines considered separately approximately the same? | Homogeneity of Regressions p-value [a] = 0.41 |
| Are differences in mean iron concentrations for background and site significant when excluding effect of covariate? | Adjusted Means p-value [a] = 0.01 |

(1) ANCOVA for Two Independent Samples performed using the online analytical tool available through Vassar College (http://vassarstats.net/ancova2L.html).

# APPENDIX F.6

# Low Molecular Weight and High Molecular Weight PAHs

*This page intentionally left blank.*

| High Molecular Weight PAHs | | | |
|---|---|---|---|
| Lacustrine Silt and Clay (Psc) | | | |
| Surface Soil (0 - 1 ft bgs) | | | |
|  | | | |
| General Statistics [1] | | | |
| FOD: | 8/8 | FOD: | 25/25 |
| Data Distribution: | Normal | Data Distribution: | Lognormal |
| Homogeneity of Variance (Levene's Test) p-value: | 0.22 | | |
| Hypothesis Testing [1] | | | |
| Type: | Dunn's Test | | |
| p-value: | 0.0025 | | |

Notes:

(1) Statistically significantly different at $p \leq 0.05$.

(2) Data distributions were determined using the United States Environmental Protection Agency (USEPA) ProUCL Version 5.2 software. All other statistical analyses presented were performed using the Real Statistics Using Excel package developed by Charles Zaiontz for direct use within Microsoft Excel (https://www.real-statistics.com/).

ft bgs - feet below ground surface

FOD - Frequency of Detection

| High Molecular Weight PAHs | | | |
|---|---|---|---|
| Lacustrine Silt and Clay (Psc) | | | |
| Subsurface Soil (1 - 5 ft bgs) | | | |
|  | | | |
| General Statistics [1] | | | |
| FOD: | 2/8 | FOD: | 13/25 |
| Data Distribution: | Not Discernible | Data Distribution: | Lognormal |
| Homogeneity of Variance (Levene's Test) p-value: | Not Applicable (N/A) | | |
| Hypothesis Testing [1] | | | |
| Type: | N/A | | |
| p-value: | N/A | | |

Notes:

(1) Statistically significantly different at $p \leq 0.05$.

(2) Data distributions were determined using the United States Environmental Protection Agency (USEPA) ProUCL Version 5.2 software. All other statistical analyses presented were performed using the Real Statistics Using Excel package developed by Charles Zaiontz for direct use within Microsoft Excel (https://www.real-statistics.com/).

Notes
(1) For data sets with non-detect results, Kaplan-Meier (KM) statistical methods were used to derive means and summations.

An/(An+Ph) = Anthracene/(Anthracene + Phenanthrene)
BaA/(BaA+Chry) = Benzo(a)anthracene/(Benzo(a)anthracene + Chrysene)
FlA/(FlA+Py) = Fluoranthene/(Fluoranthene + Pyrene)
HMW = High Molecular Weight
LMW = Low Molecular Weight
N/A = Not Applicable
PAH = Polycyclic Aromatic Hydrocarbon
-- = Not Evaluated

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 35 | 95% UTL with95% Coverage | 0.011 |
| Approx, f used to compute achieved CC | 1.842 | Approximate Actual Confidence Coefficient achieved by UTL | 0.834 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.00772 |
| 95% USL | 0.011 | 95% KM Chebyshev UPL | 0.0111 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 69 | 95% UTL with95% Coverage | 0.012 |
| Approx, f used to compute achieved CC | 1.816 | Approximate Actual Confidence Coefficient achieved by UTL | 0.871 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.011 |
| 95% USL | 0.012 | 95% KM Chebyshev UPL | 0.0146 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 24 | 95% UTL with95% Coverage | 0.011 |
| Approx, f used to compute achieved CC | 1.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.708 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.011 |
| 95% USL | 0.011 | 95% KM Chebyshev UPL | 0.0141 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 24 | 95% UTL with95% Coverage | 0.013 |
| Approx, f used to compute achieved CC | 1.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.708 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.013 |
| 95% USL | 0.013 | 95% KM Chebyshev UPL | 0.0231 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 24 | 95% UTL with95% Coverage | 0.056 |
| Approx, f used to compute achieved CC | 1.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.708 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.0448 |
| 95% USL | 0.056 | 95% KM Chebyshev UPL | 0.0528 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Former New York Ordnance Works, Baldwinsville, NY**

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| 95% USL | 13000 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.**

**Nonparametric Distribution Free Background Statistics**

**Data appear to follow a Discernible Distribution**

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 24 | 95% UTL with95% Coverage | 0.034 |
| Approx, f used to compute achieved CC | 1.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.708 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.027 |
| 95% USL | 0.034 | 95% KM Chebyshev UPL | 0.0325 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Sd (bias corrected) | 0.0123 | 95% Percentile of Chisquare (2kstar) | 4.317 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

|---|---|---|---|
| Order of Statistic, r | 33 | 95% UTL with95% Coverage | 1 |
| Approx, f used to compute achieved CC | 1.737 | Approximate Actual Confidence Coefficient achieved by UTL | 0.816 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.482 |
| 95% USL | 1 | 95% KM Chebyshev UPL | 0.864 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

|---|---|---|---|
| 95% Chebyshev UPL | 189.6 | 99% Percentile | 160.4 |
| 95% USL | 320 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 85 | 95% UTL with95% Coverage | 0.09 |
| Approx, f used to compute achieved CC | 2.237 | Approximate Actual Confidence Coefficient achieved by UTL | 0.933 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.011 |
| 95% USL | 0.09 | 95% KM Chebyshev UPL | 0.0462 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 85 | 95% UTL with95% Coverage | 0.099 |
| Approx, f used to compute achieved CC | 2.237 | Approximate Actual Confidence Coefficient achieved by UTL | 0.933 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.0082 |
| 95% USL | 0.099 | 95% KM Chebyshev UPL | 0.0507 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 43 | 95% UTL with95% Coverage | 0.17 |
| Approx, f used to compute achieved CC | 2.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.89 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.104 |
| 95% USL | 0.17 | 95% KM Chebyshev UPL | 0.151 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Sd (bias corrected) | 0.148 | 95% Percentile of Chisquare (2kstar) | 38.95 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Nonparametric Upper Limits for Background Threshold Values**

| | | | | | |
|---|---|---|---|---|---|
| Order of Statistic, order | | 43 | 95% UTL with | 95% Coverage | 0.22 |
| Approx, f used to compute achieved CC | | 2.263 | Approximate Actual Confidence Coefficient achieved by UTL | | 0.89 |
| | | | Approximate Sample Size needed to achieve specified CC | | 59 |
| 95% Percentile Bootstrap UTL with | 95% Coverage | 0.216 | 95% BCA Bootstrap UTL with | 95% Coverage | 0.18 |
| | 95% UPL | 0.176 | | 90% Percentile | 0.136 |
| | 90% Chebyshev UPL | 0.206 | | 95% Percentile | 0.16 |
| | 95% Chebyshev UPL | 0.272 | | 99% Percentile | 0.203 |
| | 95% USL | 0.22 | | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| 95% Chebyshev UPL | 169069 | 99% Percentile | 98980 |
| 95% USL | 100000 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| Order of Statistic, r | 85 | 95% UTL with95% Coverage | 0.081 |
| Approx, f used to compute achieved CC | 2.237 | Approximate Actual Confidence Coefficient achieved by UTL | 0.933 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.0086 |
| 95% USL | 0.081 | 95% KM Chebyshev UPL | 0.0414 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| 95% Chebyshev UPL | 46.12 | 99% Percentile | 30.92 |
| 95% USL | 36 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 85 | 95% UTL with95% Coverage | 0.15 |
| Approx, f used to compute achieved CC | 2.237 | Approximate Actual Confidence Coefficient achieved by UTL | 0.933 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.011 |
| 95% USL | 0.15 | 95% KM Chebyshev UPL | 0.0751 |

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Former New York Ordnance Works, Baldwinsville, NY**

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 85 | 95% UTL with95% Coverage | 0.058 |
| Approx, f used to compute achieved CC | 2.237 | Approximate Actual Confidence Coefficient achieved by UTL | 0.933 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.00927 |
| 95% USL | 0.058 | 95% KM Chebyshev UPL | 0.0305 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| | 95% Chebyshev UPL | 36444 | | 99% Percentile | 28760 |
| | 95% USL | 32000 | | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Nonparametric Upper Limits for Background Threshold Values**

| | | | |
|---|---|---|---|
| Order of Statistic, order | 48 | 95% UTL with 95% Coverage | 92 |
| Approx, f used to compute achieved CC | 2.526 | Approximate Actual Confidence Coefficient achieved by UTL | 0.915 |
| | | Approximate Sample Size needed to achieve specified CC | 59 |
| 95% Percentile Bootstrap UTL with 95% Coverage | 63.65 | 95% BCA Bootstrap UTL with 95% Coverage | 63.23 |
| 95% UPL | 10.46 | 90% Percentile | 8.46 |
| 90% Chebyshev UPL | 45.64 | 95% Percentile | 9.485 |
| 95% Chebyshev UPL | 63.15 | 99% Percentile | 53.93 |
| 95% USL | 92 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20. Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| 95% Percentile Bootstrap UTL with | 95% Coverage | 31500 | 95% BCA Bootstrap UTL with | 95% Coverage | 31500 |
| | 95% UPL | 27000 | | 90% Percentile | 19800 |
| | 90% Chebyshev UPL | 31099 | | 95% Percentile | 26400 |
| | 95% Chebyshev UPL | 40260 | | 99% Percentile | 29900 |
| | 95% USL | 32000 | | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| Approx, f used to compute achieved CC | 1.816 | Approximate Actual Confidence Coefficient achieved by UTL | 0.871 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.0607 |
| 95% USL | 0.1 | 95% KM Chebyshev UPL | 0.0941 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 11 | 95% UTL with95% Coverage | 0.012 |

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

| | | | |
|---|---|---|---|
| Approx, f used to compute achieved CC | 0.579 | Approximate Actual Confidence Coefficient achieved by UTL | 0.431 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.012 |
| 95% USL | 0.012 | 95% KM Chebyshev UPL | 0.0217 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 19 | 95% UTL with95% Coverage | 0.31 |
| Approx, f used to compute achieved CC | 1 | Approximate Actual Confidence Coefficient achieved by UTL | 0.623 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.31 |
| 95% USL | 0.31 | 95% KM Chebyshev UPL | 0.382 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Sd (bias corrected) | 0.152 | 95% Percentile of Chisquare (2kstar) | 16.01 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

**Table H-1**
**ProUCL UPL and UTL Calculation Output - Soil**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 126 | 95% UTL with95% Coverage | 0.6 |
| Approx, f used to compute achieved CC | 1.658 | Approximate Actual Confidence Coefficient achieved by UTL | 0.891 |
| Approximate Sample Size needed to achieve specified CC | 124 | 95% UPL | 0.505 |
| 95% USL | 0.87 | 95% KM Chebyshev UPL | 0.836 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 24 | 95% UTL with95% Coverage | 0.11 |
| Approx, f used to compute achieved CC | 1.263 | Approximate Actual Confidence Coefficient achieved by UTL | 0.708 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.11 |
| 95% USL | 0.11 | 95% KM Chebyshev UPL | 0.124 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | 95% Chebyshev UPL | 23.79 | | 99% Percentile | 19.77 |
| | 95% USL | 24 | | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| 95% Chebyshev UPL | 2494 | 99% Percentile | 2011 |
| 95% USL | 2500 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| Approx, f used to compute achieved CC | 0.474 | Approximate Actual Confidence Coefficient achieved by UTL | 0.37 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 1700 |
| 95% USL | 1700 | 95% KM Chebyshev UPL | 2643 |

**Table H-2**
**ProUCL UPL and UTL Calculation Output - Groundwater**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Sd (bias corrected) | 1807 | 95% Percentile of Chisquare (2kstar) | 3.623 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| | | | |
|---|---|---|---|
| 95% UTL with 95% Coverage | 83201 | 90% Percentile (z) | 4739 |
| 95% UPL (t) | 14401 | 95% Percentile (z) | 8593 |
| 95% USL | 18395 | 99% Percentile (z) | 26236 |

**Nonparametric Distribution Free Background Statistics**

Data appear Normal at 1% Significance Level

**Nonparametric Upper Limits for Background Threshold Values**

| | | | |
|---|---|---|---|
| Order of Statistic, order | 9 | 95% UTL with 95% Coverage | 2800 |
| Approx, f used to compute achieved CC | 0.474 | Approximate Actual Confidence Coefficient achieved by UTL | 0.37 |
| | | Approximate Sample Size needed to achieve specified CC | 59 |
| 95% Percentile Bootstrap UTL with 95% Coverage | 2800 | 95% BCA Bootstrap UTL with 95% Coverage | 2800 |
| 95% UPL | 2800 | 90% Percentile | 1600 |
| 90% Chebyshev UPL | 3502 | 95% Percentile | 2200 |
| 95% Chebyshev UPL | 4631 | 99% Percentile | 2680 |
| 95% USL | 2800 | | |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

**Background DL/2 Statistics Assuming Lognormal Distribution**

| | | | |
|---|---|---|---|
| Mean in Original Scale | 38133 | Mean in Log Scale | 9.445 |
| SD in Original Scale | 53674 | SD in Log Scale | 1.694 |
| 95% UTL95% Coverage | 2145837 | 95% UPL (t) | 349813 |
| 90% Percentile (z) | 110828 | 95% Percentile (z) | 205072 |
| 99% Percentile (z) | 650479 | 95% USL | 450566 |

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data appear to follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 9 | 95% UTL with95% Coverage | 160000 |
| Approx, f used to compute achieved CC | 0.474 | Approximate Actual Confidence Coefficient achieved by UTL | 0.37 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 160000 |
| 95% USL | 160000 | 95% KM Chebyshev UPL | 270735 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Sd (bias corrected) | 1.76 | 95% Percentile of Chisquare (2kstar) | 5.405 |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

| MLE Sd (bias corrected) | N/A | 95% Percentile of Chisquare (2kstar) | N/A |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.

**Nonparametric Distribution Free Background Statistics**

Data do not follow a Discernible Distribution

**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**

| | | | |
|---|---|---|---|
| Order of Statistic, r | 9 | 95% UTL with95% Coverage | 0.13 |
| Approx, f used to compute achieved CC | 0.474 | Approximate Actual Confidence Coefficient achieved by UTL | 0.37 |
| Approximate Sample Size needed to achieve specified CC | 59 | 95% UPL | 0.13 |
| 95% USL | 0.13 | 95% KM Chebyshev UPL | 0.21 |

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

| MLE Mean (bias corrected) | N/A | | |
| MLE Sd (bias corrected) | N/A | 95% Percentile of Chisquare (2kstar) | N/A |

**Gamma ROS Statistics using Imputed Non-Detects**

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

**Table H-2**
**ProUCL UPL and UTL Calculation Output - Groundwater**
**Phase 1 Risk Screening and Data Gaps Analysis**
**Former New York Ordnance Works, Baldwinsville, NY**

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes

-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions

J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes

-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions

J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes

-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| |
|---|
| ND = Not detected at the LOD |
| Detect = Detected result |
| Detect = Detected result > BTV |

Geology

| |
|---|
| Psc = Lacustrine Silt and Clay |
| Ps = Sorted Sand and Gravel |
| Pd = Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions

J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend
ND – Not detected at the LOD
Detect – Detected result
Detect – Detected result > BTV

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-18
Site to Background Sample Comparison - Area of Concern 3, Subsurface Soil (1 - 5 ft bgs, Psc)
Phase 1 Risk Screening and Data Gap Analysis

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-19
Site to Background Sample Comparison - Area of Concern 3, Total Soil (0 - 5 ft bgs, Psc)
Phase 1 Risk Screening and Data Gap Analysis

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-30
Site to Background Sample Comparison - Area of Concern 5 (Boiler House), Total Soil (0 - 10 ft bgs, Ps)
Phase 1 Risk Screening and Data Gap Analysis

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-36
Site to Background Sample Comparison - Area of Concern 5 (Coal Aggregate Bins), Total Soil (0 - 10 ft bgs, Psc)
Phase 1 Risk Screening and Data Gap Analysis
Former New York Ordnance Works, Baldwinsville, New York

| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-47
Site to Background Sample Comparison - Area of Concern 5 (Coal Storage Area), Total Soil (0 - 10 ft bgs, Psc)
Phase 1 Risk Screening and Data Gap Analysis
Former New York Ordnance Works, Baldwinsville, New York

| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-58
Site to Background Sample Comparison - Area of Concern 5 (Electric Substation), Total Soil (0 - 10 ft bgs, Psc)
Phase 1 Risk Screening and Data Gap Analysis

| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
LOD = Limit of Detection
LOQ = Limit of Quantitation
mg/kg = millgram per kilogram
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Table I-74
Site to Background Sample Comparison - Area of Concern 5 (Possible Dump Area), Total Soil (0 - 10 ft bgs, Ps)
Phase 1 Risk Screening and Data Gap Analysis

N = Primary Sample
ND = Non-Detect or Not Detected
% = Percent

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > BTV |

Geology

| | |
|---|---|
| Psc | Lacustrine Silt and Clay |
| Ps | Sorted Sand and Gravel |
| Pd | Diamicton (Till) |

(1) See Subsection 5.4.1 for BTV determination steps.

(2) The analyte is considered potentially related to a site release if the sample size is greater than 20 and detections exceed the BTV in more than 5% of samples. For sample sizes less than or equal to 20, a single exceedance of the BTV was used to determine the potential for a site release.

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.
R – The presence or absence of the analyte cannot be substantiated by the data provided.

Notes
-- = Not Evaluated
C = Combined Primary/Field Duplicate Sample
CASRN = Chemical Abstracts Service Registry Number
EPA = Environmental Protection Agency
LOD = Limit of Detection
N/A = Not Applicable
N = Primary Sample
ND = Non-Detect or Not Detected
RSL = Regional Screening Level
SL = Screening Level
µg/L = microgram per liter
(1) See Section 4.0 for data reduction steps.

Legend

| | |
|---|---|
| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > SL |

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD.
However, the associated numerical value is approximate.

| Detect | Detected result > SL |

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD.
However, the associated numerical value is approximate.

| ND | Not detected at the LOD |
| Detect | Detected result |
| Detect | Detected result > SL |

Qualifier Definitions
J – The reported result was an estimated value (+/- indicates a positive/negative bias).
U – The analyte was not detected and was reported as less than the limit of detection (LOD).
UJ – The analyte was not detected and was reported as less than the LOD.
However, the associated numerical value is approximate.
