The notable subsurface soil parent/FD RPD exceedances are as follows:

- NYOW-03-PH005-B: FD RPDs > 50% for calcium (80%) and manganese (57%).
- NYOW-03-PH006-B_R: FD RPD > 50% for acetone (60%).
- NYOW-03-PH012-B: FD RPD > 50% for naphthalene (144%), fluorene (113%), magnesium (110%), phenanthrene (94%), cadmium (92%), calcium (90%), thallium (62%), potassium (59%), lead (56%), and benzo(g,h,i)perylene (52%).

**Table 21** summarizes the number of subsurface soil results that were qualified due to MS/MSD RPD exceedances:

| **Table 21:** AOC 3 Subsurface Soil Summary – Analytical Precision (MS/MSD pairs) | |
|---|---|
| Total number of Subsurface Soil results | 3096 |
| Subsurface Soil results qualified for MS/MSD RPD exceedances | 4 (<1%) |

The notable subsurface soil MS/MSD RPD exceedances are as follows:

- NYOW-03-PH005-B: MS/MSD RPDs > 40% for benzo(b)fluoranthene (47%), benzo(a)pyrene (44%), and benzo(k)fluoranthene (41%).
- NYOW-03-PH008-B: MS/MSD RPD > 20% for calcium (56%).

There were no subsurface soil results qualified for LCS/LCSD RPD exceedances.

Groundwater

**Table 22** summarizes the number of groundwater results that were qualified due to parent/FD RPD exceedances:

| **Table 22:** AOC 3 Groundwater Summary – Analytical and Field Precision (1 parent/FD pair) | |
|---|---|
| Total number of GW results for parent/FD pair | 308 |
| GW results qualified for parent/FD RPD exceedances | 3 (1.0%) |

The notable groundwater parent/FD RPD exceedances are as follows:

- NYOW-03-WL013-A: FD RPD > 30% for dissolved manganese (46%).

**Table 23** summarizes the number of groundwater results that were qualified due to MS/MSD RPD exceedances:

| **Table 23:** AOC 3 Groundwater Summary – Analytical Precision (MS/MSD pairs) | |
|---|---|
| Total number of Groundwater results | 1223 |
| Groundwater results qualified for MS/MSD RPD exceedances | 1 (<1%) |

The notable groundwater MS/MSD RPD exceedances are as follows:

- NYOW-03-WL009-A: MS/MSD RPD > 20% for picric acid (73%).

There were no groundwater results qualified for LCS/LCSD RPD exceedances.

#### *2.2.1.5 AOC 4 ISM*

There were no target analytes detected in any of the AOC 4 ISM samples. Therefore, there were no ISM results qualified for field replicate RSD exceedances. There were also no ISM soil results qualified due to MS/MSD RPD or LCS/LCSD RPD exceedances. The DQOs for the project were achieved with regard to precision for the AOC 4 ISM sampling event.

#### *2.2.1.6 Background*

Surface Soil

**Table 24** summarizes the number of surface soil results that were qualified due to parent/FD RPD exceedances:

| **Table 24:** Background Surface Soil Summary – Analytical and Field Precision (5 parent/FD pairs) | |
|---|---|
| Total number of Surface Soil results for parent/FD pairs | 440 |
| Surface Soil results qualified for parent/FD RPD exceedances | 18 (4.1%) |

The notable surface soil parent/FD RPD exceedances are as follows:

- NYOW-B-SL007-A: FD RPDs >50% for fluoranthene (127%), pyrene (124%), benzo(a)pyrene (111%), benzo(b)fluoranthene (109%), mercury (104%), and CEC (68%).
- NYOW-B-SL017-A: FD RPD >50% for TOC (55%).
- NYOW-B-SL027-A: FD RPD >50% for calcium (61%).
- NYOW-B-SL037-A: FD RPD >50% for calcium (65%).

**Table 25** summarizes the number of surface soil results that were qualified due to MS/MSD RPD exceedances:

| **Table 25:** Background Surface Soil Summary – Analytical Precision (MS/MSD pairs) | |
|---|---|
| Total number of Surface Soil results | 2200 |
| Surface Soil results qualified for MS/MSD RPD exceedances | 41 (1.9%) |

The notable surface soil MS/MSD RPD exceedances are as follows:

- NYOW-B-SL006-A: MS/MSD RPDs >20% for manganese (26%), calcium (24%), and TOC (22%).
- NYOW-B-SL016-A: MS/MSD RPDs >20% for cadmium (40%), thallium (39%), selenium (37%), arsenic (34%), beryllium (31%), cobalt (31%), lead (31%), nickel (30%), sodium (29%), chromium (29%), copper (29%), vanadium (28%), magnesium (24%), zinc (24%), barium (23%), and potassium (22%).
- NYOW-B-SL026-A: MS/MSD RPDs >20% for selenium (22%) and thallium (21%).
- NYOW-B-SL046-A: MS/MSD RPD >20% for magnesium (36%). MS/MSD RPDs >40% for phenanthrene (113%), fluoranthene (81%), anthracene (81%), benzo(a)anthracene (73%), pyrene (72%), chrysene (61%), benzo(a)pyrene (55%), benzo(b)fluoranthene (53%), benzo(k)fluoranthene (49%), indeno(1,2,3-cd)pyrene (48%), fluorene (47%), and benzo(g,h,i)perylene (43%).
- NYOW-B-SL050-A: MS/MSD RPDs >20% for calcium (62%), beryllium (22%), cobalt (22%), nickel (21%), sodium (21%), and chromium (20%).

**Table 26** summarizes the number of surface soil results that were qualified due to LCS/LCSD RPD exceedances:

| **Table 26:** Background Surface Soil Summary – Analytical Precision (LCS/LCSD pairs) | |
|---|---|
| Total number of Surface Soil results | 2200 |
| Surface Soil results qualified for LCS/LCSD RPD exceedances | 26 (1.2%) |

The notable surface soil LCS/LCSD RPD exceedances are as follows:

- LCS/LCSD RPDs > 40% for benzo(g,h,i)perylene (91%), indeno(1,2,3-c,d)pyrene (91%), dibenz(a,h)anthracene (79%), naphthalene (78%), and benzo(a)pyrene (42%).

Subsurface Soil

**Table 27** summarizes the number of subsurface soil results that were qualified due to parent/FD RPD exceedances:

| **Table 27:** Background Subsurface Soil Summary – Analytical and Field Precision (9 parent/FD pairs) | |
|---|---|
| Total number of Subsurface Soil results for parent/FD pairs | 792 |
| Subsurface Soil results qualified for parent/FD RPD exceedances | 43 (5.4%) |

The notable subsurface soil parent/FD RPD exceedances are as follows:

- NYOW-B-PH011-C: FD RPDs >50% for chrysene (126%), CEC (78%), and TOC (77%).
- NYOW-B-PH018-B: FD RPDs >50% for CEC (136%), cobalt (76%), arsenic (64%), and TOC (54%).
- NYOW-B-PH018-C: FD RPDs >50% for TOC (106%), magnesium (68%), lead (63%), chromium (59%), and vanadium (52%).
- NYOW-B-PH021-C: FD RPDs >50% for calcium (128%) and magnesium (69%).
- NYOW-B-PH026-C: FD RPDs >50% for calcium (111%) and TOC (77%).
- NYOW-B-PH031-C: FD RPD >50% for TOC (55%).
- NYOW-B-PH036-C: FD RPD >50% for antimony (74%).
- NYOW-B-PH041-C: FD RPDs >50% for CEC (87%) and TOC (73%).
- NYOW-B-PH046-C: FD RPD >50% for TOC (170%).

**Table 28** summarizes the number of subsurface soil results that were qualified due to MS/MSD RPD exceedances:

| **Table 28:** Background Subsurface Soil Summary – Analytical Precision (MS/MSD pairs) | |
|---|---|
| Total number of Subsurface Soil results | 4356 |
| Subsurface Soil results qualified for MS/MSD RPD exceedances | 48 (1.1%) |

The notable subsurface soil MS/MSD RPD exceedances are as follows:

- NYOW-B-PH007-C: MS/MSD RPDs > 20% for calcium (38%), barium (29%), manganese (24%), beryllium (23%), cobalt (23%), copper (23%), lead (23%), magnesium (23%), sodium (23%), vanadium (23%), nickel (22%), potassium (22%), chromium (22%), and zinc (21%).
- NYOW-B-PH026-C: MS/MSD RPD >20% for manganese (81%).
- NYOW-B-PH028-B: MS/MSD RPDs > 20% for sodium (34%), beryllium (33%), chromium (33%), cobalt (33%), lead (33%), nickel (33%), potassium (32%), vanadium (31%), barium (31%), copper (31%), zinc (27%), magnesium (24%), and calcium (21%).
- NYOW-B-PH046-B: MS/MSD RPDs > 20% for calcium (105%), cobalt (35%), nickel (34%), lead (33%), beryllium (32%), chromium (32%), sodium (32%), barium (31%), copper (30%), vanadium (30%), zinc (29%), magnesium (28%), and potassium (28%).
- NYOW-B-PH033-C: MS/MSD RPD for TOC >20% (56%).

**Table 29** summarizes the number of subsurface soil results that were qualified due to LCS/LCSD RPD exceedances:

| **Table 29:** Background Subsurface Soil Summary – Analytical Precision (LCS/LCSD pairs) | |
|---|---|
| Total number of Subsurface Soil results | 4356 |
| Subsurface Soil results qualified for LCS/LCSD RPD exceedances | 10 (<1%) |

The notable subsurface soil LCS/LCSD RPD exceedances are as follows:

- LCS/LCSD RPDs > 40% for benzo(g,h,i)perylene (91%), indeno(1,2,3-c,d)pyrene (91%), dibenz(a,h)anthracene (79%), naphthalene (78%), and benzo(a)pyrene (42%).

Groundwater

**Table 30** summarizes the number of groundwater results that were qualified due to parent/FD RPD exceedances:

| **Table 30:** Background Groundwater Summary – Analytical and Field Precision (1 parent/FD pair) | |
|---|---|
| Total number of GW results for parent/FD pair | 82 |
| GW results qualified for parent/FD RPD exceedances | 1 (1.2%) |

The notable groundwater parent/FD RPD exceedances are as follows:

- Field Duplicate WL-DUP-001_210514 (collected from NYOW-B-WL003-A): FD RPD >30% for dissolved iron (119%).

There were no background groundwater results qualified due to MS/MSD RPD exceedances.

**Table 31** summarizes the number of groundwater results that were qualified due to LCS/LCSD RPD exceedances:

| **Table 31:** Background Groundwater Summary – Analytical Precision (LCS/LCSD pairs) | |
|---|---|
| Total number of GW results | 410 |
| Number of GW results qualified for LCS/LCSD RPD exceedances | 9 (2.2%) |

The notable groundwater LCS/LCSD RPD exceedances are as follows:

- LCS/LCSD RPDs > 40% for naphthalene (69%), 2-methylnaphthalene (69%), 1-methylnaphthalene (68%), acenaphthene (64%), acenaphthylene (64%), fluorene (58%), phenanthrene (51%), anthracene (51%), benzo(k)fluoranthene (46%), chrysene (45%), fluoranthene (44%), benzo(a)anthracene (43%), benzo(a)pyrene (41%), and pyrene (41%), and benzo(b)fluoranthene (40%).

### 2.2.2 Accuracy

Accuracy is the closeness of a measured result to an accepted reference value and is usually measured as a percent recovery (%R). Warning limits are defined as minor QC excursions that often result in the associated data being qualified as estimated (J/UJ). Control limits are defined as significant QC excursions which may result in the rejection of the associated data. QC analyses used to measure accuracy include LCSs, MSs, and surrogates. Upper and lower QC limits are provided in the UFP-QAPP (USACE, 2020). The total numbers of analytical results qualified for surrogate, LCS/LCSD, and MS/MSD recovery anomalies are summarized for each AOC/matrix combination. However, results with a final bias of indeterminate nature were not further evaluated for usability and are therefore not included in the analytical bias summary tables. The QC samples demonstrated that the analytical system was in control during sample preparation and analysis (i.e., operating correctly), with the exceptions noted below.

#### *2.2.2.1 AOC 5*

Surface Soil

**Table 32** summarizes the number of AOC 5 surface soil results that were qualified for non-conformances related to accuracy:

| **Table 32:** AOC 5 Surface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Surface Soil results | 2134 |
| Surface Soil results qualified for surrogate %R anomalies | 112 (5.2%) |
| Surface Soil results qualified for LCS/LCSD %R anomalies | 20 (<1%) |
| Surface Soil results qualified for MS/MSD %R anomalies | 80 (3.7%) |

Two surface soil samples from the Possible Dump (NYOW-05-SL001-A, NYOW-05-SL002-A) exhibited surrogate recoveries below the lower warning limit but greater than the lower control limit for SVOCs. All of the sample results were non-detect and qualified as "UJ" on the basis of low bias. The remaining three soil samples from the Possible Dump had SVOC surrogates recover within control.

Three surface soil samples from within and around the Boiler House (NYOW-05-SL018-A, NYOW-05-SL019-A, and NYOW-05-SL020-A) exhibited surrogate recoveries below the lower warning limit but greater than the lower control limit for PAHs, indicating potential low bias. Other soil samples within and around the Boiler House (NYOW-05-SL016, NYOW-05-SL017, and NYOW-05-SL025) had acceptable recoveries.

Five surface soil samples from the Electric Substation (NYOW-05-SL011-A, NYOW-05-SL012-A, NYOW-05-SL013-A, NYOW-05-SL014-A, and NYOW-05-SL015-A) had LCS/LCSD recoveries less than the lower warning limit for dibenz(a,h)anthracene, benzo(a)pyrene, benzo(g,h,i)perylene, and indeno(1,2,3-c,d)pyrene. The recoveries were greater than the lower control limit and the results are usable with potential low bias.

Five MS/MSD samples for surface soil at AOC-5 had results that required qualification (NYOW-05-SL003-A, NYOW-05-SL010-A, NYOW-05-SL017-1-A, NYOW-05-SL022-A, and NYOW-05-SL025-A). The results are discussed in the sections below.

- MS/MSD sample NYOW-05-SL003-A exhibited recoveries less than the lower warning limits for SVOCs carbazole (19%), hexachlorobenzene (43%), atrazine (46%), dimethyl phthalate (47%), diethyl phthalate (47%), and di-n-butyl phthalate (50%). The associated sample results were non-detect and were qualified as "UJ" for low bias. MS/MSD sample NYOW-05-SL003-A exhibited recoveries above the upper warning limits for PAHs fluoranthene (122%, 125%), pyrene (126%, 134%), phenanthrene (282%, 295%), naphthalene (481%, 444%), 1-methylnaphthalene (492%, 484%), 2-methylnaphthalene (622%, 606%), and chrysene (124%). The associated positive detections were qualified "J+", indicating high bias. MS/MSD sample NYOW-05-SL003-A exhibited recoveries above the upper warning limit for arsenic (134%, 120%). The associated positive detection was qualified "J+", for high bias. MS/MSD sample NYOW-05-SL003-A exhibited recoveries below the lower warning limit for zinc (62%), manganese (69%), lead (79%), nickel (81%), cobalt (81%), and chromium (84%). The associated sample results were qualified as "J-", indicating low bias.
- MS/MSD sample NYOW-05-SL010-A exhibited recoveries below the lower warning limit for PAHs phenanthrene (0%), naphthalene (23%), 1-methylnaphthalene, (27%), benzo(b)fluoranthene (35%), pyrene (45%), and chrysene (53%). The associated sample results were positive detections and are qualified as "J-" for low bias. Calcium recovered above the upper warning limit at 128% and the result was qualified as "J+" for high bias. Manganese did not recover in MSD sample NYOW-05-SL010-A; the associated detected result was qualified as "J-" for low bias.
- MS/MSD sample NYOW-05-SL017-1-A exhibited low recoveries of SVOCs bis(2-chloroethyl) ether (26%), 2,2'-oxybis(1-chloropropane) (29%), N-nitroso-di-n-propylamine (33%), nitrobenzene (34%), 2-nitrophenol (35%), biphenyl (35%), 2-chloronaphthalene (36%), 1,2,4,5-tetrachlorobenzene (37%), 2,4-dichlorophenol (38%), dibenzofuran (43%), di-n-octyl phthalate (44%), benzyl butyl phthalate (44%), and bis(2-ethylhexyl)phthalate (45%). The associated non-detect results are qualified "UJ", indicating low bias. Fluoranthene and benzo(b)fluoranthene recovered below the lower warning limits, at 53% and 47%, respectively, and the results were qualified as "J-" for low bias. Multiple metal analytes (calcium, magnesium, barium, zinc, nickel, lead, cobalt, and silver) recovered below the lower warning limit and the results were qualified as "J-" or "UJ", indicating low bias.
- MS/MSD sample NYOW-05-SL022-A exhibited recoveries less than the lower warning limit for lead (76%), sodium (80%), beryllium (81%), cobalt (81%), and chromium (82%), and the results were qualified as "J-" or "UJ", indicating low bias. Potassium and barium recovered above the upper warning limit, at 132% and 122%, respectively, and the results were qualified as "J+" for high bias. Calcium and magnesium recovered above the upper warning limit; however, the results were affected by additional anomalies and a bias indicator was not assigned (i.e., "J" qualifiers).
- MS/MSD sample NYOW-05-SL025-A exhibited recoveries greater than the upper warning limit for benzo(a)anthracene (139%), chrysene (129%), fluoranthene (121%), and pyrene (125%). The results were qualified as "J+" for high bias. Multiple metal analytes (zinc, cobalt, lead, nickel, beryllium, silver, chromium, and magnesium) recovered below the lower warning limit and the results were qualified as "J-"or "UJ", indicating low bias. Manganese recovered once above and once below the associated warning limits and was qualified as "J" for indeterminate bias.

**Table 33**, below, summarizes the number of AOC 5 surface soil results that are biased based on the non-conformances discussed above.

**Table 33**
**Analytical Bias Summary - AOC 5 - Soil 0-1 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Biased Samples | Reason Code(s) | Number of High Biased Samples | Reason Code(s) | Number of Samples Not Affected |

Subsurface Soil

**Table 34** summarizes the number of AOC 5 subsurface soil results that were qualified for non-conformances related to accuracy:

| **Table 34:** AOC 5 Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Subsurface Soil results | 5736 |
| Subsurface Soil results qualified for surrogate %R anomalies | 197 (3.4%) |
| Subsurface Soil results qualified for LCS/LCSD %R anomalies | 66 (1.2%) |

| **Table 34:** AOC 5 Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Subsurface Soil results qualified for MS/MSD %R anomalies | 17 (<1%) |

One subsurface soil sample from the Possible Dump (NYOW-05-PH003-B) exhibited surrogate recoveries below the lower warning limit but greater than the lower control limit for SVOCs. All of the sample results were non-detect and qualified as "UJ" on the basis of low bias. The other nine soil samples from the Possible Dump had surrogates recover within control.

One subsurface soil sample from the Coal Storage Area (NYOW-05-PH007-C) exhibited surrogate recoveries between the lower warning and the lower control limits for PAHs, indicating low bias. The 13 other soil samples within the Coal Storage Area had acceptable recoveries.

Three subsurface soil samples from the Dual Coal Aggregate Bins A&B (NYOW-05-PH021-C, NYOW-05-PH024-B, NYOW-05-PH024-C) had surrogate recoveries between the lower warning and lower control limits for PAHs, indicating low bias. The five other soil samples within the Dual Coal Aggregate Bins A&B had acceptable recoveries.

Two subsurface soil samples from within the Boiler House (NYOW-05-PH017-1-C and NYOW-05-PH019-B) had surrogate recoveries between the lower warning and control limits for PAHs, indicating low bias. The eight other soil samples within and surrounding the Boiler House had acceptable recoveries.

Both of the "B" and "C" interval subsurface soil samples from the Electric Substation (NYOW-05-SL011, NYOW-05-SL012, NYOW-05-SL013, NYOW-05-SL014, and NYOW-05-SL015) had LCS/LCSD recoveries less than the lower warning limit for benzo(a)pyrene, benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, and dibenz(a,h)anthracene. The recoveries were greater than the lower control limit and the results are usable with potential low bias.

Three MS/MSD subsurface soil samples at AOC 5 had results that required qualification (NYOW-05-PH003-B, NYOW-05-PH011-B, and NYOW-05-PH021-C). The results are discussed in the sections below.

- MS/MSD sample NYOW-05-PH003-B exhibited a recovery greater than the upper warning limit for potassium at 155%; the sample result was qualified as "J+" for high bias. Magnesium and zinc recovered below the lower warning limit, at 66% and 73%, respectively and were qualified as "J-" for low bias. Antimony and manganese recovered below the lower warning limit were qualified as "J", for indeterminate bias.
- MS/MSD sample NYOW-05-PH011-B exhibited recoveries greater than the upper warning limit for potassium (119%, 117%) and magnesium (133%, 144%). The sample results were qualified as "J+", indicating high bias.
- The recoveries of SVOCs hexachlorobenzene (45%), 4-bromophenyl phenyl ether (45%), di-n-butyl phthalate (47%), and 2,4-dinitrotoluene (47%) were less than the lower warning limits for MS/MSD sample NYOW-05-PH021-C. The results were non-detect and were qualified as "UJ" for low bias. Zinc recovered above the upper control limit at 203% and the positive detection was qualified as "J+" for high bias.

**Table 35**, below, summarizes the number of AOC 5 subsurface soil results that are biased based on the non-conformances discussed above.

Groundwater

**Table 36** summarizes the number of AOC 5 groundwater results that were qualified for non-conformances related to accuracy:

| **Table 36:** AOC 5 Groundwater Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of GW results | 1,438 |
| Groundwater results qualified for surrogate %R anomalies | 536 (37%) |
| Groundwater results qualified for LCS/LCSD %R anomalies | 85 (5.9%) |
| Groundwater results qualified for MS/MSD %R anomalies | 25 (1.7%) |

All 12 groundwater samples had base/neutral (B/N) surrogates recover below the lower warning limit for SVOCs. Two of the groundwater samples recovered below the lower control limit and the results were rejected (**Section 2.2.4.1**). The only SVOC analytes detected in groundwater were caprolactam (NYOW-05-WL019-A) and the acid-extractable compound phenol (NYOW-05-WL025-A). Caprolactam and phenol were not detected above their respective PALs.

Seven groundwater samples (NYOW-05-WL006-A, NYOW-05-WL010-A, NYOW-05-WL016-A, NYOW-05-WL017-1-A, NYOW-05-WL019-A, NYOW-05-WL024-A, and NYOW-05-WL025-A) exhibited surrogate recoveries between the lower warning and control limits for PAHs, indicating low bias. The surrogates for the other five samples recovered within the acceptance limits.

Three groundwater samples (NYOW-05-WL004-A, NYOW-05-WL017-1-A, and NYOW-05-WL019-A) had low LCS/LCSD recoveries for acid and B/N extractable SVOCs. The recoveries were greater than the lower control limit and the results are usable with potential low bias.

Three groundwater samples (NYOW-05-WL006-A, NYOW-05-WL008-A, and NYOW-05-WL024-A) had low LCS/LCSD recoveries for benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, and indeno(1,2,3-cd)pyrene. The recoveries were greater than the lower control limit and the results are usable with potential low bias.

All 12 groundwater samples had low LCS/LCSD recoveries for dibenz(a,h)anthracene. The recoveries were greater than the lower control limit and the results are usable with potential low bias.

One MS/MSD sample for groundwater (NYOW-05-WL001-A) had low recoveries for PAHs: benzo(a)pyrene, benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, and dibenz(a,h)anthracene; SVOCs: hexachlorobenzene; and, multiple VOCs, including ethylbenzene and tetrachloroethylene. The recoveries were greater than the lower control limit and the non-detect results are usable with low bias.

**Table 37**, below, summarizes the number of AOC 5 groundwater results that are biased based on the non-conformances discussed above.

#### *2.2.2.2 AOC 4*

Surface Soil

**Table 38** summarizes the number of AOC 4 surface soil results that were qualified for non-conformances related to accuracy:

| **Table 38:** AOC 4 Surface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Surface Soil results | 72 |
| Surface Soil results qualified for surrogate %R anomalies | 0 |
| Surface Soil results qualified for LCS/LCSD %R anomalies | 0 |
| Surface Soil results qualified for MS/MSD %R anomalies | 1 (1.4%) |

One MS/MSD sample (NYOW-04-SL001-A) for AOC 4 surface soil exhibited recoveries less than the lower warning limit but greater than the lower control limit for picric acid at 38% and 41%, respectively. The associated non-detect picric acid result was qualified "UJ".

**Table 39**, below, summarizes the number of AOC 4 surface soil results that are biased based on the non-conformances discussed above.

**Table 39**
**Analytical Bias Summary - AOC 4 - Discrete Soil 0-1 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Biased Samples | Reason Code(s) | Number of High Biased Samples | Reason Code(s) | Number of Samples Not Affected |
|---|---|---|---|---|---|---|---|
| SW8330A | Picric acid | 16 | 1 (6.3%) | M | -- | -- | 15 |

Notes: M = MS/MSD Recovery

Subsurface Soil

**Table 40** summarizes the number of AOC 4 subsurface soil results that were qualified for non-conformances related to accuracy:

| **Table 40:** AOC 4 Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Subsurface Soil results | 448 |
| Subsurface Soil results qualified for surrogate %R anomalies | 8 (1.8%) |
| Subsurface Soil results qualified for LCS/LCSD %R anomalies | 0 |
| Subsurface Soil results qualified for MS/MSD %R anomalies | 4 (<1%) |

Two subsurface soil samples (NYOW-04-PH040-B and NYOW-04-PH071-B) exhibited surrogate recoveries for B/N-extractable and acid-extractable surrogates between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB and 2,4-DNP were non-detect and were qualified "UJ".

Two subsurface soil samples (NYOW-04-PH007-B and NYOW-04-PH041-B) exhibited B/N-extractable surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB were non-detect and were qualified "UJ".

One subsurface soil sample (NYOW-04-PH079-B) exhibited acid-extractable surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for 2,4-DNP were non-detect and were qualified "UJ".

One subsurface soil sample (NYOW-04-PH002-C) exhibited a surrogate recovery for 1,2-dinitrobenzene (DNB) between the lower warning and lower control limits for explosives, indicating low bias. The associated picric acid result was non-detect and was qualified "UJ".

Four MS/MSD subsurface soil samples at AOC 4 had results that required qualification:

- MSD sample NYOW-04-PH052-B exhibited a recovery less than the lower warning limit but greater than the lower control limit for picric acid at 46%. The associated sample result was non-detect and was qualified as "UJ" for low bias.

- MS/MSD sample NYOW-04-PH084-B exhibited recoveries less than the lower warning limit but greater than the lower control limit for picric acid at 28% and 26%, respectively. The associated sample result was non-detect and was qualified as "UJ" for low bias.
- MS/MSD sample NYOW-04-PH085-C exhibited recoveries less than the lower warning limit but greater than the lower control limit for picric acid at 38% and 40%, respectively. The associated sample result was non-detect and was qualified as "UJ" for low bias.
- MS/MSD sample PH-DUP-001_210202 exhibited recoveries less than the lower warning limit but greater than the lower control limit for picric acid at 34% and 33%, respectively. The associated sample result was non-detect and was qualified as "UJ" for low bias.

**Table 41**, below, summarizes the number of AOC 4 subsurface soil results that are biased based on the non-conformances discussed above.

**Table 41**
**Analytical Bias Summary - AOC 4 - Discrete Soil 1-10 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |
|---|---|---|---|---|---|---|---|
| SW8270D | 2,4-Dinitrochlorobenzene | 101 | 4 (4.0%) | I | -- | -- | 97 |
| SW8270D | 2,4-Dinitrophenol | 101 | 3 (3.0%) | I | -- | -- | 98 |
| SW8330A | Picric acid | 101 | 5 (5.0%) | I/M | -- | -- | 96 |

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

Groundwater

**Table 42** summarizes the number of AOC 4 groundwater results that were qualified for non-conformances related to accuracy:

| **Table 42:** AOC 4 Groundwater Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of GW results | 53 |
| Groundwater results qualified for surrogate %R exceedances | 16 (30.2%) |
| Groundwater results qualified for LCS/LCSD %R exceedances | 0 |
| Groundwater results qualified for MS/MSD %R exceedances | 0 |

Eight groundwater samples (NYOW-04-WL001-A, NYOW-04-WL002-A, NYOW-04-WL004-A, NYOW-04-WL005-A, NYOW-04-WL079-A, NYOW-04-WL080-A, NYOW-04-WL081-A, and NYOW-04-WL083-A) exhibited surrogate recoveries for terphenyl-d14 between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB were non-detect and were qualified "UJ". One groundwater sample (NYOW-04-WL082-A) exhibited surrogate recoveries for 2,4,6-tribromophenol, nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 between the lower warning and

lower control limits for SVOCs, indicating low bias. The associated results for DNCB and 2,4-DNP were non-detect and were qualified "UJ".

Five groundwater samples (NYOW-04-WL001-A, NYOW-04-WL004-A, NYOW-04-WL006-A, NYOW-04-WL037-A, and NYOW-04-WL079-A) exhibited surrogate recoveries between the lower warning and lower control limits for the explosives analysis, indicating low bias. The associated picric acid results were non-detect and were qualified "UJ".

**Table 43**, below, summarizes the number of AOC 4 groundwater results that are biased based on the non-conformances discussed above.

**Table 43**
**Analytical Bias Summary - AOC 4 - Groundwater**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |
|---|---|---|---|---|---|---|---|
| SW8270D | 2,4-Dinitrochlorobenzene | 16 | 7 (44%) | I | -- | -- | 9 |
| SW8270D | 2,4-Dinitrophenol | 16 | 1 (6.3%) | I | -- | -- | 15 |
| SW8330B | Picric acid | 15 | 5 (33%) | I | -- | -- | 10 |

Notes: I = Surrogate Recovery

#### *2.2.2.3 AOC 1*

Surface Soil

**Table 44** summarizes the number of AOC 1 surface soil results that were qualified for non-conformances related to accuracy:

| **Table 44:** AOC 1 Surface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Surface Soil results | 897 |
| Surface Soil results qualified for surrogate %R anomalies | 9 (1.0%) |
| Surface Soil results qualified for LCS/LCSD %R anomalies | 6 (<1%) |
| Surface Soil results qualified for MS/MSD %R anomalies | 12 (1.3%) |

One surface soil sample (NYOW-01-SL030-A) exhibited surrogate recoveries for B/N-extractable and acid-extractable surrogates between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB and 2,4-DNP were non-detect and were qualified "UJ".

Seven surface soil samples (NYOW-01-SL016-A, NYOW-01-SL022-A, NYOW-01-SL023-A, NYOW-01-SL033-A, NYOW-01-SL034-A, NYOW-01-SL035-A, and NYOW-01-SL036-A) exhibited B/N-

extractable surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB were non-detect and were qualified "UJ".

Two surface soil samples (NYOW-01-SL005-A and NYOW-01-SL018-A) had LCS/LCSD recoveries greater than the upper warning limit for barium (113%) at 114%. The associated positive detections were qualified as "J+".

Three surface soil samples (NYOW-01-SL026-A, NYOW-01-SL029-A, and NYOW-01-SL030-A) were associated with an LCSD that exhibited a 0% recovery for TOC. The LCS recovered within criteria. The associated TOC results were positive detections and were qualified as "J-".

Six MS/MSD samples for surface soil at AOC 1 had results that required qualification (NYOW-01-SL002-A, NYOW-01-SL021-A, NYOW-01-SL023-A, NYOW-01-SL025-A, NYOW-01-SL029-A, and NYOW-01-SL036-A). The results are discussed below:

- For MS/MSD sample NYOW-01-SL002-A, potassium recovered above the upper warning limit and the positive detection was qualified "J+", for high bias. Chromium, magnesium, and antimony recovered below the lower warning limits and the results were qualified as "J-", indicating low bias. TOC recovered above the upper warning limit at 259% and 157%, respectively. The positive TOC detection was qualified as "J+". Picric acid recovered below the lower warning limit at 15% and 15%, respectively. The non-detect picric acid sample result was qualified "UJ".
- For MS/MSD sample NYOW-01-SL021-A, calcium recovered above the upper warning limit and zinc recovered below the lower warning limit at 36%. The associated positive detections were affected by additional anomalies and were qualified "J", without bias indicators.
- For MS/MSD sample NYOW-01-SL023-A, TOC recovered below the lower control limit at 0% and the sample result was qualified as "J-".
- For MS/MSD sample NYOW-01-SL029-A, TOC recovered above the upper warning limit at 171%. The sample result was affected by additional anomalies and was qualified "J", without a bias indicator.
- MS/MSD sample NYOW-01-SL025-A exhibited recoveries for picric acid below the lower warning limit at 26% and 23%, respectively, and the non-detect sample result was qualified as "UJ".
- MS/MSD sample NYOW-01-SL036-A exhibited recoveries for picric acid below the lower warning limit at 15% and 16%, respectively, and the non-detect sample result was qualified as "UJ".

**Table 45,** below, summarizes the number of AOC 1 surface soil results that are biased based on the non-conformances discussed above.

**Table 45**
**Analytical Bias Summary - AOC 1 - Soil 0-1 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |
|---|---|---|---|---|---|---|---|
| SW6010C | Barium | 30 | -- | -- | 2 (6.7%) | C | 28 |
| SW6010C | Chromium | 30 | 1 (3.3%) | M | -- | -- | 29 |
| SW6010C | Magnesium | 30 | 1 (3.3%) | M | -- | -- | 29 |
| SW6010C | Potassium | 30 | -- | | 1 (3.3%) | M | 29 |
| SW6020A | Antimony | 30 | 1 (3.3%) | M | -- | -- | 29 |
| SW8270D | 2,4-Dinitrochlorobenzene | 30 | 8 (27%) | I | -- | -- | 22 |
| SW8270D | 2,4-Dinitrophenol | 29 | 1 (3.3%) | I | -- | -- | 28 |
| SW8330A | Picric acid | 30 | 3 (10%) | M | -- | -- | 27 |

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

Subsurface Soil

**Table 46** summarizes the number of AOC 1 subsurface soil results that were qualified for non-conformances related to accuracy:

| **Table 46:** AOC 1 Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Subsurface Soil results | 755 |
| Subsurface Soil results qualified for surrogate %R anomalies | 8 (1.1%) |
| Subsurface Soil results qualified for LCS/LCSD %R anomalies | 6 (<1%) |
| Subsurface Soil results qualified for MS/MSD %R anomalies | 28 (3.7%) |

One subsurface soil sample (NYOW-01-PH015-B) exhibited surrogate recoveries for B/N-extractable and acid-extractable surrogates between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB and 2,4-DNP were non-detect and were qualified "UJ".

Six subsurface soil samples (NYOW-01-PH016-B, NYOW-01-PH016-C, NYOW-01-PH020-B, NYOW-01-PH020-C, NYOW-01-PH023-C, and NYOW-01-PH024-C) exhibited B/N-extractable surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated results for DNCB were non-detect and were qualified "UJ".

Four subsurface soil samples (NYOW-01-PH005-B, NYOW-01-PH005-C, NYOW-01-PH018-B, and NYOW-01-PH018-C) had LCS/LCSD recoveries greater than the upper warning limit for barium (113%) at 114%. The associated positive detections were qualified as "J+".

Three MS/MSD samples for subsurface soil at AOC 1 had results that required qualification (NYOW-01-PH002-B, NYOW-01-PH019-B, and NYOW-01-PH023-B). The results are discussed below:

- MS/MSD sample NYOW-01-PH002-B exhibited picric acid recoveries less than the lower warning limit at 23% and 21%, respectively. The associated non-detect sample result was qualified "UJ". MS/MSD sample NYOW-01-PH002-B exhibited recoveries outside of warning limits for magnesium (71% and 125%) and potassium (126% and 122%). The positive detection for magnesium is qualified as "J" and the detection for potassium is qualified as "J+". MSD sample NYOW-01-PH002-B exhibited a recovery greater than the upper warning limit for TOC at 147%. The associated positive detection is qualified as "J+".
- MS/MSD sample NYOW-01-PH019-B exhibited picric acid recoveries less than the lower warning limit at 37% and 41%, respectively. The associated non-detect sample result was qualified "UJ". MS/MSD sample NYOW-01-PH019-B exhibited TOC recoveries less than the lower warning limit at 35% and 19%, respectively. The associated positive detection is qualified as "J-". MS/MSD sample NYOW-01-PH019-B exhibited recoveries below the warning limits for silver, barium, beryllium, calcium, cobalt, chromium, magnesium, manganese, sodium, nickel, lead, vanadium, and zinc. The associated positive detections for all analytes were qualified as "J-", except for the non-detect silver result, which was qualified as "UJ".
- MS/MSD sample NYOW-01-PH023-B exhibited low TOC recoveries at -69% and 17%, respectively. The associated positive detection was affected by additional anomalies and was qualified "J". MS/MSD sample NYOW-01-PH023-B exhibited recoveries below the warning limits for cobalt, chromium, copper, magnesium, sodium, nickel, lead, and zinc. The associated positive detections were qualified as "J-".

**Table 47**, below, summarizes the number of AOC 1 subsurface soil results that are biased based on the non-conformances discussed above.

**Table 47**
**Analytical Bias Summary - AOC 1 - Soil 1-10 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |
|---|---|---|---|---|---|---|---|
| SW6010C | Barium | 22 | 1 (4.5%) | M | 4 (18%) | C | 17 |

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

Groundwater

**Table 48** summarizes the number of AOC 1 groundwater results that were qualified for non-conformances related to accuracy:

| **Table 48:** AOC 1 Groundwater Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of GW results | 261 |
| Groundwater results qualified for surrogate %R anomalies | 11 (4.2%) |
| Groundwater results qualified for LCS/LCSD %R anomalies | 0 |
| Groundwater results qualified for MS/MSD %R anomalies | 2 (<1%) |

Eight groundwater samples (NYOW-01-WL001-A, NYOW-01-WL005-A, NYOW-01-WL006-B, NYOW-01-WL018-A, NYOW-01-WL019-A, NYOW-01-WL021-A, NYOW-01-WL022-A_R, and NYOW-01-WL024-A) exhibited surrogate recoveries between the lower warning and control limits for SVOCs, indicating low bias. The associated non-detect DNCB results were qualified "UJ".

Two groundwater samples (NYOW-01-WL019-A and NYOW-01-WL024-A) exhibited surrogate recoveries between the lower warning and lower control limits for 1,2-DNB in the explosives analysis, indicating low bias. The associated picric acid results were non-detect and were qualified "UJ".

The NYOW-01-WL001-A MS/MSD sample exhibited recoveries less than the lower warning limit for dissolved antimony (85%) at 80% and 82%, respectively. The associated sample result is qualified as "J-".

The NYOW-01-WL001-A MSD sample exhibited a recovery less than the lower warning limit for picric acid (80%) at 57%. The associated non-detect sample result is qualified as "UJ".

**Table 49**, below, summarizes the number of AOC 1 groundwater results that are biased based on the non-conformances discussed above.

**Table 49**

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

#### *2.2.2.4 AOC 3*

Surface Soil

**Table 50** summarizes the number of AOC 3 surface soil results that were qualified for non-conformances related to accuracy:

| **Table 50:** AOC 3 Surface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Surface Soil results | 1859 |
| Surface Soil results qualified for surrogate %R anomalies | 201 (10.8%) |
| Surface Soil results qualified for LCS/LCSD %R anomalies | 82 (4.4%) |
| Surface Soil results qualified for MS/MSD %R anomalies | 50 (2.7%) |

Two surface soil samples (NYOW-03-SL007-A and NYOW-03-SL008-A) exhibited surrogate recoveries greater than the upper warning limits for PAHs, indicating high bias. The associated positive detections were qualified "J+".

One surface soil sample (NYOW-03-SL012-A) exhibited surrogate recoveries between the lower warning and lower control limits for PAHs, indicating low bias. The associated results were qualified "J-".

Five surface soil samples (NYOW-03-SL004-A, NYOW-03-SL005-A, NYOW-03-SL006-A, NYOW-03-SL012-A, and NYOW-03-SL015-A) exhibited surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated non-detect results were qualified "UJ" and the associated detections were qualified "J-".

One surface soil sample (NYOW-03-SL008-A) exhibited a recovery greater than the upper warning limit for decachlorobiphenyl. The associated PCB-1260 sample result was qualified as "J+".

Two surface soil samples (NYOW-03-SL006-A and NYOW-03-SL012-A) were associated with LCS/LCSD recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated non-detect results were qualified "UJ" and the associated detections were qualified "J-".

Five MS/MSD samples for surface soil at AOC 3 had results that required qualification (NYOW-03-SL002-A, NYOW-03-SL004-A, NYOW-03-SL005-A, NYOW-03-SL009-A, and NYOW-03-SL009-A_R). The results are discussed below:

- MS/MSD sample NYOW-03-SL002-A exhibited recoveries for picric acid below the lower warning limit (50%) at 34% and 35%, respectively, and the non-detect sample result was qualified as "UJ".
- MS/MSD sample NYOW-03-SL004-A exhibited recoveries less than the lower warning limits but greater than the lower control limits for atrazine (43%), 4-chloroaniline (13%, 15%), 3-nitroaniline (30%), and 4-nitroaniline (33%) in the SVOCs analysis. The associated sample results were non-detect and were qualified as "UJ".
- MS/MSD sample NYOW-03-SL004-A exhibited recoveries less than the lower warning limits but greater than the lower control limits for benzo(b)fluoranthene (48%), benzo(g,h,i)perylene (41%), and indeno(1,2,3-cd)pyrene (46%). The associated sample results were positive detections and were qualified as "J-".
- MS/MSD sample NYOW-03-SL004-A exhibited recoveries less than the lower warning limits for manganese (75%) and lead (80%). The associated sample results were positive detections and were qualified as "J-".
- MS/MSD sample NYOW-03-SL005-A exhibited recoveries less than the lower warning limits but greater than the lower control limits for 2,4-dinitrotoluene (42%, 45%), 2-nitroaniline (43%), atrazine (40%, 42%), benzyl butyl phthalate (45%), bis(2-ethylhexyl)phthalate (46%), caprolactam (41%), carbazole (47%), di-n-butyl phthalate (47%), diethyl phthalate (46%), dimethyl phthalate (47%), and N-nitroso-di-n-propylamine (35%) in the SVOCs analysis. The associated sample results were non-detect and were qualified as "UJ".
- MS/MSD sample NYOW-03-SL005-A exhibited recoveries greater than the upper warning limit for potassium (118%). The positive detection for potassium is qualified as "J+".
- MS/MSD sample NYOW-03-SL009-A exhibited recoveries less than the lower warning limits and lower control limits for acenaphthylene (19%, 4%), anthracene (49%), benzo(a)anthracene (-15%, 2%), benzo(a)pyrene (-13%, -15%), benzo(b)fluoranthene (-76%, -90%), benzo(g,h,i)perylene (13%, -7%), benzo(k)fluoranthene (10%, 6%), chrysene (-38%, -32%), fluoranthene (-141%, -74%), fluorene (46%), indeno(1,2,3-c,d)pyrene (5%, -6%), phenanthrene (-122%, -63%), and pyrene (-83%, -52%). The associated sample results were positive detections and were qualified as "J-".
- MS/MSD sample NYOW-03-SL009-A exhibited recoveries for picric acid below the lower warning limit (50%) at 30% and 28%, respectively, and the non-detect sample result was qualified as "UJ".
- MS/MSD sample NYOW-03-SL009-A exhibited recoveries outside of warning limits for calcium (130%), manganese (123%), copper (78%), silver (78%), vanadium (77%), barium (76%), chromium (76%), cobalt (75%), nickel (75%), beryllium (74%), sodium (74%), and lead (73%). The associated sample results were qualified as "UJ", "J-", or "J+".

- MSD sample NYOW-03-SL009-A_R exhibited recoveries less than the lower warning limits for caprolactam (46%) and hexachlorocyclopentadiene (28%) at 41% and 27%, respectively. The associated sample results were non-detect and were qualified as "UJ".

**Table 51**, below, summarizes the number of AOC 3 surface soil results that are biased based on the non-conformances discussed above.

**Table 51**

Notes: I = Surrogate Recovery, C = LCS Recovery, M = MS/MSD Recovery

Subsurface Soil

**Table 52** summarizes the number of AOC 3 subsurface soil results that were qualified for non-conformances related to accuracy:

| **Table 52:** AOC 3 Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Subsurface Soil results | 3096 |
| Subsurface Soil results qualified for surrogate %R anomalies | 255 (8.2%) |
| Subsurface Soil results qualified for LCS/LCSD %R anomalies | 28 (<1%) |
| Subsurface Soil results qualified for MS/MSD %R anomalies | 39 (1.3%) |

Subsurface soil sample NYOW-03-PH009-B exhibited recoveries less than the lower warning limits for surrogates 2-fluorobiphenyl and nitrobenzene-d5 at 38% and 41%, respectively. The associated sample results were non-detect and were qualified as "UJ".

Five subsurface soil samples (NYOW-03-PH004-B, NYOW-03-PH005-B_R, NYOW-03-PH008-B_R, NYOW-03-PH013-B_R, and NYOW-03-PH015-B_R) exhibited surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated non-detect results were qualified "UJ".

Six subsurface soil samples (NYOW-03-PH005-B_R, NYOW-03-PH006-B_R, NYOW-03-PH007-B_R, NYOW-03-PH016-B_R, NYOW-03-PH017-B_R, and NYOW-03-PH018-B_R) were associated with an LCS recovery less than the lower warning limit for chloroform (78%) at 77%, indicating low bias. The associated non-detect results were qualified "UJ".

Three subsurface soil samples (NYOW-03-PH006-B_R, NYOW-03-PH007-B_R, and NYOW-03-PH008-B_R) were associated with LCS/LCSD recoveries less than the lower warning limits for 2,2'-oxybis[1-chloropropane] (31% and 30%), 2,6-dinitrotoluene (43%), bis(2-ethylhexyl)phthalate (50% and 26%), hexachlorocyclopentadiene (26% and 23%), butyl benzyl phthalate (46%), bis(2-chloroethyl)ether (26%), and N-nitroso-di-n-propylamine (32%). The associated soil sample results were non-detect and were qualified as "UJ".

Four MS/MSD samples for subsurface soil at AOC 3 had results that required qualification (NYOW-03-PH005-B, NYOW-03-PH008-B, NYOW-03-PH008-B_R, and NYOW-03-PH016-B). The results are discussed below:

- MS/MSD sample NYOW-03-PH005-B exhibited recoveries less than the lower control limit for anthracene (33%), fluoranthene (-13%, -66%), phenanthrene (36%, 32%), dibenz(a,h)anthracene (-37%, -155%), and pyrene (6%, -81%) . The associated positive detections were qualified as "J-".
- MS/MSD sample NYOW-03-PH008-B exhibited recoveries less than the lower warning limits for barium (68%, 70%), beryllium (68%, 69%), calcium (2.5%), chromium (69%, 70%), cobalt (67%, 69%), copper (69%, 70%), magnesium (65%, 47%), manganese (63%, 76%), nickel (66%, 68%), potassium (79%), silver (70%, 71%), sodium (67%, 68%), vanadium (70%, 71%), zinc (65%, 58%), and lead (63%, 65%). The associated sample results were qualified as "UJ" or "J-".
- MS/MSD sample NYOW-03-PH008-B exhibited recoveries for picric acid below the lower warning limit (50%) at 17% and 18%, respectively, and the non-detect sample result was qualified as "UJ".
- MS/MSD sample NYOW-03-PH008-B_R exhibited recoveries less than the lower warning limits for multiple analytes in the SVOCs analysis: hexachlorocyclopentadiene (16%, 27%), 2,2'-

oxybis[1-chloropropane] (27%), bis(2-chloroethyl)ether (27%), phenol (32%), N-nitroso-di-n-propylamine (35%), 2-chloronaphthalene (39%), 2,6-dinitrotoluene (40%), 4-chlorophenyl phenyl ether (42%), 2-nitroaniline (42%), 4-bromophenyl phenyl ether (44%), 2,4-dinitrotoluene (44%), butyl benzyl phthalate (47%), carbazole (48%), diethyl phthalate (48%), dimethyl phthalate (50%), di-n-butyl phthalate (50%), and bis(2-ethylhexyl) phthalate (50%). The associated sample results were non-detect and were qualified as "UJ".

- MS/MSD sample NYOW-03-PH016-B exhibited recoveries for picric acid below the lower warning limit (50%) at 25% and 26%, respectively, and the non-detect sample result was qualified as "UJ".

**Table 53**, below, summarizes the number of AOC 3 subsurface soil results that are biased based on the non-conformances discussed above.

Groundwater

**Table 54** summarizes the number of AOC 3 groundwater results that were qualified for non-conformances related to accuracy:

| **Table 54:** AOC 3 Groundwater Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of GW results | 1223 |
| Groundwater results qualified for surrogate %R anomalies | 204 (16.7%) |
| Groundwater results qualified for LCS/LCSD %R anomalies | 0 |
| Groundwater results qualified for MS/MSD %R anomalies | 3 (<1%) |

Five groundwater samples (NYOW-03-WL002-A, NYOW-03-WL007-A, NYOW-03-WL013-A, NYOW-03-WL014-A, and NYOW-03-WL015-A) exhibited surrogate recoveries between the lower warning and lower control limits for SVOCs, indicating low bias. The associated non-detect results were qualified "UJ" and the associated detections were qualified "J-". The remaining three groundwater samples did not have any results qualified on the basis of SVOC surrogate recoveries.

Three groundwater samples (NYOW-03-WL007-A, NYOW-03-WL009-A, and NYOW-03-WL015-A) exhibited surrogate recoveries between the lower warning and lower control limits for 1,2-DNB in the explosives analysis, indicating low bias. The associated picric acid results were non-detect and were qualified "UJ".

The NYOW-03-WL009-A MSD sample exhibited a recovery less than the lower warning limit for dissolved calcium (87%) at 80%. The associated sample result is qualified as "J-".

The NYOW-03-WL009-A MS/MSD sample exhibited recoveries less than the lower warning limit for N-nitroso-diphenylamine (51%) at 27% and 24%, respectively. The associated non-detect sample result is qualified as "UJ".

The NYOW-03-WL009-A MSD sample exhibited a recovery less than the lower warning limit for picric acid (80%) at 50%. The associated sample result is qualified as "UJ".

**Table 55**, below, summarizes the number of AOC 3 groundwater results that are biased based on the non-conformances discussed above.

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

#### *2.2.2.5 AOC 4 ISM*

**Table 56** summarizes the number of AOC 4 ISM soil results that were qualified for non-conformances related to accuracy:

| **Table 56:** AOC 4 ISM Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of ISM Soil results | 99 |
| ISM Soil results qualified for surrogate %R anomalies | 60 (60.6%) |
| ISM Soil results qualified for LCS/LCSD %R anomalies | 0 |
| ISM Soil results qualified for MS/MSD %R anomalies | 9 (9.1%) |

Surrogate recoveries were less than the lower warning limits but greater than the lower control limits for 34 ISM replicates in the SVOC analysis. The associated sample results were non-detect and were qualified as "UJ" to indicate low bias.

Three AOC 4 ISM soil samples (NYOW-04-DU001-SL-A, NYOW-04-DU005-SL-B, and NYOW-04-DU013-SL-A) exhibited MS/MSD recoveries that were less than the lower warning limit but greater than the lower control limit for picric acid. The associated non-detect sample results for all replicates within the three affected DUs were qualified "UJ" to indicate low bias.

There is no grinding LCS (laboratory control sample standard reference material [LCSSRM]) that contains the analytes in the SVOC list. The explosives LCSSRM does not contain picric acid. As a result, the impact of sample milling on the SVOCs and explosive analyte recoveries could not be quantified.

**Table 57**, below, summarizes the number of AOC 4 ISM soil results that are biased based on the non-conformances discussed above.

**Table 57**
**Analytical Bias Summary - AOC 4 - ISM Soil - 0 to 1 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |

| SW8270D | 2,4-Dinitrochlorobenzene | 34 | 33 (97%) | I | -- | -- | 1 |
| SW8270D | 2,4-Dinitrophenol | 29 | 27 (93%) | I | -- | -- | 2 |
| SW8330B | Picric acid | 36 | 9 (25%) | M | -- | -- | 27 |

Notes: I = Surrogate Recovery, M = MS/MSD Recovery

#### *2.2.2.6 Background*

Surface Soil

**Table 58** summarizes the number of Background surface soil results that were qualified for non-conformances related to accuracy:

| **Table 58:** Background Surface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Surface Soil results | 2200 |
| Surface Soil results qualified for surrogate %R anomalies | 190 (8.6%) |
| Surface Soil results qualified for LCS/LCSD %R anomalies | 43 (2.0%) |
| Surface Soil results qualified for MS/MSD %R anomalies | 45 (2.0%) |

Eleven surface soil samples (NYOW-B-SL024-A, NYOW-B-SL025-A, NYOW-B-SL027-A, NYOW-B-SL031-A, NYOW-B-SL038-A, NYOW-B-SL040-A, NYOW-B-SL041-A, NYOW-B-SL046-A, NYOW-B-SL048-A, NYOW-B-SL049-A, and NYOW-B-SL050-A) exhibited surrogate recoveries below the lower

warning limit but greater than the lower control limit for PAHs. The sample results were qualified as "J-" or "UJ" on the basis of low bias. The remaining 34 surface soil samples had surrogates recover within control.

Five surface soil samples (NYOW-B-SL015-A, NYOW-B-SL016-A, NYOW-B-SL017-A, NYOW-B-SL018-A, and NYOW-B-SL019-A) were associated with LCS/LCSD recoveries less than the lower warning limit for cobalt (85%), at 84.7%. The results are usable, with low bias, and were qualified "J-".

Fourteen surface soil samples (NYOW-B-SL021-A, NYOW-B-SL026-A, NYOW-B-SL036-A, NYOW-B-SL037-A, NYOW-B-SL038-A, NYOW-B-SL039-A, NYOW-B-SL042-A, NYOW-B-SL043-A, NYOW-B-SL044-A, NYOW-B-SL045-A, NYOW-B-SL046-A, NYOW-B-SL047-A, NYOW-B-SL048-A, and NYOW-B-SL050-A) were associated with LCS/LCSD recoveries less than the lower warning limits for indeno(1,2,3-c,d)pyrene (49%), benzo(g,h,i)perylene (49%), benzo(k)fluoranthene (56%), and dibenz(a,h)anthracene (50%) at 29.8%, 27.8%, 52.3%, and 34.3%, respectively. In addition, the LCS/LCSD recovery was greater than the upper warning limit for naphthalene (111%) at 140%. All results are usable, and were qualified "J-", "UJ", or "J+" as appropriate.

Seven Background surface soil MS/MSD samples had metals results that required qualification (NYOW-B-SL006-A, NYOW-B-SL016-A, NYOW-B-SL020-A, NYOW-B-SL026-A, NYOW-B-SL029-A, NYOW-B-SL046-A, and NYOW-B-SL050-A) for percent recoveries that were less than or greater than the warning limits for aluminum, arsenic, barium, beryllium, calcium, chromium, cobalt, iron, lead, magnesium, manganese, mercury, nickel, potassium, sodium, vanadium, and zinc. All results are usable, and were qualified "J-", "UJ", or "J+" as appropriate.

Three Background surface soil MS/MSD samples had PAH results that required qualification (NYOW-B-SL006-A, NYOW-B-SL023-A, and NYOW-B-SL046-A) for percent recoveries that were less than or greater than the warning limits for anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-c,d)pyrene, phenanthrene, and pyrene. All results are usable and were qualified "J-" or "J+" as appropriate.

**Table 59**, below, summarizes the number of Background surface soil results that are biased based on the non-conformances discussed above.

**Table 59**
**Analytical Bias Summary - Background - Soil 0-1 ft bgs**
**Data Usability Assessment**

Notes: I = Surrogate Recovery, C = LCS Recovery, M = MS/MSD Recovery

Subsurface Soil

**Table 60** summarizes the number of Background subsurface soil results that were qualified for non-conformances related to accuracy:

| **Table 60:** Background Subsurface Soil Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of Subsurface Soil results | 4,356 |
| Subsurface Soil results qualified for surrogate %R anomalies | 144 (3.3%) |
| Subsurface Soil results qualified for LCS/LCSD %R anomalies | 81 (1.9%) |
| Subsurface Soil results qualified for MS/MSD %R anomalies | 51 (1.2%) |

Eight subsurface soil samples (NYOW-B-PH025-B, NYOW-B-PH028-C, NYOW-B-PH029-B, NYOW-B-PH039-C, NYOW-B-PH046-C, NYOW-B-PH048-B, NYOW-B-PH048-C, and NYOW-B-PH050-C) exhibited surrogate recoveries below the lower warning limit but greater than the lower control limit for PAHs. The sample results were qualified as "J-" or "UJ" on the basis of low bias. The remaining 82 subsurface soil samples had surrogates recover within control.

Ten subsurface soil samples (NYOW-B-PH015-B, NYOW-B-PH015-C, NYOW-B-PH016-B, NYOW-B-PH016-C, NYOW-B-PH017-B, NYOW-B-PH017-C, NYOW-B-PH018-B, NYOW-B-PH018-C, NYOW-B-PH019-B and NYOW-B-PH019-C) were associated with LCS/LCSD recoveries less than the lower warning limit for cobalt (85%), at 84.7%. The results are usable, with low bias, and were qualified "J-".

Twenty-three subsurface soil samples were associated with LCS/LCSD recoveries less than the lower warning limits for indeno(1,2,3-c,d)pyrene (130%), benzo(g,h,i)perylene (127%), benzo(k)fluoranthene (123%), and dibenz(a,h)anthracene (129%) at 29.8%/48.8%, 27.8%, 52.3%, and 34.3%, respectively. In addition, the LCS/LCSD recovery was greater than the upper warning limit for naphthalene (111%) at 140%. All results are usable, and were qualified "J-", "UJ", or "J+" as appropriate.

Seven Background subsurface soil MS/MSD samples (NYOW-B-PH006-B, NYOW-B-PH007-C, NYOW-B-PH026-B, NYOW-B-PH026-C, NYOW-B-PH028-B, NYOW-B-PH036-B, and NYOW-B-PH046-B) had metals results that required qualification for percent recoveries that were less than or greater than the warning limits for aluminum, barium, beryllium, calcium, chromium, cobalt, copper, lead, magnesium, manganese, nickel, potassium, sodium, thallium, vanadium, and zinc. All results are usable, and were qualified "J-", "UJ", or "J+" as appropriate.

Three Background subsurface soil MS/MSD samples (NYOW-B-PH018-B, NYOW-B-PH036-B, and NYOW-B-PH048-B) had PAH results that required qualification for percent recoveries that were less than the warning limits for 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, chrysene, fluoranthene, and pyrene. All results are usable and were qualified "J-" or "UJ" as appropriate.

One Background subsurface soil MS/MSD sample (NYOW-B-PH033-C) had a TOC result that required qualification for a %R that was less than the lower warning limit but greater than the lower control limit at 12%. The results are usable and were qualified "J-" for low bias.

**Table 61**, below, summarizes the number of Background subsurface soil results that are biased based on the non-conformances discussed above.

**Table 61**
**Analytical Bias Summary - Background - Soil 1-10 ft bgs**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |

| SW9060A | Total Organic Carbon | 90 | 1 (1.1%) | M | -- | -- | 89 |

Notes: I = Surrogate Recovery, C = LCS Recovery, M = MS/MSD Recovery

Groundwater

**Table 62** summarizes the number of Background groundwater results that were qualified for non-conformances related to accuracy:

| **Table 62:** Background Groundwater Summary – Accuracy (Surrogate, LCS/LCSD, and MS/MSD %R) | |
|---|---|
| Total number of GW results | 410 |
| Groundwater results qualified for surrogate %R anomalies | 53 (12.9%) |
| Groundwater results qualified for LCS/LCSD %R anomalies | 12 (2.9%) |
| Groundwater results qualified for MS/MSD %R anomalies | 6 (1.5%) |

Two groundwater samples (NYOW-B-WL001-A and NYOW-B-WL004-A) exhibited surrogate recoveries below the lower warning limit but greater than the lower control limit for PAHs. The sample results were qualified as "J-" or "UJ" on the basis of low bias. The remaining seven groundwater samples had surrogates recover within control.

Five groundwater samples (NYOW-B-WL003-A, NYOW-B-WL005-A , NYOW-B-WL010-A, NYOW-B-WL047-A, and NYOW-B-WL050-A) were associated with low LCS/LCSD recoveries for fluorene (49%), anthracene (51%), benzo(a)pyrene (45%), benzo(g,h,i)perylene (38%), benzo(k)fluoranthene (49%), dibenz(a,h)anthracene (43%), and indeno(1,2,3-c,d)pyrene (41%). In addition, one groundwater sample (NYOW-B-WL031-A) was associated with high LCS/LCSD recoveries for benzo(a)anthracene (122%) and chrysene (124%). All results are usable, and were qualified "J-", "UJ", or "J+" as appropriate.

One MS/MSD sample for groundwater (NYOW-B-WL001-A) had low recoveries for PAHs benzo(a)pyrene (44%, 49%), benzo(b)fluoranthene (47%, 51%), benzo(g,h,i)perylene (28%, 33%), benzo(k)fluoranthene (46%, 50%), dibenz(a,h)anthracene (29%, 35%), and indeno(1,2,3-c,d)pyrene (26%, 32%). The recoveries were greater than the lower control limit; the non-detect results are usable and were qualified "UJ" for low bias.

**Table 63** summarizes the number of Background groundwater results that are biased based on the non-conformances discussed above.

**Table 63**
**Analytical Bias Summary - Background - Groundwater**
**Data Usability Assessment**
**Former New York Ordnance Works, Onondaga, NY**

| Test Method | Analyte | Number of Samples | Number of Low Bias Samples | Reason Code(s) | Number of High Bias Samples | Reason Code(s) | Number of Samples Not Affected |

| BNASIMD | Pyrene | 9 | 2 (22%) | I | -- | -- | 7 |

Notes: I = Surrogate Recovery, C = LCS Recovery, M = MS/MSD Recovery

### 2.2.3 Representativeness

Representativeness qualitatively expresses the degree to which data accurately reflect Site conditions. Factors that affect the representativeness of analytical data include proper sample collection and preservation techniques, use of standard analytical methods, sampling design, and determination of matrix or analyte interferences. Field sampling representativeness was attained through strict adherence to the UFP-QAPP and use of field sampling standard operating procedures (SOPs) for field data collection (USACE, 2020). The rationale supporting the number and type of samples for chemical analysis is described in Worksheet #17 of the UFP-QAPP (USACE, 2020b). No deviations from the field sampling SOPs were identified.

#### *2.2.3.1 AOC 5*

Sampling design deviations (**Section 2.1.1**) included the relocation of two soil samples to avoid wetland areas and one dry monitoring well. The alternate locations are consistent with the soil and groundwater sampling objectives for AOC 5 and do not adversely affect representativeness.

Surface and Subsurface Soil:

Due to a laboratory equipment failure, all soil samples were analyzed outside the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). While microbial degradation is significantly reduced by storing samples at 4°C, some loss of organic material can occur, and the loss is exacerbated by prolonged storage. All positive detections for TOC were qualified as "J-" and all non-detect results were qualified as "UJ" to indicate low bias for TOC results.

Subsurface soil samples NYOW-05-PH016-B and NYOW-05-PH019-B were extracted outside of the 14-day holding time period for SVOCs. All of the sample results were non-detect and were qualified as "UJ" and are usable.

A total of 38 of the 83 surface and subsurface soil samples collected from AOC 5 (46%) could not be thoroughly homogenized before sub-sampling and extraction for SVOC and PAH analyses due to their clay matrix. The affected samples include: NYOW-05-PH001-C, NYOW-05-PH002-B, NYOW-05-PH002-C, NYOW-05-PH003-B, NYOW-05-PH004-C, NYOW-05-PH005-B, NYOW-05-PH005-C, NYOW-05-PH006-C, NYOW-05-SL011-A, NYOW-05-PH011-B, NYOW-05-PH011-C, NYOW-05-SL012-A, NYOW-05-PH012-B, NYOW-05-PH012-C, NYOW-05-SL013-A, NYOW-05-PH013-B, NYOW-05-PH013-C, NYOW-05-SL014-A, NYOW-05-PH014-B, NYOW-05-PH014-C, NYOW-05-SL015-A, NYOW-05-PH015-B, NYOW-05-PH015-C, NYOW-05-SL018-A, NYOW-05-PH018-B, NYOW-05-PH018-C, NYOW-05-SL019-A, NYOW-05-PH019-C, NYOW-05-PH020-C, NYOW-05-PH021-B, NYOW-05-PH021-C, NYOW-05-PH022-C, NYOW-05-PH023-C, NYOW-05-PH024-C, NYOW-05-PH025-B, and NYOW-05-PH025-C.

Mixing of a strongly aggregated soil (e.g., clay) to reduce intra-sample variability is difficult due to the presence of cohesive clumps that require mechanical disaggregation. Nonetheless, the two parent/FD pairs that were affected by homogenization difficulties did not exhibit RPD exceedances in the SVOC and PAH analyses. The resulting uncertainty was partially addressed by implementing a robust, biased soil sampling program targeted to potential source areas. The sample results are considered usable.

Groundwater:

Groundwater sample NYOW-05-WL016-A was extracted outside of the 7-day holding time for SVOCs. All of the sample results were non-detect and were qualified as "UJ". The data is considered usable for its intended purpose.

Daily calibrations of the water quality meter were acceptable and WQP were allowed to stabilize at each location prior to sampling; therefore, groundwater data are considered to be representative of the aquifer.

#### *2.2.3.2 AOC 4*

Sampling design deviations (**Section 2.1.2**) included the relocation of ten planned borings. The alternate locations are consistent with the soil and groundwater sampling objectives for AOC 4 and do not adversely affect representativeness.

Surface and Subsurface Soil:

There were no non-conformances related to soil sampling or analysis that adversely affected representativeness.

Groundwater:

Nine of the 16 groundwater samples collected from AOC 4 clogged the solid phase extraction (SPE) cartridge (i.e., flow rate <4 mL/minute) during extraction in the explosives analysis. The extracted volumes indicated that sufficient volume encountered the solid phase media to support sample analysis and avoid repreparation of the samples at a dilution. The sample LOQs were adjusted accordingly. One sample (NYOW-04-WL003-A) that clogged the SPE cartridge exhibited a surrogate recovery of 1,2-DNB that was greater than the upper control limit; however, the sample result was non-detect and not affected by positive bias. Given that a limited sample volume (7.1 milliliters [mL]) was extracted before the cartridge clogged, the non-detect picric acid result was qualified as "UJ" on the basis of professional judgment.

Consistent with the laboratory SOP and Method 3535A, sample NYOW-04-WL005-A required vacuum filtration through glass fiber filter paper prior to analysis due to turbidity. The filtered sample was returned to the original sample container after filtration and the surrogate was added to the container. Method 3535A indicates that use of a filter aid will not result in a loss of method performance if clogging is encountered; therefore, the representativeness of the temporary well sample was maintained.

Daily calibrations of the water quality meter were acceptable and WQP were allowed to stabilize at each location prior to sampling; therefore, groundwater data are considered to be representative of the aquifer.

#### *2.2.3.3 AOC 1*

Sampling design deviations (**Section 2.1.3**) included the relocation of 14 boring locations. The alternate locations are consistent with the soil and groundwater sampling objectives for AOC 1 and do not adversely affect representativeness.

Surface and Subsurface Soil:

Nine SVOC soil samples (NYOW-01-SL021-A, NYOW-01-PH021-B, NYOW-01-PH021-C, NYOW-01-SL022-A, NYOW-01-PH022-B, NYOW-01-PH022-C, NYOW-01-SL024-A, NYOW-01-PH024-B, and NYOW-01-PH024-C) were received at the laboratory at temperatures of 8.7°C, 10.9°C, and 10.5°C, due to a shipping delay. The associated non-detect sample results were qualified as "UJ" and may be affected by low bias.

Sample PH-DUP-002_210408 contained free liquid in the sample container for Method 8330A. There was no indication that the sample container was compromised or infiltrated by melted ice water and the boring location was documented to contain mud. The sample was air dried to remove moisture and sieved prior to analysis, consistent with the methodology. The impact on data quality is considered negligible.

Groundwater:

Two of the three groundwater samples required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to PCB analysis. There was no associated impact on data quality. There were no non-conformances related to groundwater sampling or analysis that adversely affected representativeness.

#### *2.2.3.4 AOC 3*

Sampling design deviations (**Section 2.1.4**) included the relocation of 14 planned borings. The alternate locations are consistent with the soil and groundwater sampling objectives for AOC 3 and do not adversely affect representativeness.

Surface and Subsurface Soil:

Sample NYOW-03-PH005-B appeared to contain PCBs based on the chromatogram; however, due to weathering or other environmental processes, the PCBs in the sample did not closely match any of the laboratory's Aroclor standards used for instrument calibration. The sample has been quantified and reported as PCB-1260 and the result was qualified as "NJ" to indicate that the Aroclor peak exhibited a marginal pattern-matching quality and is considered quantitatively and qualitatively estimated.

A total of 27 of the 32 soil samples required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to PCB analysis. Sample NYOW-03-PH005-B required a mercury clean-up via EPA Method 3660A, to reduce matrix interferences caused by sulfur. There was no associated impact on data quality.

The following samples were not analyzed at minimum starting mass (i.e., 15 grams) for %M analysis due to limited sample volume: NYOW-03-PH001-B (10.81 grams [g]), NYOW-03-PH002-B (11.12 grams), NYOW-03-PH003-B (11.64 g), NYOW-03-PH004-B (11.77 g), NYOW-03-PH010-B (11.18 g), and NYOW-03-PH011-B (10.11 g). The laboratory SOP indicates that 13g to 17g of representative, wet, soil sample should be weighed. Since the solids fraction is the ratio of the weight of the dried soil to the weight of the wet soil, the small reduction in starting mass (i.e., 10g to 11g) is not significant if the initial weighed mass was representative.

Eight of the 32 soil samples collected from AOC 3 (NYOW-03-SL001-A, NYOW-03-SL002-A, NYOW-03-PH002-B, NYOW-03-SL003-A, NYOW-03-PH003-B, NYOW-03-PH004-B, NYOW-03-SL010-A, and NYOW-03-PH011-B) could not be thoroughly homogenized before sub-sampling and extraction for PCBs, SVOC, and EPA Method 8270D-SIM analyses were performed, due to their clay matrix. Mixing of a strongly aggregated soil (e.g., clay) to reduce intra-sample variability is difficult due to the presence of cohesive clumps that require mechanical disaggregation. The resulting uncertainty was partially addressed by implementing a robust, biased soil sampling program targeted to potential source areas.

Groundwater:

Four SVOC groundwater samples (NYOW-03-WL009-A, NYOW-03-WL013-A, NYOW-03-WL014-A, and NYOW-03-WL015-A). were received at the laboratory at temperatures of 8.7°C, 10.9°C, and 10.5°C, due to a shipping delay. The associated sample results were qualified as "J-" or "UJ" and may be affected by low bias.

Groundwater sample NYOW-03-WL002-A was received with a pH > 2 and was analyzed outside of the 7-day holding time period for unpreserved samples. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

Groundwater sample NYOW-03-WL010-A contained headspace greater than 6mm; the associated positive detections were qualified as "J-" and non-detects were qualified as "UJ".

Groundwater sample NYOW-03-WL013-A was collected in a properly preserved vial for VOCs; however, the pH of 7 was outside the required criteria of pH<2 when verified by the laboratory. The sample was

analyzed outside the 7-day holding time specified for unpreserved samples (11 days). The associated sample results were non-detect and were qualified as "UJ".

A portion of sample NYOW-03-WL010-A was used for PCBs analysis, rather than testing the entire sample amount in the original container, due to a significant sediment layer in the bottles. Consequently, the required solvent rinse of the original container could not be performed. The impact on data quality is considered negligible.

Five of the eight groundwater samples required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to PCB analysis. There was no associated impact on data quality.

#### *2.2.3.5 AOC 4 ISM*

Sampling design deviations (**Section 2.1.5**) included the relocation of 21 ISM replicates to avoid areas of gravel. The alternate locations are consistent with the ISM soil sampling objectives for AOC 4 and do not adversely affect representativeness.

Upon being submitted for reanalysis, ISM replicates NYOW-04-DU005-SL-A and NYOW-04-DU005-SL-B were extracted outside of the 14-day holding time period but within two times the holding time for SVOCs. All of the associated sample results were non-detect and were qualified as "UJ".

ISM soil sample results are not adjusted for moisture content but the impact to the moisture correction is not likely to be significant. The soil samples are dried to constant weight prior to analysis; therefore, it is unlikely that significant moisture remains after drying. If there is moisture not accounted for, the concentrations at which the non-detects are reported are lower than what would be reported for the moisture-adjusted results.

#### *2.2.3.6 Background*

Sampling design deviations (**Section 2.1.6**) included the relocation of 21 soil boring locations to avoid wetland and surface water areas. The alternate locations are still within historic soil units and do not adversely affect representativeness. Daily calibrations of the water quality meter were acceptable and WQP were allowed to stabilize at each location prior to sampling; therefore, groundwater data are considered to be representative of the aquifer. All parameters related to analytical representativeness were in control with the exceptions noted below.

<u>Surface and Subsurface Soil:</u>

Due to a laboratory equipment failure, 74 samples were analyzed outside the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). While microbial degradation is significantly reduced by storing samples at 4°C, some loss of organic material can occur, and the loss is exacerbated by prolonged storage. All positive detections for TOC were qualified as "J-" and all non-detect results were qualified as "UJ" to indicate low bias for the affected TOC results.

Eight of the 135 soil samples collected from the background area (NYOW-B-PH006-C, NYOW-B-PH007-B, NYOW-B-PH007-C, NYOW-B-PH011-B, NYOW-B-SL022-A, NYOW-B-PH022-B, NYOW-B-PH022-C, and NYOW-B-PH026-C) could not be thoroughly homogenized before sub-sampling and extraction for the EPA Method BNASIM analysis was performed due to their clay matrix. Mixing of a strongly aggregated soil (e.g., clay) to reduce intra-sample variability is difficult due to the presence of

cohesive clumps that require mechanical disaggregation. The resulting uncertainty was partially addressed by implementing a robust, biased soil sampling program targeted to potential source areas.

### 2.2.4 Completeness

Field completeness represents a comparison of the number of samples collected to the number of samples planned. Analytical completeness is a measure of the amount of valid data obtained compared to the amount of data expected. Measurements are considered valid if they are unqualified or are qualified as estimated during data validation. Trace results, defined as results that are qualified as estimated because they fall between the detection limit (DL) and the LOQ, are not counted in the total number of qualified results summarized below.

#### *2.2.4.1 AOC 5*

For the Phase 1 investigation at AOC 5, all planned samples were collected, and the field completeness is 100%. A total of 2,324 of 9,308 chemistry results for investigative samples were qualified during the data validation process and 81 results were rejected based on a serious deficiency. The analytical completeness for AOC 5 is 99.1%. A description of the chemistry sample results that were rejected is presented below by matrix.

Surface Soil

One surface soil sample result for 2,2'-oxybis[1-chloropropane] was rejected for sample NYOW-05-SL003-A. The result was rejected based on a gross exceedance of the closing continuing calibration percent difference criteria. All other surface soil sample results are usable. The analytical completeness for 2,2'-oxybis[1-chloropropane] results in surface soil samples is 94%.

Subsurface Soil

One subsurface soil sample result for 2,2'-oxybis[1-chloropropane] was rejected for sample NYOW-05-PH003-B. The result was rejected based on a gross exceedance of the closing continuing calibration percent difference criteria. All other subsurface soil sample results for 2,2'-oxybis[1-chloropropane] are usable.

One soil sample (NYOW-05-PH016-B) had results rejected for low bias of benzaldehyde, hexachloroethane, and 1,4-dioxane based on low LCS recoveries of 1%, 6%, and 0%, respectively. All other subsurface soil sample results are usable.

**Table 64** presents a summary of subsurface soil results rejected during data validation:

**Table 64: AOC 5 Subsurface Soil - Rejected Results**

| Analyte | Total Results | Results Rejected | Reason | Completeness for Matrix/Analyte |
|---|---|---|---|---|
| 2,2'-oxybis[1-chloropropane] | 55 | 1 | Closing CCV %D | 98% |
| Benzaldehyde | 55 | 1 | LCS %R | 98% |
| Hexachloroethane | 55 | 1 | LCS %R | 98% |
| 1,4-Dioxane | 55 | 1 | LCS %R | 98% |

Notes: CCV = continuing calibration verification %D = Percent deviation

Groundwater

Results for B/N SVOCs associated with groundwater samples collected from AOC 5 temporary well locations NYOW-05-WL-024-A (west of the Dual Coal Aggregate Bins A&B) and NYOW-05-WL-010-A (within the southern portion of the Coal Storage Area) were rejected based on surrogate recoveries less than the rejection threshold (i.e., 10%) resulting in low bias. The analytical completeness for each of the following B/N-extractable analytes in groundwater samples is 86%:

- 1,2,4,5-Tetrachlorobenzene
- 1,4-Dioxane
- 2,4-Dinitrotoluene
- 2,6-Dinitrotoluene
- 2-Chloronaphthalene
- 2-Nitroaniline
- 3,3'-Dichlorobenzidine
- 3-Nitroaniline
- 4-Bromophenyl phenyl ether
- 4-Chloroaniline
- 4-Chlorophenyl phenyl ether
- 4-Nitroaniline
- Acetophenone
- Atrazine
- Benzaldehyde
- Benzyl butyl phthalate
- Biphenyl (Diphenyl)
- Bis(2-chloroethoxy)methane
- Bis(2-chloroethyl) ether (2-Chloroethyl ether)
- Bis(2-ethylhexyl)phthalate
- Caprolactam
- Carbazole
- Dibenzofuran
- Diethyl phthalate
- Dimethyl phthalate
- di-n-Butyl phthalate
- di-n-Octyl phthalate
- Hexachlorobenzene
- Hexachlorobutadiene
- Hexachlorocyclopentadiene
- Hexachloroethane
- Isophorone
- Nitrobenzene
- N-Nitrosodi-n-propylamine
- N-Nitrosodiphenylamine

The B/N sample results from the remaining temporary wells are considered usable and less than the PALs, with the exception of 3,3'-dichlorobenzidine, discussed in **Section 2.2.6** (Sensitivity). 3,3'-Dichlorobenzidine was historically used in the production of dyes and pigments (National Center for Biotechnology Information [NCBI], 2021). The affected sample locations are within the Coal Storage Area and Coal Aggregate Bin where disposal of dyed material is unlikely to have occurred.

Six of 12 temporary well groundwater sample results for 2,2'-oxybis[1-chloropropane] were recommended for rejection based on the closing continuing calibration percent difference. Usable groundwater results from the six remaining wells were non-detect with LOQs below the PAL. 2,2'-Oxybis[1-chloropropane] is highly water soluble and was potentially applied to surface soil as an agricultural pesticide; the AOC 5 soil sample results for 2,2'-oxybis[1-chloropropane] were non-detect, indicating that the analyte is not likely associated with activities at the Site.

**Table 65** presents a summary of groundwater results rejected during data validation:

**Table 65: AOC 5 Groundwater - Rejected Results**

| Analyte | Total Results | Results Rejected | Reason | Completeness for Matrix/Analyte |
|---|---|---|---|---|
| 2,2'-oxybis[1-chloropropane] | 14 | 6 | Closing CCV %D | 57% |
| B/N-extractable SVOCs | 490 | 70 | Surrogate %R | 86% |

Lithology

All soil borings were complete, and characterization of lithology is 100%. All of the grain size distribution sample results were determined to be valid, without qualification during data validation.

#### *2.2.4.2 AOC 4*

For the Phase 1 investigation at AOC 4, all planned samples were collected, and the field completeness is 100%. A total of 92 out of 573 chemistry results were qualified during the data validation process and one result was rejected based on a serious deficiency. The analytical completeness for AOC 4 is 99.8%. Analytical completeness was 100% for all analyte/matrix combinations with the exception noted below.

The picric acid result for one groundwater sample (NYOW-04-WL080-A) was rejected based on surrogate recovery of less than 10%. It should be noted that picric acid was not detected in any groundwater sample collected within AOC 4, including adjacent temporary wells NYOW-04-WL-036-A, NYOW-04-WL-081-A, and NYOW-04-WL-003-A. The direction of groundwater flow is toward NYOW-04-080 from west to east (NYOW-04-036 toward NYOW-04-080), indicating that upgradient locations are not impacted by picric acid. The picric acid data set is sufficient to support the Phase I evaluation and the rejected result does not affect the overall usability of the data set. The analytical completeness of picric acid results in groundwater samples is 94.4%. All other groundwater sample results are usable.

Lithology

All soil borings were complete, and characterization of lithology is 100%.

#### *2.2.4.3 AOC 1*

For the Phase 1 investigation at AOC 1, the overall field completeness is 80.3%. For surface soil, 30 samples were collected while 22 were planned; the field completeness is 136%. For subsurface soil, 22 samples were collected of the 44 that were planned; the field completeness is 50%. For groundwater, 9 samples were collected of the 10 that were planned; the field completeness is 90%. A total of 568 out of 1,913 chemistry results were qualified during the data validation process and one result was rejected based on a serious deficiency. The analytical completeness for AOC 1 is 99.9%. Analytical completeness was 100% for all analyte/matrix combinations with the exception noted below.

The non-detect 2,4-DNP result for one surface soil sample (NYOW-01-SL036-A) was rejected based on low MS/MSD recoveries below 10% at 0% and 0%, respectively. The 2,4-DNP data set is sufficient to support the Phase I evaluation and the rejected result does not affect the overall usability of the data set. The analytical completeness of 2,4-DNP results in AOC 1 surface soil samples is 96.9%.

#### *2.2.4.4 AOC 3*

For the Phase 1 investigation at AOC 3, all planned samples were collected, and the field completeness is 100%. A total of 1,702 out of 6,178 chemistry results were qualified during the data validation process and one result was rejected based on a serious deficiency.

The following samples for method 8270D were received at the Eurofins/TestAmerica Savannah laboratory outside the required temperature criteria: NYOW-03-SL008-A, NYOW-03-PH008-B, NYOW-03-SL009-A, NYOW-03-PH009-B, NYOW-03-SL013-A, SL-DUP-001_210405, NYOW-03-PH013-B, NYOW-03-

SL014-A, NYOW-03-PH014-B, NYOW-03-SL015-A, NYOW-03-PH015-B, and EB-01_210405. Bluestone instructed the laboratory to cancel sample analysis; however, the analysis was inadvertently performed. The results were qualified as "X" and were subsequently rejected. The affected sample locations were resampled; therefore, the initial results are not included in the completeness evaluation. No further validation of the rejected data was conducted.

The analytical completeness for AOC 3 is >99.9%. Analytical completeness was 100% for all analyte/matrix combinations with the exception noted below.

The non-detect 3,3'-dichlorobenzidine result for one surface soil sample (NYOW-03-SL004-A) was rejected based on low MS/MSD recoveries below 10% at 3% and 1%, respectively. The 3,3'-dichlorobenzidine data set is sufficient to support the Phase I evaluation and the rejected result does not affect the overall usability of the data set. The analytical completeness of 3,3'-dichlorobenzidine results in AOC 3 surface soil samples is 94.4%.

#### *2.2.4.5 AOC 4 ISM*

For the Phase 1 investigation at AOC 4, all planned ISM samples were collected, and the field completeness is 100%. A total of 69 of 99 chemistry results were qualified during the data validation process and nine results were rejected based on a serious deficiency. The analytical completeness for AOC 4 ISM is 91.7%. Analytical completeness was 100% for the ISM soil analyte picric acid. Analytical completeness percentages for the ISM soil analytes 2,4-DNP and DNCB were 80.6% and 94.4%, respectively. Details are provided below for the chemistry sample results that were rejected.

One ISM soil sample (NYOW-04-DU001-SL-A) and its collocated replicates (NYOW-04-DU001-SL-B and NYOW-04-DU001-SL-C) had results rejected for low bias of 2,4-dinitrophenol based on low MS/MSD recoveries of 0% and 8%, respectively.

One ISM soil sample (NYOW-04-DU005-SL-C) had its non-detect DNCB and 2,4-DNP SVOC results rejected because the sample was extracted more than two times beyond the 14-day preparatory holding time period during reanalysis.

One ISM soil sample (NYOW-04-DU009-SL-C) and its collocated replicates (NYOW-04-DU009-SL-A and NYOW-04-DU009-SL-B) had results rejected for low bias of 2,4-dinitrophenol based on a low MSD recovery of 0%.

One ISM soil sample (NYOW-04-DU010-SL-C) had results rejected for low bias of DNCB based on a low recovery of 6% for surrogate nitrobenzene-d5.

**Table 66** presents a summary of ISM soil results rejected during data validation:

**Table 66: AOC 4 ISM Soil - Rejected Results**

| Analyte | Total Results | Results Rejected | Reason(s) | Completeness for Matrix/Analyte |
|---|---|---|---|---|
| 2,4-Dinitrophenol | 36 | 7 | MS/MSD %Recovery (6)<br>Preparatory hold time (1) | 80.6% |
| 2,4-Dinitrochlorobenzene | 36 | 2 | Preparatory hold time (1)<br>Surrogate %Recovery (1) | 94.4% |

Lithology

All soil borings were complete, and characterization of lithology is 100%.

#### *2.2.4.6 Background*

For the Phase 1 investigation of soil and groundwater background, all planned samples were collected, and the field completeness is 100%. A total of 2,189 of the 6,966 chemistry results were qualified during the data validation process and zero results were rejected based on a serious deficiency. Analytical completeness was 100% for all background analyte/matrix combinations.

Lithology

All soil borings were complete, and characterization of lithology is 100%. Samples NYOW-B-PH024-C and NYOW-B-PH025-B appeared as though cooler water had entered the sample container for geotechnical analysis (grain size distribution). The laboratory proceeded with analysis and the results for grain size were qualified as "X" and recommended for rejection. The completeness percent for grain size is 95.5% (946 of 990 results). The affected samples were categorized as Ps based on the soil boring logs.

### 2.2.5 Comparability

Comparability expresses the degree of confidence with which one data set can be compared to either past data from the current project or data from another study. It is dependent upon the proper design of the sampling program and is satisfied by ensuring that the approved plans are followed, and that proper sampling and analysis techniques are applied. Further, when assessing comparability, data sets should be of known and documented quality. The use of standardized sampling and analytical methods, units of reporting, and site selection procedures help to ensure comparability.

For the Phase 1 sampling events, standard field sampling and typical laboratory protocols were used and are considered to have generated data with an acceptable level of comparability to similarly scoped background sampling or future investigative sampling events for surface soil, subsurface soil, and temporary well data. Any recommendations to adjust future sampling and analytical techniques are expected to result in data that can be combined with the Phase 1 data, with the exception of temporary well data.

### 2.2.6 Sensitivity

Sensitivity refers to an instrument's or method's minimum concentration that can be reliably measured or reported, i.e., the LOQ. In order to meet the needs of data users, project data must meet the measurement performance criteria (MPC) for sensitivity and project LOQs specified in Worksheet #15 of the UFP-QAPP (USACE, 2020). The laboratory reported all field sample results at the lowest possible dilution. Additionally, any analytes that were detected below the LOQ and above the DL were reported and qualified "J", as estimated values, by the laboratory. In the following sections, the impact of method sensitivity on the ability to meet PALs will be discussed. Summary statistics for human health and ecological PALs have been compiled and are presented in **Appendix C** (**Tables #1 - #30**) of this data usability assessment report. Analytes that are italicized below attain the PAL at the LOD.

#### *2.2.6.1 AOC 5*

Surface Soil

- In AOC 5, the PALs for all SVOC analytes in surface soil were met by the LOQs, with the exception of *1,2,4,5-tetrachlorobenzene*, 2,3,4,6-tetrachlorophenol, 2,4-dichlorophenol, 2,4-dimethylphenol, *2,6-dinitrotoluene*, 2-chloronapthalene, 2-chlorophenol, *2-methylphenol*, 2-nitroaniline, 3,3'-dichlorobenzidine, 4,6-dinitro-2-methylphenol, atrazine, biphenyl, *bis(2-chloroethoxy)methane*, bis(2-chloroethyl) ether, bis(2-ethylhexyl)phthalate, carbazole, *m-&p-cresols*, *dibenzofuran*, *diethyl phthalate*, di-n-butyl phthalate, *hexachlorobenzene*, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, *N-nitroso-di-n-propylamine*, and *pentachlorophenol*. (**Appendix C Tables #26 through #30**).
- The PALs for all PAH analytes in surface soil were met by the LOQs, with the exception of dibenz(a,h)anthracene (**Appendix C Table #26**) and acenaphthene (**Appendix C Table #27**). Five samples that were non-detect for dibenz(a,h)anthracene had LOQs that exceeded the PAL. Of those five samples, one sample had an LOD that met the PAL. Two samples that were non-detect for acenaphthene had LOQs that exceeded the PAL; both samples had LODs that met the PAL.
- None of the PALs for PCBs analytes in surface soil were met by the LOQs. The PALs were met by the LODs for PCB-1016, PCB-1232, PCB-1248, PCB-1254, PCB-1260, PCB-1262, and PCB-1268. (**Appendix C Table #29**).
- The PALs for all metals analytes in surface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #26 and #27**) and mercury (**Appendix Table #29**).

Subsurface Soil

- In AOC 5, the PALs for all VOC analytes in subsurface soil were met by the LOQs, with the exception of 1,2-dibromo-3-chloropropane, acetone, bromomethane, *cis-1,2-dichloropropene*, and *trans-1,2-dichloropropene*. (**Appendix C Tables #26 and #28**).
- In AOC 5, the PALs for all SVOC analytes in subsurface soil were met by the LOQs, with the exception of: *1,2,4,5-tetrachlorobenzene*, 2,3,4,6-tetrachlorophenol, 2,4-dichlorophenol, 2,4-dimethylphenol, *2,6-dinitrotoluene*, 2-chloronapthalene, 2-chlorophenol, *2-methylphenol*, 2-nitroaniline, 3,3'-dichlorobenzidine, 4,6-dinitro-2-methylphenol, atrazine, biphenyl, *bis(2-chloroethoxy)methane*, *bis(2-chloroethyl) ether*, bis(2-ethylhexyl)phthalate, carbazole, *m-&p-cresols*, *dibenzofuran*, *diethyl phthalate*, di-n-butyl phthalate, *hexachlorobenzene*, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, *N-nitroso-di-n-propylamine*, and *pentachlorophenol*. (**Appendix C Tables #26 through #30**).
- The PALs for all PAH analytes in subsurface soil were met by the LOQs.
- None of the PALs for PCBs analytes in subsurface soil were met by the LOQs. The PALs were met by the LODs for PCB-1016, PCB-1232, PCB-1248, PCB-1260, PCB-1262, and PCB-1268. (**Appendix C Table #29**).
- The PALs for all metals analytes in subsurface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #26 and #27**), mercury (**Appendix C Table #29**), and silver (**Appendix C Table #29**). One sample that was non-detect for silver had an LOQ that exceeded the PAL; however, the sample's LOD met the PAL.

Groundwater

- In AOC 5, the PALs for all VOC analytes in groundwater were met by the LOQs, with the exception of 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2-dibromoethane, 1,2-dichloroethane, *1,2-dichloropropane*, *1,4-dichlorobenzene*, 2-hexanone, *benzene*, bromodichloromethane, bromomethane, *carbon tetrachloride*, chloroform, *cis-dichloropropene*, *dibromochloromethane*, *trans-dichloropropene*, and vinyl chloride. (**Appendix C Table #26**).
- In AOC 5, the PALs for all SVOC analytes in groundwater were met by the LOQs, with the exception of 1,2,4,5-tetrachlorobenzene, 1,4-dioxane, 2,4,6-trichlorophenol, *2,4-dichlorophenol*, 2,4-dinitrotoluene, 2,6-dinitrotoluene, *2-chlorophenol*, *2-nitroaniline*, 3,3'-dichlorobenzidine, 3-nitroaniline, 4,6-dinitro-2-methylphenol, 4-chloroaniline, 4-nitroaniline, atrazine, biphenyl, *bis(2-chloroethoxy)methane*, bis(2-chloroethyl) ether, *bis(2-ethylhexyl)phthalate*, dibenzofuran, hexachlorobenzene, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, nitrobenzene, N-nitroso-di-n-propylamine, and pentachlorophenol. (**Appendix C Table #26**).
- The PALs for all PAH analytes in groundwater were met by the LOQs, with the exception of benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene (**Appendix C Table #26**).
- The PALs for PCBs analytes in groundwater were not met by the LOQs for PCB-1016, PCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, and PCB-1260. (**Appendix C Table #26**).
- The PALs for all metals analytes in groundwater were met by the LOQs, with the exception of antimony, cadmium, mercury, *nickel*, selenium, *silver*, thallium, and *vanadium* (**Appendix C Table #26**).

#### *2.2.6.2 AOC 4*

Surface Soil

- All of the 2,4-DNP and picric acid surface soil sample results were non-detect, with the LOQs and LODs greater than the invertebrate and mammal ecological PALs (**Appendix C Tables #18 and #20**). The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- All of the DNCB surface soil sample results were non-detect, with the LOQs exceeding the ecological PAL for plant receptors; however, the PAL was achieved with the LODs (**Appendix C Table #17**).

Subsurface Soil

- All of the 2,4-DNP and picric acid subsurface soil sample results were non-detect, with the LOQs and LODs greater than the invertebrate and mammal ecological PALs (**Appendix C Tables #18 and #20**). The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- All of the DNCB subsurface soil sample results were non-detect, with the LOQs exceeding the ecological PAL for plant receptors; however, the PAL was achieved with the LODs (**Appendix C Table #17**).

Groundwater

- In AOC 4, all groundwater 2,4-DNP sample results were non-detect, with the LOQs and LODs greater than the human health PAL (**Appendix C Table #16**). The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedance of this PAL was anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- All groundwater DNCB results were non-detect; however, a PAL has not been established for DNCB.
- All groundwater picric acid results were non-detect; the human health PAL was achieved by the LOQ in 13 of the 15 samples, and by the LOD in 14 of the 15 samples, indicating that sensitivity objectives were substantially met, and that the data are usable (**Appendix C Table #16**).

#### *2.2.6.3 AOC 1*

Surface Soil

- At AOC 1, all of the 2,4-DNP surface soil sample results were non-detect, with the LOQ and LOD greater than the PAL (**Appendix C Tables #8 and #10**). The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- At AOC 1, all of the DNCB surface soil sample results were non-detect, with the LOQ exceeding the PAL; however, the PAL was achieved with the LOD (**Appendix C Table #7**).
- At AOC 1, one surface soil sample had a positive detection for picric acid; the remaining 29 results were non-detect, with the LOQs and LODs greater than the PAL (**Appendix C Tables #8 and #10**). The PAL for picric acid is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- At AOC 1, the PALs for all metals analytes in surface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #6 and #7**) and mercury (**Appendix C Table #9**). Exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). One sample that was non-detect for beryllium had an LOQ that exceeded the PAL; however, the sample's LOD met the PAL (**Appendix C Table #7**).

Subsurface Soil

- At AOC 1, all of the 2,4-DNP subsurface soil sample results were non-detect, with the LOQ and LOD greater than the PAL (**Appendix C Tables #8 and #10**). The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- At AOC 1, all of the DNCB subsurface soil sample results were non-detect, with the LOQ exceeding the PAL; however, the PAL was achieved with the LOD (**Appendix C Table #7**).
- At AOC 1, all of the picric acid subsurface soil sample results were non-detect, with the LOQs and LODs greater than the PAL (**Appendix C Tables #8 and #10**). The PAL for picric acid is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- At AOC 1, the PALs for all metals analytes in subsurface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #6 and #7**) and mercury (**Appendix C Table #9**). Exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). One

sample that was non-detect for selenium had an LOQ that exceeded the PAL; however, the sample's LOD met the PAL (**Appendix C Table #7**).

Groundwater

- At AOC 1, all of the 2,4-DNP groundwater sample results were non-detect, with the LOQ and LOD greater than the PAL (**Appendix C Table #6**). The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- At AOC 1, all of the DNCB groundwater sample results were non-detect; however, a PAL has not been established for DNCB.
- At AOC 1, all of the picric acid groundwater sample results were non-detect, and the PAL was achieved by the LOQ (**Appendix C Table #6**).
- At AOC 1, the PALs for all metals analytes in groundwater were met by the LOQs, with the exception of antimony, arsenic, cadmium, mercury, nickel, selenium, silver, thallium, and vanadium (**Appendix C Table #6**). Of those analytes, the PALs were met by the LODs for nickel, silver, and vanadium.

#### *2.2.6.4 AOC 3*

Surface Soil

- In AOC 3, the PALs for all SVOC analytes in surface soil were met by the LOQs, with the exception of *1,2,4,5-tetrachlorobenzene*, 2,3,4,6-tetrachlorophenol, 2,4-dichlorophenol, 2,4-dimethylphenol, *DNCB*, 2,4-dinitrophenol, *2,6-dinitrotoluene*, 2-chloronapthalene, 2-chlorophenol, *2-methylphenol*, 2-nitroaniline, 3,3'-dichlorobenzidine, 4,6-dinitro-2-methylphenol, atrazine, biphenyl, *bis(2-chloroethoxy)methane*, *bis(2-chloroethyl) ether*, bis(2-ethylhexyl)phthalate, carbazole, m- & p-cresols, *dibenzofuran*, *diethyl phthalate*, di-n-butyl phthalate, *hexachlorobenzene*, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, N-nitroso-di-n-propylamine, and *pentachlorophenol*. (**Appendix C Tables #11 through #15**).
- At AOC 3, all of the picric acid surface soil sample results were non-detect, with the LOQs and LODs greater than the PAL (**Appendix C Tables #13 and #15**). The PAL for picric acid is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- The PALs for all PAH analytes in surface soil were met by the LOQs.
- None of the PALs for PCBs analytes in surface soil were met by the LOQs. The PALs were met by the LODs for PCB-1248, PCB-1260, PCB-1262, and PCB-1268. (**Appendix C Table #14**).
- The PALs for all metals analytes in surface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #11 and #12**).

Subsurface Soil

- In AOC 3, the PALs for all VOC analytes in subsurface soil were met by the LOQs, with the exception of 1,2-dibromo-3-chloropropane, acetone, bromomethane, *cis-1,2-dichloropropene*, and *trans-1,2-dichloropropene*. (**Appendix C Tables #11 and #13**).
- In AOC 3, the PALs for all SVOC analytes in subsurface soil were met by the LOQs, with the exception of *1,2,4,5-tetrachlorobenzene*, 2,3,4,6-tetrachlorophenol, 2,4-dichlorophenol, 2,4-dimethylphenol, *DNCB*, 2,4-dinitrophenol, *2,6-dinitrotoluene*, 2-chloronapthalene, 2-chlorophenol, *2-methylphenol*, 2-nitroaniline, 3,3'-dichlorobenzidine, 4,6-dinitro-2-methylphenol, atrazine, biphenyl, *bis(2-*

*chloroethoxy)methane*, *bis(2-chloroethyl) ether*, bis(2-ethylhexyl)phthalate, carbazole, m- & p-cresols, *dibenzofuran*, *diethyl phthalate*, di-n-butyl phthalate, *hexachlorobenzene*, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, N-nitroso-di-n-propylamine, and *pentachlorophenol*. (**Appendix C Tables #11 through #15**).

- At AOC 3, all of the picric acid subsurface soil sample results were non-detect, with the LOQs and LODs greater than the PAL (**Appendix C Tables #13 and #15**). The PAL for picric acid is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- The PALs for all PAH analytes in subsurface soil were met by the LOQs, with the exception of benzo(a)pyrene and dibenz(a,h)anthracene (**Appendix C Table #11**). One sample that was non-detect for benzo(a)pyrene had an LOQ that exceeded the PAL; however, the sample's LOD met the PAL. One sample that was non-detect for dibenz(a,h)anthracene had an LOQ and LOD that exceeded the PAL.
- None of the PALs for PCBs analytes in subsurface soil were met by the LOQs. The PALs were met by the LODs for PCB-1016, PCB-1232, PCB-1248, PCB-1260, PCB-1262, and PCB-1268. (**Appendix C Table #14**).
- The PALs for all metals analytes in subsurface soil were met by the LOQs, with the exception of thallium (**Appendix C** Tables #11 and #12), *selenium* (**Appendix C Table #12**) and mercury (**Appendix C Table #14**).

Groundwater

- In AOC 3, the PALs for all VOC analytes in groundwater were met by the LOQs, with the exception of 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, 1,2-dibromo-3-chloropropane, 1,2-dibromoethane, 1,2-dichloroethane, *1,2-dichloropropane*, *1,4-dichlorobenzene*, 2-hexanone, *benzene*, bromodichloromethane, bromomethane, *carbon tetrachloride*, chloroform, *cis-dichloropropene*, *dibromochloromethane*, *trans-dichloropropene*, and vinyl chloride. (**Appendix C Table #11**).
- In AOC 3, the PALs for all SVOC analytes in groundwater were met by the LOQs, with the exception of 1,2,4,5-tetrachlorobenzene, 1,4-dioxane, 2,4,6-trichlorophenol, *2,4-dichlorophenol*, 2,4-DNP, 2,4-dinitrotoluene, 2,6-dinitrotoluene, *2-chlorophenol*, *2-nitroaniline*, 3,3'-dichlorobenzidine, 3-nitroaniline, 4,6-dinitro-2-methylphenol, 4-chloroaniline, 4-nitroaniline, atrazine, biphenyl, *bis(2-chloroethoxy)methane*, bis(2-chloroethyl) ether, *bis(2-ethylhexyl)phthalate*, dibenzofuran, hexachlorobenzene, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, nitrobenzene, N-nitroso-di-n-propylamine, and pentachlorophenol. (**Appendix C Table #11**).
- At AOC 3, all of the picric acid groundwater sample results were non-detect, and the PAL was achieved by the LOQ (**Appendix C Table #11**).
- The PALs for all PAH analytes in groundwater were met by the LOQs, with the exception of benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene (**Appendix C Table #11**).
- The PALs for PCBs analytes in groundwater were not met by the LOQs for PCB-1016, PCB-1221, PCB-1232, PCB-1242, PCB-1248, PCB-1254, and PCB-1260. (**Appendix C Table #11**).
- The PALs for all metals analytes in groundwater were met by the LOQs, with the exception of antimony, arsenic, cadmium, *cobalt*, mercury, *nickel*, selenium, *silver*, thallium, and *vanadium* (**Appendix C Table #11**).

#### *2.2.6.5 AOC 4 ISM*

- All of the 2,4-DNP and picric acid ISM soil sample results were non-detect, with the LOQs and LODs greater than the invertebrate and mammal ecological PALs (**Appendix C Tables #23 and #25**). The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).
- All of the DNCB ISM soil sample results were non-detect, and the LOQs were lower than the PALs for 32 of the 34 samples, indicating that sensitivity objectives were substantially met (**Appendix C Table #22**).

#### *2.2.6.6 Background*

Surface Soil

- The PALs for all PAH analytes in surface soil were met by the LOQs.
- The PALs for all metals analytes in surface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #1 and #2**), *selenium* (**Appendix C Table #2**), and *antimony* (**Appendix C Table #5**).

Subsurface Soil

- The PALs for all PAH analytes in subsurface soil were met by the LOQs.
- The PALs for all metals analytes in subsurface soil were met by the LOQs, with the exception of thallium (**Appendix C Tables #1 and #2**), *selenium* (**Appendix C Table #2**), and mercury (**Appendix C Table #4**).

Groundwater

- The PALs for all PAH analytes in groundwater were met by the LOQs, with the exception of benzo(a)anthracene, benzo(a)pyrene, *naphthalene*, and dibenz(a,h)anthracene (**Appendix C Table #1**).
- The PALs for all metals analytes in groundwater were met by the LOQs, with the exception of antimony, arsenic, cadmium, *cobalt*, mercury, *nickel*, selenium, *silver*, thallium, and *vanadium* (**Appendix C Table #1**).

### 2.2.7 Statistical Method Evaluation

Statistical methods that are used for the project are documented in the NYOW Phase 1 Risk Screening Approach Technical Memorandum (Bluestone, 2022). The objectives of the statistical analysis are:

- To assess if there are any CERCLA constituents present and related to historical DoD activities, as well as present above risk-based screening levels and background concentrations.
- To identify potential source areas and/or areas of higher concentrations.
- To focus additional fieldwork to collect data for an RI and to meet risk assessment-related DQOs if potential impacts from DoD-related constituents are indicated.

To meet these objectives, a site versus background comparison was performed. To complete the site versus background comparison, the data sets were required to have a minimum of 8 samples. Both the site and background data sets met the minimum sample size requirement, and the data are considered representative.

A systemic sampling design was implemented at AOC 4 to specifically address spatial coverage and media variability (i.e., soil heterogeneity). Within the other AOCs and the background reference area, judgmental sampling was used to evaluate suspected or likely contamination areas. For the Phase 1 risk screening, the maximum detection concentration (MDC) is the statistic used to inform Phase 2 decision-making; therefore, adequate spatial coverage, rather than calculation of an alternative statistic, is the paramount concern. With the exception of the locations that could not be sampled and represent potentially permanent data gaps (**Section 2.1)** the purposive sampling design was adequately executed to identify source areas and/or areas of higher concentrations. Summary statistics are provided as **Appendix C**.

### 2.2.8 Summary and Conclusions

#### *2.2.8.1 AOC 5*

Based on this assessment of DQIs for AOC 5, the data obtained during the site investigation are of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings. Furthermore, the quantity and quality of data are sufficient to update the CSM and support the identification of data gaps. The rejected results in AOC 5 are for compounds not likely to be DoD-related nor risk drivers; however, analytical completeness for B/N extractable SVOCs was less than 90% for many compounds in groundwater. The data needs will continue to be assessed by the project team as findings are evaluated and the CSM evolves. A description of the findings that may affect future remedial investigation activities at AOC 5 is presented below.

Surface and Subsurface Soil Conclusions

The bioavailability of many constituents is dependent upon the TOC content. In general, higher TOC leads to lower bioavailability and subsequently, a lower potential for toxicity. When TOC is biased low, toxicity may be overestimated; therefore, the uniformly low-biased TOC data obtained for AOC 5 may impact future ecological risk evaluations. Analysis of TOC is recommended for future Phase 2 soil sampling.

Soil sample heterogeneity was documented through the analysis of field duplicate and MS/MSD sample pairs, affecting primarily PAHs and metals in surface soil and metals in subsurface soil. Surface soil heterogeneity of PAHs is likely attributable to their anthropogenic (pyrogenic) disposition and the depositional mechanism of PAH transport to the shallow soil interval. Implementation of an ISM sampling approach during the Phase 2 investigation will improve soil characterization and support the calculation of representative mean sample concentrations for metals and PAHs.

The following analytes in surface soil had low bias primarily attributable to low surrogate or MS/MSD recoveries at a frequency greater than 20% of samples (5 in 25 samples): benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and pyrene. Analytes in subsurface soil with low surrogate or MS/MSD recoveries affecting more than 20% of samples (10 in 50 samples) included benzo(a)pyrene, benzo(g,h,i)perylene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. These low recoveries may be associated with the significantly greater difficulty in homogenizing clay soil and extracting PAHs from high clay content soil because of the strong adsorption of PAHs to clay surfaces. The extraction efficiency of EPA Method 3546 (microwave extraction) is comparable or better than available alternatives (e.g., Soxhlet and ultrasonic extraction); therefore, the selected extraction method should be retained for future sampling events. For the Phase 1 sampling event, samples were field homogenized by thorough mixing in a Ziplock bag. It is recommended that future

discrete soil samples be homogenized sequentially, first in quarter-sample segments and then in combined half-sample and full sample segments.

To reduce the impact to sensitive habitat areas, mapped wetland areas were avoided by relocating two soil borings. Wetland avoidance will result in a permanent data gap for collection of spatially representative soil samples at AOC 5.

Chemicals with a significant potential to be both risk-driving and site-related met analytical sensitivity requirements (i.e., attainment of the PAL with the LOQ) or attained the PAL with the LOD for soil.

Groundwater Conclusions

Temporary monitoring wells were not developed, and discrete groundwater samples were collected using a peristaltic pump as grab samples in accordance with the UFP-QAPP. Upon initial discharge of groundwater from the sampling tubing, the field water quality parameters were measured, and samples were collected without development, purging, or field parameter stabilization. Sample turbidity ranged from 30.2 NTU (NYOW-05-008) to the upper instrument limit (> 1,000 NTU). The presence of particles in the sample may result in an overestimation of groundwater concentrations for metals and SVOCs. Installation of permanent monitoring wells is recommended to obtain representative groundwater samples from AOC 5.

All three groundwater samples collected from the Possible Dump (NYOW-05-WL001-A, NYOW-05-WL004-A, and NYOW-05-WL005-A) did not attain PALs for PCBs. For NYOW-05-WL001-A, only 800 mL of muddy groundwater was received by the laboratory. Submission of full volume aliquots is necessary to achieve the laboratory LOQ. All three samples were affected by matrix interference and two samples required sulfuric acid cleanup to reduce interferences. Similarly, all 12 groundwater samples from AOC 5 had low base/neutral surrogate recoveries, indicating potential matrix effects. Results for B/N SVOCs associated with well locations NYOW-05-WL-024-A (west of the Dual Coal Aggregate Bins A&B) and NYOW-05-WL-010-A (within the southern portion of the Coal Storage Area) were rejected based on surrogate recoveries less than 10%. Installation of permanent wells may lessen matrix effects in Phase 2. PCBs and SVOCs represent a current data gap in the AOC 5 Possible Dump groundwater investigation area.

The PALs for PAHs in groundwater (benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene) that were not met by LOQs were already analyzed by the most sensitive analytical technique (i.e., BNASIM). The PALs for all metals analytes in groundwater that were not met by LOQs were either attained by the LOD or were already analyzed by the most sensitive analytical technique (i.e., ICP-MS), with the exception of cadmium and selenium. It is recommended that cadmium and selenium be analyzed by Method 6020A during Phase 2 Sampling events. The groundwater PALs for PCBs were not met. Future sampling of PCBs could employ concentrated extracts during sample preparation; however, PCBs were not identified as risk-drivers in soil and are not soluble in water.

#### *2.2.8.2 AOC 4*

Based on this assessment of DQIs for AOC 4, the data obtained during the site investigation are of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings. Furthermore, the quantity and quality of data are sufficient to update the CSM and support the identification of data gaps. The rejected groundwater result for picric acid in AOC 4 is downgradient and bounded by results are considered usable. The data needs will continue to be assessed by the project team as findings

are evaluated and the CSM evolves. A description of the findings that may affect future remedial investigation activities at AOC 4 is presented below.

Surface and Subsurface Soil Conclusions

There were no non-conformances related to soil sampling or analysis that adversely affected data usability.

All of the 2,4-DNP and picric acid surface soil sample results were non-detect, with the LOQs and LODs greater than ecological PALs. All of the 2,4-DNP and picric acid subsurface soil sample results were non-detect, with the LOQs and LODs greater than ecological PALs. The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).

Groundwater Conclusions

Temporary monitoring wells were not developed, and discrete groundwater samples were collected using a peristaltic pump as grab samples in accordance with the UFP-QAPP. Upon initial discharge of groundwater from the sampling tubing, the field water quality parameters were measured, and samples were collected without development, purging, or field parameter stabilization. Sample turbidity ranged from 10.8 NTU (NYOW-04-004) to the upper instrument limit (> 1,000 NTU). The presence of particles in the sample may result in an overestimation of groundwater concentrations; however, all of the groundwater sample results were non-detect. It is noted that 9 of 16 groundwater samples clogged the SPE cartridge (i.e., flow rate <4 mL/minute) during extraction in the explosives analysis and one sample (NYOW-04-WL005-A) required vacuum filtration through glass fiber filter paper prior to analysis due to turbidity. It is possible that the extraction efficiency was compromised for samples with high particulate load, and installation of permanent wells is recommended.

The following analytes in groundwater had low bias qualifiers primarily attributable to low surrogate recoveries at a frequency greater than 20% of samples: DNCB (44% and picric acid (33%). The picric acid result for one groundwater sample (NYOW-04-WL080-A) was rejected based on surrogate recovery of less than 10%. Installation of permanent monitoring wells is recommended to obtain representative groundwater samples from AOC 4.

In AOC 4, all 2,4-DNP sample results in groundwater were non-detect, with the LOQs and LODs greater than the human health PAL. The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedance of this PAL was anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). All groundwater picric acid results were non-detect; the human health PAL was achieved by the LOQ in 13 of the 15 samples, and by the LOD in 14 of the 15 samples, indicating that sensitivity objectives were substantially met.

#### *2.2.8.3 AOC 1*

Based on this assessment of DQIs for AOC 1, the data obtained during the site investigation are of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings. Furthermore, the quantity and quality of data are sufficient to update the CSM and support the identification of data gaps. The rejected result for 2,4-DNP in AOC 1 does not affect the overall usability of the dataset. The data needs will continue to be assessed by the project team as findings are evaluated and the CSM evolves. A description of the findings that may affect future remedial investigation activities at AOC 1 is presented below.

Surface and Subsurface Soil Conclusions

Subsurface soil samples could not be collected from NYOW-01-007, NYOW-01-009, NYOW-01-011, and NYOW-01-013. Due to the existing concrete building foundations and steep slopes, borings NYOW-01-008, NYOW-01-010, NYOW-01-012, and NYOW-01-014 were not installed. The sampling plan was modified to include additional surface soil samples from NYOW-01-025 through NYOW-01-039. The preliminary human health and ecological CSMs include receptors only exposed to surface soil; therefore, the usability of the data for risk screening is not affected.

Samples were not collected at two locations (NYOW-01-003 and NYOW-01-004) because Bluestone did not have ROE for either property. These borings could not be relocated and represent an existing and potentially permanent data gap.

Soil sample heterogeneity was documented through the analysis of field duplicate and MS/MSD sample pairs, affecting primarily metals in surface soil and subsurface soil. Implementation of an ISM sampling approach during the Phase 2 investigation will improve soil characterization and support the calculation of representative mean sample concentrations for metals.

DNCB in surface soil had low bias attributable to low surrogate recoveries at a frequency greater than 20% of samples (8 in 30 samples). DNCB in subsurface soil also had low bias attributable to low surrogate recoveries at a frequency greater than 20% of samples (6 in 22 samples). There was no indication that matrix interference was responsible for the low recoveries. The extraction efficiency of EPA Method 3546 is comparable or better than available; therefore, the selected extraction method should be retained for future sampling events.

The non-detect 2,4-DNP result for one surface soil sample (NYOW-01-SL036-A) was rejected based on low MS/MSD recoveries below 10% at 0% and 0%, respectively. The 2,4-DNP data set is sufficient to support the Phase I evaluation and the rejected result does not affect the overall usability of the data set.

Chemicals with a significant potential to be both risk-driving and site-related met analytical sensitivity requirements (i.e., attainment of the PAL with the LOQ) or attained the PAL with the LOD. All of the 2,4-DNP surface and subsurface soil sample results were non-detect, with the LOQs and LODs greater than the ecological PALs. One surface soil sample had a positive detection for picric acid; the remaining surface and subsurface soil results were non-detect, with the LOQs and LODs greater than the PAL. The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). The PALs for all metals analytes in surface and subsurface soil were met by the LOQs, with the exception of thallium and mercury. Exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).

Groundwater Conclusions

The planned groundwater sample from NYOW-01-003 could also not be collected because Bluestone did not have ROE for either property. The unsampled location represents a data gap.

DNCB in groundwater had low bias attributable to low surrogate recoveries at a frequency greater than 20% of samples (8 in 9 samples). Picric acid in groundwater had low bias attributable to low surrogate and matrix spike recoveries at a frequency greater than 20% of samples (3 in 10 samples). No groundwater data was rejected at AOC 1.

At AOC 1, all of the 2,4-DNP groundwater sample results were non-detect, with the LOQ and LOD greater than the PAL. The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedances of the PAL were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). The PALs for all metals analytes in groundwater were met by the LOQs, with the exception of antimony, arsenic, cadmium, mercury, nickel, selenium, silver, thallium, and vanadium. Of those analytes, the PALs were met by the LODs for nickel, silver, and vanadium. Cadmium and selenium were analyzed by Method 6010C; changing to Method 6020A may be warranted for future sampling events.

#### *2.2.8.4 AOC 3*

Based on this assessment of DQIs for AOC 3, the data obtained during the site investigation are of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings. Furthermore, the quantity and quality of data are sufficient to update the CSM and support the identification of data gaps. The rejected result for 3,3'-dichlorobenzidine, a compound that is not likely to be DoD-related nor a risk driver, does not adversely affect data usability. The data needs will continue to be assessed by the project team as findings are evaluated and the CSM evolves. A description of the findings that may affect future remedial investigation activities at AOC 3 is presented below.

Surface and Subsurface Soil Conclusions

Soil sample heterogeneity was documented through the analysis of field duplicate and MS/MSD sample pairs, affecting primarily PAHs in surface soil and PAHs and metals in subsurface soil. Implementation of an ISM sampling approach during the Phase 2 investigation will improve soil characterization and support the calculation of representative mean sample concentrations for metals and PAHs.

SVOCs in surface and subsurface soil had low bias attributable to low surrogate, LCS/LCSD, and MS/MSD recoveries at a frequency greater than 20% of samples; however, none of the affected compounds are likely to be risk drivers at the site.

Eight of the 32 soil samples collected from AOC 3 could not be thoroughly homogenized before sub-sampling and extraction for PCBs, SVOC, and EPA Method BNASIM analyses were performed, due to their clay matrix. Implementation of an ISM sampling approach during the Phase 2 investigation will improve soil characterization and support the calculation of representative mean sample concentrations for PCBs and PAHs.

Chemicals with a significant potential to be both risk-driving and site-related met analytical sensitivity requirements (i.e., attainment of the PAL with the LOQ) or attained the PAL with the LOD. All of the 2,4-DNP and picric acid surface soil sample results were non-detect, with the LOQs and LODs greater than the ecological PALs. All of the 2,4-DNP and picric acid subsurface soil sample results were non-detect, with the LOQs and LODs greater than the ecological PALs. The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). The PALs for all metals analytes in surface and subsurface soil were met by the LOQs, with the exception of thallium and mercury. Exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).

Groundwater Conclusions

SVOCs in surface and subsurface soil had low bias attributable to low surrogate, LCS/LCSD, and MS/MSD recoveries at a frequency greater than 20% of samples; however, none of the affected compounds are likely to be risk drivers at the site.

The PALs for all PAH analytes in groundwater were met by the LOQs, with the exception of benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene. PAHs in groundwater were already analyzed by the most sensitive analytical method (i.e., BNASIM). The PALs for all metals analytes in groundwater that were not met by LOQs were either attained by the LOD or were already analyzed by the more sensitive analytical technique (i.e., ICP-MS), with the exception of cadmium and selenium. It is recommended that cadmium and selenium be analyzed by Method 6020A during Phase 2 Sampling events. The groundwater PALs for PCBs were not met. Future sampling of PCBs could employ concentrated extracts during sample preparation; however, PCBs were not identified as risk-drivers in soil and are not soluble in water. All groundwater 2,4-DNP sample results were non-detect, with the LOQs and LODs greater than the human health PAL. The PAL for 2,4-DNP is not attainable with contemporary analytical methodology; exceedance of this PAL was anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020).

#### *2.2.8.5 AOC 4 ISM*

Based on this assessment of DQIs for AOC 4 ISM, the data obtained during the site investigation are not of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings in all of the decision units. A description of the findings that may affect future remedial investigation activities at AOC 4 is presented below.

ISM Surface Soil Conclusions

The ISM samples for SVOC analysis underwent the complete ISM processing and subsampling procedures, rather than having aliquots removed for SVOC analysis/moisture content prior to drying, as was specified in the UFP-QAPP. The decision to process ISM samples for the SVOC analysis was based on information provided in the ISM-2 guidance regarding the loss potential of SVOCs during air drying and the consideration that air exposure at the laboratory was not likely to produce analyte loss for surface soils that had been exposed to ambient air for many years (ITRC, 2021). There is no LCSSRM available that contains the SVOC analytes DNCB and 2,4-DNP, and the explosives LCSSRM does not contain picric acid. As a result, the impact that sample milling may have on the recovery of all analytes cannot be quantified. In addition, generally low surrogate recoveries were associated with the ISM samples for SVOC analysis. An equivalent mass of Ottowa Sand was added to the samples before reanalysis in order to increase contact with the solvent, with the intent to improve surrogate recoveries. This approach did not typically improve surrogate recoveries.

DNCB in ISM surface soil had low bias attributable to low surrogate recoveries at a frequency greater than 20% of samples (33 in 34 samples). 2,4-DNP in ISM surface soil had low bias attributable to low surrogate recoveries at a frequency greater than 20% of samples (27 in 29 samples). Picric acid in ISM surface soil had low bias attributable to low surrogate and matrix spike recoveries at a frequency greater than 20% of samples (9 in 36 samples).

For DU 1, all three replicates had results rejected for low bias of 2,4-dinitrophenol based on low MS/MSD recoveries and an exposure point concentration (EPC) based on the upper confidence limit (UCL) of three replicates cannot be calculated. For DU 5, I replicate had results rejected for DNCB and 2,4-DNP due to holding time exceedances and the UCL of three replicate samples cannot be calculated. At DU 9, three replicates had results rejected for low bias of 2,4-DNP due to an MSD that did not recover. For DU 10, one replicate had the result for DNCB rejected based on a low surrogate recovery and the UCL of the sample replicate cannot be calculated.

All of the 2,4-DNP and picric acid ISM soil sample results were non-detect, with the LOQs and LODs greater than the invertebrate and mammal ecological PALs. The PALs for 2,4-DNP and picric acid are not attainable with contemporary analytical methodology; exceedances of these PALs were anticipated prior to sampling as documented in the UFP-QAPP (USACE, 2020). All of the DNCB ISM soil sample results were non-detect, and the LOQs were lower than the PALs for 32 of the 34 samples, indicating that sensitivity objectives were substantially met.

#### *2.2.8.6 Background*

Based on this assessment of DQIs for Background, the data obtained during the site investigation are of sufficient quantity and quality to support the Phase 1 investigation and human health and ecological risk screenings. Furthermore, the quantity and quality of data are sufficient to update the CSM and support the identification of data gaps. The data needs will continue to be assessed by the project team as findings are evaluated and the CSM evolves. A description of the findings that may affect future remedial investigation activities is presented below.

Surface and Subsurface Soil Conclusions

The objective of the subsurface soil sampling to obtain 15 samples for each soil type was not achieved; however, the sample size is sufficient (i.e., $n \geq 8$) to compare site soil to background using summary statistics (e.g., ranges, means, medians, standard deviations), exploratory graphical displays (e.g., side-by-side box plots) and to calculate BTVs (Bluestone, 2022). In the case of AOC 5, where the investigation is an initial SI, any comparisons with background is for informational purposes and not used to eliminate methods and/or analytes from further investigation (Bluestone, 2022). The Psc unit could not be sampled south of the edge of the wetland, resulting in the greatest overall relocation distances and a potential data gap.

Soil sample heterogeneity was documented through the analysis of field duplicate and MS/MSD sample pairs, affecting PAHs and metals in surface soil and subsurface soil. Implementation of an ISM sampling approach during the Phase 2 investigation will improve soil characterization and support the calculation of representative mean sample concentrations for metals and PAHs.

The following analytes in surface soil had low bias primarily attributable to low surrogate, LCS/LCSD, or MS/MSD recoveries at a frequency greater than 20% of samples (9 in 45 samples): benzo(g,h,i)perylene, benzo(k)fluoranthene, fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and pyrene. Analytes in subsurface soil with low surrogate, LCS/LCSD, or MS/MSD recoveries affecting more than 20% of samples (18 in 90 samples) included benzo(g,h,i)perylene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene. These low recoveries may be associated with the significantly greater difficulty in homogenizing clay soil and extracting PAHs from high clay content soil because of the strong adsorption of PAHs to clay surfaces. The extraction efficiency of EPA Method 3546 (microwave extraction) is comparable or better than available alternatives (e.g., Soxhlet and ultrasonic extraction); therefore, the

selected extraction method should be retained for future sampling events. For the Phase 1 sampling event, samples were field homogenized by thorough mixing in a Ziplock bag. It is recommended that future discrete soil samples be homogenized sequentially, first in quarter-sample segments and then in combined half-sample and full sample segments.

Due to a laboratory equipment failure, 74 samples were analyzed outside the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). While microbial degradation is significantly reduced by storing samples at 4°C, some loss of organic material can occur, and the loss is exacerbated by prolonged storage. The bioavailability of many constituents is dependent upon the TOC content. In general, higher TOC leads to lower bioavailability and subsequently, a lower potential for toxicity. When TOC is biased low, toxicity may be overestimated; therefore, the uniformly low-biased TOC data obtained for the background data may impact the risk screening. Analysis of TOC is recommended for future Phase 2 soil sampling.

Eight of the 135 soil samples collected from the background area could not be thoroughly homogenized before sub-sampling and extraction for the EPA Method BNASIM analysis was performed due to their clay matrix. Mixing of a strongly aggregated soil (e.g., clay) to reduce intra-sample variability is difficult due to the presence of cohesive clumps that require mechanical disaggregation. The resulting uncertainty was partially addressed by implementing a robust, biased soil sampling program targeted to potential source areas. It is recommended that future discrete soil samples be homogenized sequentially, first in quarter-sample segments and then in combined half-sample and full sample segments. It is noted that an ISM processing will also address homogenization issues.

The PALs for all metal analytes in surface and subsurface soil were met by the LOQs or limits of detection (LODs), with the exception of thallium and mercury.

Groundwater Conclusions

All PAHs in groundwater had low bias primarily attributable to low surrogate, LCS/LCSD, or MS/MSD recoveries at a frequency greater than 20% of samples (2 in 9 samples).

The PALs for all PAH analytes in groundwater were met by the LOQs or LODs, with the exception of benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene. PAHs in groundwater were already analyzed by the most sensitive analytical method (i.e., BNASIM). The PALs for all metals analytes in groundwater that were not met by LOQs were either attained by the LOD or were already analyzed by the more sensitive analytical technique (i.e., ICP-MS), with the exception of cadmium and selenium. It is recommended that cadmium and selenium be analyzed by Method 6020A during Phase 2 Sampling events.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 3 May 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-146929-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in March 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-146929-2 | 280-146929-3 | NYOW-03-SL003-A | 3/31/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.7°C, 2.8°C, and 2.9°C. All requested target analytes were reported.

The majority of the containers were received with the first FedEx receipt at 10:15 AM; however, the containers for the following samples were received in a second receipt which occurred at 14:35 PM: NYOW-03-SL011-A and NYOW-03-PH011-B. Due to a LIMS limitation, only one receipt time is allowed per login; therefore, the receipt time of 10:15 AM was applied to all samples.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-146929-1.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 2 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM Rev 1: 280-146964-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-146964-2 | 280-146964-2 | NYOW-03-SL005-A | 4/1/2021 | CEC |
| 280-146964-2 | 280-146964-3 | NYOW-03-PH005-B | 4/1/2021 | CEC |
| 280-146964-2 | 280-146964-4 | [1]PH-DUP-001_210401 | 4/1/2021 | CEC |

[1]PH-DUP-001_210401 collected from NYOW-03-PH005-B

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.0°C, 1.3°C, 1.9°C, 3.6°C, and 5.4°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-146964-1.

**COMMENTS**

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for CEC (PH-DUP-001_210401 and NYOW-03-PH005-B). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate pair met the precision criteria for CEC with an RPD of 26%.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 0.5°C, 0.7°C, 1.2°C, 1.3°C, 2.5°C, and 3.3°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-146997-1.

**COMMENTS**

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for CEC (PH-DUP-001_210402 and NYOW-01-PH023-C). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate pair met the precision criteria for CEC with an RPD of 7%.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January

2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.5°C, 1.8°C, 2.2°C, 3.7°C, and 4.2°C. All requested target analytes were reported.

One 8-ounce soil jar did not have a collection time on the label for sample NYOW-03-PH009-B. The sample was logged in accordance with the COC.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-147031-1.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for CEC (SL-DUP-001_210405 and NYOW-03-SL013-A). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate and parent sample pair did not meet the precision criteria (RPD = 63%) and the results are qualified as "J" as shown in the table below.

| Sample | Analyte | Result | Qualifier |
|---|---|---|---|
| NYOW-03-SL013-A | CEC | 21 | J |
| SL-DUP-001_210405 | CEC | 11 | J |

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

[2]PH-DUP-002_210406 collected from NYOW-01-PH019-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 1.2°C, 1.9°C, 2.8°C, and 3.3°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-147085-1.

**COMMENTS**

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for CEC (SL-DUP-001_210406 and NYOW-01-SL019-A, and PH-DUP-002_210406 and NYOW-01-PH019-C). The RPD must be less than 50% when at least one result is greater than the LOQ. CEC met the precision criteria for both field duplicate pairs with RPDs of 27% and 10%, respectively.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 28 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-147159-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-147159-2 | 280-147159-1 | NYOW-01-SL021-A | 4/7/2021 | CEC |
| 280-147159-2 | 280-147159-2 | NYOW-01-PH021-B | 4/7/2021 | CEC |
| 280-147159-2 | 280-147159-3 | NYOW-01-PH021-C | 4/7/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Ten coolers were received by the laboratory at temperatures of 0.6°C, 0.7°C, 0.8°C, 1.2°C, 1.3°C, 1.6°C, 2.3°C, 2.4°C, 2.9°C, and 3.7°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-147159-1.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 2 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM Rev 1: 280-147306-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-147306-2 | 280-147306-4 | NYOW-01-SL002-A | 4/9/2021 | CEC |
| 280-147306-2 | 280-147306-5 | NYOW-01-PH002-B | 4/9/2021 | CEC |
| 280-147306-2 | 280-147306-6 | NYOW-01-PH002-C | 4/9/2021 | CEC |
| 280-147306-2 | 280-147306-7 | [1]PH-DUP-001_210409 | 4/9/2021 | CEC |

[1]PH-DUP-001_210409 collected from NYOW-01-PH002-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.7°C, 0.8°C, and 0.9°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-147306-1.

**COMMENTS**

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for CEC (PH-DUP-001_210409 and NYOW-01-PH002-C). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate and parent sample pair met the acceptance criteria with an RPD of 15%.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's

(EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 0.5°C, 0.9°C, 1.5°C, and 3.7°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-147423-1.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 28 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-146931-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in March 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-146931-1 | 280-146931-1 | NYOW-03-SL003-A | 3/31/2021 | Grain Size |
| 280-146931-1 | 280-146931-2 | NYOW-03-PH003-B | 3/31/2021 | Grain Size |
| 280-146931-1 | 280-146931-3 | NYOW-03-SL001-A | 3/31/2021 | Grain Size |
| 280-146931-1 | 280-146931-4 | NYOW-03-PH001-B | 3/31/2021 | Grain Size |
| 280-146931-1 | 280-146931-5 | NYOW-03-SL011-A | 3/31/2021 | Grain Size |
| 280-146931-1 | 280-146931-6 | NYOW-03-PH011-B | 3/31/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 1.7°C, 2.3°C, 2.8°C, and 2.9°C. All requested target analytes were reported.

The majority of the containers were received with the first FedEx receipt at 10:15; however, the containers for two samples (NYOW-03-SL011-A and NYOW-03-PH011-B) were received with a second receipt which occurred at 14:35 on the same day. Due to a LIMS limitation, only one receipt time is allowed with each SDG. The receipt time of 10:15 was applied to all samples by the laboratory.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control (QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

| 280-146990-1 | 280-146990-5 | NYOW-03-PH007-B | 4/1/2021 | Grain Size |

[1]PH-DUP-001_210401 collected from NYOW-03-PH005-B

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.0°C, 1.3°C, 1.9°C, 3.6°C, and 5.4°C. All requested target analytes were reported. .

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for grain size (PH-DUP-001_210401 and NYOW-03-PH005-B). The RPD must be less than 50% for each soil type. Gravel and coarse sand did not meet the precision criteria for this field duplicate pair. Results greater than 0% are qualified as “J” and results reported as equal to 0% are qualified as “UJ” as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| NYOW-03-PH005-B | Gravel | 0.0 | UJ |
| PH-DUP-001_210401 | Gravel | 0.4 | J |
| NYOW-03-PH005-B | Coarse Sand | 0.2 | J |
| PH-DUP-001_210401 | Coarse Sand | 0.8 | J |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 0.5°C, 0.7°C, 1.2°C, 1.3°C, 3.3°C, and 3.5°C. All requested target analytes were reported. .

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for grain size (PH-DUP-001_210402 and NYOW-01-PH023-C). The RPD must be less than 50% for each soil type. All soil types met the precision criteria for the field duplicate pair.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 28 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-147033-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-147033-1 | 280-147033-1 | NYOW-03-SL009-A | 4/5/2021 | Grain Size |
| 280-147033-1 | 280-147033-2 | NYOW-03-PH009-B | 4/5/2021 | Grain Size |
| 280-147033-1 | 280-147033-3 | NYOW-03-SL013-A | 4/5/2021 | Grain Size |
| 280-147033-1 | 280-147033-4 | [1]SL-DUP-001_210405 | 4/5/2021 | Grain Size |
| 280-147033-1 | 280-147033-5 | NYOW-03-PH013-B | 4/5/2021 | Grain Size |

[1]SL-DUP-001_210405 collected from NYOW-03-SL013-A

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.5°C, 1.8°C, 2.2°C, 3.7°C, and 4.2°C. All requested target analytes were reported. .

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for grain size (SL-DUP-001_210405 and NYOW-03-SL013-A). The RPD must be less than 50% for each soil type. Gravel, coarse sand, medium sand, and clay did not meet the precision criteria for this field duplicate pair. Results greater than 0% are qualified as "J" as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| NYOW-03-SL013-A | Gravel | 11.4 | J |
| SL-DUP-001_210405 | Gravel | 4.3 | J |
| NYOW-03-SL013-A | Coarse Sand | 1.7 | J |
| SL-DUP-001_210405 | Coarse Sand | 0.8 | J |
| NYOW-03-SL013-A | Medium Sand | 4.3 | J |
| SL-DUP-001_210405 | Medium Sand | 1.4 | J |
| NYOW-03-SL013-A | Clay | 0.9 | J |
| SL-DUP-001_210405 | Clay | 1.8 | J |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

[2]PH-DUP-002_210406 collected from NYOW-01-PH019-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 1.2°C, 1.9°C, 2.8°C, and 3.3°C. All requested target analytes were reported. .

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for grain size (SL-DUP-001_210406 collected from NYOW-01-SL019-A, and PH-DUP-002_210406 collected from NYOW-01-PH019-C). The RPD must be less than 50% for each soil type. Gravel and clay did not meet the precision criteria for PH-DUP-002_210406 collected from NYOW-01-PH019-C. Results greater than 0% are qualified as "J" as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| PH-DUP-002_210406 | Gravel | 2.6 | J |
| NYOW-01-PH019-C | Gravel | 25.9 | J |
| PH-DUP-002_210406 | Clay | 14.1 | J |
| NYOW-01-PH019-C | Clay | 5.8 | J |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Ten coolers were received by the laboratory at temperatures of 0.6°C, 0.7°C, 0.8°C, 1.2°C, 1.3°C, 1.6°C, 2.2°C, 2.4°C, 2.9°C, and 3.7°C. All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control (QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 3 May 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-147309-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-147309-1 | 280-147309-1 | NYOW-01-SL002-A | 4/9/2021 | Grain Size |
| 280-147309-1 | 280-147309-2 | NYOW-01-PH002-B | 4/9/2021 | Grain Size |
| 280-147309-1 | 280-147309-3 | NYOW-01-PH002-C | 4/9/2021 | Grain Size |
| 280-147309-1 | 280-147309-4 | [1]PH-DUP-001_210409 | 4/9/2021 | Grain Size |

[1]PH-DUP-001_210409 collected from NYOW-01-PH002-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.7°C, 0.8°C, and 0.9°C. All requested target analytes were reported. .

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for grain size (PH-DUP-001_210409 and NYOW-01-PH002-C). The RPD must be less than 50% for each soil type. All soil types met the precision criteria for the field duplicate pair.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 17 May 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-147421-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the methods specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-147421-1 | 280-147421-1 | NYOW-01-SL007-A | 4/13/2021 | Grain Size |
| 280-147421-1 | 280-147421-2 | NYOW-01-SL027-A | 4/13/2021 | Grain Size |
| 280-147421-1 | 280-147421-3 | NYOW-01-SL026-A | 4/13/2021 | Grain Size |
| 280-147421-1 | 280-147421-4 | NYOW-01-SL025-A | 4/13/2021 | Grain Size |
| 280-147421-1 | 280-147421-5 | NYOW-01-SL009-A | 4/13/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition. Due to a commercial shipping delay, the following samples were received at the Seattle laboratory above the required temperature criteria at 13.3ºC: NYOW-01-SL007-A, NYOW-01-SL027-A, NYOW-01-SL026-A, NYOW-01-SL025-A, NYOW-01-SL009-A, NYOW-01-SL028-A, NYOW-01-SL029-A, NYOW-01-SL030-A, NYOW-01-SL039-A, NYOW-01-SL038-A and NYOW-01-SL037-A. Water was present in the cooler, indicating evidence of melted ice. To prevent evaporation from occurring, refrigeration is

necessary; however, given the marginal temperature exceedance and the improbability of significant evaporation from soil jars maintained below room temperature, qualification of the data is not necessary.

All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control (QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 3 September 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Rev 1: 280-146964-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330A (soils)
- Picric Acid by SW-846 Method 8330B (aqueous)
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 1 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | BNASIMD | D2216 | SW6010C | SW6020A | SW7470A | SW7471B | SW8082A | SW8270D | SW8330A | SW8330B | SW9060A |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

N – The analysis indicates the presence of an analyte for which there was presumptive evidence to make a "tentative identification."

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were initially received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.0°C, 1.3ºC, 1.9ºC, 3.6ºC and 5.4ºC.

As a result of improper storage of the deionized water Terra Core® samplers, volatile organic compounds (VOCs) were cancelled and resampled. The VOCs are not included in the completeness calculation.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs and SVOCs with SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification (ICV) results and frequencies were subject to review. Minimum

calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

PCBs Method 8082A:

ICV 280-533282/10 exhibited a percent difference (%D) greater than 20% for one PCB-1016 peak at 22%. The associated sample results are qualified as “UJ”.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, %Ds, and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

CCV 680-664086/3 exhibited %Ds greater than 20% for benzaldehyde (-23.7%) and caprolactam (-28.7%). The associated aqueous sample results were non-detect and are qualified as “UJ”.

CCV 680-664585/2 exhibited a %D greater than 20% for pentachlorophenol at -20.9%. The associated soil sample results were non-detect and are qualified as “UJ”.

CCVs 680-663652/2 and 680-663652/29 exhibited %Ds greater than 20% for DNP at 21.3% and -57.6%. There are no associated investigative samples.

CCV 680-664524/2 exhibited %Ds greater than 20% for 1,4-dioxane at 27.4%, 2-nitroaniline at 20.2%, 2,4-dinitrophenol at 20.2%, 4-nitrophenol at 32.3%, and di-n-octyl phthalate at 20.1%. The associated soil sample result was non-detect and is qualified as “UJ”.

The closing CCV for analysis batch 680-664086/27 was performed 20 minutes outside of the tune window. The associated non-detect equipment blank sample result for DNCB is qualified as “UJ”.

PCBs by Method 8082A:

CCV 280-533592/29 exhibited %Ds greater than 20% for all 5 PCB 1016 peaks and for 3 of 5 PCB 1260 peaks ranging from 20.1% to 45.5% on the secondary column. The associated detected soil sample results are qualified as “J” and non-detects are qualified as “UJ”.

CCV 280-533592/30 exhibited %Ds greater than 20% for all 5 PCB 1016 peaks and for 3 of 5 PCB 1260 peaks ranging from 20.3% to 45.5% on the secondary column. The associated soil sample results were previously qualified; no further action is necessary.

CCV 280-533592/14 exhibited %Ds greater than 20% for all 5 PCB 1016 peaks ranging from 28.1% to 45.6% on the secondary column. The associated soil sample results were previously qualified; no further action is necessary.

CCV 280-533273/34 exhibited %Ds greater than 20% for 2 PCB-1016 peaks and 1 PCB-1260 peak ranging from -20.4% to -22.4% on the primary column. The associated soil sample results are qualified as “UJ”.

CCV 280-533273/45 exhibited %Ds greater than 20% for all 5 PCB 1016 peaks and for 3 of 5 PCB 1260 peaks ranging from -21% to -44.3% on the primary column. The associated soil sample results were previously qualified; no further action is necessary.

CCV 280-533273/55 exhibited %Ds greater than 20% for 3 PCB-1016 peaks ranging from -20.5% to -23% on the primary column. The associated soil sample results were previously qualified; no further action is necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

SVOCs by Method 8270D:

Method blank sample 680-663747/10-A exhibited a positive detection for di-n-butyl phthalate at 44 µg/kg. The associated positive detections less than the LOQ are qualified as “U” at the LOD or LOQ.

Method blank sample 680-664082/10-A exhibited a positive detection for di-n-butyl phthalate at 105 µg/kg. The associated positive detection is less than the LOQ and is qualified as “U” at the LOD or LOQ.

Method blank sample 680-664738/15-A exhibited positive detections for bis(2-ethylhexyl)phthalate (BEHP) at 114 µg/kg and di-n-butyl phthalate at 73 µg/kg. The associated results for BEHP were non-detect; qualification is not necessary. The associated positive results for di-n-butyl phthalate less than the LOQ are qualified as “U” at the LOQ or LOQ.

SVOCs with SIM by Method 8270D:

Method blank sample 80-531849/1-A exhibited positive detections for 1-methylnaphthalene at 0.0185 µg/L and 2-methylnaphthalene at 0.0275 µg/L. The associated sample results were non-detect; qualification is not necessary.

Metals by Method 6010C:

Preparation blank sample 280-532085/1-A exhibited positive detections greater than the detection limit but less than the LOQ for manganese and zinc at 0.134 mg/kg and 0.805 mg/kg, respectively. The associated sample results were non-detect; qualification is not required.

Equipment blank sample EB-01_210401 exhibited positive detections below the LOQ for iron at 56 µg/L and barium at 1.8 µg/L. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

CCB 280-532444/96 exhibited positive detections for beryllium and manganese below their LOQs at 0.376 µg/L and 5.23 µg/L, respectively. The results for beryllium and manganese were greater than the aqueous LOQ; on the basis of professional judgment, qualification is not necessary.

CCB 280-532444/108 exhibited positive detections for beryllium, calcium, and iron below their LOQs at 0.276 µg/L, 266 µg/L and 49.2 µg/L, respectively. The results for beryllium, calcium and iron were greater than the aqueous LOQ; on the basis of professional judgment, qualification is not necessary.

CCB 280-532444/121 exhibited positive detections for aluminum, beryllium, and iron below their LOQs at 21.1 µg/L, 0.339 µg/L and 46.9 µg/L, respectively. The results for aluminum, beryllium, and iron were greater than the aqueous LOQ; on the basis of professional judgment, qualification is not necessary.

Metals by Method 6020A:

Equipment blank sample EB-01_210401 exhibited positive detections below the LOQ for cobalt at 0.23 µg/L, thallium at 0.37 µg/L, and lead at 0.21 µg/L. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Preparation blank sample 280-532089/1-A exhibited a positive detection for thallium below the LOQ at 0.141 µg/L. The associated equipment blank sample result is qualified as “U” at the LOQ.

CCB 280-532447/42 exhibited a positive detection for thallium below the LOQ at 0.121 µg/L. The CCB did not bracket the analysis of investigative samples; qualification is not necessary.

CCBs 280-532447/96 and 280-532447/109 exhibited positive detections for thallium below the LOQ at 0.098 µg/L and 0.105 µg/L, respectively. The associated equipment blank sample result was previously qualified as non-detect; further action is not necessary.

CCB 280-532167/137 exhibited a positive detection for thallium below the LOQ at 0.137 µg/L. The associated sample results were greater than the aqueous LOQ; qualification is not necessary on the basis of professional judgment.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-03-SL005-A exhibited recoveries less than the lower warning limits for base/neutral (B/N) extractable surrogates nitrobenzene-d5 (34%), 2-fluorobiphenyl (43%) and terphenyl-d14 (50%). The associated B/N sample results were non-detect and are qualified as "UJ".

Sample NYOW-03-SL006-A exhibited recoveries less than the lower warning limits for acid extractable surrogates 2-fluorophenol (22%) and phenol-d5 (25%). The associated acid extractable sample results were non-detect and are qualified as "UJ".

SVOCs with SIM by Method 8270D:

Sample NYOW-03-PH005-B did not recover for terphenyl-d14. The sample was analyzed at a 20X dilution; qualification is not necessary.

Sample NYOW-03-PH005-B exhibited a recovery greater than the upper control limit for fluoranthene-d10 at 105%. The sample was analyzed at a 20X dilution; qualification is not necessary.

Sample NYOW-03-SL007-A exhibited a recovery greater than the upper control limit for fluoranthene-d10 at 126%. The associated positive detections are qualified as "J+".

Sample NYOW-03-SL007-A exhibited a recovery greater than the upper control limit for fluoranthene-d10 at 129%. The sample was analyzed at a 40X dilution; qualification is not necessary.

Sample NYOW-03-SL007-A did not recover for nitrobenzene. The sample was analyzed at a 40X dilution; qualification is not necessary.

PCBs by Method 8082A:

Sample NYOW-03-PH007-B exhibited a retention time (RT) shift for surrogate DCB on the primary columns at -0.037 minutes. The RT shift is less than ±0.1 minutes, the surrogates recovered within control, and PCBs were not detected in the sample; qualification is not necessary.

Picric Acid by Method 8330B:

Sample EB-01_210401 exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 79%. The associated sample results were non-detect and are qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-663391/9-A/10-A exhibited recoveries less than the lower warning limit for atrazine at 14% and 12%. The associated equipment blank sample result was non-detect and is qualified as “UJ”. The recoveries for nitrobenzene were greater than the upper warning limit at 122% and 130%. The associated sample results were non-detect; qualification is not necessary.

LCS 680-664082/11-A exhibited multiple recoveries less than the lower warning limit. The LCS/LCSD pair also exhibited multiple RPDs greater than the control limit as shown in the tables below. The associated soil sample results were non-detect and are qualified as “UJ”.

| | | |
|---|---|---|
| 1,2,4,5-Tetrachlorobenzene | 26.44 | 37 - 119 |
| 2,2'-Oxybis(1-chloropropane) | 25.23 | 33 - 131 |

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-03-SL005-A exhibited recoveries less than the lower warning limits for multiple analytes as shown below. The associated sample results were non-detect and are qualified as "UJ".

| Analyte | MS Recovery | SD Recovery |
|---|---|---|
| 2,4-Dinitrotoluene | 42 | 45 |
| 2-Nitroaniline | 43 | -- |
| Atrazine | 40 | 42 |
| Benzyl butyl phthalate | 45 | -- |
| Bis(2-ethylhexyl)phthalate | 46 | -- |
| Caprolactam | 41 | -- |
| Carbazole | 47 | -- |
| Di-n-butyl phthalate | 47 | -- |
| Diethyl phthalate | 46 | -- |
| Dimethyl phthalate | 47 | -- |
| N-Nitrosodi-n-propylamine | 35 | -- |

MS/SD sample NYOW-03-SL006 exhibited an RPD greater than 20% for DNCB at 22%. The associated sample result was non-detect; qualification is not required.

SVOCs with SIM by Method 8270D:

MS/SD sample NYOW-03-PH005-B exhibited recoveries less than the lower control limit for benzo(a)anthracene (16%, -80%), benzo(a)pyrene (-346%, -929%), benzo(b)fluoranthene (-369%, 1291%), benzo(g,h,i)perylene (-224%, -531%), benzo(k)fluoranthene (-228%, -571%), chrysene (-218%, -499%), dibenz(a,h)anthracene (-37%, -155%), and indeno(1,2,3-cd)pyrene (-403%, -763%) at a 20X dilution. The sample concentrations were greater than 4X the spiked amount with the exception of dibenz(a,h)anthracene. In addition, the MS/SD RPDs were greater

than 40% for benzo(a)pyrene (44%), benzo(b)fluoranthene (47%), and benzo(k)fluoranthene (41%),The associated detection for dibenz(a,h)anthracene is qualified as “J-“.

MS/SD sample NYOW-03-PH005-B exhibited recoveries less than the lower control limit for anthracene (33%), fluoranthene (-13%, -66%), phenanthrene (36%, 32%), and pyrene (6%, -81%) at a 1X dilution. The associated positive detections are qualified as “J-“.

Picric Acid by Method 8330A:

MS/SD sample NYOW-03-PH016-B exhibited recoveries less than 50% at 25% and 26%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

Metals by Method 6010C:

MS/SD sample NYOW-03-SL005-A exhibited recoveries outside of control limits for aluminum (607%, 608%), calcium (-1801%, -1910%), iron (379%, 451%), manganese (36%), and potassium (118%). The sample concentrations were greater than 4X the spiked amount for aluminum, calcium, iron, and manganese. The positive detection for potassium is qualified as “J+”.

## DUAL COLUMN IMPRECISION

All positive detections for dual column methods had RPDs less than 40%.

## POST-DIGESTION SPIKE

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-03-SL005-A. Aluminum (-1%), calcium (-10%), iron (-67%), and manganese (-32%) recovered below the lower control limit. The aluminum, calcium, iron, and manganese concentrations were greater than 4X the spiked amount in the MS. Silver recovered below the lower control limit at 75%. The MS/SD recoveries for silver were within warning limits. Therefore, the post-digestion spike was not used to evaluate these MS/SD recovery failures.

## ICP SERIAL DILUTION

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-03-SL005-A. The %Ds were greater than the control limit for calcium (14%), magnesium (11%), and manganese (15%). The associated sample results are qualified as “J”.

## LOW-LEVEL CHECK STANDARD

Low-level check standards (CCVL) for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted below.

Metals by Method 6010C:

CCVL 280-532444/109 exhibited a recovery greater than the upper control limit for calcium at 124%. The associated sample results were greater than ICV and CCV concentrations; qualification is not necessary.

CCVL 280-532444/122 exhibited a recovery greater than the upper control limit for iron at 126%. The associated sample results were greater than ICV and CCV concentrations; qualification is not necessary.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

Metals by Method 6010C:

The Interference Check Solution A (ICSA) associated with batch 280-532444 had barium present above the LOD at 12.45 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532171 had barium present above the LOD at 12 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

Metals by Method 6020A:

The ICSA associated with batch 280-532447 had cobalt present above the LOD at 0.439 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

The VOC soil samples were cancelled prior to analysis; however, the laboratory data package contains VOC results for the trip blank and equipment blank samples. The results were not validated.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC sample batch 680-663391. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC SIM sample batch 280-531849. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous PCB sample batch 280-531871. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous picric acid sample batch 280-531661. An LCS and LCSD were performed.

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210401 collected from NYOW-03-PH005-B and SL-DUP-001_210401 collected from NYOW-03-SL006-A). The RPD must be less than 50% when at least one result is greater than the LOQ. For percent solids, the RPD must be less than 20%. The following analytes did not meet the precision criteria:

- PH-DUP-001_210401 collected from NYOW-03-PH005-B:

| Analyte | Parent Result | Parent LOQ | Duplicate Result | Duplicate LOQ | RPD | Qualifier |
|---|---|---|---|---|---|---|
| 1-Methylnaphthalene | 18 | 12 | ND | 12 | NA | J |

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, and a small piece of glass that would not pass through the sieve: NYOW-03-SL005-A, NYOW-03-PH005-B, PH-DUP-001_210401, NYOW-03-SL016-A, NYOW-03-PH016-B, NYOW-03-SL007-A, NYOW-03-PH007-B, NYOW-03-SL006-A, SL-DUP-001_210401, and NYOW-03-PH006-B. The material was removed and not extracted.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences prior to PCB analysis: NYOW-03-SL005-A, NYOW-03-PH005-B, PH-DUP-001_210401, NYOW-03-SL016-A, NYOW-03-PH016-B, NYOW-03-SL007-A, NYOW-03-PH007-B, NYOW-03-SL006-A, SL-DUP-001_210401, NYOW-03-PH006-B, associated with preparation batch 280-531464 and analytical batch 280-533273.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences: EB-01_210401 associated with preparation batch 280-531871 and analytical batch 280-533282. Equipment blank extracts undergo cleanup when the associated sample extracts are treated with sulfuric acid to facilitate comparison of the analytical results. Method requirements indicate that blanks must be subjected to the same cleanup as the associated samples.

The following sample appears to contain PCBs based on the chromatogram; however, due to weathering or other environmental processes, the PCBs in the sample do not closely match any of the laboratory's Aroclor standards used for instrument calibration: NYOW-03-PH005-B. The sample has been quantified and reported as PCB-1260 and the result is qualified as “NJ”.

The following sample required a mercury clean-up, via EPA Method 3660A, to reduce matrix interferences caused by sulfur: NYOW-03-PH005-B.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for SVOC with SIM analysis of two soil samples due to sample dilution. Several metal analytes (antimony, arsenic, selenium, thallium, mercury) had LOQs greater than PQLGs due to percent moisture adjustments. Several Aroclors and SVOCs had LOQs greater than PQLGs due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 20 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-146929-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in March 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330A (soils)
- Picric Acid by SW-846 Method 8330B (aqueous)
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 31 March 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were initially received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 1.7ºC, 2.8ºC, 2.9ºC and 5.9ºC.

The majority of the containers were received with the first FedEx receipt at 10:15am; however, the containers for the following samples were received in a second receipt which occurred at 14:35pm on the same day: NYOW-03-SL010-A, NYOW-03-PH010-B, NYOW-03-SL011-A, NYOW-03-PH011-B, NYOW-03-PH012-B and EB-01_210331. Due to a LIMS limitation, only one receipt time is allowed for each login; therefore, the receipt time of 10:15am was applied to all samples.

The containers for the following samples were received on 4/2/2021 at 10:50am, logged in under 280-146994-1 and reported under 280-146929-1: NYOW-03-SL012-A and TB-01_210331. Containers for VOC analysis were not initially received for the following samples: NYOW-03-PH004-B, NYOW-03-PH003-B, NYOW-03-PH001-B, NYOW-03-PH002-B, NYOW-03-PH010-B, NYOW-03-PH011-B, NYOW-03-PH012-B, PH-DUP-001_210331, and EB-01_210331.

Sample NYOW-03-SL012-A was re-extracted 4 days outside of the holding time period and reanalyzed for SVOCs. The initial analysis should be used for data interpretation; qualification is not necessary.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs and SVOCs with SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification (ICV) results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

PCBs Method 8082A:

ICV 280-533282/10 exhibited a percent difference (%D) greater than 20% for one PCB-1016 peak at 22%. The associated sample results are qualified as “UJ”.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, %Ds, and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

CCV 680-663985/17 exhibited %Ds greater than 20% for benzaldehyde (-21.7%) and atrazine (24.2%). The associated aqueous sample results were non-detect and are qualified as "UJ".

CCV 680-664758/2 exhibited a %D greater than 20% for 4-nitrophenol at 30.5%. The associated soil sample results were non-detect and are qualified as "UJ".

CCV 680-664524/2 exhibited %Ds greater than 20% for 1,4-dioxane at 27.4%, 2-nitroaniline at 20.2%, 2,4-dinitrophenol at 20.2%, 4-nitrophenol at 32.3%, and di-n-octyl phthalate at 20.1%. The associated soil sample result was non-detect and is qualified as "UJ".

CCV 680-6 65758/3 exhibited %Ds greater than 20% for benzaldehyde (23.8%) and caprolactam (32%). The associated soil sample results were non-detect and are qualified as "UJ".

PCBs by Method 8081A:

CCV 280-533293/38 exhibited %Ds greater than 20% for all 5 PCB 1016 peaks ranging from 24.1% to 30.4% on the secondary column. The associated non-detect soil sample results are qualified as "UJ".

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, trip blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

VOCs by Method 8260C:

Method blank sample 280-532314/9 exhibited positive detections for 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene at 0.404 µg/L and 0.427 µg/L, respectively. The associated equipment blank and trip blank sample results were non-detect; qualification is not necessary.

SVOCs by Method 8270D:

Method blank sample 680-663321/10-A exhibited a positive detection for di-n-butyl phthalate at 149 µg/kg. The associated positive detections less than the LOQ are qualified as "U" at the LOQ.

Method blank sample 680-664082/10-A exhibited a positive detection for di-n-butyl phthalate at 105 µg/kg. The associated positive detection is less than the LOQ and is qualified as "U" at the LOQ.

Method blank sample 680-664738/15-A exhibited positive detections for bis(2-ethylhexyl)phthalate at 114 µg/kg and di-n-butyl phthalate at 73 µg/kg. The associated results were for the reanalysis of sample NYOW-03-SL012-A. The initial results should be used for data interpretation; qualification is not necessary.

SVOCs with SIM by Method 8270D:

Method blank sample 280-531832/1-A exhibited positive detections below the LOQ for acenaphthene at 0.428 µg/kg and acenaphthylene at 1.9 µg/kg. The associated sample results were greater than 5X the blank amount; qualification is not necessary.

Metals by Method 6010C:

Preparation blank sample 280-531353/1-A exhibited a positive detection greater than the detection limit but less than the LOQ for aluminum at 3.69 mg/kg. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Equipment blank sample EB-01_210331 exhibited positive detections below the LOQ for cadmium at 0.64 µg/L and magnesium at 31 µg/L. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

CCB 280-538331/35 exhibited a positive detection for beryllium at 0.201 µg/L. The associated equipment blank sample result was non-detect; qualification is not required.

CCB 280-531674/77 exhibited a positive detection for lead at 2.93 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Mercury by Method 7470A:

Equipment blank sample EB-01_210331 exhibited a positive detection below the LOQ for mercury at 0.035 µg/L. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Method blank sample 280-532311/1-A exhibited a positive detection at 0.0417 µg/L. The associated equipment blank sample result is qualified as "U" at the LOD.

Mercury by Method 7471B:

Initial calibration blank (ICB) 280-532125/9 and subsequent CCBs 280-532125/12, 280-532125/24, and 280-532125/36 exhibited positive detections at 0.0652 µg/L, 0.0654 µg/L, 0.0637 µg/L, and 0.0626 µg/L, respectively. The associated sample results less than the aqueous LOQ are qualified as "U" at the LOQ.

Metals by Method 6020A:

Preparation blank sample 280-531347/1-A exhibited a positive detection for thallium below the LOQ at 0.0043 mg/kg. The associated positive detections below the LOQ are qualified as "U" at the LOQ.

ICB 280-531619/7 exhibited a positive detection for thallium at 0.137 µg/L. The subsequent CCBs (280-531619/30, 280-531619/49, 280-531619/55, 280-531619/66, and 280-531619/79) exhibited positive detections below the LOQ ranging from 0.118 µg/L to 0.170 µg/L. The associated positive detections were greater than the aqueous LOQ; qualification is not necessary on the basis of professional judgment.

CCB 280-532167/137 exhibited a positive detection for thallium below the LOQ at 0.137 µg/L. The associated sample result was previously qualified on the basis of method blank contamination; no further action is necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-03-PH004-B exhibited a recovery less than the lower warning limit for base/neutral (B/N) extractable surrogate terphenyl-d14 at 49%. The associated B/N sample results were non-detect and are qualified as "UJ".

Sample NYOW-03-SL004-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 45%. The associated positive B/N sample results are qualified as "J-" and non-detects are qualified as "UJ".

Sample PH-DUP-001_210331 exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 47%. The associated positive B/N sample results are qualified as "J-" and non-detects are qualified as "UJ".

Sample NYOW-03-SL012-A exhibited recoveries less than the lower warning limits for 2-fluorophenol (23%), terphenyl-d14 (52%), and phenol-d5 (28%). The associated positive detections are qualified as J-" and non-detects are qualified as "UJ".

SVOCs with SIM by Method 8270D:

Sample NYOW-03-PH010-B did not recover for any of the five surrogate spikes. The sample was analyzed at a 10X dilution; qualification is not necessary.

Sample NYOW-03-SL010-A exhibited a recovery greater than the upper control limit for fluoranthene-d10 at 107%. The sample was analyzed at a 10X dilution; qualification is not necessary.

Sample NYOW-03-SL012-A exhibited a recovery less than the lower warning limit for nitrobenzene-d5 at 43%. The associated sample results are qualified as “J-”.

Picric Acid by Method 8330B:

Sample EB-01_210331 exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 70%. The associated sample results were non-detect and are qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-663202/11-A/12-A exhibited recoveries less than the lower warning limit for atrazine at 15% and 15%. The associated equipment blank sample result was non-detect and is qualified as “UJ”.

LCS 680-664082/11-A exhibited multiple recoveries less than the lower warning limit. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

| Hexachlorocyclopentadiene | 72 |
| 3,3'-Dichlorobenzidine | 76 |

LCSD 680-664738/17-A exhibited RPDs greater than 20% for multiple analytes as shown in the table below. The associated sample results were non-detect; qualification is not necessary.

| | |
|---|---|
| 1,2,4,5-Tetrachlorobenzene | 20.60 |
| 2,2'-Oxybis(1-chloropropane) | 24.93 |
| 2,3,4,6-Tetrachlorophenol | 29.97 |
| 2,4,5-Trichlorophenol | 25.29 |
| 2,4,6-Trichlorophenol | 23.81 |
| 2,4-Dichlorophenol | 21.92 |
| 2,4-Dinitrophenol | 29.51 |
| 2,4-Dinitrotoluene | 26.19 |
| 2,6-Dinitrotoluene | 29.88 |
| 2-Chloronaphthalene | 24.92 |
| 2-Chlorophenol | 23.31 |
| 2-Methylphenol (o-Cresol) | 27.85 |
| 2-Nitrophenol | 21.44 |
| 4,6-Dinitro-2-methylphenol | 24.56 |
| 4-Bromophenyl phenyl ether | 24.86 |
| 4-Chloro-3-methylphenol | 27.57 |
| 4-Chloroaniline | 23.83 |
| 4-Chlorophenyl phenyl ether | 26.55 |
| 4-Nitrophenol | 24.26 |
| Acetophenone | 21.74 |
| Atrazine | 24.76 |
| Dimethyl phthalate | 25.98 |
| Hexachlorobenzene | 25.76 |
| Hexachlorobutadiene | 22.46 |
| Hexachlorocyclopentadiene | 23.58 |
| Hexachloroethane | 23.13 |
| Isophorone | 24.68 |
| N-Nitrosodi-n-propylamine | 25.70 |
| N-Nitrosodiphenylamine | 26.57 |
| Nitrobenzene | 20.17 |
| Pentachlorophenol | 24.79 |
| Phenol | 25.11 |
| Benzaldehyde | 22.54 |
| Benzyl butyl phthalate | 26.38 |
| Bis(2-chloroethoxy)methane | 21.62 |
| Bis(2-chloroethyl) ether (2-Chloroethyl ether) | 22.80 |
| Bis(2-ethylhexyl)phthalate | 28.52 |
| Caprolactam | 25.43 |
| Carbazole | 23.55 |
| Cresols, m- & p- | 28.57 |
| Di-n-butyl phthalate | 25.15 |
| di-n-Octyl phthalate | 27.95 |
| Dibenzofuran | 24.92 |
| Diethyl phthalate | 26.49 |

Metals by Method 6020A:

LCS 280-531341/2-A exhibited a recovery less than 85% for antimony at 84.75%. The associated equipment blank sample result is qualified as “UJ”.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-03-SL004-A exhibited recoveries less than the lower control limit for multiple analytes as shown below. The associated sample results were non-detect and are qualified as “UJ” with the exception of 3,3’-dichlorobenzidine, which is qualified as “X” and recommended for rejection.

| Analyte | MS Recovery | SD Recovery |
|---|---|---|
| 3-Nitroaniline | -- | 30% |

| Analyte | MS Recovery | SD Recovery |
|---|---|---|
| 4-Chloroaniline | 13% | 15% |
| Atrazine | 43% | -- |
| 3,3'-Dichlorobenzidine | 3% | 1% |
| 4-Nitroaniline | -- | 33% |

MS/SD sample NYOW-03-SL004-A exhibited RPDs greater than 20% for 3,3'-dichlorobenzidine at 79%, 3-nitroaniline at 31%, and 4-nitroaniline at 28%. The associated sample results were non-detect; qualification is not required.

MS/SD sample NYOW-03-PH012-B exhibited an RPD greater than 20% for DNCB at 33%. The associated sample result was non-detect; qualification is not necessary.

SVOCs with SIM by Method 8270D:

MS/SD sample NYOW-03-SL004-A exhibited recoveries less than the lower warning limits for benzo(b)fluoranthene (48%), benzo(g,h,i)perylene (41%), and indeno(1,2,3-cd)pyrene (46%). The associated sample results were positive detections and are qualified as "J-".

Picric Acid by Method 8330A:

MS/SD sample NYOW-03-SL002-A exhibited recoveries less than 50% at 35% and 34%, respectively. The associated sample result was non-detect and is qualified as "UJ".

Metals by Method 6010C:

MS/SD sample NYOW-03-SL004-A exhibited recoveries outside of control limits for aluminum (284%, 276%), iron (127%), lead (80%), and manganese (75%). The sample concentrations were greater than 4X the spiked amount for aluminum and iron. The positive detections for lead and manganese are qualified as "J-".

Metals by Method 6020A:

MS/SD sample NYOW-03-SL004-A exhibited RPDs greater than 20% for arsenic (30%), cadmium (33%), selenium (32%), and thallium (35%). The associated positive detections are qualified as "J" and the associated non-detect for thallium is qualified as "UJ".

**DUAL COLUMN IMPRECISION**

PCBs by Method 8082A:

Sample NYOW-03-SL010-A exhibited dual column imprecision greater than 40% for PCB-1260 at 64%. The associated positive detection is qualified as "J".

## SAMPLE POST-DIGESTION SPIKE

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-03-SL004-A. Aluminum (-41%), iron (11%), and manganese (77%) recovered below the lower control limit. The aluminum, iron, and manganese concentrations were greater than 4X the spiked amount in the MS; therefore, the PDS was not used to evaluate these MS/SD recovery failures.

A PDS was performed on equipment blank sample EB-01_210331. Silver did not meet the recovery criteria; however, PDS are not required for silver.

## ICP SERIAL DILUTION

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-03-PH004-B. All %Ds were less than 10%.

Metals by Method 6020A:

An ICP serial dilution was performed for sample NYOW-03-PH004-B. All %Ds were less than 10%.

Mercury by Method 7471B:

An ICP serial dilution was performed for sample NYOW-03-PH004-B. All %Ds were less than 10%.

## LOW-LEVEL CHECK STANDARD

Low-level check standards (CCVL) for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted below.

Metals by Method 6010C:

CCVL 280-531674/89 exhibited a recovery greater than the upper control limit for lead at 121%. The associated sample results less than the CCV concentration are qualified as “J+”.

## INTERFERENCE CHECK SAMPLES

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

Metals by Method 6010C:

The Interference Check Solution A (ICSA) associated with batch 280-531674 had barium present above the LOD at 12 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532597 had barium present above the LOD at 12.5 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

There was insufficient sample volume to perform a MS/SD associated with VOC sample batches 280-531755 and 280-532314. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC SIM sample batch 280-531382 and solid sample batch 280-531832. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous PCB sample batch 280-531871 and soil sample batch 280-531867. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous picric acid sample batch 280-531661. An LCS and LCSD were performed.

The following samples in preparation batch 280-531308 and analytical batch 280-533288 were diluted for SVOC SIM analysis due to the nature of the sample matrix: NYOW-03-SL010-A, NYOW-03-PH010-B, and NYOW-03-SL011-A. The samples could not be concentrated to the final method required volume and the LOQs were proportionally elevated. The samples were reported to be black and viscous.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210331 collected from NYOW-03-PH012-B). The RPD must be less than 50% when at least one result is greater than the LOQ. The following analytes did not meet the precision criteria:

- PH-DUP-001_210331 collected from NYOW-03-PH012-B: benzo(g,h,i)perylene (52%), fluorene (113%), naphthalene (144%), phenanthrene (94%), calcium (90%), lead (56%), magnesium (110%), potassium (59%), cadmium (92%), and thallium (62%).

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, sticks, vegetation, and wood chips that would not pass through the sieve: NYOW-03-SL004-A, NYOW-03-PH004-B, NYOW-03-SL003-A, NYOW-03-PH003-B, NYOW-03-SL001-A, NYOW-03-PH001-B, NYOW-03-SL002-A, NYOW-03-PH002-B, NYOW-03-SL010-A, NYOW-03-PH010-B, NYOW-03-SL011-A, NYOW-03-PH011-B, NYOW-03-SL012-A, NYOW-03-PH012-B, PH-DUP-001_210331. The material was removed and not extracted.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences prior to PCB analysis: NYOW-03-SL010-A, NYOW-03-PH010-B, NYOW-03-SL011-

A, NYOW-03-PH011-B, NYOW-03-PH012-B, and PH-DUP-001_210331 associated with preparation batch 280-531309 and analytical batch 280-533282.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences: NYOW-03-SL012-A associated with preparation batch 280-531871 and analytical batch 280-533293.

Sample EB-01_210331 required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences.

In preparation batch 280-531309 for PCB analysis, the following samples could not be thoroughly homogenized before sub-sampling was performed due to sample matrix: NYOW-03-SL010-A, NYOW-03-PH011-B, and PH-DUP-001_210331. Sample NYOW-03-PH011-B was clay. Sample NYOW-03-SL010-A contained a lot of vegetation. Samples NYOW-03-SL010-A and PH-DUP-001_210331 contained many rocks.

In preparation batch 280-531308 for SVOC SIM analysis, the following samples could not be thoroughly homogenized before sub-sampling was performed due to sample matrix: NYOW-03-PH004-B, NYOW-03-SL003-A, NYOW-03-PH003-B, NYOW-03-SL001-A, NYOW-03-SL002-A, NYOW-03-PH002-B, NYOW-03-SL010-A, NYOW-03-PH011-B, and PH-DUP-001_210331. Samples NYOW-03-PH004-B, NYOW-03-PH003-B, NYOW-03-PH002-B, and NYOW-03-PH011-B were clay. Samples NYOW-03-SL003-A, NYOW-03-SL001-A, and NYOW-03-SL010-A contained a lot of vegetation. Samples NYOW-03-SL010-A and PH-DUP-001_210331 contained rocks.

The following samples were not analyzed at minimum starting mass (i.e., 15 grams) for percent moisture analysis due to limited sample volume: NYOW-03-PH004-B (11.77 g), NYOW-03-PH003-B (11.64 g), NYOW-03-PH001-B (10.81 g), NYOW-03-PH002-B (11.12 g), NYOW-03-PH010-B (11.18 g), and NYOW-03-PH011-B (10.11 g).

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for SVOC with SIM analysis of soil samples due to sample dilution. Several metal analytes (antimony, arsenic, cobalt, selenium, thallium, mercury) had LOQs greater than PQLGs due to percent moisture adjustments. Several VOCs (carbon disulfide, cis-1,3-dichloropropene, 1,2-dibromo-3-chloropropane, bromomethane, and trans-1,3-dichloroproapne) Aroclors and SVOCs had LOQs greater than PQLGs due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of the rejected result. In addition,

analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 19 August 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM Rev 1: 280-146997-1 Revision 2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- SVOCs 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330A (soils)
- Picric Acid by SW-846 Method 8330B (aqueous)
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 2 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were initially received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.5ºC, 0.7ºC, 0.7°C, 1.2ºC, 1.3ºC, 2.5ºC and 3.3ºC.

One cooler was received late at a temperature of 0.7°C. For sample NYOW-03-WL010-A, only the VOC vials were initially received. Sample containers for EB-02_210402 were received on 5 April 2021 and logged in under SDG 280-147011-1.

One 1L glass amber was received broken for sample NYOW-03-WL010-A; however, sufficient sample volume remained to perform the analysis for SVOCs.

Sample NYOW-03-WL010-A contained headspace greater than 6mm; the associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

Sample NYOW-03-WL002-A was received with a pH > 2 and was analyzed outside of the 7-day holding time period for unpreserved samples. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | | X |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs and  SVOCs with SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification (ICV) results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP

certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

PCBs Method 8082A:

ICV 280-533282/10 exhibited a percent difference (%D) greater than 20% for one PCB-1016 peak at 22%. The associated sample results are qualified as “UJ”.

TOC by Method 9060A:

The ICV analyzed on 4/6/2021 at 11:34 exhibited a recovery greater than 110% at 115%. The associated positive detection is qualified as “J”.

Metals by Method 6010C:

Low level initial calibration verification (ICVL) 280-535905/12 exhibited a recovery greater than the upper control limit for selenium at 124%. The associated equipment blank sample result was non-detect; qualification is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, %Ds, and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

Continuing calibration verification (CCV) 280-532441/2 exhibited %Ds greater than the control limit for bromoform at -21.4% and bromomethane at -23.3%. The associated sample results were non-detect and are qualified as “UJ”.

SVOCs by Method 8270D:

Closing CCV 664086 was analyzed 20 minutes outside of the 12-hour tune window. The associated aqueous sample results for DNCB are qualified as “UJ”.

CCV 680-664086/3 exhibited %Ds greater than 20% for benzaldehyde (-23.7%) and caprolactam (-46.1%). The associated aqueous sample positive detections are qualified “J-“ and non-detect results are qualified as “UJ”.

TOC by Method 9060A:

The CCVs analyzed on 4/6/2021 at 13:53 and 17:39 exhibited recoveries greater than 110% at 111% and 135%, respectively. The associated sample result was previously qualified; no further action is necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, trip blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

VOCs by Method 8260C:

Method blank sample 280-532441/10 exhibited a positive detection for carbon disulfide at 0.7790 µg/L. The associated sample results were non-detect; qualification is not necessary.

SVOCs with SIM by Method 8270D:

Method blank sample 80-531849/1-A exhibited positive detections for 1-methylnaphthalene at 0.0185 µg/L and 2-methylnaphthalene at 0.0275 µg/L. The associated sample results were non-detect; qualification is not necessary.

Metals by Method 6010C:

Preparation blank sample 280-532238/1-A exhibited a positive detection greater than the detection limit but less than the LOQ for iron at 23.9 µg/L. The associated dissolved iron concentrations were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Preparation blank sample 280-535695/1-A exhibited a positive detection greater than the detection limit but less than the LOQ for sodium at 386 µg/L. The associated equipment blank sample result was non-detect; qualification is not required.

Equipment blank sample EB-02_210402 exhibited a positive detection below the LOQ for iron at 24 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Equipment blank sample EB-01_210402 exhibited positive detections below the LOQ for barium (2.4 µg/L) and iron (57 µg/L). The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Continuing calibration blanks (CCB) 280-535905/119 and 280-535905/128 exhibited positive detections less than the LOQ for beryllium at 0.243 µg/L and 0.328 µg/L, respectively. The associated equipment blank sample result is qualified as “U” at the LOD.

CCB 280-532597/38 exhibited a positive detection for potassium below the LOQ at 244 µg/L. The associated soil sample results were greater than the aqueous LOQ; qualification is not necessary on the basis of professional judgment.

Metals by Method 6020A:

Preparation blank sample 280-532234/1-A exhibited positive detections greater than the detection limit but less than the LOQ for cobalt, lead and thallium at 0.213 µg/L, 0.191 µg/L, and

0.165 µg/L, respectively. The associated equipment blank sample result for thallium was less than the LOQ and is qualified as "U" at the LOD. The results for cobalt and lead were non-detect; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-SL023-A exhibited a recovery less than the lower warning limit for base/neutral (B/N) extractable surrogate terphenyl-d14 at 45%. The associated B/N sample result (DNCB) was non-detect and is qualified as "UJ".

Sample NYOW-01-SL016-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 45%. The associated B/N sample result (DNCB) was non-detect and is qualified as "UJ".

Sample NYOW-01-PH016-B exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 48%. The associated B/N sample result (DNCB) was non-detect and is qualified as "UJ".

Sample NYOW-01-PH016-C exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 49%. The associated B/N sample result (DNCB) was non-detect and is qualified as "UJ".

Sample NYOW-01-PH023-C exhibited recoveries less than the lower warning limits for B/N extractable surrogates nitrobenzene-d5 and 2-fluorobiphenyl at 34% and 41%, respectively. The associated B/N sample result for DNCB was non-detect and is qualified as "UJ".

Sample NYOW-03-WL002-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 21%. The associated positive detections for B/N sample results are qualified as "J-" and non-detect results are qualified as "UJ".

Sample NYOW-03-WL007-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 45%. The associated B/N sample results were non-detect and are qualified as "UJ".

Sample NYOW-01-PH015-B exhibited recoveries less than the lower warning limits for 2,4,6-tribromophenol (37%), 2-fluorobiphenyl (38%), nitrobenzene-d5 (32%), and terphenyl-d14 (43%). The associated sample results were non-detect and are qualified as "UJ".

Picric Acid by Method 8330B:

Sample NYOW-03-WL007-A exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 62%. The associated sample results were non-detect and are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

LCS 280-532441/6 exhibited a recovery greater than the upper warning limit for 1,2-dichlorobenzene at 129%. The LCS/LCSD pair also exhibited a RPD greater than 20% at 24%. The associated sample results were non-detect; qualification is not required.

SVOCs by Method 8270D:

LCSD 680-663756/13-A exhibited an RPD greater than 20% for DNP at 28%. The associated sample results were non-detect; qualification is not necessary.

Picric Acid by Method 8330B:

LCSD 280-531805/3-A exhibited an RPD greater than 20% at 22%. The associated sample result was non-detect; qualification is not necessary.

Metals by Method 6010C:

LCS 280-532862/2-A exhibited a recovery equal to the upper control limit for barium at 113%. Qualification is not required.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-01-PH023-B exhibited a RPD greater than the control limit for DNCB at 22%. The associated sample result was non-detect; qualification is not required.

Metals by Method 6010C:

MS/SD sample NYOW-01-PH023-B exhibited recoveries less than the lower warning limits and/or RPDs greater than the control limit for multiple analytes as shown below. The associated positive detections and are qualified as “J-“ or “J” and non-detects are qualified as “UJ”.

| Analyte | MS Recovery | SD Recovery | RPD | Qualifier |
|---|---|---|---|---|
| Beryllium | -- | -- | 28 | J |

| Analyte | MS Recovery | SD Recovery | RPD | Qualifier |
|---|---|---|---|---|
| Calcium | -- | -- | 21 | J |
| Chromium | 81 | -- | 26 | J- |
| Cobalt | 74 | 83 | 25 | J- |
| Copper | 65 | 77 | 21 | J- |
| Lead | 73 | -- | 26 | J- |
| Magnesium | 35 | 58 | -- | J- |
| Nickel | 71 | 82 | 26 | J- |
| Potassium | -- | -- | 21 | J |
| Silver | -- | -- | 26 | UJ |
| Sodium | 76 | -- | 29 | J- |
| Vanadium | -- | -- | 25 | J |
| Zinc | 68 | -- | 24 | J- |

MS/SD sample NYOW-01-PH023-B exhibited recoveries outside of control limits for aluminum (421%, 412%), calcium (-156%, -3%), iron (-28%, -13%), and manganese (9%, 8%). The sample concentrations were greater than 4X the spiked amount; qualification is not required.

TOC by Method 9060A:

MS/SD sample NYOW-01-PH023-B exhibited recoveries less than 10% at -66% and 20%. The MS/SD RPD was also greater than 20% at 61%. The associated positive detection is qualified as "J".

MS sample NYOW-01-SL023-A did not recover (i.e., 0%). The MS/SD RPD was also reported as greater than 20% by the laboratory. The associated positive detection is qualified as "J-".

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## POST-DIGESTION SPIKE

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-01-PH023-B. Aluminum recovered above the upper control limit at 421%. Calcium (-156%), iron (-28%), and manganese (9%) recovered below the lower control imit. The aluminum, calcium, iron, and manganese

concentrations were greater than 4X the spiked amount in the MS; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures.

The PDS for NYOW-01-PH023-B exhibited recoveries less than the lower control limit for chromium (81%), cobalt (74%), copper (65%), lead (76%), magnesium (35%), nickel (71%), sodium (76%) and zinc (68%). The associated sample results were previously qualified; no further action is necessary.

**ICP SERIAL DILUTION**

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-01-PH023-B. The %Ds were greater than the control limit for calcium (14%) and iron (13%). The associated sample results are qualified as "J".

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

The Interference Check Solution A (ICSA) associated with batches 280-532597 and 280-532171 had barium present above the LOD at 12.5 µg/L and 12 µg/L, respectively. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA results minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532447 had cobalt present above the LOD at 0 0.439 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batch 280-532747 had barium present above the LOD at 13.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

There was insufficient sample volume to perform a MS/SD associated with aqueous VOC sample batch 280-532441. An LCS and LCSD were performed.

Sample NYOW-03-WL010-A clogged the syringe for the screening analysis of VOCs by GC/FID used to determine the workable dilution for final analysis by method 8260C. The sample was decanted to remove sediment before screening. The primary sample was analyzed at a 1X dilution and is not affected by selected dilution or screening anomaly.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC batch 680-663561. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC reanalysis batch 680-665102. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC SIM sample batch 280-531849. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous PCB sample batch 280-531871. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous picric acid sample batches 280-531661 and 280-531805. An LCS and LCSD were performed.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210402 collected from NYOW-01-PH023-C). The RPD must be less than 50% when at least one result is greater than the LOQ. Calcium (83%), cobalt (65%), magnesium (61%), nickel (59%), and TOC did not meet the precision criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-01-SL023-A, NYOW-01-PH023-B, NYOW-01-PH023-C, PH-DUP-001_210402, NYOW-01-SL015-A, NYOW-01-PH015-B, NYOW-01-PH015-C, NYOW-01-SL016-A, NYOW-01-PH016-B, and NYOW-01-PH016-C. The material was removed and not extracted.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences prior to PCB analysis: NYOW-03-WL010-A, NYOW-03-WL007-A, and EB-02_210402.

A portion of sample NYOW-03-WL010-A was used for analysis, rather than testing the entire sample amount in the original container, due to significant sediment layer in the bottles. As such, the required solvent rinse of the original container could not be performed.

LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for SVOC analysis of aqueous sample NYOW-03-WL010-A and for multiple analytes associated with all aqueous SVOC analyses. Two aqueous samples had slightly elevated LOQs relative to the PQLGs. Mercury, DNP, and DNCB, and several 6020A metals had LOQs for soil greater than PQLGs due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 4 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 2: 280-147031-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D (BNASIMD)
- Picric Acid by SW-846 Method 8330A (soils)
- Picric Acid by SW-846 Method 8330B (equipment blank)
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) for samples collected on 5 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | BNASIMD | D2216 | SW6010C | SW6020A | SW7470A | SW7471B | SW8082A | SW8260C | SW8270D | SW8330A | SW8330B | SW9060A |

Notes: SL-DUP-001_210405 collected from NYOW-03-SL013-A

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.5°C, 1.8°C, 2.2°C, 3.7°C, and 4.2°C.

One of two 8-ounce soil jars appeared to contain cooler water for sample NYOW-03-PH008-B[MSD]. The container was marked "Do Not Use". Sufficient volume remained to perform the matrix spike duplicate.

One of two 8-ounce soil jars did not have a collection time on the label: NYOW-03-PH009-B. The sample was logged in accordance with the COC.

No labels were present on the vials for sample TB-01_210405. The sample was logged in accordance with the COC.

The following samples for method 8270D were received at the Savannah laboratory outside the required temperature criteria: NYOW-03-SL008-A, NYOW-03-PH008-B, NYOW-03-SL009-A, NYOW-03-PH009-B, NYOW-03-SL013-A, SL-DUP-001_210405, NYOW-03-PH013-B, NYOW-03-SL014-A, NYOW-03-PH014-B, NYOW-03-SL015-A, NYOW-03-PH015-B, and EB-01_210405. The cooler was shipped out priority overnight from Denver to Savannah; however, due to a FedEx transit delay, the cooler arrived on 4/12 at a temperature of 17.6°C. Bluestone was contacted and the laboratory was instructed to cancel sample analysis; however, the laboratory inadvertently performed the analysis. The results are qualified as "X" and recommended for rejection. The affected sample locations will be resampled and are not included in the completeness calculation. No further validation of the rejected data was conducted.

Surrogates 2-Fluorobiphenyl and Nitrobenzene-d5 recovered below the lower warning limit for sample NYOW-03-PH009-B for ***SVOC SIM*** analysis. Evidence of matrix interferences was not obvious. The sample was re-extracted/reanalyzed, and surrogates were in control. Both sets of results were reported; however, the re-extraction was performed 2 days outside of the 14-day extraction holding time. Therefore, the initial results are recommended for data interpretation.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs and  SVOCs with SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

PCBs by Method 8082A:

Initial calibration sample 280-533282/10 exhibited a %D greater than the control limit for PCB-1016 Peak 5 at 22%. Two passing calibration verifications were performed prior to the analysis of the equipment blank sample; qualification is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

Continuing calibration verification (CCV) 280-531986/2 exhibited a %D greater than the control limit for acetone at 21.5%. The associated sample results were non-detect and are qualified as “UJ”.

PCBs by Method 8082A:

CCV 280-533293/38 exhibited %Ds greater than the control limit with positive biases for PCB-1016 peaks ranging from 24.1% to 30.4%. The associated soil sample results for SL-DUP-001_210405 are qualified as “UJ”.

Opening CCV 280-533290/3 exhibited a %D greater than the control limit with negative bias for a PCB-1016 peak at 42.9%. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

CCV 280-533290/19 exhibited a %D greater than the control limit with negative bias for a PCB-1016 peak at 37.6%. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

CCV 280-533290/32 exhibited %Ds greater than the control limit with negative biases for PCB-1016 peaks ranging from 20.5% to 21.5%. The associated soil sample results are qualified as "UJ".

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, trip blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

VOCs by Method 8260C:

Method blank sample MB 280-531982/3-A exhibited a positive detection methylene chloride (4.48 µg/kg). The associated sample results were non-detect; qualification is not required.

SVOCs by Method 8270D with SIM:

Method blank sample MB 280-531849/1-A exhibited positive detections for 1-methylnaphthalene (0.0185 µg/L) and 2-methylnaphthalene (0.0275 µg/L). The associated equipment blank sample results were non-detect; qualification is not required.

Method blank sample MB 280-531832/1-A exhibited positive detections below the LOQ for acenaphthene (0.428 µg/kg) and acenaphthylene (1.9 µg/kg). The associated soil sample results less than the LOD or LOQ are qualified as "U" at the LOD or LOQ.

Metals by Method 6010C:

Preparation blank sample 280-532642/1-A exhibited positive detections greater than the detection limit but less than the LOQ for aluminum (1.85 mg/kg), cobalt (0.07 mg/kg), nickel (0.2 mg/kg), and zinc (1.05 mg/kg). The associated positive detections for were greater than the LOQ; qualification is not necessary.

Equipment blank sample EB-01_210405 exhibited positive detections below the LOQ for aluminum (26 µg/L) and beryllium (0.55 µg/L). The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Continuing calibration blank (CCB) 280-532973/48 exhibited a positive detection below the LOQ for cobalt at 1.28 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary.

CCB 280-532444/96 exhibited positive detections for beryllium and manganese at 0.376 µg/L and 5.23 µg/L, respectively. The associated equipment blank sample result for beryllium is qualified as "U" at the LOQ. The manganese result was non-detect; qualification is not necessary.

Metals by Method 6020A:

Initial calibration blank (ICB) 280-532776/15 exhibited a positive detection for antimony. The ICB did not bracket the analysis of investigative samples; qualification is not necessary.

ICB 280-533080/15 exhibited a positive detection for antimony. The ICB did not bracket the analysis of investigative samples; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

Samples EB-01_210405 and TB-01_210405 exhibited recoveries greater than the upper warning limit for toluene-d8 at 113% and 113%, respectively. The associated sample results were non-detect; qualification is not required.

SVOCs by Method 8270D with SIM:

Sample NYOW-03-PH009-B exhibited recoveries less than the lower warning limits for 2-fluorobiphenyl and nitrobenzene-d5 at 38% and 41%, respectively. The associated sample results were non-detect and are qualified as "UJ".

Sample NYOW-03-SL008-A exhibited a recovery greater than the upper control limit for fluoranthene-d10 at 113% for the 1X dilution analysis. The associated positive detections are qualified as "J+". Results reported from the reanalysis performed at 40X were not qualified on the basis of surrogate recoveries.

Sample NYOW-03-SL015-A was analyzed at 10X and 100X dilutions. The sample results were not qualified on the basis of surrogate recoveries.

Sample EB-01_210405 exhibited recoveries less than the lower warning limits for 2-fluorobiphenyl and nitrobenzene-d5 at 50% and 46%, respectively. The associated sample results were non-detect and are qualified as "UJ".

PCBs by Method 8082A:

Sample NYOW-03-SL008-A exhibited a recovery greater than the upper control limit for decachlorobiphenyl at 213%. The associated positive detection for PCB-1260 is qualified as "J+".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D with SIM:

Aqueous LCS/LCSD 280-531849/2-A/3-A exhibited relative percent differences greater than the control limit for benzo(g,h,i)perylene (20%), dibenz(a,h)anthracene (25%), and indeno(1,2,3-cd)pyrene (22%). The associated equipment blank sample results were non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

MSD sample NYOW-03-PH008-B exhibited a recovery greater than the control limit for methyl tert-butyl ether at 126%. The associated sample result was non-detect; qualification is not required.

SVOCs by Method 8270D with SIM:

MS/SD sample NYOW-03-SL009-A exhibited recoveries less than the lower warning limits and control limit as shown in the table below. In addition, the MS/SD RPD for phenanthrene was greater than the control limit at 42%. The associated sample results were positive detections and are qualified as "J-".

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Acenaphthylene | 19 | 4 | -- | J- |
| Anthracene | 49 | -- | -- | J- |
| Benzo(a)anthracene | -15 | 2 | -- | J- |
| Benzo(a)pyrene | -13 | -15 | -- | J- |
| Benzo(b)fluoranthene | -76 | -90 | -- | J- |
| Benzo(g,h,i)perylene | 13 | -7 | -- | J- |

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Benzo(k)fluoranthene | 10 | 6 | -- | J- |
| Chrysene | -38 | -32 | -- | J- |
| Fluoranthene | -141 | -74 | -- | J- |
| Fluorene | -- | 46 | -- | J- |
| Indeno(1,2,3-c,d)pyrene | 5 | -6 | -- | J- |
| Phenanthrene | -122 | -63 | 42 | J- |
| Pyrene | -83 | -52 | -- | J- |

Picric Acid by Method 8330A:

MS/SD sample NYOW-03-PH008-B exhibited recoveries less than the lower control limit at 17% and 18%, respectively. The associated sample result is qualified as “UJ”.

MS/SD sample NYOW-03-SL009-A exhibited recoveries less than the lower control limit at 30% and 28%, respectively. The associated sample result is qualified as “UJ”.

Metals by Method 6010C:

MS/SD sample NYOW-03-PH008-B exhibited recoveries outside of control limits for aluminum. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-03-PH008-B exhibited recoveries and RPDs outside of warning limits for the analytes shown below. The associated sample results were qualified as “UJ” or “J-“.

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Barium | 68 | 70 | -- | J- |
| Beryllium | 68 | 69 | -- | J- |
| Calcium | -- | 2.5 | 56 | J- |
| Chromium | 69 | 70 | -- | J- |
| Cobalt | 67 | 69 | -- | J- |
| Copper | 69 | 70 | -- | J- |
| Magnesium | 65 | 47 | -- | J- |
| Manganese | 63 | 76 | -- | J- |
| Nickel | 66 | 68 | -- | J- |
| Potassium | -- | 79 | -- | J- |
| Silver | 70 | 71 | -- | UJ |
| Sodium | 67 | 68 | -- | J- |
| Vanadium | 70 | 71 | -- | J- |

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Zinc | 65 | 58 | -- | J- |
| Lead | 63 | 65 | -- | J- |

MS/SD sample NYOW-03-SL009-A exhibited recoveries and a RPD outside of control limits for aluminum and recoveries outside of control limits for iron. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-03-SL009-A exhibited recoveries and RPDs outside of warning limits for the analytes shown below. The associated sample results were qualified as "UJ", "J", "J-", or "J+".

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Barium | -- | 76 | 39 | J- |
| Beryllium | -- | 74 | 40 | J- |
| Calcium | 130 | -- | 40 | J+ |
| Chromium | -- | 76 | 38 | J- |
| Cobalt | -- | 75 | 39 | J- |
| Copper | -- | 78 | 38 | J- |
| Magnesium | -- | -- | 35 | J |
| Manganese | 123 | -- | 22 | J+ |
| Nickel | -- | 75 | 37 | J- |
| Potassium | -- | -- | 38 | J |
| Silver | -- | 78 | -- | UJ |
| Sodium | -- | 74 | 41 | J- |
| Vanadium | -- | 77 | 35 | J- |
| Zinc | -- | -- | 30 | J |
| Lead | -- | 73 | 37 | J- |

Metals by Method 6020A:

MS/SD sample NYOW-03-SL009-A exhibited a RPD outside of control limits for antimony at 31%. The associated sample result is qualified as "J".

## DUAL COLUMN IMPRECISION

PCBs by Method 8082A:

Sample NYOW-03-SL008-A exhibited dual column imprecision greater than the control limit (i.e., 40%) for PCB-1260 at 68%. The associated sample result was previously qualified; no further action is necessary.

Sample NYOW-03-SL013-A exhibited dual column imprecision greater than the control limit for PCB-1260 at 52%. The associated sample result is qualified as "J".

Sample NYOW-03-SL015-A exhibited dual column imprecision greater than the control limit for PCB-1260 at 104%. The associated sample result is qualified as “J”.

Sample NYOW-03-SL014-A exhibited dual column imprecision greater than the control limit for PCB-1260 at 52%; the non-detect result from the primary column was reported. The secondary column result was below the LOD. On the basis of professional judgment, qualification is not necessary.

**POST-DIGESTION SPIKE**

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-03-PH008-B. Aluminum (-128%), iron (-214%), and manganese (-16%) recovered below the lower control limit. The aluminum concentration was greater than 4X the spiked amount in the MS. Iron recovered within control in the MS/SD sample; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures. The result for manganese was previously qualified; no further action is necessary.

Metals by Method 6020A:

A PDS was performed for MS/SD sample NYOW-03-PH008-B and all recoveries were acceptable.

**ICP SERIAL DILUTION**

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-03-PH008-B. The %Ds were greater than the control limit for aluminum (17%), calcium (23%), iron (20%), and magnesium (21%). The associated sample results are qualified as “J”.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

The Interference Check Solution A (ICSA) associated with batch 280-532980 had cobalt present above the LOD at 0.428 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batch 280-532973 had barium present above the LOD at 13.3 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532316 had barium present above the LOD at 12.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532808 had cobalt present above the LOD at 0.475 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The initial and closing ICSA associated with batch 280-533080 had cobalt present above the LOD at 0.472 µg/L and 0.455 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

There was insufficient sample volume to perform a MS/SD associated with aqueous VOC batch 280-532592. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with PCB batch 280-531867. An LCS and LCSD were performed.

One field duplicate and parent sample pair was collected and analyzed for all parameters (SL-DUP-001_210405 and NYOW-03-SL013-A). The RPD must be less than 50% when at least one result is greater than the LOQ. The following RPDs did not meet the precision criteria: acenaphthylene (69%), anthracene (73%), benzo(a)anthracene (63%), benzo(a)pyrene (61%), benzo(b)fluoranthene (59%), benzo(g,h,i)perylene (65%), benzo(k)fluoranthene (54%), chrysene (70%), fluoranthene (59%), and phenanthrene (200%). The TOC RPD (67%) also did not meet the precision criteria.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences prior to PCB analysis: NYOW-03-SL008-A, NYOW-03-PH008-B, SL-DUP-001_210405, NYOW-03-SL009-A, NYOW-03-PH009-B, NYOW-03-SL013-A, NYOW-03-PH013-B, NYOW-03-SL014-A, NYOW-03-PH014-B, NYOW-03-SL015-A, and NYOW-03-PH015-B.

Samples NYOW-03-SL008-A (40X), SL-DUP-001_210405 (10X), NYOW-03-SL014-A (10X), NYOW-03-SL015-A (10X), and NYOW-03-SL015-A (100X) required dilution prior to analysis. The reporting limits have been adjusted accordingly. Samples SL-DUP-001_210405, NYOW-03-SL014-A, and NYOW-03-SL015-A produced a dark viscous extract.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for SVOCs with SIM due to sample dilution. Metal analytes, PCBs, and three VOCs (carbon disulfide, cis-1,3-dichloropropene, and trans-1,3-dichloropropene) had LOQs greater than the PQLG due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. As noted in the section on Sample Receipt and Holding Times, all data for SVOC 8270D analysis of samples NYOW-03-SL008-A, NYOW-03-PH008-B, NYOW-03-SL009-A, NYOW-03-PH009-B, NYOW-03-SL013-A, SL-DUP-001_210405, NYOW-03-PH013-B, NYOW-03-SL014-A, NYOW-03-PH014-B, NYOW-03-SL015-A, NYOW-03-PH015-B, and EB-01_210405 are rejected based on shipping delays that resulted in temperature exceedances. Re-sampling will be conducted to replace these data; therefore, completeness is calculated for this SDG based only on the remaining data.

Analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Signed:

Emily Strake, CEP

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 1: 280-147085

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soil) and 8330B (aqueous samples)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Methods 7471B (soil) and 7470A (aqueous samples)
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 6 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided.

Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 1.2°C, 1.9°C, 2.8°C, and 3.3°C.

The following samples were submitted for analysis and subsequently canceled due to uncertainty in the property line location: NYOW-01-SL002-A, NYOW-01-PH002-B, NYOW-01-PH002-C, and PH-DUP-001_210406.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

<u>SVOCs by Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP

certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Preparation blank sample 280-532642/1-A exhibited positive detections greater than the detection limit but less than the LOQ for aluminum (1.85 mg/kg), cobalt (0.07 mg/kg), nickel (0.2 mg/kg), and zinc (1.05 mg/kg). The associated positive detections for aluminum, cobalt, and zinc were greater than the LOQ; qualification is not necessary. The field duplicate sample SL-DUP-001_210406 result for nickel was less than the LOQ and is qualified as “U” at the LOQ.

Equipment blank sample EB-01_210406 exhibited positive detections below the LOQ for barium (1.3 µg/L) and manganese (4.0 µg/L). The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Metals by Method 6020A:

Initial calibration blanks (ICBs) 280-533158/15, 280-532808/15, and 280-533080/15 exhibited positive detections for antimony. The ICBs did not bracket the analysis of investigative samples; qualification is not necessary.

Continuing calibration blanks (CCBs) 280-533080/92, 280-533080/114, and 280-533080/127 exhibited positive detections for lead. The CCBs did not bracket the analysis of investigative samples; qualification is not necessary.

Preparation blank sample 280-532640/1-A exhibited a positive detection less than the LOQ for thallium at 0.0062 mg/kg. The associated soil sample results less than the LOQ are qualified as “U” at the LOQ.

CCB 280-532980/202 exhibited a positive detection below the LOQ for thallium at 0.096 µg/L. The associated sample results were previously qualified; no further action is necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-PH020-B exhibited a recovery less than the lower warning limit for base/neutral (BN) extractable surrogate, terphenyl-d14 at 53%. The associated BN sample result for DNCB was non-detect and is qualified as "UJ".

Picric Acid by Method 8330B:

Sample EB-01_210406 exhibited a surrogate recovery less than the lower warning limit for 1,2-dinitrobenzene at 47%. The associated non-detect sample result is qualified as "UJ".

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-664738/17-A/20-A exhibited a RPD greater than the control limit for DNP at 30%. The associated equipment blank sample result was non-detect; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-01-PH019-B exhibited an RPD greater than the control limit for DNP at 86%. The associated sample result was non-detect; qualification is not necessary.

Picric Acid by Method 8330A:

MS/SD sample NYOW-01-PH019-B exhibited recoveries less than the lower control limit at 37% and 41%, respectively. The associated sample result is qualified as "UJ".

Metals by Methods 6010C and 6020A:

MS/SD sample NYOW-01-PH019-B exhibited recoveries outside of control limits for aluminum and iron. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-01-PH019-B exhibited recoveries and RPDs outside of warning limits for the analytes shown below. The associated sample results are qualified as "UJ" or "J-", or "J" as shown below.

| Analyte | MS % Recovery | SD % Recovery | MS/SD RPD | Qualifier |
|---|---|---|---|---|
| Calcium | -55 | -51 | -- | J- |
| Cobalt | 83 | 75 | -- | J- |
| Lead | 79 | 78 | -- | J- |
| Magnesium | 57 | 65 | -- | J- |
| Manganese | 80 | 46 | -- | J- |
| Zinc | 80 | -- | -- | J- |
| Barium | -- | 77 | -- | J- |
| Beryllium | -- | 72 | -- | J- |
| Chromium | -- | 77 | -- | J- |
| Nickel | -- | 77 | -- | J- |
| Silver | -- | 75 | -- | UJ |
| Sodium | -- | 69 | -- | J- |
| Vanadium | -- | 76 | -- | J- |
| Antimony | -- | -- | 24 | UJ |
| Iron | -- | -- | 39 | J |
| Cadmium | -- | -- | 21 | J |

TOC by Method 9060A:

MS/SD sample NYOW-01-PH019-B exhibited recoveries less than the lower warning limits at 35% and 19%, respectively. The associated sample result is qualified as "J-".

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## POST-DIGESTION SPIKE

Metals by Method 6010C:

A post-digestion spike (PDS) was not performed by the laboratory for sample NYOW-01-PH019-B because a PDS was performed on a different MS/SD sample in the same batch.

Metals by Method 6020A:

A PDS was performed for MS/SD sample NYOW-01-PH019-B and all recoveries were acceptable.

Metals by Method 7471B:

A PDS was performed for MS/SD sample NYOW-01-PH019-B and mercury recovered above the upper control limit at 125%. The MS/SD recoveries were acceptable, and the sample result was non-detect; qualification is not necessary.

**ICP SERIAL DILUTION**

Metals by Method 6010C:

An ICP serial dilution was not performed by the laboratory for sample NYOW-01-PH019-B because a serial dilution was performed on a different MS/SD sample in the same batch.

Metals by Method 6020A:

An ICP serial dilution was performed for sample NYOW-01-PH019-B and all %Ds were acceptable.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

The Interference Check Solution A (ICSA) associated with batch 280-532980 had cobalt present above the LOD at 0.428 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batch 280-532973 had barium present above the LOD at 13.3 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-533071 had barium present above the LOD at 14.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is equal to the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532808 had cobalt present above the LOD at 0.475 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The initial and closing ICSA associated with batch 280-533080 had cobalt present above the LOD at 0.472 µg/L and 0.455 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

In preparation batch 280-532022, the following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, and small concrete fragments that would not pass through the sieve: NYOW-01-SL019-A, SL-DUP-001_210406, NYOW-01-PH019-B, NYOW-01-PH019-C, PH-DUP-002_210406, NYOW-01-SL020-A, NYOW-01-PH020-B, and NYOW-01-PH020-C. This material was removed and not extracted.

There was insufficient sample volume to perform a MS/SD associated with aqueous metals batches 280-532781, 280-532770, and 280-532450. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous SVOC batch 680-664004. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with aqueous 8330B batch 280-532158. An LCS and LCSD were performed.

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (SL-DUP-001_210406 and NYOW-01-SL019-A, and PH-DUP-002_210406 and NYOW-01-PH019-C). The RPD must be less than 50% when at least one result is greater than the LOQ. The following analytes did not meet the precision criteria:

- SL-DUP-001_210406 and NYOW-01-SL019-A: aluminum (84%), barium (64%), chromium (77%), cobalt (59%), copper (69%), lead (57%), nickel (82%), potassium (57%), vanadium (62%), and TOC (139%).
- PH-DUP-002_210406 and NYOW-01-PH019-C: copper (58%), zinc (57%), and TOC (152%).

LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for mercury, antimony, arsenic, selenium, thallium, DNCB and DNP due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM Revision 1: 280-147159-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- SVOCs 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330A (soils)
- Picric Acid by SW-846 Method 8330B (aqueous)
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 7 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were initially received in good condition, properly preserved on ice. Ten coolers were received by the laboratory at temperatures of 0.6ºC, 0.7ºC, 0.8ºC, 1.2ºC, 1.3ºC, 1.6ºC, 2.3ºC, 2.4ºC, 2.9ºC and 3.7ºC.

The following samples for SVOCs were received at the Savannah laboratory outside of the required temperature criteria: NYOW-01-SL021-A, NYOW-01-PH021-B, NYOW-01-PH021-C,

NYOW-01-SL022-A, NYOW-01-PH022-B, NYOW-01-PH022-C, NYOW-01-SL024-A, NYOW-01-PH024-B, NYOW-01-PH024-C, EB-01_210407, NYOW-03-WL009-A, NYOW-03-WL013-A, WL-DUP-001_210407, NYOW-03-WL014-A, NYOW-03-WL015-A, and EB-02_210407. The coolers were shipped out priority overnight on 4/9 from Denver to Savannah; however, due to a FedEx transit delay, the coolers arrived on 4/12 at temperatures of 8.7°C, 10.9°C, and 10.5°C. Bluestone was contacted and the laboratory was instructed to proceed with the analysis. The associated sample results are qualified as "J-" for detects and "UJ" for non-detects.

Sample NYOW-03-WL013-A was collected in a properly preserved vial for VOCs; however, the pH of 7 was outside the required criteria of pH<2 when verified by the laboratory. The sample was analyzed outside the 7-day holding time specified for unpreserved samples (11 days). The associated sample results were non-detect and are qualified as "UJ".

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | | X |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs and  SVOCs with SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP

certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

Metals by Method 6010C:

Low level initial calibration verification (ICVL) 280-533866/12 exhibited a recovery greater than the upper control limit for zinc. The ICVL did not bracket the analysis of investigative samples; qualification is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

Continuing calibration verification (CCV) 280-532934/2 exhibited %Ds greater than the control limit for bromoform at 20.5% and 1,2-dibromo-3-chloropropane at 23.6%. The associated sample results were non-detect and are qualified as “UJ”.

Closing CCV 280-532934/37 exhibited a %D greater than the control limit with a negative bias for dichlorodifluoromethane at 53.2%. The associated sample results were non-detect and are qualified as “UJ”.

PCBs by Method 8082A:

CCV 280-533927/18 exhibited a %D greater than the control limit with negative bias for a PCB-1260 peak at 20.8% on the primary chromatography column. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

CCV 280-533927/27 exhibited %Ds greater than the control limit with negative biases for PCB-1016 peaks ranging from 20.8% to 45.5% on the primary column. The CCV also exhibited %Ds greater than the control limit with negative biases for two PCB-1260 peaks at 20.4% and 20.8%. The associated sample results were non-detect and are qualified as “UJ”.

CCV 280-533927/36 exhibited %Ds greater than the control limit with negative biases for PCB-1016 peaks ranging from 20.8% to 23.2% on the primary column. The CCV also exhibited a %D greater than the control limit with a negative bias for one PCB-1260 peak at 20.3%. The associated sample results were non-detect and are qualified as “UJ”.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, trip blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Preparation blank sample 280-532238/1-A exhibited a positive detection greater than the detection limit but less than the LOQ for iron at 23.9 µg/L. The associated positive detections less than the LOQ are qualified as "U" at the LOD or the LOQ. For results greater than the LOQ, qualification is not necessary on the basis of professional judgment.

Equipment blank sample EB-02_210407 exhibited a positive detection below the LOQ for calcium at 92 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Equipment blank sample EB-01_210407 exhibited positive detections below the LOQ for barium (1.6 µg/L) and manganese (2.5 µg/L). The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Metals by Method 6020A:

Initial calibration blank (ICB) 280-532776/15 exhibited a positive detection for antimony. Antimony was not reported from the analytical batch; qualification is not necessary.

ICB 280-532808/15 exhibited a positive detection for antimony. The associated sample results were non-detect; qualification is not necessary.

Continuing calibration blanks (CCBs) 280-532808/65, 280-532808/68, 280-532808/81, and 280-532808/92 exhibited positive detections for thallium, antimony, and/or lead. The CCBs did not bracket the analysis of investigative samples; qualification is not necessary.

CCB 280-532776/103 exhibited a positive detection below the LOQ for thallium at 0.096 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

CCB 280-532776/112 exhibited positive detections below the LOQ for lead and thallium at 0.029 µg/L and 0.142 µg/L, respectively. The associated equipment blank sample results were non-detect; qualification is not necessary.

Mercury by Method 7470A:

ICB 280-533658/10-A exhibited a positive detection for mercury at 0.0283 µg/L. The associated sample result below the LOQ is qualified as "U". The results greater than the LOQ are not qualified on the basis of professional judgment.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

Sample EB-02_210407 exhibited a recovery greater than the upper warning limit for 1,2-dichloroethane-d4 at 138%. The associated sample results were non-detect; qualification is not required.

SVOCs by Method 8270D:

Sample NYOW-01-SL022-A exhibited recoveries less than the lower warning limits for base/neutral (B/N) extractable surrogates nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 at 31%, 38%, and 39%, respectively. The associated B/N sample result (DNCB) was non-detect and is qualified as “UJ”.

Sample NYOW-01-PH022-C exhibited recoveries less than the lower warning limits for B/N extractable surrogates nitrobenzene-d5 and 2-fluorobiphenyl at 36% and 41%, respectively. The associated B/N sample result (DNCB) was non-detect and is qualified as “UJ”.

Sample NYOW-01-PH024-C exhibited recoveries less than the lower warning limits for B/N extractable surrogates nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 at 34%, 40%, and 51%, respectively. The associated B/N sample result (DNCB) was non-detect and is qualified as “UJ”.

Sample NYOW-03-WL013-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 39%. The associated B/N sample results were non-detect and are qualified as “UJ”.

Sample NYOW-03-WL014-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 42%. The associated B/N sample results were non-detect and are qualified as “UJ”.

Sample NYOW-03-WL015 exhibited recoveries less than the lower warning limit for 2,4,6-tribromophenol and terphenyl-d14 at 23% and 32%, respectively. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Picric Acid by Method 8330B:

Samples EB-01_210407, NYOW-03-WL009-A, WL-DUP-001_210407, NYOW-03-WL015-A, and EB-02_210407 exhibited recoveries less than the lower warning limit for 1,2-dinitrobenzene at 81%, 78%, 77%, 30%, and 72%, respectively. The associated sample results were non-detect and are qualified as “UJ”.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

LCSD 280-532934/4/5 exhibited RPDs greater than the control limits for 1,1,2,2-tetrachloroethane (23%), 1,1,2-trichloroethane (21%), 2-butanone (21%), bromoform (21%), and 1,2-dibromo-3-chloropropane (24%). The associated sample results were non-detect; qualification is not required.

Metals by Method 6010C:

LCS 280-532862/2-A exhibited a recovery equal to the upper control limit for barium at 113%. Qualification is not required.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-03-WL009-A exhibited recoveries less than the lower warning limit for n-Nitrosodiphenylamine at 27% and 24%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

MS/SD sample NYOW-01-SL021-A exhibited a RPD greater than the control limit for DNP at 22%. The associated sample result was non-detect; qualification is not required.

Picric Acid by Method 8330B:

SD sample NYOW-03-WL009-A exhibited a recovery less than the lower control limit at 50%. In addition, the MS/SD RPD was greater than the control limit at 73%. The associated sample result is qualified as “UJ”.

Metals by Method 6010C:

SD sample NYOW-03-WL009-A exhibited a recovery less than the lower warning limit for calcium at 80%. The associated sample result is qualified as “J-“.

MS/SD sample NYOW-01-SL021-A exhibited recoveries outside of warning limits for aluminum, iron, and manganese. The spiked amount was less than 4X the sample concentrations; qualification is not necessary.

MS sample NYOW-01-SL021-A exhibited a recovery less than the lower warning limit for zinc at 36%. In addition, the SD exhibited recoveries greater than the upper control limit for zinc and calcium at 127% and 392%, respectively. The MS/SD RPDs for calcium, manganese, and zinc were greater than the control limit at 59%, 23%, and 71%, respectively. The associated sample results for zinc and manganese are qualified as "J". The associated sample result for calcium is qualified as "J+".

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**POST-DIGESTION SPIKE**

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-01-SL021-A. Aluminum, calcium, iron, and manganese recovered below the lower control limit. The aluminum, iron, and manganese concentrations were greater than 4X the spiked amount in the MS; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures. The result for calcium was previously qualified as "J+" and the final qualifier is "J".

A PDS was not performed for sample NYOW-03-WL009-A.

**ICP SERIAL DILUTION**

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-01-SL021-A. The %Ds were greater than the control limit for magnesium (15%) and manganese (25%). The associated sample results are qualified as "J".

An ICP serial dilution was not performed for sample NYOW-03-WL009-A.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

Metals by Method 6010C:

The Interference Check Solution A (ICSA) associated with batch 280-533314 had barium present above the LOD at 14.2 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-533071 had barium present above the LOD at 14.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is equal to the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532747 had barium present above the LOD at 13.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

Metals by Method 6020A:

The initial and closing ICSA associated with batch 280-532808 had cobalt present above the LOD at 0.455 µg/L and 0.475 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The initial and closing ICSA associated with batch 280-532776 had cobalt present above the LOD at 0.455 µg/L and 0.475 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

There was insufficient sample volume to perform a MS/SD associated with aqueous picric acid batch 280-532158. An LCS and LCSD were performed.

There was insufficient sample volume to perform a MS/SD associated with picric acid batch 280-532827. An LCS and LCSD were performed.

One field duplicate and parent sample pair was collected and analyzed for all parameters (WL-DUP-001_210407 collected from NYOW-03-WL013-A). The RPD must be less than 30% when one or more sample result is greater than the LOQ. The following analytes did not meet the precision criteria:

- WL-DUP-001_210407 and NYOW-03-WL013-A: dissolved iron (200%) and dissolved manganese (46%)

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, and small concrete fragments that would not pass through the sieve: NYOW-01-SL021-A, NYOW-01-PH021-B, NYOW-01-PH021-C, NYOW-01-SL022-A, NYOW-01-PH022-B, NYOW-01-PH022-C, NYOW-01-SL024-A, NYOW-01-PH024-B, and NYOW-01-PH024-C. The material was removed and not extracted.

The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences prior to PCB analysis: NYOW-03-WL009-A, NYOW-03-WL009-A, NYOW-03-

WL013-A, WL-DUP-001_210407, NYOW-03-WL014-A, NYOW-03-WL015-A, and EB-02_210407.

LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for metal analytes, including mercury, DNP, and DNCB due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM Revision 1: 280-147251-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (aqueous)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 8 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | D2216 | SW6010C | SW6010C - Dissolved | SW6020A | SW6020A - Dissolved | SW7470A | SW7470A - Dissolved | SW7471B | SW8270D | SW8330A | SW8330B |

Notes: SL-DUP-001_210408 collected from NYOW-01-SL005-A, PH-DUP-001_210408 collected from NYOW-01-PH005-B, PH-DUP-002_210408 collected from NYOW-01-PH005-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.1°C, 1.9°C, and 2.5°C.

Sample PH-DUP-002_210408 contained free liquid in the sample container for Method 8330A. There was no indication that the sample container was compromised or infiltrated by melted ice water and the boring location was documented to contain mud. The sample was air dried to remove moisture and sieved prior to analysis, consistent with the methodology.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily continuing calibration verifications (CCVs) are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

Metals by Method 6010C:

Low-level initial calibration verification (ICV) standard 280-533866/12 exhibited a recovery greater than the upper control limit for zinc. The ICV did not bracket the analysis of investigative samples; qualification is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

CCV 680-666053/2 exhibited a %D greater than the control limit for DNP with positive bias at 26.2%. The associated soil sample results are qualified as “UJ”.

Metals by Method 6010C:

CCV 280-533459/92 exhibited a recovery greater than the upper control limit for potassium. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

CCVs 280-533459/92, 280-533459/104, 280-533459/115, and 280-533459/126 exhibited recoveries greater than the upper control limit for aluminum at 112%, 112%, 113%, and 113%, respectively. The associated total aluminum result for the equipment blank sample was non-detect; qualification is not required.

Metals by Method 6020A:

Low-level CCVs 280-533080/62 and 280-533080/75 exhibited recoveries less than the lower control limit for thallium at 76% and 73%, respectively. The associated dissolved thallium results are qualified as “UJ”.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial and continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Equipment blank sample EB-01_210408 exhibited positive detections below the LOQ for barium, iron, and calcium. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Method blank sample 280-532238/1-A exhibited a positive detection for dissolved iron below the LOQ at 23.9 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

Metals by Method 6020A:

Initial calibration blank (ICB) 280-533080/15 exhibited a positive detection for antimony at 0.832 µg/L. The associated sample results were non-detect; qualification is not necessary.

ICB 280-533145/15 exhibited a positive detection for antimony at 0.832 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

Mercury by Method 7470A:

ICB 280-533658/10-A exhibited a positive detection for mercury. The associated sample results were non-detect; qualification is not necessary.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-WL006-B exhibited a recovery less than the lower warning limit for base/neutral (B/N) extractable surrogate terphenyl-d14 at 38%. The associated B/N extractable compound result (DNCB) is qualified as “UJ”.

Sample NYOW-01-WL019-A exhibited a recovery less than the lower warning limit for B/N extractable surrogate terphenyl-d14 at 28%. The associated result for DNCB is qualified as “UJ”.

Picric Acid by Method 8330B:

Sample EB-01_210408 exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 80%. The associated result is qualified as “UJ”.

Sample NYOW-01-WL019-A exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 18%. The associated result is qualified as “UJ”.

Sample NYOW-01-WL006-B exhibited a recovery greater than the upper warning limit for 1,2-dinitrobenzene at 138%. The associated sample result was non-detect; qualification is not required.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

Metals by Method 6010C:

LCS 280-532862/2-A exhibited a recovery greater than the upper warning limit for barium at 113.5%. The associated positive detections are qualified as “J+”.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-01-PH018-C exhibited an RPD greater than the control limit for DNCB at 49%. The associated sample result was non-detect; qualification is not necessary.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**POST-DIGESTION SPIKE**

A post-digestion spike was not performed.

**ICP SERIAL DILUTION**

A ICP serial dilution was not performed.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted for CCVs above.

**INTERFERENCE CHECK SAMPLES**

Interference check samples (ICS) A and AB recoveries were evaluated and met the acceptance criteria.

The ICSA associated with batch 280-533314 had barium present above the LOD at 14.2 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-532747 had barium present above the LOD at 13.4 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium; qualification is not necessary.

The initial and closing ICSA associated with batch 280-533080 had cobalt present above the LOD at 0.472 µg/L and 0.455 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batch 280-533459 had barium present above the LOD at 13.6 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium; qualification is not necessary.

The initial and closing ICSA associated with batch 280-533145 had cobalt present above the LOD at 0.455 µg/L and 0.473 µg/L, respectively. The initial and closing ICSA associated with batch 280-533145 also had barium present above the LOD at 1.334 µg/L and 1.345 µg/L, respectively. The ICS vendor has noted that cobalt and barium are trace impurities in the ICSA with trace concentrations of 3 µg/L and 12 µg/L, respectively; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Three field duplicate and parent sample pairs were collected and analyzed for all parameters (SL-DUP-001_210408 collected from NYOW-01-SL005-A, PH-DUP-001_210408 collected from NYOW-01-PH005-B, PH-DUP-002_210408 collected from NYOW-01-PH005-C). The RPD must be less than 50% when one or more result is greater than the LOQ. All sample results met the precision criteria for the field duplicate pair with the exception noted below:

- SL-DUP-001_210408 and NYOW-01-SL005-A: zinc (165%)

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-01-SL005-A, SL-DUP-001_210408, NYOW-01-PH005-B, PH-DUP-001_210408, NYOW-01-PH005-C, PH-DUP-002_210408, NYOW-01-SL018-A, NYOW-01-PH018-B, and NYOW-01-PH018-C. The material was removed and not extracted.

A MS/SD was not performed for method 8330A soil batch 280-533256 or method 8330B aqueous batch 280-532435. An LCS/LCSD pair was performed in each instance.

A MS/SD was not performed for the method 8270D aqueous batch 280-664153. An LCS/LCSD pair was performed.

A MS/SD was not performed for methods 6010C, 6020A, and 7470A. An LCS/LCSD pair was performed for each sample batch.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for SVOCs, antimony and mercury due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM Revision 1: 280-147306-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soil) and 8330B (aqueous samples)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Methods 7471B (soil) and 7470A (aqueous samples)
- Total Organic Carbon (TOC) by SW-846 Method 9060A
- Percent Moisture by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 9 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria.

The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in the condition described below. Four coolers were received by the laboratory at temperatures of 0.7°C, 0.8°C, 0.9°C, and 12.2°C.

Due to a FedEx shipping delay, the following samples were received on 04/14/21 while the rest of the samples listed on the COC were delivered on 04/10/21 and logged under 280-147306. In accordance with a Bluestone request, these samples were logged in a separate SDG 280-147430-1: NYOW-01-WL022-A and NYOW-01-WL023-A. These samples were received at 12.2°C and one the glass amber containers for sample NYOW-01-WL022-A was broken. The SVOC and picric acid analyses were cancelled. The affected sample locations will be resampled and are not included in the completeness calculation.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | | X |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

SVOCs by Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verification (CCV) 680-666526/2 exhibited a %D greater than the control limit with positive bias for DNP at 22.1%. The associated soil sample results were non-detect and are qualified as “UJ”.

The following closing CCV samples were analyzed marginally outside of the method defined tuning window (by 8 and 36 minutes): 680-666526/27 for DNP and 680-666526/28 for DNCB. All associated samples ran within the tuning window and the CCV samples were within control limits for all target analytes. The associated sample results for DNP were previously qualified; no further action is necessary. The results for DNCB were non-detect and are qualified as “UJ”.

Metals by Method 6010C:

CCVs 280-533459/104 and 280-533459/115 exhibited recoveries greater than the upper control limit for aluminum at 112% and 113%, respectively. The associated equipment blank sample result was non-detect; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Method blank sample 280-533568/1-A exhibited a positive detection for iron below the LOQ at 28.7 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary on the basis of professional judgment.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-WL021-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 40%. The associated base/neutral (BN) sample result for DNCB was non-detect and is qualified as "UJ".

Picric Acid by Methods 8330A and 8330B:

Sample EB-01_210409 exhibited a surrogate recovery less than the lower warning limit at 78% for 1,2-dinitrobenzene. The associated sample result is qualified as "UJ".

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-665265/7-A/8-A exhibited a RPD greater than the control limit for DNCB at 26%. The associated sample results were non-detect; qualification is not required.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

Picric Acid by Methods 8330A and 8330B:

MS/SD sample NYOW-01-SL002-A exhibited recoveries less than the lower warning limit at 15% and 15%, respectively. The associated sample result is qualified as "UJ".

MS/SD sample NYOW-01-PH002-B exhibited recoveries less than the lower warning limit at 23% and 21%, respectively. The associated sample result is qualified as “UJ”.

Metals by Method 6010C:

MS/SD sample NYOW-01-SL002-A exhibited recoveries outside of control limits for aluminum, calcium, iron, and manganese. The sample concentration was greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-01-SL002-A exhibited recoveries outside of warning limits for chromium (84% and 84%), magnesium (67%), and potassium (128% and 132%). The associated positive detections for chromium and magnesium are qualified as “J-“. The positive detection for potassium is qualified as “J+”.

MS/SD sample NYOW-01-PH002-B exhibited recoveries outside of control limits for aluminum, calcium, iron, and manganese. The sample concentration was greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-01-PH002-B exhibited recoveries outside of warning limits for magnesium (71% and 125%) and potassium (126% and 122%). The positive detection for magnesium is qualified as “J” and the detection for potassium is qualified as “J+”.

MS/SD sample NYOW-01-PH002-B exhibited RPDs greater than the control limit for beryllium (21%), calcium (58%), cobalt (23%), nickel (21%), and sodium (21%). The associated sample results are qualified as “J”.

MS sample NYOW-01-WL022-A exhibited a recovery greater than the upper warning limit for silver at 116%. The associated sample result was non-detect; qualification is not necessary.

Metals by Method 6020A:

MS sample NYOW-01-SL002-A exhibited a recovery outside of warning limits for antimony (81%). The associated positive detection is qualified as “J-“.

MS/SD sample NYOW-01-PH002-B exhibited a RPD greater than the control limit for cadmium at 21%. The associated sample result is qualified as “J”.

TOC by Method 9060A:

SD sample NYOW-01-PH002-B exhibited a recovery greater than the upper warning limit for TOC at 147%. In addition, the MS/SD RPD was greater than the control limit at 30%. The associated positive detection is qualified as “J+”.

Sample NYOW-01-SL002-A exhibited recoveries greater than the upper warning limit for TOC at 259% and 157%, respectively. In addition, the MS/SD RPD was greater than the control limit at 48%. The associated sample result is qualified as “J+”.

**POST-DIGESTION SPIKE**

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-01-SL002-A. Aluminum, barium, calcium, iron, and manganese recovered outside of control limits. Aluminum, calcium, iron, and manganese concentrations were greater than 4X the spiked amount; qualification is not necessary. Barium recovered within control limits in the MS/SD sample; therefore, the PDS was not used to evaluate MS recovery failures.

A PDS was not performed for sample NYOW-01-PH002-B with MS/SD recovery failures for magnesium, and potassium. The associated sample results were previously qualified; no further action is necessary.

A PDS was performed for sample NYOW-01-WL022-A and manganese recovered below the lower control limits. Manganese recovered within control limits in the MS/SD sample; therefore, the PDS was not used to evaluate MS recovery failures.

Metals by Method 6020A:

A PDS was performed for MS/SD sample NYOW-01-SL002-A. All analytes recovered within the control limits.

Metals by Method 7471B:

A PDS was performed for sample NYOW-01-SL002-A. Mercury recovered above the upper control limit; however, the MS/SD recoveries were acceptable. Qualification is not necessary.

**ICP SERIAL DILUTION**

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-01-SL002-A. The %Ds for magnesium (23%) and manganese (29%) were greater than the control limit and are qualified as “J”.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards (LLCCV) for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted below.

Metals by Method 6010C:

LLCCVs 280-533867/139 and 280-533867/150 recovered above the control limit for copper at 127% and 126%, respectively. The associated sample concentrations were less than the level spiked in the ICV and CCVs; the sample results are qualified as “J+”.

Metals by Method 6020A:

LLCCVs 280-533080/62 and 280-533080/75 recovered below the lower control limit for thallium at 76% and 73%, respectively. The associated sample concentrations were non-detect and are qualified as “UJ”.

**INTERFERENCE CHECK SAMPLES**

Interference check samples (ICS) A and AB recoveries were evaluated and met the acceptance criteria. Cobalt was detected above the LOD in the initial and closing ICSA associated with batch 280-533080 at 0.472 µg/L and 0.455 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a potential trace concentration of 3 µg/L; qualification is not necessary.

Cobalt was detected above the LOD in the initial ISCA associated with batch 280-533817 at 0.462 µg/L. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a potential trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batches 280-533317, 280-533867, and 280-533459 had barium present above the LOD. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is below the LOD for barium (2 µg/L) in each batch; qualification is not necessary.

Cobalt was detected above the LOD in the initial and closing ICSA associated with batch 280-533145 at 0.455 µg/L and 0.473 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a potential trace concentration of 3 µg/L; qualification is not necessary.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

A MS/SD was not performed for aqueous SVOC batch 680-664530 and picric acid batch 280-532584 due to limited volume. An LCS/LCSD was performed for each batch.

For preparation batch 280-532457, the following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-01-SL002-A, NYOW-01-PH002-B, NYOW-01-PH002-C, and PH-DUP-001_210409. This material was removed and not extracted.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210409 collected from NYOW-01-PH002-C). The RPD must be less than 50% when one or more sample results is greater than the LOQ. All sample results met the precision criteria for the field duplicate pair with the exception noted below:

- PH-DUP-001_210409 and NYOW-01-PH002-C: TOC (200%)

All soil and aqueous LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for DNP. The soil LOQs were slightly greater than PQLGs for DNCB and mercury due to percent moisture adjustments. All other PQLGs were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM Revision 2: 280-147363-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330B (aqueous samples)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A

Table 1, below, summarizes the sample delivery group (SDG) collected 12 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | SW6010C - Dissolved | SW6020A - Dissolved | SW7470A - Dissolved | SW8270D | SW8330B |
|---|---|---|---|---|---|---|---|---|
| EB-01_210412 | 280-147363-6 | Water | Equipment Blank/EB | X | X | X | X | X |
| NYOW-01-WL001-A | 280-147363-1 | Water | Field Sample/N | X | X | X | X | X |
| NYOW-01-WL005-A | 280-147363-3 | Water | Field Sample/N | X | X | X | X | X |

Notes: WL-DUP-001_210412 collected from NYOW-01-WL005-A

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 0.5°C, 1.7°C, 1.9°C, and 2.0°C.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

<u>SVOCs by Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP

certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6020A:

Initial calibration blank (ICB) 280-533080/15 exhibited a positive detection for antimony. The ICB did not bracket the analysis of investigative samples; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Samples NYOW-01-WL001-A, NYOW-01-WL018-A, NYOW-01-WL005-A, WL-DUP-001_210412, and NYOW-01-WL024-A exhibited recoveries less than the lower warning limits for base/neutral (B/N) extractable surrogate terphenyl-d14 at 48%, 43%, 40%, 45%, and 24%, respectively. The associated B/N sample results (DNCB) were non-detect and are qualified as "UJ".

Picric Acid by Method 8330B:

Samples NYOW-01-WL001-A, NYOW-01-WL018-A, NYOW-01-WL005-A, and WL-DUP-001_210412 exhibited recoveries greater than the upper warning limit for 1,2-dinitrobenzene at 156%, 167%, 201%, and 123%, respectively. The associated sample results were non-detect; qualification is not required.

Samples NYOW-01-WL024-A and EB-01_210412 exhibited surrogate recoveries less than the lower warning limit at 52% and 80%, respectively. The associated sample results are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

Picric Acid by Method 8330B:

MS/SD sample NYOW-01-WL001-A exhibited a recovery less than the lower warning limit at 57%. The associated sample result is qualified as “UJ”. In addition, the MS/SD RPD was greater than the control limit at 38%. Non-detect data is not qualified on this basis.

Metals by Method 6020A:

MS/SD sample NYOW-01-WL001-A exhibited recoveries less than the lower warning limit for antimony at 80% and 82%, respectively. The associated sample result is qualified as “J-”.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## POST-DIGESTION SPIKE

Metals by Method 6020A:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-01-WL001-A. Antimony recovered within the control limits.

## ICP SERIAL DILUTION

Metals by Method 6010C:

An ICP serial dilution was performed for sample NYOW-01-WL001-A. All %Ds were less than the control limit.

## LOW-LEVEL CHECK STANDARD

Low-level check standards (LLCCV) for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted below.

Metals by Method 6010C:

LLCCV 280-533822/129 recovered above the control limit for sodium at 129%. The associated sample concentrations were less than the level spiked in the ICV and CCVs; the sample results are qualified as "J+".

Metals by Method 6020A:

LLCCVs 280-533080/62 and 280-533080/75 recovered below the lower control limit for thallium at 76% and 73%, respectively. The associated sample concentrations were non-detect. The associated sample results are qualified as "UJ".

**INTERFERENCE CHECK SAMPLES**

Interference check samples (ICS) A and AB recoveries were evaluated and met the acceptance criteria.

Cobalt was detected above the LOD in the initial and closing ICSA at 0.472 µg/L and 0.455 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

The ICSA associated with batch 280-533822 had barium present above the LOD at 13.1 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

**COMMENTS**

One field duplicate and parent sample pair was collected and analyzed for all parameters (WL-DUP-001_210412 collected from NYOW-01-WL005-A). The RPD must be less than 30% when at least one results is greater than the LOQ. Aluminum (RPD = 137%) and iron (RPD = 79%) did not meet the precision criteria.

All aqueous LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for DNP. All other PQLGs were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 1: 280-147423-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Total Organic Carbon (TOC) by Method SW-846 9060A
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 13 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | D2216 | SW6010C | SW6020A | SW7470A | SW7471B | SW8270D | SW8330A | SW8330B | SW9060A |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 3.5°C, 0.9°C, 1.5°C, and 3.7°C.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different

ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

Metals by Method 6010C:

Low-level initial calibration verification (ICV) standard 280-533604/10 exhibited a recovery less than the lower control limit for selenium at 74%. The ICV did not bracket the analysis of investigative samples; qualification is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verifications (CCV) 680-666526/27 and 680-666526/28 were analyzed 8 and 36 minutes beyond the 12-hour tune window. The associated soil sample results were non-detect and are qualified as “UJ”.

CCV 680-666053/2 exhibited a %D greater than the control limit for DNP with positive bias at 26.2%. The associated equipment blank sample result is qualified as “UJ”.

CCV 680- 666526/2 exhibited a %D greater than the control limit for DNP with positive bias at 22.1%. The associated sample results were previously qualified; no further action is necessary.

CCV 680- 666658/2 exhibited a %D greater than the control limit for DNP with positive bias at 27.9%. The associated soil sample results were non-detect and are qualified as “UJ”.

CCV 667546/3 exhibited a %D greater than the control limit for DNCB with positive bias at 22.7%. The associated sample results are for a reanalysis batch; qualification is not necessary.

Metals by Method 6010C:

Low-level calibration verification standard 280-533604/72 exhibited a recovery greater than the upper control limit for calcium at 125% and a recovery less than the lower control limit for selenium at 76%. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Equipment blank sample EB-01_210413 exhibited a positive detection below the LOQ for chromium at 0.88 µg/L. The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Continuing calibration blanks (CCB) 280-533604/71, 280-533604/85, and 280-533604/99 exhibited positive detections below the LOQ for iron (28.9 µg/L), beryllium (0.191 µg/L), magnesium (226 µg/L), and sodium (1,390 µg/L). The associated equipment blank sample results were non-detect; qualification is not required.

CCB 280-534126/22 exhibited a positive detection below the LOQ for chromium at 0.777 µg/L. The associated sample result was greater than the aqueous LOQ; qualification is not necessary on the basis of professional judgment.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-SL026-A exhibited recoveries less than the lower warning limit for each of the six surrogate compounds ranging from 25% to 29%. The sample was analyzed at a 5X dilution, and the surrogates were diluted out; qualification is not necessary.

Sample NYOW-01-SL028-A exhibited recoveries less than the lower warning limit for each of the six surrogate compounds ranging from 25% to 31%. The sample was analyzed at a 5X dilution, and the surrogates were diluted out; qualification is not necessary.

Sample NYOW-01-SL030-A exhibited recoveries less than the lower warning limit for 2-fluorobiphenyl (41%), 2-fluorophenol (34%), and nitrobenzene-d5 (36%). The sample was reanalyzed outside of the extraction holding time period and the surrogates recovered within control. The initial results should be used for data interpretation. The associated initial sample results were non-detect and are qualified as “UJ”.

Sample NYOW-01-SL033-A exhibited recoveries less than the lower warning limit for base/neutral (B/N) extractable surrogates 2-fluorobiphenyl (35%) and nitrobenzene-d5 (32%). The sample was reanalyzed outside of the extraction holding time period and the surrogates recovered within

control. The initial result should be used for data interpretation. The associated initial sample result for B/N extractable DNCB was non-detect and is qualified as "UJ".

Sample NYOW-01-SL032-A exhibited recoveries less than the lower warning limit for each of the six surrogate compounds ranging from 29% to 38%. The sample was analyzed at a 5X dilution, and the surrogates were diluted out; qualification is not necessary.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-665777/17-A/18-A exhibited a RPD greater than the control limit for DNP at 27%. The associated soil sample results were non-detect; qualification is not necessary.

LCS/LCSD 680-667192/11-A/12-A exhibited a RPD greater than the control limit for DNCB at 25%. The associated soil sample results were non-detect; qualification is not necessary.

TOC by Method 9060A:

LCSD 280-534855/4 did not recover (i.e., 0%). In addition, the LCS/LCSD RPD was greater than the control limit at 231%. The laboratory noted a potential instrument malfunction associated only with the LCSD. The associated sample results were positive detections and are qualified as "J-".

Metals by Method 6010C:

LCS 280-533186/2-A exhibited a recovery greater than the upper warning limit for silver at 117%. The associated equipment blank sample result was non-detect; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-01-SL007-A exhibited an RPD greater than the control limit for DNP at 59%. The associated sample result was non-detect; qualification is not necessary.

Picric Acid by Method 8330A:

MS/SD sample NYOW-01-SL025-A exhibited recoveries less than the lower warning limit at 26% and 23%, respectively. The associated sample result is qualified as "UJ".

TOC by Method 9060A:

MS sample NYOW-01-SL029-A exhibited a recovery greater than the upper warning limit at 168%. The MS/SD RPD was equal to the control limit at 20%. The associated positive sample result is qualified as “J”.

**DUAL COLUMN IMPRECISION**

Picric Acid by Method 8330A:

Sample NYOW-01-SL026-A exhibited dual column imprecision greater than the control limit at 194%. The primary column peak was manually integrated for an elevated baseline. The secondary column peak was manually integrated because the fronting peak was incompletely integrated. No obvious chromatographic interference was identified. Consistent with the QSM and SW-846 Method 8000D, the lower result from the primary column was reported. The sample result is qualified as “J”.

**POST-DIGESTION SPIKE**

A post-digestion spike was performed for the soil mercury batch and recovered within control.

**ICP SERIAL DILUTION**

A ICP serial dilution was performed for the soil mercury batch and recovered within control.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted for CCVs above.

**INTERFERENCE CHECK SAMPLES**

Interference check samples (ICS) A and AB recoveries were evaluated and met the acceptance criteria.

The ICSA associated with batch 280-533459 had barium present above the LOD at 13.6 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-533604 had barium present above the LOD at 13.3 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The initial and closing ICSA associated with batch 280-533313 had cobalt present above the LOD at 0.404 µg/L and 0.451 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

A field duplicate was not collected as part of this SDG.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, slag, and some glass that would not pass through the sieve: NYOW-01-SL007-A, NYOW-01-SL027-A, NYOW-01-SL026-A, NYOW-01-SL025-A, NYOW-01-SL009-A, NYOW-01-SL028-A, NYOW-01-SL029-A, NYOW-01-SL030-A, NYOW-01-SL033-A, NYOW-01-SL031-A, NYOW-01-SL032-A, NYOW-01-SL011-A, NYOW-01-SL039-A, NYOW-01-SL038-A, and NYOW-01-SL037-A. The material was removed and not extracted.

The following samples were diluted prior to SVOC analysis due to sample matrix: NYOW-01-SL026-A, NYOW-01-SL028-A, and NYOW-01-SL032-A. The LOQs were adjusted accordingly.

Sample NYOW-01-SL033-A in preparation batch 280-532668 contained free liquid in the sample jar. The sample was air dried prior to analysis. The laboratory did not note any receipt exceptions that would indicate potential cooler water infiltration of the sample container.

A MS/SD was not performed for method 8330B (equipment blank sample analysis). An LCS/LCSD pair was performed.

A MS/SD was not performed for the method 8270D aqueous batch (equipment blank sample analysis) or soil reanalysis batch 680-667192. An LCS/LCSD pair was performed in each instance.

A MS/SD was not performed for methods 6010C, 6020A, and 7470A. An LCS/LCSD pair was performed for each sample batch.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for metals and mercury due to percent moisture adjustments. LOQs were greater than PQLGs for SVOCs due to sample dilution and percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 8 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 1: 280-147471-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in April 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected on 14 April 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | D2216 | SW6010C | SW6020A | SW7470A | SW7471B | SW8270D | SW8330A | SW8330B |
|---|---|---|---|---|---|---|---|---|---|---|---|
| NYOW-01-SL013-A | 280-147471-3 | Solid | Field Sample/N | X | X | X | | X | X | X | |
| NYOW-01-SL034-A | 280-147471-2 | Solid | Field Sample/N | X | X | X | | X | X | X | |
| NYOW-01-SL035-A | 280-147471-4 | Solid | Field Sample/N | X | X | X | | X | X | X | |
| NYOW-01-SL036-A | 280-147471-1 | Solid | Field Sample/N | X | X | X | | X | X | X | |
| EB-01_210414 | 280-147471-5 | Water | Equipment Blank/EB | | X | X | X | | X | | X |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the

basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 1.1°C.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verification (CCV) 680-666053/2 exhibited a %D greater than the control limit for DNP with positive bias at 26.2%. The associated equipment blank sample result was non-detect and is qualified as “UJ”.

Closing CCV 680-666966/22 exhibited a %D greater than the control limit for DNP with negative bias at 60.4%. The associated soil sample results were non-detect and are qualified as “UJ”.

CCV 680-667546/3 exhibited a %D greater than the control limit for DNCB with positive bias at 22.7%. The CCV is associated with the reanalysis analytical batch; qualification is not necessary.

Metals by Method 6010C:

Low-level calibration verification standards 280-533604/61 and 280-533604/72 exhibited recoveries greater than the upper control limit for calcium at 130% and 125%, respectively. The associated soil sample results were greater than the ICV/CCV concentrations; qualification is not necessary.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Preparation blank sample 280-533707/1-A exhibited a positive detection less than the LOQ for barium (1.73 µg/L). The associated equipment blank sample result was non-detect; qualification is not necessary.

Equipment blank sample EB-01_210414 exhibited positive detections below the LOQ for iron (54 µg/L) and zinc (6.2 µg/L). The associated soil sample results are not qualified on the basis of aqueous equipment blanks.

Continuing calibration blank (CCB) 280-533604/60 exhibited positive detections below the LOQ for aluminum (18 µg/L), beryllium (0.195 µg/L), iron (28.6 µg/L), and magnesium (50.6 µg/L). CCB 280-533604/71 also exhibited a detection below the LOQ for iron (28.9 µg/L). The associated sample results for aluminum, iron, and magnesium were greater than the LOQ; on the basis of professional judgment, qualification is not necessary. The associated sample results for beryllium less than the aqueous LOQ are qualified as “U” at the LOQ.

Metals by Method 6020A:

Initial calibration blank (ICB) 280-533818/15 exhibited a positive detection for antimony (0.520 µg/L) below the LOQ. The instrument was recalibrated with a blank and a single standard during the sequence and prior to the analysis of investigative samples; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-SL036-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 44%. The associated base/neutral (BN) extractable compound (DNCB) was non-detect and is qualified as “UJ”.

Sample NYOW-01-SL034-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 38%. The associated BN extractable compound (DNCB) was non-detect and is qualified as “UJ”.

Sample NYOW-01-SL035-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 42%. The associated BN extractable compound (DNCB) was non-detect and is qualified as “UJ”.

Picric Acid by Method 8330B:

Sample EB-01_210414 exhibited a surrogate recovery less than the lower warning limit at 72%. The associated sample result is qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-666171/10-A/11-A exhibited a RPD greater than the control limit for DNCB at 22%. The associated soil sample results were non-detect; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample NYOW-01-SL036-A did not recover (i.e., 0%) for DNP. The associated sample result was non-detect and is qualified as “X”.

Picric Acid by Method 8330A:

MS/SD sample NYOW-01-SL036-A exhibited recoveries less than the lower warning limit at 15% and 16%, respectively. The associated sample result is qualified as “UJ”.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**POST-DIGESTION SPIKE**

No post-digestion spike analyses were performed.

**ICP SERIAL DILUTION**

No serial dilution tests were performed.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted for CCVs above.

**INTERFERENCE CHECK SAMPLES**

Interference check samples (ICS) A and AB recoveries were evaluated and met the acceptance criteria.

Metals by Method 6010C:

The ICSA associated with batch 280-534309 had barium present above the LOD at 13.5 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

The ICSA associated with batch 280-533604 had barium present above the LOD at 13.3 µg/L. The laboratory confirmed via ICP-MS that barium is a trace impurity in the ICSA at a concentration of 12.4 µg/L. The ICSA result minus the trace contamination concentration confirmed by ICP-MS is less than the LOD for barium (2 µg/L); qualification is not necessary.

Metals by Method 6020A:

The initial and closing ICSA associated with batch 280-533313 had cobalt present above the LOD at 0.404 µg/L and 0.451 µg/L, respectively. The ICS vendor has noted that cobalt is a trace impurity in the ICSA with a trace concentration of 3 µg/L; qualification is not necessary.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

A field duplicate sample was not analyzed as part of this SDG.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, and small plastic fragments that would not pass through the sieve: NYOW-01-SL036-A, NYOW-01-SL034-A, NYOW-01-SL013-A, and NYOW-01-SL035-A. The material was removed and not extracted.

The following samples were diluted prior to SVOC reanalysis: NYOW-01-SL036-A, NYOW-01-SL034-A, NYOW-01-SL013-A, and NYOW-01-SL035-A. The initial sample results should be used for data interpretation.

A MS/SD was not performed for method 8330B (equipment blank sample analysis). An LCS/LCSD pair was performed.

A MS/SD was not performed for methods 6010C, 6020A, 7471B, and 7470A. An LCS/LCSD pair was performed for each sample batch.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for SVOCs, arsenic, antimony, selenium, thallium, cobalt, and mercury due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of the “X” qualified result. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 21 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 1: 280-148199-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected on 4 May 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | D2216 | SW8270D |
|---|---|---|---|---|---|
| NYOW-03-PH005-B_R | 280-148199-2 | Solid | Field Sample/N | | X |
| NYOW-03-PH006-B_R | 280-148199-15 | Solid | Field Sample/N | | X |
| NYOW-03-PH007-B_R | 280-148199-14 | Solid | Field Sample/N | | X |
| NYOW-03-PH008-B_R | 280-148199-13 | Solid | Field Sample/N | X | X |

Notes: SL-DUP-001_210504 collected from NYOW-03-SL008-A_R

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 2.6°C.

Samples NYOW-03-PH006-B_R, NYOW-03-PH007-B_R, NYOW-03-PH008-B_R, NYOW-03-PH015-B_R, and NYOW-03-SL015-A_R were reanalyzed 8 days after the 14-day holding time period. The initial sample results should be used for data interpretation.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

SVOCs Method 8270D:

2,4-Dinitrochlorobenzene (DNCB) is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verification (CCV) 680-668479/2 exhibited %Ds greater than the control limit for 2,4-dinitrophenol at 43% and 4,6-dinitro-2-methylphenol at 32%. The associated equipment blank sample results were non-detect and are qualified as “UJ”.

CCV 680-669878/2 exhibited a %D greater than the control limit for pentachlorophenol at -26.6%. The associated sample results were non-detect and are qualified as “UJ”.

Closing CCV 680-669878/26 exhibited a %D greater than the control limit for hexachlorocyclopentadiene at -59.5%. The associated soil sample results were non-detect and are qualified as “UJ”.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the method.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blanks with the exceptions noted below.

SVOCs by Method 8270D:

Equipment blank sample EB-01_210504 exhibited a positive detection for bis(2-ethylhexyl)phthalate below the LOQ at 1.9 µg/L. Soil sample results are not qualified on the basis of aqueous equipment blanks.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-03-PH005-B_R exhibited a recovery less than the lower warning limit for terphenyl-d14 at 52%. The associated base/neutral (BN) extractable compounds are qualified as "UJ".

Sample NYOW-03-SL015-A_R exhibited a recovery less than the lower warning limit for nitrobenzene-d5 at 37%. The associated positive detections for BN extractable compounds are qualified as "J-" and non-detects are qualified as "UJ".

Sample NYOW-03-PH015-B_R exhibited recoveries less than the lower warning limits for nitrobenzene-d5 at 33%, 2-fluorobiphenyl at 42%, and terphenyl-d14 at 49%. The associated BN extractable compounds are qualified as "UJ".

Sample NYOW-03-PH013-B_R exhibited a recovery less than the lower warning limit for terphenyl-d14 at 53 %. The associated base/neutral (BN) extractable compounds are qualified as "UJ".

Sample NYOW-03-PH008-B_R exhibited recoveries less than the lower warning limits for 2-fluorophenol at 27%, phenol-d5 at 29%, nitrobenzene-d5 at 28%, 2-fluorobiphenyl at 34%, and terphenyl-d14 at 37%. The associated acid and BN extractable compounds are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS/LCSD 680-669099/5-A/6-A exhibited recoveries less than the lower warning limits for 2,2'-oxybis[1-chloropropane] (31% and 30%), 2,6-dinitrotoluene (43%), bis(2-ethylhexyl)phthalate (50% and 26%), hexachlorocyclopentadiene (26% and 23%), butyl benzyl phthalate (46%), bis(2-chloroethyl)ether (26%), and n-nitrosodi-n-propylamine (32%). The associated soil sample results were non-detect and are qualified as "UJ".

LCSD 680-668918/15-A exhibited RPDs greater than 20% for 3,3'-dichlorobenzidine (28%), atrazine (25%), and caprolactam (24%). The associated soil sample results were non-detect; qualification is not necessary.

LCSD 680-669099/10-A exhibited an RPD greater than 20% for DNCB at 26%. The associated soil sample results were non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

SD sample NYOW-03-SL009-A_R exhibited recoveries less than the lower warning limits for caprolactam (41%) and hexachlorocyclopentadiene (27%). The associated sample results were non-detect and are qualified as "UJ".

MS/SD sample NYOW-03-SL009-A_R exhibited RPDs greater than 20% for the majority of analytes as shown in the table below. The associated sample results were non-detect; qualification is not necessary.

| Compound | RPD | Compound | RPD |
|---|---|---|---|
| 1,2,4,5-Tetrachlorobenzene | 35 | 4-Nitrophenol | 46 |
| 1,4-Dioxane | 28 | Acetophenone | 37 |
| 2,2'-oxybis[1-chloropropane] | 34 | Biphenyl | 36 |
| 2,3,4,6-Tetrachlorophenol | 43 | Bis(2-chloroethoxy)methane | 38 |
| 2,4,5-Trichlorophenol | 39 | Bis(2-chloroethyl)ether | 33 |
| 2,4,6-Trichlorophenol | 37 | Bis(2-ethylhexyl) phthalate | 43 |
| 2,4-Dichlorophenol | 37 | Butyl benzyl phthalate | 42 |
| 2,4-Dimethylphenol | 41 | Caprolactam | 51 |
| 2,4-Dinitrophenol | 56 | Carbazole | 42 |
| 2,4-Dinitrotoluene | 46 | Dibenzofuran | 40 |
| 2,6-Dinitrotoluene | 40 | Diethyl phthalate | 44 |
| 2-Chloronaphthalene | 36 | Dimethyl phthalate | 42 |
| 2-Chlorophenol | 34 | Di-n-butyl phthalate | 43 |
| 2-Methylphenol | 38 | Di-n-octyl phthalate | 41 |
| 2-Nitroaniline | 39 | Hexachlorobenzene | 41 |
| 2-Nitrophenol | 30 | Hexachlorobutadiene | 35 |
| 3,3'-Dichlorobenzidine | 70 | Hexachlorocyclopentadiene | 46 |

| Compound | RPD | Compound | RPD |
|---|---|---|---|
| 3-Nitroaniline | 49 | Hexachloroethane | 27 |
| 4,6-Dinitro-2-methylphenol | 39 | Isophorone | 37 |
| 4-Bromophenyl phenyl ether | 40 | m & p - Cresol | 41 |
| 4-Chloro-3-methylphenol | 42 | Nitrobenzene | 37 |
| 4-Chloroaniline | 49 | N-Nitrosodi-n-propylamine | 40 |
| 4-Chlorophenyl phenyl ether | 41 | N-Nitrosodiphenylamine | 40 |
| 4-Nitroaniline | 51 | Pentachlorophenol | 49 |
| Benzaldehyde | 37 | Phenol | 37 |

MS sample NYOW-03-PH008-B_R exhibited a recovery less than the lower warning limit for hexachlorocyclopentadiene at 27%. The associated sample result is qualified as “UJ”.

SD sample NYOW-03-PH008-B_R exhibited multiple recoveries less than the lower warning limits as shown below. The associated sample results are qualified as “UJ”.

| Compound | Recovery | Compound | Recovery |
|---|---|---|---|
| 2,2'-oxybis[1-chloropropane] | 27 | Bis(2-chloroethyl)ether | 27 |
| 2,4-Dinitrotoluene | 44 | Bis(2-ethylhexyl) phthalate | 50 |
| 2,6-Dinitrotoluene | 40 | Butyl benzyl phthalate | 47 |
| 2-Chloronaphthalene | 39 | Carbazole | 48 |
| 2-Nitroaniline | 42 | Diethyl phthalate | 48 |
| 4-Bromophenyl phenyl ether | 44 | Dimethyl phthalate | 50 |
| 4-Chlorophenyl phenyl ether | 42 | Di-n-butyl phthalate | 50 |
| Hexachlorocyclopentadiene | 16 | N-Nitrosodi-n-propylamine | 35 |
| Phenol | 32 | | |

MS sample NYOW-03-PH008-B_R exhibited RPDs greater than 20% for the majority of analytes as shown in the table below. The associated sample results were non-detect; qualification is not necessary.

| Compound | RPD | Compound | RPD |
|---|---|---|---|
| 1,2,4,5-Tetrachlorobenzene | 34 | 4-Nitrophenol | 44 |

| Compound | RPD | Compound | RPD |
|---|---|---|---|
| 1,4-Dioxane | 37 | Acetophenone | 24 |
| 2,2'-oxybis[1-chloropropane] | 42 | Biphenyl | 32 |
| 2,3,4,6-Tetrachlorophenol | 34 | Bis(2-chloroethoxy)methane | 40 |
| 2,4,5-Trichlorophenol | 34 | Bis(2-chloroethyl)ether | 30 |
| 2,4,6-Trichlorophenol | 44 | Bis(2-ethylhexyl) phthalate | 24 |
| 2,4-Dimethylphenol | 29 | Butyl benzyl phthalate | 29 |
| 2,4-Dinitrophenol | 65 | Caprolactam | 26 |
| 2,4-Dinitrotoluene | 46 | Carbazole | 31 |
| 2,6-Dinitrotoluene | 49 | Dibenzofuran | 30 |
| 2-Chloronaphthalene | 40 | Diethyl phthalate | 33 |
| 2-Chlorophenol | 41 | Dimethyl phthalate | 30 |
| 2-Methylphenol | 50 | Di-n-butyl phthalate | 26 |
| 2-Nitroaniline | 29 | Di-n-octyl phthalate | 22 |
| 2-Nitrophenol | 38 | Hexachlorobenzene | 33 |
| 3,3'-Dichlorobenzidine | 40 | Hexachlorobutadiene | 38 |
| 3-Nitroaniline | 32 | Hexachlorocyclopentadiene | 52 |
| 4,6-Dinitro-2-methylphenol | 73 | Hexachloroethane | 48 |
| 4-Bromophenyl phenyl ether | 41 | Isophorone | 33 |
| 4-Chloro-3-methylphenol | 29 | m & p - Cresol | 44 |
| 4-Chloroaniline | 41 | Nitrobenzene | 25 |
| 4-Chlorophenyl phenyl ether | 43 | N-Nitrosodi-n-propylamine | 28 |
| 4-Nitroaniline | 44 | N-Nitrosodiphenylamine | 32 |
| Benzaldehyde | 45 | Pentachlorophenol | 22 |
| Atrazine | 24 | Phenol | 48 |

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

One field duplicate and parent sample pair was collected and analyzed for SVOCs and percent solids (SL-DUP-001_210504 collected from NYOW-03-SL008-A_R). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate pair met the precision criteria.

A MS/SD and LCS/LCSD was performed for each sample batch with the exception of a MS/SD for aqueous batch 680-667976.

LOQs were greater than Project Quantitation Limit Goals (PQLGs) for multiple SVOCs due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 21 July 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM Revision 1: 280-148205-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG) collected 4 May 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | D2216 | SW8260C |
|---|---|---|---|---|---|
| NYOW-03-PH005-B_R | 280-148205-4 | Solid | Field Sample/N | X | X |
| NYOW-03-PH006-B_R | 280-148205-6 | Solid | Field Sample/N | X | X |
| NYOW-03-PH007-B_R | 280-148205-5 | Solid | Field Sample/N | X | X |
| NYOW-03-PH016-B_R | 280-148205-2 | Solid | Field Sample/N | X | X |

Notes: PH-DUP_001_210504 collected from NYOW-03-PH006-B_R

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were initially received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 2.6ºC.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

Continuing calibration verification (CCV) CCV 280-535434/2 exhibited %Ds greater than the control limit for trichlorofluoromethane (28.7%) and 2-butanone (-20.4%). The associated sample results for trichlorofluoromethane were non-detect and are qualified as “UJ”. The associated positive detections for 2-butanone are qualified as “J-“ and non-detects are qualified as “UJ”.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, trip blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, trip blanks, and equipment blanks.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exception noted below.

VOCs by Method 8260C:

LCS 280-535446/1-A exhibited a recovery less than the lower warning limit for chloroform at 77%. The associated sample results were non-detect and are qualified as “UJ”.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. No MS/SD were performed for preparation batches associated with this SDG.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

There was insufficient sample volume to perform a MS/SD associated with the solid and aqueous preparation batches (535446 and 535986). An LCS and LCSD were performed.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP_001_210504 collected from NYOW-03-PH006-B_R). The RPD must be less than 50% when at least one result is greater than the LOQ. Acetone did not meet the precision criteria with an RPD of 60%.

LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for several VOCs due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 11 June 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM: 280-148678-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) by the method specified below.

- Picric Acid by SW-846 Method 8330B

Table 1, below, summarizes the sample delivery group (SDG) collected 14 May 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | SW8330B |
|---|---|---|---|---|
| EB-03_210514 | 280-148678-3 | Water | Equipment Blank/EB | X |
| NYOW-01-WL022-A_R | 280-148678-1 | Water | Field Sample/N | X |
| NYOW-01-WL023-A_R | 280-148678-2 | Water | Field Sample/N | X |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Two coolers were received by the laboratory at a temperature of 1.8°C and 1.8°C.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks and equipment blanks. Method blanks were prepared and analyzed with each batch. Picric acid was not detected in the method blanks or the equipment blank sample.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. Due to limited sample volume, a MS/SD was not performed for picric acid analysis. An LCSD was performed to evaluate precision.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

No field duplicate samples were submitted as part of this SDG.

All Project Quantitation Limit Goals (PQLGs) were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No data was qualified on the basis of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 17 June 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM: 680-198955-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Savannah, GA (DoD ELAP Certification #L2463) by the method specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D

Table 1, below, summarizes the sample delivery group (SDG) collected 14 May 2021, laboratory and client sample identification numbers, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## TABLE 1: SAMPLE SUMMARY

| Field Sample ID | Lab Sample ID | Matrix | Type/Type Code | SW8270D |
|---|---|---|---|---|
| EB-03_210514 | 680-198955-3 | Water | Equipment Blank/EB | X |
| NYOW-01-WL022-A_R | 680-198955-1 | Water | Field Sample/N | X |
| NYOW-01-WL023-A_R | 680-198955-2 | Water | Field Sample/N | X |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 4.3°C.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exception noted below.

SVOCs by Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the method.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blanks.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-01-WL022-A_R exhibited a recovery less than the lower warning limit for base/neutral (B/N) extractable surrogate terphenyl-d14 at 41%. The associated sample result for B/N analyte DNCB was non-detect and is qualified as “UJ”.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative

percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. A MS/SD pair was not analyzed as part of this SDG. An LCS/LCSD was performed for the aqueous SVOC batch to evaluate precision.

**COMMENTS**

No field duplicates were collected as part of this SDG.

All aqueous LOQs were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Savannah, GA and were reported under sample delivery group (SDG) 680-199995-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 2 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The equipment blank sample arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 2.4º C.

| Analytical Method | Data Reviewer Comment |
|---|---|

September 07, 2021

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

**Reason Code Definitions**

| Code | Definition |
|---|---|

There are no Flag Code definitions to display.

**Bias**

| | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 2 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The equipment blank sample arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 4.4º C.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Savannah, GA and were reported under sample delivery group (SDG) 680-199837-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- LCS Recovery
- LCS RPD

- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 2 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO | Eurofins Environment Testing TestAmerica, Savannah, GA and were reported under sample delivery group (SDG) 280-149650-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Equipment Blank
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 32 results (69.57%) out of the 46 results (sample and field QC samples) reported are qualified based on review and 1 results (2.17%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 5.0ºC.

The container label for the following samples did not match the information listed on the Chain-of-Custody (COC): NYOW-04-DU006-SL-A, NYOW-04-DU006-SL-B, and NYOW-04-DU006-SL-C. The container labels list the sample IDs as NYOW-04-DU007. The COC states NYOW-04-DU006. The sample was logged in accordance with the COC.

In preparation batch 280-539631, the following samples were air dried and sieved per the procedure; however, the samples contained
rocks and vegetation that would not pass through the sieve: NYOW-04-DU014-SL-A, NYOW-04-DU014-SL-B, NYOW-04-DU014-SL-C, NYOW-04-DU013-SL-A, NYOW-04-DU013-SL-B, NYOW-04-DU013-SL-C, NYOW-04-DU011-SL-A, NYOW-04-DU011-SL-B, NYOW-04-DU011-SL-C, NYOW-04-DU010-SL-A, NYOW-04-DU010-SL-B, NYOW-04-DU010-SL-C, NYOW-04-DU006-SL-A, NYOW-04-DU006-SL-B and NYOW-04-DU006-SL-C. This material was removed and not extracted.

The samples reached a fully ground state in less than 5 milling cycles. Milling was stopped when samples reached a fully milled state in order to reduce the chance of analyte loss due to overheating in accordance with the instructions in the SOP.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW8270D | There is no LCSSRM that contains the analytes in the 8270 method list. As a result, the impact of sample milling on the analyte recovery cannot be quantified. |
| SW8330B | The explosives LCSSRM does not contain picric acid. As a result, the impact of sample milling on the analyte recovery cannot be quantified. |

October 19, 2021

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU013-SL-A (SD)/ 280-149650-4MSD | 2,4-Dinitrochlorobenzene | 27.33 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW8330B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU013-SL-A (MS)/ 280-149650-4MS | Picric acid | 26.83 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |
| NYOW-04-DU013-SL-A (SD)/ 280-149650-4MSD | Picric acid | 28.15 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Modified Qualifiers for test method SW8330B**

| FieldSample ID / LabSample ID | Type | Analyte | LOQ | Lab Result | ADR Result | Modified Result | Reason |
|---|---|---|---|---|---|---|---|
| NYOW-04-DU013-SL-B 280-149650-5 | FR | Picric acid | 98.0 | 98.0 U M | 98.0 U | 98.0 UJ | M |
| NYOW-04-DU013-SL-C 280-149650-6 | FR | Picric acid | 96.0 | 96.0 U M | 96.0 U | 96.0 UJ | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| M | MS Recovery |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| X | The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended. |

**Bias**

| | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

**Review Questions**

| Method: SW8270D (Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | • | | | Initial analyses were performed within holding times. Reanalyses were performed outside of the extraction holding time period. |
| Were all requested target analytes reported? | • | | | |
| Was the GC/MS system properly tuned based on method criteria? | • | | | |
| Was instrument tuning completed every 12 hours during sample analysis? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | • | | | |
| Were Internal Standard retention times and area criteria within method requirements? | • | | | |
| Were internal standards spiked for every sample, standard, and QC sample? | • | | | |
| Were surrogate recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was a method blank prepared and analyzed with each batch? | • | | | A grinding blank was prepared and the results are reported in SDG J149607. |
| Were target analytes in the method blank less than MDL? | • | | | |
| Were target analytes in the field blank less than MDL? | • | | | EB-01-210609 sample results are reported in SDG J199995-1. |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | A LCSSRM was not performed. A LCSSRM for the target analytes is not available. |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | • | | | |
| Was a MS/MSD pair prepared with each batch? | | • | | MS/SDs not performed for reanalysis batches. |
| Were MS/MSD recoveries within project acceptance limits? | • | | | |
| Was the MS/MSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | | | • | Three ISM replicate samples were collected within each Decision Unit. The RSD of replicate results was not calculated because all results were ND.<br><br>Triplicate sample analysis was performed and the results are reported in SDG J149607. |
| Were QAPP specified laboratory PQLs achieved? | • | | | |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |
| Were DoD QSM corrective actions followed if deviations were noted? | | • | | RE/RA performed significantly outside of extraction holding time. |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO | Eurofins Environment Testing TestAmerica, Savannah, GA and were reported under sample delivery group (SDG) 280-149543-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Equipment Blank
- Lab Blank
- Lab Replicate RPD
- Laboratory Triplicate RSD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Reference Material
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 14 results (73.68%) out of the 19 results (sample and field QC samples) reported are qualified based on review and 3 results (15.79%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 0.9ºC.

The following samples were air dried and sieved; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-04-DU001-SL-A, NYOW-04-DU001-SL-B, NYOW-04-DU001-SL-C, NYOW-04-DU002-SL-A, NYOW-04-DU002-SL-B, and NYOW-04-DU002-SL-C. This material was removed and not extracted.

The samples reached a fully ground state in less than 5 milling cycles. Milling was stopped when samples reached a fully milled state in order to reduce the chance of analyte loss due to overheating in accordance with the instructions in the SOP.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW8270D | There is no LCSSRM that contains the analytes in the 8270 method list. As a result, the impact of sample milling on the analyte recovery cannot be quantified. |
| SW8330B | The explosives LCSSRM does not contain picric acid. As a result, the impact of sample milling on the picric acid recovery cannot be quantified. |

October 05, 2021

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

**Quality Control Outliers for test method SW8270D, LCS RPD**

The objective of laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. LCS/LCSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory control sample/laboratory control sample duplicate RPD results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCSD 680-673627/22-A (BD)/ LCSD 680-673627/22-A | 2,4-Dinitrochlorobenzene | 20.66 | < 20 | < 20 | rpd | J/None | Z | |
| LCSD 680-676250/10-A (BD)/ LCSD 680-676250/10-A | 2,4-Dinitrochlorobenzene | 20.09 | < 20 | < 20 | rpd | J/None | Z | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A (MS)/ 280-149543-1MS | 2,4-Dinitrophenol | 0.000 | 10 - 130 | 10 - 200 | percent | J/X | M | |
| NYOW-04-DU001-SL-A (SD)/ 280-149543-1MSD | 2,4-Dinitrophenol | 7.799 | 10 - 130 | 10 - 200 | percent | J/X | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A 280-149543-1MS | FR | 2,4-Dinitrophenol | 810 | 620 U J1 | 620 X | | ug/kg | M |
| NYOW-04-DU001-SL-B 280-149543-1MS | FR | 2,4-Dinitrophenol | 850 | 650 U Q | 650 X | | ug/kg | M/I |
| NYOW-04-DU001-SL-C 280-149543-1MS | FR | 2,4-Dinitrophenol | 850 | 650 U | 650 X | | ug/kg | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A (SD)/ 280-149543-1MSD | 2,4-Dinitrophenol | 200.0 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A (FR)/ 280-149543-1 | 2-Fluorobiphenyl | 40.00 | 44 - 115 | 10 - 115 | percent | J/UJ | I | |

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU002-SL-B (FR)/ 280-149543-5 | 2,4,6-Tribromophenol | 31.00 | 39 - 132 | 10 - 132 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | 2-Fluorobiphenyl | 24.00 | 44 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | 2-Fluorophenol | 23.00 | 35 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | Nitrobenzene-d5 | 21.00 | 37 - 122 | 10 - 122 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | Phenol-d5 | 22.00 | 33 - 122 | 10 - 122 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | Terphenyl-d14 | 26.00 | 54 - 127 | 10 - 127 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | 2,4,6-Tribromophenol | 24.00 | 39 - 132 | 10 - 132 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | 2-Fluorobiphenyl | 43.00 | 44 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | Nitrobenzene-d5 | 36.00 | 37 - 122 | 10 - 122 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | Terphenyl-d14 | 47.00 | 54 - 127 | 10 - 127 | percent | J/UJ | I | |
| NYOW-04-DU002-SL-C (FR)/ 280-149543-6 | 2,4,6-Tribromophenol | 38.00 | 39 - 132 | 10 - 132 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Surrogate for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

**Qualified Results associated with the Surrogate for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU002-SL-C 280-149543-6 | FR | 2,4-Dinitrophenol | 840 | 640 U Q | 640 UJ | | ug/kg | I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW8330B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A (MS)/ 280-149543-1MS | Picric acid | 25.83 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |
| NYOW-04-DU001-SL-A (SD)/ 280-149543-1MSD | Picric acid | 24.63 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8330B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU001-SL-A 280-149543-1MS | FR | Picric acid | 97.0 | 97.0 U J1 | 97.0 UJ | | ug/kg | M |
| NYOW-04-DU001-SL-B 280-149543-1MS | FR | Picric acid | 96.0 | 96.0 U M | 96.0 UJ | | ug/kg | M |
| NYOW-04-DU001-SL-C 280-149543-1MS | FR | Picric acid | 95.0 | 95.0 U | 95.0 UJ | | ug/kg | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| I | Surrogate recovery outside project limits. |
| M | MS Recovery |
| TR | Trace Level Detect |
| Z | LCS RPD |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |

| | |
|---|---|
| X | The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended. |

| **Bias** | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |
| Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result | |

**Review Questions**

| Method: SW8270D (Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | • | | | Initial analyses were performed within holding times. Reextractions were performed outside of the extraction holding time period. |
| Were all requested target analytes reported? | • | | | |
| Was the GC/MS system properly tuned based on method criteria? | • | | | |
| Was instrument tuning completed every 12 hours during sample analysis? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | • | | | |
| Were Internal Standard retention times and area criteria within method requirements? | • | | | |
| Were internal standards spiked for every sample, standard, and QC sample? | • | | | |
| Were surrogate recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was a method blank prepared and analyzed with each batch? | • | | | A grinding blank was also prepared. |
| Were target analytes in the method blank less than MDL? | • | | | The grinding blank results were also less than the MDL. |
| Were target analytes in the field blank less than MDL? | • | | | EB-01-210607 sample results are reported in SDG J199837-1. |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | A LCSSRM was not performed. A LCSSRM for SVOCs is not available. |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | | • | | See QC Outliers. Sample results were non-detect; qualification is not necessary. |
| Was a MS/MSD pair prepared with each batch? | | • | | MS/SDs not performed for reanalysis batch 675494. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | MS NYOW-04-DU001-SL-A did not recover for 2,4-dinitrophenol. The SD recovery was less than 10% at 8%. The MS was reanalyzed outside of 2X the extraction holding time.<br>The 2,4-dinitrophenol results for NYOW-04-DU001-SL-A, NYOW-04-DU001-SL-B, and NYOW-04-DU001-SL-C are qualified as "X". |
| Was the MS/MSD RPD within project acceptance limits? | | • | | See QC Outliers. |

**Review Questions**

Method: SW8270D (Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry)

| Review Questions | Yes | No | NA | Comment |
|---|---|---|---|---|
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | | | • | Sample NYOW-04-DU001-SL-A was analyzed in triplicate at the laboratory. The RSD could not be calculated because all results were ND. Three ISM replicate samples were collected within each Decision Unit. The RSD of replicate results was not calculated because all results were ND. |
| Were QAPP specified laboratory PQLs achieved? | • | | | |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |
| Were DoD QSM corrective actions followed if deviations were noted? | | • | | RE/RA performed significantly outside of extraction holding time. |
| Were any data recommended for rejection (exclusion) in the data validation process? | • | | | See MS Outliers and Comments. |

**Review Questions**

Method: SW8330B (Nitroaromatics and Nitramines by HPLC)

| Review Questions | Yes | No | NA | Comment |
|---|---|---|---|---|
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | • | | | |
| Were all requested target analytes reported? | • | | | |
| Was a blank prepared and analyzed with each batch? | • | | | A soil batch grinding blank 280-539620/1-B was also prepared and analyzed. |
| Were target analytes in the blank less than MDL? | • | | | |
| Were target analytes in the field blank less than MDL? | • | | | |
| Was an LCS or LCS/LCSD pair analyzed with each batch? | • | | | |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | • | | | |
| Was a project specific MS or MS/MSD pair prepared with each batch? | | • | | A MS/SD was prepared with the soil batch. An MS/SD was not performed for the aqueous equipment blank sample batch. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was the MS/MSD RPD within project acceptance limits? | • | | | |
| Was a project-specific duplicate analyzed, and the RPD within QAPP acceptance limits? | • | | | Sample NYOW-04-DU001-SL-A was analyzed in triplicate at the laboratory. The RSD could not be calculated because all results were ND. |
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | | | • | Three ISM replicate samples were collected within each Decision Unit. The RSD of replicate results was not calculated because all results were ND. |
| Were QAPP specified laboratory reporting limits achieved? | • | | | |
| Were surrogate recoveries within project acceptance limits? | • | | | |
| Were column comparison differences with project acceptance limits? | | | • | All sample results were non-detect. |
| Was the intial calibration within criteria? | • | | | |
| Was a second source check standard analyzed and within all applicable criteria? | • | | | |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO | Eurofins Environment Testing TestAmerica, Savannah, GA and were reported under sample delivery group (SDG) 280-149607-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Equipment Blank
- Lab Blank
- Lab Replicate RPD
- Laboratory Triplicate RSD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Reference Material
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 32 results (69.57%) out of the 46 results (sample and field QC samples) reported are qualified based on review and 5 results (10.87%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 0.7ºC.
The sample containers had "ISM" included in the Sample ID. The samples were logged in accordance with the COC.
The following samples were air dried and sieved per the procedure; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-04-DU004-SL-A, NYOW-04-DU004-SL-B, NYOW-04-DU004-SL-C, NYOW-04-DU012-SL-A, NYOW-04-DU012-SL-B, NYOW-04-DU012-SL-C, NYOW-04-DU007-SL-A, NYOW-04-DU007-SL-B, NYOW-04-DU007-SL-C, NYOW-04-DU005-SL-A, and NYOW-04-DU005-SL-B. This material was removed and not extracted.
In preparation batch 280-539631, the following samples were air dried and sieved per the procedure; however, the samples contained rocks and vegetation that would not pass through the sieve: NYOW-04-DU005-SL-C, NYOW-04-DU009-SL-A, NYOW-04-DU009-SL-B, and NYOW-04-DU009-SL-C. This material was removed and not extracted.
The samples reached a fully ground state in less than 5 milling cycles. Milling was stopped when samples reached a fully milled state in order to reduce the chance of analyte loss due to overheating in accordance with the instructions in the SOP.

| Analytical Method | Data Reviewer Comment |
|---|---|
| SW8270D | There is no LCSSRM that contains the analytes in the 8270 method list. As a result, the impact of sample milling on the analyte recovery cannot be quantified. |
| SW8330B | The explosives LCSSRM does not contain picric acid. As a result, the impact of sample milling on the analyte recovery cannot be quantified. |

October 19, 2021

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

**Quality Control Outliers for test method SW8270D, LCS RPD**

The objective of laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. LCS/LCSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory control sample/laboratory control sample duplicate RPD results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCSD 680-673627/22-A (BD)/ LCSD 680-673627/22-A | 2,4-Dinitrochlorobenzene | 20.66 | < 20 | < 20 | rpd | J/None | Z | |
| LCSD 680-676250/10-A (BD)/ LCSD 680-676250/10-A | 2,4-Dinitrochlorobenzene | 20.09 | < 20 | < 20 | rpd | J/None | Z | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU009-SL-C (SD)/ 280-149607-15MSD | 2,4-Dinitrophenol | 0.000 | 10 - 130 | 10 - 200 | percent | J/X | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8270D**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU009-SL-A 280-149607-13 | FR | 2,4-Dinitrophenol | 820 | 630 U Q | 630 X | | ug/kg | M/I |
| NYOW-04-DU009-SL-B 280-149607-14 | FR | 2,4-Dinitrophenol | 810 | 620 U Q | 620 X | | ug/kg | M/I |
| NYOW-04-DU009-SL-C 280-149607-15 | FR | 2,4-Dinitrophenol | 860 | 650 U Q | 650 X | | ug/kg | M/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW8270D, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU005-SL-B (SD)/ 280-149607-11MSD | 2,4-Dinitrophenol | 21.64 | < 20 | < 20 | rpd | J/None | D | |
| NYOW-04-DU009-SL-C (SD)/ 280-149607-15MSD | 2,4-Dinitrochlorobenzene | 32.65 | < 20 | < 20 | rpd | J/None | D | |
| NYOW-04-DU009-SL-C (SD)/ 280-149607-15MSD | 2,4-Dinitrophenol | 200.0 | < 20 | < 20 | rpd | J/None | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU004-SL-A (FR)/ 280-149607-1 | 2,4,6-Tribromophenol | 27.00 | 39 - 132 | 10 - 132 | percent | J/UJ | I | |

**Quality Control Outliers for test method SW8270D, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW8330B, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-04-DU005-SL-B (MS)/ 280-149607-11MS | Picric acid | 32.00 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |
| NYOW-04-DU005-SL-B (SD)/ 280-149607-11MSD | Picric acid | 32.00 | 38 - 154 | 10 - 200 | percent | J/UJ | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for SW8330B**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |

**Table of Results with Modified Qualifiers**

**Modified Qualifiers for test method SW8270D**

| FieldSample ID / LabSample ID | Type | Analyte | LOQ | Lab Result | ADR Result | Modified Result | Reason |
|---|---|---|---|---|---|---|---|
| NYOW-04-DU012-SL-B 280-149607-5 | FR | 2,4-Dinitrophenol | 840 | 650 U Q | 650 U | 650 UJ | I |
| NYOW-04-DU012-SL-C 280-149607-6 | FR | 2,4-Dinitrochlorobenzene | 320 | 160 U Q | 160 U | 160 UJ | I |
| NYOW-04-DU012-SL-C 280-149607-6 | FR | 2,4-Dinitrophenol | 820 | 630 U Q | 630 U | 630 UJ | I |

**Modified Qualifiers for test method SW8330B**

| FieldSample ID / LabSample ID | Type | Analyte | LOQ | Lab Result | ADR Result | Modified Result | Reason |
|---|---|---|---|---|---|---|---|
| NYOW-04-DU005-SL-A 280-149607-10 | FR | Picric acid | 93.0 | 93.0 U M | 93.0 U | 93.0 UJ | M |
| NYOW-04-DU005-SL-C 280-149607-12 | FR | Picric acid | 99.0 | 99.0 U M | 99.0 U | 99.0 UJ | M |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| D | MS RPD |
| H2 | Prep Hold Time |
| I | Surrogate recovery outside project limits. |
| M | MS Recovery |
| TR | Trace Level Detect |
| Z | LCS RPD |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |
| X | The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended. |

**Bias**

| | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144913

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144913 | 280-144913-1 | NYOW-04-PH035-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-2 | NYOW-04-PH034-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-3 | NYOW-04-PH033-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-4 | NYOW-04-PH030-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-5 | NYOW-04-PH029-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-6 | NYOW-04-PH028-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-7 | NYOW-04-PH025-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-8 | NYOW-04-PH024-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |
| 280-144913 | 280-144913-9 | NYOW-04-PH023-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144913 | 280-144913-10 | NYOW-04-PH022-B | 1/25/21 | DNCB, DNP, Picric Acid, %M |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided.

Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.6°C, 2.1°C, and 2.9°C. All samples were extracted and analyzed within holding time.

For sample NYOW-04-PH035-B, the total number of containers says nine on the COC; however, only six samples were received.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP

certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The continuing calibration verification (CCV) performed on 2/10/21 at 13:37 (680-655270) exhibited a %D greater than the control limit with a positive bias for DNP at 23.6%. The associated sample results were non-detect and qualified as “UJ”.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Equipment blank sample EB-01_210125 exhibited a surrogate recovery less than the lower warning limit for terphenyl-d14 at 47%. The sample results for base/neutral extractable DNCB are qualified as “UJ”.

Sample NYOW-04-PH007-B exhibited surrogate recoveries less than the lower warning limits for nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 at 31%, 39%, and 50%, respectively. The sample was re-extracted and reanalyzed outside of the holding time period. The initial sample results should be used for data interpretation and the result for base/neutral extractable DNCB is qualified as “UJ”.

Surrogates 2-fluorophenol, phenol-d5 and nitrobenzene-d5 recovered above the upper warning limit for CCV 680-656121/2. All associated sample and QC surrogates recovered within control limits; therefore, the laboratory reported the data.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS/SD sample NYOW-04-PH035-B exhibited an RPD greater than the control limit for DNP at 82%. The associated sample result was non-detect; qualification is not necessary.

MS/SD sample NYOW-04-PH035-B exhibited an RPD greater than the control limit for DNCB at 32%. The associated sample result was non-detect; qualification is not necessary.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

No field duplicate and parent sample pairs were collected as part of this SDG.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks that would not pass through the sieve: NYOW-04-PH035-B, NYOW-04-PH034-B, NYOW-04-PH033-B, NYOW-04-PH030-B, NYOW-04-PH029-B, NYOW-04-PH028-B, NYOW-04-PH025-B, NYOW-04-PH024-B, NYOW-04-PH023-B, NYOW-04-PH022-B, NYOW-04-PH019-B, NYOW-04-PH018-B, NYOW-04-PH017-B, NYOW-04-PH014-B, NYOW-04-PH013-B, NYOW-04-PH012-B, NYOW-04-PH009-B, NYOW-04-PH008-B, and NYOW-04-PH007-B. The rocks were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All

data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 19 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144952

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soil) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144952 | 280-144952-1 | NYOW-04-PH039-B | 1/26/21 | DNCB, DNP, Picric Acid, %M |
| 280-144952 | 280-144952-2 | NYOW-04-PH040-B | 1/26/21 | DNCB, DNP, Picric Acid, %M |
| 280-144952 | 280-144952-3 | NYOW-04-PH041-B | 1/26/21 | DNCB, DNP, Picric Acid, %M |
| 280-144952 | 280-144952-4 | NYOW-04-PH044-B | 1/26/21 | DNCB, DNP, Picric Acid, %M |
| 280-144952 | 280-144952-5 | NYOW-04-PH045-B | 1/26/21 | DNCB, DNP, Picric Acid, %M |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.6°C, 0.9°C, and 4.0°C. All samples were extracted and analyzed within holding time.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The continuing calibration verification (CCV) performed on 2/10/21 at 13:37 (680-655270/2) exhibited a %D greater than the control limit with a positive bias for DNP at 23.6%. There are no associated samples; qualification is not necessary.

The closing continuing calibration verifications (CCVC) 680-655680/31 and 680-655680/32 were performed 2 and 26 minutes outside the method-specified tuning window, respectively. The CCVCs passed for both target analytes; however, the results for associated soil samples are qualified as “UJ” based on Module 1 recommendations.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-04-PH040-B exhibited recoveries less than the lower warning limit for 2-fluorophenol, nitrobenzene-d5, and 2-fluorobiphenyl at 34%, 34%, and 41%, respectively. The

sample was re-extracted and reanalyzed outside of the holding time. The initial sample results for DNP and DNCB should be used for data interpretation and are qualified as “UJ”.

Sample NYOW-04-PH041-B exhibited a recovery less than the lower warning limit for 2-fluorobiphenyl at 41%. The sample was re-extracted and reanalyzed outside of the holding time. The initial sample results for DNCB should be used for data interpretation and are qualified as “UJ”.

Sample NYOW-04-PH071-B exhibited recoveries less than the lower warning limits for nitrobenzene-d5, 2-fluorophenol, 2-fluorobiphenyl, and terphenyl-d14 at 29%, 32%, 34%, and 52%, respectively. The sample was re-extracted and reanalyzed outside of the holding time. The initial sample results for DNP and DNCB should be used for data interpretation and are qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCS 680-655043/18-A exhibited a recovery greater than the upper warning limit for DNCB at 164%. The associated sample results were non-detect; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS/SD sample NYOW-04-PH052-B exhibited a RPD greater than the control limit for DNP at 28%. The associated sample results were non-detect; qualification is not necessary.

Picric Acid by Methods 8330A and 8330B:

SD sample NYOW-04-PH052-B exhibited a recovery less than the lower warning limit at 46%. The associated sample result was non-detect and is qualified as “UJ”.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210126 and NYOW-04-PH053-B, and PH-DUP-002_210126 and NYOW-04-PH063-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. Both field duplicate pairs met the precision criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks or vegetation that would not pass through the sieve: NYOW-04-PH039-B, NYOW-04-PH040-B, NYOW-04-PH041-B, NYOW-04-PH044-B, NYOW-04-PH045-B, NYOW-04-PH046-B, NYOW-04-PH047-B, NYOW-04-PH048-B, NYOW-04-PH051-B, NYOW-04-PH052-B, NYOW-04-PH052-B, NYOW-04-PH052-B, NYOW-04-PH053-B, PH-DUP-001_210126, NYOW-04-PH056-B, NYOW-04-PH057-B, NYOW-04-PH058-B, NYOW-04-PH061-B, NYOW-04-PH062-B, NYOW-04-PH063-B, PH-DUP-002_210126, NYOW-04-PH066-B, NYOW-04-PH067-B, NYOW-04-PH068-B, NYOW-04-PH071-B, NYOW-04-PH072-B, NYOW-04-PH073-B, NYOW-04-PH076-B, NYOW-04-PH077-B, NYOW-04-PH078-B. The rocks and vegetation were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 4 May 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144996 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144996 | 280-144996-1 | NYOW-04-PH065-B | 1/27/21 | DNCB, DNP, Picric Acid, %M |
| 280-144996 | 280-144996-2 | NYOW-04-PH064-B | 1/27/21 | DNCB, DNP, Picric Acid, %M |

[2]PH-DUP-002_210127 collected from NYOW-04-PH016-B
[3]PH-DUP-003_210127 collected from NYOW-04-PH026-B

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Two coolers were received by the laboratory at temperatures of 2.1°C and 2.4°C. All samples were extracted and analyzed within holding time with the exception of the equipment blank analysis for ***SVOCs***. Sample EB-01_210127 was re-extracted and reanalyzed outside of the holding time period for DNCB and DNP. The initial results extracted within hold should be used for data interpretation.

Sample nomenclature for NYOW-04-PHO42-B was corrected by the laboratory to NYOW-04-PH042-B.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

The continuing calibration verification (CCV) analyzed on 2/10/21 at 13:37 exhibited a %D greater than the control limit with a positive bias for 2,4-dinitrophenol at 23.6%. There are no associated samples; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

Surrogates 2-fluorophenol and phenol-d5 exhibited %Ds greater than the control limit in the continuing calibration verification (CCV 680-655888/4). The surrogates were within control limits in all associated samples and batch QC. On the basis of professional judgment, qualification is not necessary.

Picric Acid by Method 8330A and 8330B:

Equipment blank sample EB-01_210127 exhibited a recovery less than the lower warning limit for 1,2-dinitrobenzene at 71%. 1,2-Dinitrobenzene also failed the surrogate recovery criteria low for

method blank sample MB 280-525291/1-A and for laboratory control sample duplicate 280-525291/3-A. The reported result for the equipment blank is qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. LCSD were not performed for soil sample batches associated with 8270D analysis or for picric acid. Matrix spike duplicates were performed to assess precision in all instances. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCS/LCSD 680-655801/16-A/680-655801/17-A exhibited recoveries greater than the upper warning limit for DNCB at 177% and 148%, respectively. The associated equipment blank sample result was non-detect; qualification is not necessary.

LCS 680-655043/18-A exhibited a recovery greater than the upper warning limit for DNCB at 164%. The associated soil sample results were non-detect; qualification is not required.

Due to laboratory error, DNP was not spiked into the LCS associated with the equipment blank sample. The laboratory re-extracted and reanalyzed the sample outside of the 2X holding time rejection threshold and reported both sets of non-detect results. The quantitation report did not indicate a response for DNP and no peaks within the retention time window were present on the chromatogram. It is recommended that the initial sample result be used for data interpretation on the basis of professional judgment. The associated sample result is qualified as “UJ”.

Picric Acid by Methods 8330A and 8330B:

LCS/LCSD 280-525291/3-A exhibited a relative percent difference greater than the control limit at 21%. The associated sample results were non-detect; qualification is not required.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. A MS/MSD was not performed in conjunction with the equipment blank sample for 8270D analysis; however, an LCSD was performed. All MS/SD recoveries and RPDs were within acceptance criteria.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Three field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210127 and NYOW-04-PH043-B, PH-DUP-002_210127 and NYOW-04-PH016-B, and PH-DUP-003_210127 and NYOW-04-PH026-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All of the field duplicate sample pairs met the precision criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, wood, or leaves that would not pass through the sieve: NYOW-04-PH065-B, NYOW-04-PH064-B, NYOW-04-PH060-B, NYOW-04-PH059-B, NYOW-04-PH043-B, PH-DUP-001_210127, NYOW-04-PH042-B, NYOW-04-PH016-B, PH-DUP-002_210127, NYOW-04-PH015-B, NYOW-04-PH020-B, NYOW-04-PH021-B, NYOW-04-PH026-B, PH-DUP-003_210127, NYOW-04-PH027-B, NYOW-04-PH031-B, NYOW-04-PH032-B, NYOW-04-SL083-A, NYOW-04-PH083-B, and NYOW-04-PH083-C. The rocks, wood, or leaves were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 4 May 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-145030 Revision 3

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 1.3°C. All samples were extracted and analyzed within holding time.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The continuing calibration verification (CCV) performed on 2/22/21 at 17:22 (680-656575/4) exhibited a %D greater than the control limit with a positive bias for DNCB at 20.5%. The

associated sample results are for the reanalysis of sample NYOW-04-PH079-B; qualification is not necessary.

The CCV performed on 2/23/21 at 03:08 (680-656575/30) exhibited a gross exceedance of the %D greater than the control limit with negative bias for DNP at 66.8%. The associated sample results are for the reanalysis of sample NYOW-04-PH079-B; qualification is not necessary.

The CCV performed on 2/10/21 at 13:37 (680-655270/2) exhibited a %D greater than the control limit with positive bias for DNP at 23.6%. The are no associated investigative samples; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits with the exceptions noted. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

SVOCs by Method 8270D:

CCVs 680-656078/32 exhibited internal standard responses greater than the upper limit for 1,4-dichlorobenzene-d4. The internal standard is not used to quantitate DNP or DNCB; qualification is not necessary.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and the equipment blank.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-04-PH079-B exhibited surrogate recoveries less than the lower warning limit for 2,4,6-tribromophenol and 2-fluorophenol at 29% and 33%, respectively. The laboratory re-extracted and reanalyzed the sample outside of the holding time period and the surrogates recovered within control. The sample result for acid extractable DNP is qualified as “UJ”.

Picric Acid by Methods 8330A and 8330B:

Sample NYOW-04-PH002-C exhibited a recovery less than the lower control limit for 1,2-dinitrobenzene at 80%. The associated sample result was non-detect and is qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative

percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCS/LCSD 680-655801/16-A/17-A exhibited recoveries greater than the upper warning limits for DNCB at 177% and 148%, respectively. The associated sample results were non-detect; qualification is not necessary.

Due to laboratory error, DNP was not spiked into the LCS associated with the equipment blank sample. The laboratory re-extracted and reanalyzed the sample outside of the 2X holding time rejection threshold and reported both sets of non-detect results. The quantitation report did not indicate a response for DNP and no peaks within the retention time window were present on the chromatogram. It is recommended that the initial sample result be used for data interpretation on the basis of professional judgment. The associated sample result is qualified as “UJ”.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS/SD sample 680-195051-A-16-E/F did not recover for DNP. The spiked sample did not originate from the Site; qualification is not necessary.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Three field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210128 and NYOW-04-PH081-B, SL-DUP-001_210128 and NYOW-04-SL081-A, and SL-DUP-002_210128 and NYOW-04-SL002-A). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All of the field duplicate sample pairs met the acceptance criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, vegetation, and/or glass that would not pass through the sieve: NYOW-04-SL081-A, NYOW-04-PH081-B, NYOW-04-PH081-C, SL-DUP-001_210128, PH-DUP-001_210128, NYOW-04-SL079-A, NYOW-04-PH079-B, NYOW-04-PH079-C, NYOW-04-SL002-

A, SL-DUP-002_210128, NYOW-04-PH002-B, and NYOW-04-PH002-C. The rocks, vegetation, and/or glass were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 19 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-145058 Revision 2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-145058 | 280-145058-1 | NYOW-04-SL004-A | 1/29/21 | DNCB, DNP, Picric Acid, %M |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data*

*Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 1.3°C. All samples were extracted and analyzed within holding time.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and the equipment blank.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exception noted below. An LCSD was not performed for the 8270D soil sample batch or for the picric acid preparation batches. A matrix spike duplicate was analyzed to evaluate precision in each instance.

SVOCs Method 8270D:

LCS/LCSD 680-654810/16-A/680-654810/17-A exhibited recoveries greater than the upper control limit for DNCB at 146% and 176%, respectively. The associated equipment blank sample result was non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS/SD sample 280-145209-B-2-C exhibited a RPD greater than the control limit for DNP at 21%. The spiked sample results were reported in a different SDG; qualification is not necessary.

MS/SD sample 280-145209-B-2-E exhibited a RPD greater than the control limit for DNCB at 22%. The spiked sample results were reported in a different SDG; qualification is not necessary.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

No field duplicates were collected as part of this SDG.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and/or vegetation that would not pass through the sieve: NYOW-04-SL004-A, NYOW-04-PH004-B, NYOW-04-PH004-C, NYOW-04-SL005-A, NYOW-04-PH005-B, and NYOW-04-PH005-C. The rocks and/or vegetation were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. No results were qualified as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 30 April 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM: 280-145110

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in February 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330B

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.8°C, 1.0°C, and 3.6°C. All samples were extracted and analyzed within holding time.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Samples NYOW-04-WL083-A, NYOW-04-WL081-A, NYOW-04-WL079-A, NYOW-04-WL005-A, NYOW-04-WL004-A, and NYOW-04-WL002-A exhibited surrogate recoveries less than the lower warning limits for terphenyl-d14 at 48%, 44%, 43%, 29%, 43%, and 45%, respectively. The sample results for base/neutral extractable DNCB are qualified as “UJ”.

Picric Acid by Method 8330B:

Samples WL-DUP-001_210201, NYOW-04-WL079-A, and NYOW-04-WL004-A exhibited surrogate recoveries less than the lower warning limit for 1,2-dinitrobenzene at 61%, 82%, and 68%, respectively. The associated sample results for WL-DUP-001_210201, NYOW-04-WL079-A, and NYOW-04-WL004-A are qualified as “UJ”.

Samples NYOW-04-WL083-A and NYOW-04-WL002-A exhibited surrogate recoveries greater than the upper warning limit for 1,2-dinitrobenzene at 215% and 134%, respectively. The associated sample results were non-detect; qualification is not necessary.

LCSD 280-525291/3-A and method blank sample 280-525291/1-A exhibited recoveries less than the lower warning limit for surrogate 1,2-dinitrobenzene. The laboratory did not perform re-extraction and reanalysis because the associated samples were outside of the holding time rejection threshold. This justification was noted in the laboratory case narrative.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS 680-654810/16-A exhibited a recovery greater than the upper warning limit for DNCB at 146%. The associated sample results were non-detect; qualification is not necessary.

LCSD 680-654810/17-A exhibited a recovery greater than the upper warning limit for DNCB at 176%. The associated sample results were non-detect; qualification is not necessary.

Picric Acid by Method 8330B:

LCS/LCSD 280-525291/3-A exhibited a RPD greater than the control limit at 21%. The associated sample results were non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. MS/SDs were not performed; the laboratory analyzed a LCSD to evaluate precision.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (WL-DUP-001_210201 and NYOW-04-WL079-A, and WL-DUP-002_210201 and NYOW-04-WL004-A). For sample results that are greater than 5X the LOQ, the RPD must be less than 30%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All analytes met the precision criteria for these field duplicate pairs.

Consistent with the laboratory SOP and method 3535A, sample NYOW-04-WL005-A required vacuum filtration through glass fiber filter paper prior to analysis due to turbidity. The filtered sample was returned to the original sample container after filtration and the surrogate was added to the container. Method 3535A indicates that use of a filter aid will not result in a loss of method performance if clogging is encountered. During the solid phase extraction (SPE) of picric acid by SW-846 Method 3535, the laboratory noted that several samples clogged the SPE cartridge (i.e., flow rate < 4 mL/minute): WL-DUP-001_210201, NYOW-04-WL083-A, and NYOW-04-WL004-A. The extraction volumes ranged from 31.7 mL to 468 mL, indicating that sufficient volume was extracted through the filter to avoid re-preparation at a sample dilution. The surrogate recoveries of 1,2-DNB for these four samples were 103%, 61%, 215%, and 68% respectively. The lower warning limit for 1,2-DNB is 83%; therefore, the sample results for WL-DUP-001_210201 and NYOW-04-WL004-A were qualified during validation as “UJ”. The surrogates monitor extraction efficiency, and the recoveries for the affected samples were all well above the rejection threshold (i.e., 10%). The sample LOQs were adjusted accordingly, and the Project Quantitation Limit Goal (PQLG, 2 µg/L) was not met. The sample LODs are below the Project Action Level.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 16 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-145163

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in February 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-145163 | 280-145163-1 | NYOW-04-SL036-A | 2/2/21 | DNCB, DNP, Picric Acid, %M |
| 280-145163 | 280-145163-2 | NYOW-04-PH036-B | 2/2/21 | DNCB, DNP, Picric Acid, %M |

[1]PH-DUP-001_210202 collected from NYOW-04-PH036-B

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 1.3°C. All samples were extracted and analyzed within holding time.

There was an extra zero in the field duplicate sample ID. The sample was listed as PH-DUP-001_2102020 on the COC instead of PH-DUP-001_210202.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits with the exceptions noted below. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

SVOCs Method 8270D:

The internal standard response of naphthalene-d8 for closing calibration verification CCVC 680-656423/31 was biased high outside of acceptance limits at 208%. The associated target analyte (DNCB) %D was within control limits at 9.1%. All other samples and batch QC contained internal standards within acceptance limits. On the basis of professional judgment, qualification is not necessary.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCSD 680-655153/18-A exhibited a recovery greater than the upper warning limit for DNCB at 135%. The associated sample results were non-detect; qualification is not necessary.

LCSD 680-655153/16-A exhibited a RPD greater than the control limit for DNP at 48%. The associated sample results were non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

SD sample 280-145209-B-2-C exhibited a RPD greater than the control limit for DNP at 21%. The spiked sample is a Site sample with results reported in a different SDG; qualification is not necessary.

SD sample 280-145209-B-2-C exhibited a RPD greater than the control limit for DNCB at 22%. The spiked sample is a Site sample with results reported in a different SDG; qualification is not necessary.

Picric Acid by Methods 8330A and 8330B:

MS/SD sample PH-DUP-001_210202 exhibited recoveries less than the lower control limit at 34% and 33%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

Insufficient sample volume was available to perform a MS/SD associated with preparation batch 280-525569 associated with the equipment blank sample analysis. A LCSD was performed to evaluate laboratory precision.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210202 and NYOW-04-PH036-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. The field duplicate pair met the precision criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and some vegetation that would not pass through the sieve: NYOW-04-SL036-A, NYOW-04-PH036-B, PH-DUP-001_210202, NYOW-04-PH036-C, NYOW-04-SL080-A, NYOW-04-PH080-B, NYOW-04-PH080-C, NYOW-04-SL082-A, NYOW-04-PH082-B, NYOW-04-PH082-C. The rocks and/or vegetation were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All

data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Two coolers were received by the laboratory at temperatures of 1.1°C and 2.0°C. All samples were extracted and analyzed within holding time.

The container labels for the following samples did not match the information listed on the COC: NYOW-04-PH075 and NYOW-04-PH074. Bluestone instructed the laboratory to log in accordance with the container label: NYOW-04-PH075-B and NYOW-04-PH074-B.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

<u>SVOCs Method 8270D:</u>

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard

has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits with the exceptions noted below. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

SVOCs Method 8270D:

The internal standard response of naphthalene-d8 for closing calibration verification CCVC 680-656423/31 was biased high outside of acceptance limits at 208%. The associated target analyte (DNCB) %D was within control limits at 9.1%. All other samples and batch QC contained internal standards within acceptance limits. On the basis of professional judgment, qualification is not necessary.

The internal standard response of dichlorobenzene-d4 for closing calibration verification CCVC 680-656273/30 was biased high outside of acceptance limits at 208%. No target analytes are quantitated by this internal standard; qualification is not necessary.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blank.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

Surrogate recoveries of 2-fluorobiphenyl, nitrobenzene-d5, and terphenyl-d14 were less than the lower control limits for matrix spike sample NYOW-04-PH085-C. The parent sample's surrogate recoveries were within control limits; no qualification is required.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCS/LCSD 680-655273/7-A/680-655273/8-A exhibited recoveries greater than the upper warning limit for DNCB at 149% and 158%, respectively. The associated sample results were non-detect; qualification is not necessary.

LCS 680-655979/22-A exhibited a recovery greater than the upper warning limit for DNCB at 169%. The associated sample results were non-detect; qualification is not required.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS/SD sample NYOW-04-PH085-C exhibited recoveries greater than the upper control limit for DNCB at 184% and 154%, respectively. In addition, the MS/SD RPD was greater than the control limit at 21%. The associated sample result was non-detect; qualification is not necessary.

SD sample NYOW-04-PH085-C exhibited a RPD greater than the control limit for DNP at 89%. The associated sample result was non-detect; qualification is not necessary.

MS/SD sample NYOW-04-PH084-B exhibited RPDs greater than the control limit for DNP at 21% and DNCB at 22%. The associated sample result was non-detect; qualification is not necessary.

Picric Acid by Methods 8330A and 8330B:

MS/SD sample NYOW-04-PH084-B exhibited recoveries less than the lower control limit at 28% and 26%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

MS/SD sample NYOW-04-PH085-C exhibited recoveries less than the lower control limit at 38% and 40%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

Insufficient sample volume was available to perform a MS/SD associated with preparation batch 280-525569 associated with the equipment blank sample analysis. A LCSD was performed to evaluate laboratory precision.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Three field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210203 and NYOW-04-PH085-B, PH-DUP-002_210203 and NYOW-04-PH006-C, and PH-DUP-003_210203 and NYOW-04-PH074-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. The field duplicate and parent sample pairs met the precision criteria.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks, occasional vegetation, and plastic fragments that would not pass through the sieve: NYOW-04-SL084-A, NYOW-04-PH084-B, NYOW-04-PH084-C, NYOW-04-SL085-A, NYOW-04-PH085-B, PH-DUP-001_210203, NYOW-04-PH085-C, NYOW-04-SL037-A, NYOW-04-PH037-B, NYOW-04-PH037-C, NYOW-04-SL038-A, NYOW-04-PH038-B, NYOW-04-PH038-C, NYOW-04-SL006-A, NYOW-04-PH006-B, NYOW-04-PH006-C, PH-DUP-002_210203, NYOW-04-PH075-B, NYOW-04-PH074-B, and PH-DUP-003_210203. The rocks, vegetation, and/or plastic were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 19 April 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM: 280-145271 Revision 2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in February 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Methods 8330A (soils) and 8330B (groundwater and equipment blank)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-145271 | 280-145271-1 | NYOW-04-WL006-A | 2/04/21 | DNCB, DNP, Picric Acid |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.6°C, 0.9°C, 1.1°C, 1.5°C, and 2.1°C. All samples were extracted and analyzed within holding time.

One of six containers was labeled differently than the COC for sample NYOW-04-SL001-A. The container indicated NYOW-04-SL00-A. The sample was logged in accordance with the COC as NYOW-04-SL001-A.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The continuing calibration verification (CCV) performed on 2/22/21 at 16:42 (680-656574/3) exhibited a %D greater than the control limit with a positive bias for DNCB at 22.2%. The associated sample results were non-detect and qualified as “UJ”.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits with the exceptions noted. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

SVOCs by Method 8270D:

CCVs 680-656078/32, 680-656273/30, 680-656423/31 exhibited internal standard responses greater than the upper limit for 1,4-dichlorobenzene-d4. The internal standard is not used to quantitate DNP or DNCB; qualification is not necessary.

CCV 680-656423/31 exhibited an internal standard response greater than the upper limit for acenaphthene-d10 at 202%. The CCV is associated with DNCB, which is quantitated by naphthalene-d8; qualification is not necessary.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and equipment blanks.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-04-WL080-A exhibited a surrogate recovery less than the lower warning limit for terphenyl-d14 at 49%. The sample results for base/neutral extractable DNCB are qualified as "UJ".

Sample NYOW-04-WL082-A exhibited surrogate recoveries less than the lower warning limits for 2,4,6-tribromophenol, nitrobenzene-d5, 2-fluorobiphenyl, and terphenyl-d14 at 39%, 33%, 35%, and 14%, respectively. There was insufficient sample volume to perform a re-extraction. The results for DNP and DNCB are qualified as "UJ".

Picric Acid by Methods 8330A and 8330B:

Samples NYOW-04-WL036-A, NYOW-04-WL082-A, and NYOW-04-WL084-A exhibited recoveries greater than the upper control limit for 1,2-dinitrobenzene at 139%, 180%, and 200%, respectively. The associated sample results were non-detect; qualification is not necessary.

Samples NYOW-04-WL006-A and NYOW-04-WL037-A exhibited recoveries less than the lower control limit for 1,2-dinitrobenzene at 14% and 75%, respectively. The associated sample results were non-detect and are qualified as "UJ".

Sample NYOW-04-WL080-A did not recover (i.e., 0%) for 1,2-dinitrobenzene. The sample clogged the solid phase extraction cartridge during extraction and evidence of matrix interference was present. The laboratory did not perform a re-extraction and reanalysis. The associated non-detect sample result is recommended for rejection and qualified as "X".

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

LCSD 680-655153/18-A exhibited a recovery greater than the upper warning limit for DNCB at 135%. The associated sample results were non-detect; qualification is not required.

LCS 680-655979/22-A recovered above the upper warning limit for DNCB at 169%. The associated sample results were non-detect; qualification is not required.

LCS 680-656149/21-A recovered above the upper control limit for DNCB at 231%. The associated sample results were non-detect; qualification is not required.

LCS/LCSD 680-655153/16-A exhibited a RPD greater than the control limit for DNP at 48%. The associated sample results were non-detect; qualification is not necessary.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS sample 280-145317-B-2-A exhibited a recovery greater than the upper control limit for DNCB. The spiked sample results were reported in a different SDG; qualification is not necessary.

MS/SD sample 280-145209-B-7-D exhibited recoveries greater than the upper control limit for DNCB. The MS/SD RPDs were also greater than the control limit for DNP and DNCB. The spiked sample results were reported in a different SDG; qualification is not necessary.

MS/SD sample NYOW-04-PH001-B exhibited a RPD greater than the control limit for DNCB at 29%. The associated sample results were non-detect; qualification is not necessary.

Picric Acid by Methods 8330A and 8330B:

MS/SD sample NYOW-04-SL001-A exhibited recoveries less than the lower warning limit for picric acid at 38% and 41%, respectively. The associated sample result was non-detect and is qualified as “UJ”.

MS/SD sample 280-145317-C-2-C exhibited a recovery and RPD greater than the control limits. The spiked sample results were reported in a different SDG; qualification is not necessary.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210204 and NYOW-04-PH001-C). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All analytes met the precision criteria for the field duplicate pair.

During the solid phase extraction (SPE) of picric acid by SW-846 Method 3535, the laboratory noted that several groundwater samples clogged the SPE cartridge (i.e., flow rate < 4 mL/minute): NYOW-04-WL006-A, NYOW-04-WL037-A, NYOW-04-WL080-A, and NYOW-04-WL036-A. The extraction volumes indicate that sufficient volume was extracted through the filter to avoid re-preparation at a sample dilution. The surrogate recoveries of 1,2-DNB for these four samples

recovered above the lower control limit with the exception of sample NYOW-04-WL080-A. The result for NYOW-04-WL080-A was rejected.

The following samples were air dried and sieved in accordance with the procedure; however, the samples contained rocks and/or vegetation that would not pass through the sieve: NYOW-04-PH070-B, NYOW-04-PH069-B, NYOW-04-PH055-B, NYOW-04-PH054-B, NYOW-04-PH050-B, NYOW-04-PH049-B, NYOW-04-SL003-A, NYOW-04-PH003-B, NYOW-04-PH003-C, NYOW-04-SL001-A, NYOW-04-PH001-B, NYOW-04-PH001-C, PH-DUP-001_210204, NYOW-04-PH011-B, and NYOW-04-PH010-B. The rocks and vegetation were removed and not extracted.

All soil sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP and DNCB. All PQLGs for picric acid were met. Groundwater sample LOQs were consistent with the PQLGs with the following exceptions for picric acid: NYOW-04-WL080-A and NYOW-04-WL036-A.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, except for the result recommended for rejection. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 4 May 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM: 280-145317 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in February 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) 2,4-dinitrochlorobenzene (DNCB) and 2,4-dinitrophenol (DNP) by SW-846 Method 8270D
- Picric Acid by SW-846 Method 8330B

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-145317 | 280-145317-1 | NYOW-04-WL038-A | 2/5/21 | DNCB, DNP, Picric Acid |
| 280-145317 | 280-145317-2 | NYOW-04-WL001-A | 2/5/21 | DNCB, DNP, Picric Acid |
| 280-145317 | 280-145317-3 | NYOW-04-WL003-A | 2/5/21 | DNCB, DNP, Picric Acid |
| 280-145317 | 280-145317-4 | EB-01_210205 | 2/5/21 | DNCB, DNP, Picric Acid |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January

2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Two coolers were received by the laboratory at temperatures of 3.0°C and 3.8°C. All samples were extracted and analyzed within holding time.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

DNCB is a non-routine analyte, and a second source is not readily available to purchase. The laboratory standard is a custom standard from one vendor; a second vendor for a DNCB standard has not been identified. Therefore, the laboratory control samples are completed from a different ampule than the calibration (but still the same vendor lot). The daily CCVs are completed with the same standards from the ICAL. The laboratory maintains Department of Defense ELAP certification for DNCB. On the basis of professional judgment, qualification of the data is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits with the exceptions noted below. All samples, standards, and QC samples were spiked with internal standards for Method 8270D.

SVOCs Method 8270D:

The internal standard response of naphthalene-d8 for closing calibration verification CCVC 680-656423/31 was biased high outside of acceptance limits at 208%. The associated target analyte (DNCB) %D was within control limits at 9.1%. All other samples and batch QC contained internal standards within acceptance limits. On the basis of professional judgment, qualification is not necessary.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks and the equipment blank.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

The surrogate recovery of terphenyl-d14 was less than the lower warning limit for sample NYOW-04-WL001-A at 30%. The associated non-detect sample result for base/neutral extractable DNCB is qualified as “UJ”.

Picric Acid by Method 8330B:

Samples NYOW-04-WL003-A and NYOW-04-WL038-A exhibited surrogate recoveries greater than the upper control limit for 1,2-dinitrobenzene at 1,607% and 229%, respectively. The associated sample results were non-detect; qualification is not necessary.

Sample NYOW-04-WL001-A exhibited a surrogate recovery less than the lower warning limit for 1,2-dinitrobenzene at 13%. The associated sample result was non-detect and is qualified as “UJ”.

Sample EB-01_210205 exhibited a surrogate recovery less than the lower control limit 1,2-dinitrobenzene at 5%. The associated sample result was non-detect and is recommended for rejection (i.e., “X” qualified). The surrogate recoveries in the associated method blank and laboratory control sample were within the control limits.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria. For picric acid analysis, LCSD were not performed.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS sample NYOW-04-WL001-A exhibited a recovery greater than the upper control limit for DNCB at 134%. The associated sample result was non-detect; qualification is not necessary.

Picric Acid by Method 8330B:

SD sample NYOW-04-WL001-A exhibited a recovery greater than the upper warning limit at 139%. In addition, the MS/SD RPD was greater than the control limit at 45%. The associated sample result was non-detect; qualification is not necessary.

## DUAL COLUMN IMPRECISION

All sample results were non-detect; therefore, column comparisons were not performed.

## COMMENTS

No field duplicates were collected as part of this SDG.

During the solid phase extraction process, samples NYOW-04-WL001-A and NYOW-04-WL003-A clogged the SPE cartridge (i.e., flow rate < 4 mL/minute). The extraction volumes were sufficient to avoid re-preparation at a sample dilution. The surrogate recovery of 1,2-DNB for sample NYOW-04-WL001-A was greater than the lower warning limit and the sample result was qualified during validation as “UJ”. The surrogate recovery of 1,2-DNB for sample NYOW-04-WL003-A was greater than the upper control limit; however, the sample result was non-detect and not affected by positive bias. Given that a limited sample volume was extracted before the cartridge clogged for sample NYOW-04-WL003-A (7.1 mL), the non-detect result is qualified as “UJ” on the basis of professional judgment. The LOQs for picric acid were adjusted accordingly.

All groundwater sample LOQs were slightly above the project quantitation limit goals (PQLGs) for DNP. All PQLGs for DNCB were met. The LOQs for picric acid were greater than the PQLG for samples NYOW-04-WL001-A and NYOW-04-WL003-A.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, except for the result recommended for rejection. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 92%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-144465-1 (Revision 1)

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the methods specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144465 | 280-144465-1 | NYOW-05-SL006-A | 1/8/2021 | Grain Size |
| 280-144465 | 280-144465-2 | NYOW-05-PH006-B | 1/8/2021 | Grain Size |
| 280-144465 | 280-144465-3 | NYOW-05-PH006-C | 1/8/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.8°C, 0.9°C, and 0.9°C. All requested target analytes were reported.

Bluestone notified the laboratory that samples NYOW-05-SL021-A, NYOW-05-PH021-B, and NYOW-05-PH021-C were not collected for grain size and should be removed from the COC.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control (QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.0°C, 1.5°C, and 2.5°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control

(QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

**COMMENTS**

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

|---|---|---|---|---|
| 280-144558 | 280-144558-1 | NYOW-05-SL003-A | 1/12/2021 | Grain Size |
| 280-144558 | 280-144558-2 | NYOW-05-PH003-B | 1/12/2021 | Grain Size |
| 280-144558 | 280-144558-3 | NYOW-05-PH003-C | 1/12/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 1.2°C, 4.1°C, 4.3°C, 4.6°C, 5.6°C, and 5.9°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No field quality control

(QC) samples were submitted with this SDG. No project action limits or detection limits are associated with Grain Size Distribution.

**COMMENTS**

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-144621-1(Revision 1)

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the methods specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144621 | 280-144621-1 | NYOW-05-SL012-A | 1/13/2021 | Grain Size |
| 280-144621 | 280-144621-2 | CANCELLED | 1/13/2021 | Grain Size |
| 280-144621 | 280-144621-3 | NYOW-05-PH012-C | 1/13/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.3°C, 0.4°C, 0.4°C, 2.4°C, and 3.0°C. All requested target analytes were reported.

The jar for sample NYOW-05-PH012-B broke during subsequent shipment to Seattle for analysis. The sample was completely submerged in water and was compromised. Bluestone instructed the laboratory to cancel the analysis of this sample.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and

include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.6°C, 0.6°C, 0.8°C, 0.9°C, and 1.7°C. All requested target analytes were reported.

Container IDs are missing "SL" or "PH" for each sample. Samples were logged according to the COC. All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144651-3

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) by the method specified below.

- Total Organic Carbon (TOC) by SW-846 Method 9060A

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144651 | 280-144651-1 | NYOW-05-SL016-A | 1/14/2021 | TOC |
| 280-144651 | 280-144651-2 | NYOW-05-PH016-B | 1/14/2021 | TOC |
| 280-144651 | 280-144651-3 | NYOW-05-PH016-C | 1/14/2021 | TOC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the DoD *General Data Validation Guidelines* (EDQW 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as “X” should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.2°C, 0.2°C, 0.8°C, 0.9°C, and 1.7°C. All requested target analytes were reported.

The container IDs on 4 oz soil jars from the following samples were missing "PH" or "SL":

NYOW-05-SL016-A, NYOW-05-PH016-B, and NYOW-05-PH016-C. The samples were logged according to the COC.

All samples were analyzed outside of the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). The positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, calibration correlation coefficients and initial calibration verification (ICV) results were subject to review. Minimum calibration levels were also verified. ICVs were performed after each initial calibration. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration verification (CCV) frequencies and recoveries were subject to review. CCVs were performed after every ten samples and at the end of each sequence. All continuing calibration recoveries met the acceptance criteria.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial calibration blanks, and continuing calibration blanks. Method blanks were prepared and analyzed with each preparation batch. Initial and continuing calibration blanks were performed at the beginning of each sequence and after every ten samples, respectively. TOC was not detected in the initial calibration blanks, continuing calibration blanks or the method blanks.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. A LCS was performed with each sample batch; LCSD were not performed. All LCS recoveries met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria and were performed at the required frequency.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for TOC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the DoD *General Data Validation Guidelines* (EDQW 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.3°C, 0.4°C, 0.4°C, 2.4°C, and 3.0°C. All requested target analytes were reported.

All samples were analyzed outside of the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). The positive detections are qualified as "J-" and non-detects are qualified as "UJ".

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, calibration correlation coefficients and initial calibration verification (ICV) results were subject to review. Minimum calibration levels were also verified. ICVs were performed after each initial calibration. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration verification (CCV) frequencies and recoveries were subject to review. CCVs were performed after every ten samples and at the end of each sequence. All continuing calibration recoveries met the acceptance criteria.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial calibration blanks, and continuing calibration blanks. Method blanks were prepared and analyzed with each preparation batch. Initial and continuing calibration blanks were performed at the beginning of each sequence and after every ten samples, respectively. TOC was not detected in the initial calibration blanks, continuing calibration blanks or the method blanks.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. A LCS was performed with each sample batch; LCSD were not performed. All LCS recoveries met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria and were performed at the required frequency.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for TOC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144550-3

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) by the method specified below.

- Total Organic Carbon (TOC) by SW-846 Method 9060A

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144550 | 280-144550-1 | NYOW-05-SL003-A | 1/12/2021 | TOC |
| 280-144550 | 280-144550-2 | NYOW-05-PH003-B | 1/12/2021 | TOC |
| 280-144550 | 280-144550-3 | NYOW-05-PH003-C | 1/12/2021 | TOC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the DoD *General Data Validation Guidelines* (EDQW 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the

originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 1.2°C, 4.1°C, 4.3°C, 4.6°C, 5.6°C, and 5.9°C. All requested target analytes were reported.

One of 16 containers was received broken for sample NYOW-05-SL003-A. One of five containers for sample NYOW-05-PH003-C was received with a crack in the side of the lid. The sample was not compromised, and the lid was replaced.

All samples were analyzed outside of the holding time period for TOC (i.e., 28 days) but within the holding time rejection threshold (56 days). The positive detections are qualified as "J-" and non-detects are qualified as "UJ".

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples analyzed within the specified holding time? | | X |

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, calibration correlation coefficients and initial calibration verification (ICV) results were subject to review. Minimum calibration levels were also verified. ICVs were performed after each initial calibration. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration verification (CCV) frequencies and recoveries were subject to review. CCVs were performed after every ten samples and at the end of each sequence. All continuing calibration recoveries met the acceptance criteria.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial calibration blanks, and continuing calibration blanks. Method blanks were prepared and analyzed with each preparation batch. Initial and continuing calibration blanks were performed at the beginning of each sequence and after every ten samples, respectively. TOC was not detected in the initial calibration blanks, continuing calibration blanks or the method blanks.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. A LCS was performed with each sample batch; LCSD were not performed. All LCS recoveries met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria and were performed at the required frequency.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for TOC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, calibration correlation coefficients and initial calibration verification (ICV) results were subject to review. Minimum calibration levels were also verified. ICVs were performed after each initial calibration. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration verification (CCV) frequencies and recoveries were subject to review. CCVs were performed after every ten samples and at the end of each sequence. All continuing calibration recoveries met the acceptance criteria.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial calibration blanks, and continuing calibration blanks. Method blanks were prepared and analyzed with each preparation batch. Initial and continuing calibration blanks were performed at the beginning of each sequence and after every ten samples, respectively. TOC was not detected in the initial calibration blanks, continuing calibration blanks or the method blanks.

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. A LCS was performed with each sample batch; LCSD were not performed. All LCS recoveries met the acceptance criteria.

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria and were performed at the required frequency with the exceptions noted below.

MS sample 280-144374-A-1 MS exhibited a recovery equal to the upper warning limit (i.e., 130%). The sample did not originate from the Site and the result was greater than 4X the spiked amount; qualification is not necessary.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for TOC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-144466-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144466 | 280-144466-1 | NYOW-05-SL006-A | 1/8/2021 | CEC |
| 280-144466 | 280-144466-2 | NYOW-05-PH006-B | 1/8/2021 | CEC |
| 280-144466 | 280-144466-3 | NYOW-05-PH006-C | 1/8/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.8°C, 0.9°C, and 0.9°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-144466-1.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

| 280-144501 | 280-144501-7 | NYOW-05-PH025-C | 1/11/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.0°C, 1.5°C, and 2.5°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-144501-1.

## COMMENTS

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-144550-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144550 | 280-144550-1 | NYOW-05-SL003-A | 1/12/2021 | CEC |
| 280-144550 | 280-144550-2 | NYOW-05-PH003-B | 1/12/2021 | CEC |
| 280-144550 | 280-144550-3 | NYOW-05-PH003-C | 1/12/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 1.2°C, 4.1°C, 4.3°C, 4.6°C, 5.6°C, and 5.9°C. All requested target analytes were reported.

One of 16 containers was received broken for sample NYOW-05-SL003-A. One of five containers for sample NYOW-05-PH003-C was received with a crack in the side of the lid. The sample was not compromised, and the lid was replaced.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-144550-1.

**COMMENTS**

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

| 280-144651 | 280-144651-3 | NYOW-05-PH016-C | 1/14/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.2°C, 0.2°C, 0.8°C, 0.9°C, and 1.7°C. All requested target analytes were reported.

The container IDs on 4 oz soil jars from the following samples were missing "PH" or "SL":

NYOW-05-SL016-A, NYOW-05-PH016-B, and NYOW-05-PH016-C. The samples were logged according to the COC.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-144651-1.

**COMMENTS**

No field duplicate and parent sample pairs were collected as part of this SDG. No field blanks were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 11 May 2021

**SUBJECT:** New York Ordnance Works Groundwater S2BVEM: 280-144706-1 Revision 3

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of groundwater samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144706 | 280-144706-1 | NYOW-05-WL016-A | 1/15/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |
| 280-144706 | 280-144706-2 | NYOW-05-WL017-1-A | 1/15/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |
| 280-144706 | 280-144706-3 | NYOW-05-WL019-A | 1/15/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144706 | 280-144706-4 | EB-01_210115 | 1/15/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. One cooler was received by the laboratory at a temperature of 0.4°C.

Sample NYOW-05-WL016-A was re-extracted outside of the holding time period for ***SVOCs*** on the fourteenth day. The initial analysis exhibited a surrogate recovery below the rejection threshold; therefore, the reanalysis should be used for data interpretation. The results are qualified as "UJ".

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs and SVOCs with SIM (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

<u>SVOCs by Method 8270D:</u>

Continuing calibration verification (CCV) 680-654183/2 exhibited %Ds greater than the control limit for with positive biases for 4-chloroaniline (23.4%), hexachlorocyclopentadiene (22.9%), 4-bromophenyl phenyl ether (32.4%), 2-chlorophenol (28.1%), 2,4-dimethylphenol (26.3%), 4-chloro-3-methylphenol, (24.5%), hexachloroethane (24.1%), and 3&4-methylphenol (21.7%), The associated sample results for the reanalysis of sample NYOW-05-WL016-A and the results were previously qualified; no further action is necessary.

CCV 680-654183/3 exhibited a %D greater than the control limit for benzaldehyde at 22.4%. The associated sample result is for the reanalysis of sample NYOW-05-WL016-A and the result was previously qualified; no further action is necessary.

CVCs 680-654183/29 and 680-654183/2 exhibited RRFs less than the method and Module 1 recommendations for hexachlorobenzene and pentachlorophenol. A CCV was performed at the LOQs and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

Closing CCV 680-653661/30 exhibited RRFs less than the method and Module 1 recommendations for hexachlorobenzene and pentachlorophenol. The associated sample results are qualified as "UJ".

CCV 680-653661/10 exhibited a %D greater than the control limit for benzaldehyde at 23.8%. The associated sample results are qualified as "UJ".

Metals by Method 6010C:

Low-level CCVs 280-525300/40 and 280-525300/54 exhibited recoveries less than the lower warning limit for selenium at 74% and 73%. The associated sample results were non-detect and are qualified as "UJ".

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

SVOCs by 8270D with SIM:

Equipment blank sample EB-01_210115 exhibited a positive detection for naphthalene above the LOQ at 0.097 µg/L. The associated sample results were greater than the LOQ but less than 5X the blank amount and are qualified as "J+".

Metals by Method 6010C:

Preparation blank 280-524875/1-A exhibited positive detections for barium, calcium, and iron below the LOQ at 0.892 µg/L, 234 µg/L, and 23 µg/L, respectively. The positive equipment blank sample result for barium is qualified as "U" at the LOD and was not used to evaluate contamination originating from field equipment decontamination procedures. The results for calcium and iron were either greater than the LOQ or non-detect; qualification is not necessary.

Metals by Method 6020A:

The initial and continuing calibration blanks associated with analysis batch 280-525115 exhibited positive detections for thallium below the LOQ ranging from 0.163 µg/L to 0.227 µg/L. The associated positive detections were below the LOQ are qualified as "U" at the LOD or LOQ.

Mercury by Method 7470A:

Preparation blank sample 280-524845/1-A exhibited a positive detection for 0.0295 µg/L. The associated sample results were non-detect; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-05-WL016-A exhibited surrogate recoveries less than the lower warning limit for 2,4,6-tribromophenol (38%), 2-fluorobiphenyl (39%), and terphenyl-d14 (7%) during the initial analysis. The sample was re-extracted outside of the holding time period (7 days) but within 2X the holding time. The reanalysis should be used for data interpretation. The reanalysis also exhibited a surrogate recovery less than the lower warning limit for terphenyld14 at 38%. The associated base/neutral (B/N) extractable compounds were non-detect and are qualified as "UJ".

Samples NYOW-05-WL017-1-A and NYOW-05-WL019-1-A exhibited surrogate recoveries less than the lower warning limit for terphenyl-d14 at 34% and 12%, respectively. The associated B/N positive detections are qualified as "J-" and non-detects are qualified as "UJ".

SVOCs by Method 8270D with SIM:

Sample NYOW-05-WL016-A exhibited surrogate recoveries less than the lower warning limits for fluoranthene-d10 (22%), terphenyl-d14 (26%), and nitrobenzene-d5 (54%). In addition, the surrogate 2-methylnaphthalene-d10 recovered above the upper warning limit at 92%. The associated positive detections are qualified as "J" and non-detects are qualified as "UJ".

Sample NYOW-05-WL017-1-A exhibited surrogate recoveries less than the lower warning limits for terphenyl-d14 at 40% and fluoranthene-d10 at 45%. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

Sample NYOW-05-WL019-1-A exhibited surrogate recoveries less than the lower warning limits for terphenyl-d14 at 39% and fluoranthene-d10 at 40%. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative

percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS 680-652805/11-A exhibited recoveries less than the lower warning limits as shown in the table below. The associated sample results were non-detect and are qualified as “UJ”.

| Analyte | LCS Recovery |
|---|---|
| 4-Chloroaniline | 31.90 |
| 2,2'-Oxybis(1-chloropropane) | 36.70 |
| Bis(2-chloroethoxy)methane | 38.40 |
| Bis(2-chloroethyl) ether | 40.10 |
| Acetophenone | 40.10 |
| Isophorone | 41.20 |
| Nitrobenzene | 41.30 |
| 4-Chloro-3-methylphenol | 41.40 |
| N-Nitrosodi-n-propylamine | 42.20 |
| 2,4-Dichlorophenol | 42.60 |
| 2-Nitrophenol | 42.60 |
| 2,4,6-Trichlorophenol | 47.80 |
| Dibenzofuran | 49.40 |
| 2,4,5-Trichlorophenol | 49.60 |

SVOCs by Method 8270D with SIM:

LCS 280-523815/2-A exhibited a recovery less than the lower warning limit for dibenz(a,h)anthracene at 43%. The associated positive detections are qualified as “J-“ and non-detects are qualified “UJ”.

LCS/LCSD 280-524781/2-A exhibited recoveries outside of control limits for indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, benzo(g,h,i)perylene, benzo(a)pyrene, benzo(k)fluoranthene, benzo(a)anthracene, and chrysene. In addition, several analytes exhibited LCS/LCSD RPDs greater than the control limit. The preparation batch is associated with sample re-extraction. The initial analyses should be used for data interpretation; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Several analytes failed exhibited recoveries less than the lower warning limit for spiked sample 280-144607-A-1-C associated with sample batch 680-653661. In addition, several analytes exceeded the RPD limit. The spiked sample and associated results were reported in a different data package; further qualification is not necessary.

SVOCs by Method 8270D with SIM:

MS/SD sample 280-144607-F-1-B exhibited recoveries less than the lower warning limit for dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, benzo(a)pyrene, and benzo(g,h,i)perylene. The spiked sample and associated results were reported in a different data package; further qualification is not necessary.

Metals by Methods 6010C and 6020A:

MS/SD sample NYOW-05-WL016-A exhibited acceptable recoveries and RPDs for all analytes.

**POST-DIGESTION SPIKE**

Metals by Methods 6010C and 6020A:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-WL016-A and all recoveries were acceptable.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-WL016-A and all %Ds were below 10% for methods 6010C and 6020A.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 7470A, 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

**COMMENTS**

No field duplicate samples were collected as part of this SDG.

Due to the presence of sediments in the sample containers, a portion of the samples NYOW-05-WL016-A, NYOW-05-WL017-1-A, and NYOW-05-WL019-A was used for analysis, rather than testing the entire sample amount. Consequently, the required solvent rinse of the original container could not be performed for SVOC SIM analysis.

The project quantitation limit goals (PQLGs) for SVOCs and metals were met.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 06 October 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM: 280-144651-1 Revision 5

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Total and Dissolved Metals by ICP SW-846 Method 6010C
- Total and Dissolved Metals by ICP-MS SW-846 Method 6020A
- Total and Dissolved Mercury (Hg) by SW-846 Method 7470A (groundwater and blank water)
- Hg by SW-846 Method 7471B (soil)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144651 | 280-144651-1 | NYOW-05-WL004-A | 1/14/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, Dissolved ICP and ICP-MS Metals, Dissolved Hg |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144651 | 280-144651-2 | [1]WL-DUP-001_210114 | 1/14/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, Dissolved ICP and ICP-MS Metals, Dissolved Hg |
| 280-144651 | 280-144651-3 | NYOW-05-WL005-A | 1/14/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, Dissolved ICP and ICP-MS Metals, Dissolved Hg |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for*

*Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.2°C, 0.2°C, 0.8°C, 0.9°C, and 1.7°C. All samples were initially extracted and analyzed within holding time.

The container IDs on 4 oz soil jars from the following samples were missing "PH" or "SL": NYOW-05-SL017-1-A, NYOW-05-PH017-1-B, NYOW-05-PH017-1-C, NYOW-05-SL016-A, NYOW-05-PH016-B and NYOW-05-PH016-C. The samples were logged according to the COC.

The pH of volatile sample NYOW-05-WL004-A was greater than 2. The sample was analyzed within the 7-day holding time period for unpreserved VOCs.

Samples EB-01_210114, EB-02_210114, NYOW-05-WL004-A, and WL-DUP-002_210114 were re-extracted outside of the holding time window for ***SVOCs*** at approximately 15 days. The initial

sample results should be used for data interpretation. The initial extraction for samples NYOW-05-WL005-A, NYOW-05-WL012-A, and WL-DUP-001_210114 were performed on the seventh day and are considered within the holding time period.

Sample NYOW-05-PH016-B was re-extracted outside of the preparation holding time at 19 days for ***SVOCs***. The initial analysis exhibited surrogate recoveries below the rejection threshold; therefore, the reanalysis should be used for data interpretation and the associated sample results are qualified as "UJ".

Samples EB-01_210114, EB-02_210114, NYOW-05-WL004-A, NYOW-05-WL005-A, NYOW-05-WL012-A, WL-DUP-001_210114, and WL-DUP-002_210114 were re-extracted outside of the holding time window for ***SVOCs with SIM*** from approximately 14 to 18 days. The initial sample results should be used for data interpretation.

Samples NYOW-05-PH017-1-C and PH-DUP-001_210114 were re-extracted outside of the holding time window for ***SVOCs with SIM*** from approximately 15 to 18 days. The initial sample results should be used for data interpretation.

Bluestone requested that the laboratory change the sample IDs for SVOCs, SVOCs with SIM, and dissolved metals analysis associated with equipment blank sample EB-02_210114 and field duplicate sample WL-DUP-002_210114. The reported results indicated that the sample bottleware was inadvertently switched prior to analysis. The laboratory report was revised to reflect the change.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs by full scan and SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and

initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The initial calibration analyzed for instrument CMSG on 1/28/2021 exhibited RRFs less than the minimum recommendations by the method and Module 1 for hexachlorobenzene and pentachlorophenol. The ICV RRFs (680-653661/9) were also below the method recommendations. A standard at or below the PQL was not subsequently analyzed. The associated sample results were non-detect and are qualified as “UJ”.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

CCV 280-523925/15 exhibited a %D greater than the control limit with a negative bias for bromomethane at 26%. The associated positive detections are qualified as “J-” and non-detects are qualified as “UJ”.

SVOCs by Method 8270D:

CCV 680-654491/3 exhibited a %D greater than the control limit for benzaldehyde at 20.9%. The associated sample result is for the reanalysis of sample NYOW-05-PH016-B and was previously qualified; no further action is necessary.

CCV 680-654491/2 exhibited a RRF less than the method and Module 1 recommendations (0.100) for hexachlorobenzene at 0.059. A CCV was performed at the LOQ and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

Closing CCVs 680-654491/34 and 680-654491/35 were performed 24 minutes and 36 minutes after the 12-hour tuning window. The associated sample results are for the reanalysis of sample NYOW-05-PH016-B and were previously qualified; no further action is necessary.

CCV 680-654183/2 exhibited %Ds greater than the control limit for with positive biases for 4-chloroaniline (23.4%), hexachlorocyclopentadiene (22.9%), 4-bromophenyl phenyl ether (32.4%), 2-chlorophenol (28.1%), 2,4-dimethylphenol (26.3%), 4-chloro-3-methylphenol, (24.5%), hexachloroethane (24.1%), and 3&4-methylphenol (21.7%), The associated sample results are qualified as “UJ”.

CCV 680-654183/3 exhibited a %D greater than the control limit for benzaldehyde at 22.4%. The associated sample results are qualified as “UJ”.

CCVs 680-654183/29 and 680-654183/2 exhibited RRFs less than the method and Module 1 recommendations for hexachlorobenzene and pentachlorophenol. A CCV was performed at the

LOQs and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

CCV 680-653363/2 exhibited a %D greater than the control limit for 2,2'-oxybis(1-chloropropane) at 27.9%. The associated sample results were non-detect and are qualified as “UJ”.

CCV 680-653363/2 exhibited %Ds greater than the control limit for hexachlorobenzene at 21% and pentachlorophenol at 24.9%. The associated sample results were non-detect and are qualified as “UJ”.

CCV 680-653363/3 exhibited a %D greater than the control limit for caprolactam at 25.3%. The associated sample results were non-detect and are qualified as “UJ”.

CVC 680-653661/30 exhibited RRFs less than the method and Module 1 recommendations for hexachlorobenzene and pentachlorophenol. The results were previously qualified on the basis of ICV RRFs; no further action is necessary.

CCV 680-653661/10 exhibited a %D greater than the control limit for benzaldehyde at 23.8%. The associated sample results are qualified as “UJ”.

CCV 680-653957/2 exhibited %Ds greater than the control limit for 2,3,4,6-tetrachlorophenol (20.5%), 4-bromophenyl phenyl ether (22%), and pentachlorophenol (23.1%). The associated sample results are qualified as “UJ”.

CCV 680-653957/3 exhibited a %D greater than the control limit for benzaldehyde at 24.3%. The associated sample results are qualified as “UJ”.

CCVs 680-653957/31 and 680-653957/2 exhibited RRFs less than the method and Module 1 recommendations for hexachlorobenzene. A CCV was performed at the LOQ and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

PCBs by Method 8082A:

The CCV analyzed on 1/27/21 at 03:40 (280-524458/3) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for all PCB 1016 and 1260 peaks. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 10:29 (280-524458/20) exhibited %Ds greater than the control limit with positive biases for the majority of PCB 1016 and 1260 peaks on the primary and secondary chromatography columns. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 15:18 (280-524458/32) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for the majority

of PCB 1016 and 1260 peaks. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 19:43 (280-524458/43) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited a %D greater than the control limit on the primary chromatography column with a positive bias for PCB 1016 peak 1. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

Metals by Method 6010C:

Low-level CCVs (LLCCV) associated with analysis batch 524791 exhibited recoveries greater than the upper control limit for sodium. The associated sample concentrations were greater than the level spiked in the ICV and CCVs; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial and continuing calibration blanks (ICB/CCB), and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

VOCs by Method 8260C:

Equipment blank sample EB-02_210114 exhibited a positive detection below the LOQ for bromomethane at 0.25 µg/L. The associated positive sample results were less than the LOQ and are qualified as “U” at either the LOQ or the LOD.

SVOCs by Method 8270D with SIM:

Equipment blank samples EB-01_210114 and EB-02_210114 exhibited positive detections greater than the LOQ for naphthalene at 0.11 µg/L and 0.12 µg/L, respectively. The associated sample results were greater than the LOQ but less than 5X the blank amounts. Consistent with Module 1, the results are qualified as “J+”.

Method blank sample MB 280-525097/1-A exhibited positive detections for benzo(k)fluoranthene, phenanthrene, benzo(b)fluoranthene, benzo(a)anthracene, chrysene, pyrene, and fluoranthene. The method blank is associated with the reanalysis of sample NYOW-05-WL004-A; qualification is not necessary.

Metals by Method 6010C:

Equipment blank sample EB-01_210114 exhibited positive detections below the LOQ for total calcium at 280 µg/L and sodium at 430 µg/L. Soil sample results are not qualified on the basis of aqueous equipment blank samples.

Method blank sample 280-524473/1-A exhibited a positive detection for dissolved iron below the LOQ at 37 µg/L. The associated sample results were greater than the LOQ; qualification is not necessary.

Metals by Method 6020A:

Preparation blank sample 280-524501/1-A exhibited a positive detection less than the LOQ for thallium at 0.0081 mg/kg. The associated soil sample results less than the LOQ were qualified as "U" at either the LOQ or the LOD.

Preparation blank sample 280-524476/1-A exhibited a positive detection less than the LOQ for dissolved thallium at 0.107 µg/L. The associated positive detection is qualified as "U" at the LOD.

Equipment blank sample EB-01_210114 exhibited positive detections below the LOQ for total thallium and antimony at 0.2 µg/L and 0.8 µg/L, respectively. Soil sample results are not qualified on the basis of aqueous equipment blank samples.

Preparation blank sample MB 280-524576/1-A exhibited positive detections for thallium and lead below the LOQ. The associated equipment blank sample result for total lead was non-detect; qualification is not necessary. The equipment blank detection for total thallium is qualified as "U" at the LOD. The thallium sample result for EB-01_210114 was not used to assess field decontamination procedures.

The ICB and CCBs for analysis batch 524751 exhibited positive detections for antimony and thallium. The results for aqueous investigative samples were non-detect; qualification is not required.

Mercury by Method 7470A:

Equipment blank sample EB-02_210114 displayed a positive detection below the LOQ for dissolved mercury at 0.033 µg/L. The associated sample results were less than the LOQ and are qualified as "U" at either the LOQ or the LOD.

Preparation blank sample 280-524517/1-A exhibited a positive detection for total mercury at 0.0413 µg/L. The associated equipment blank sample was non-detect; qualification is not required.

CCB 280-524120/13A displayed a positive detection for total mercury. The associated equipment blank sample result was non-detect; qualification is not necessary.

CCB 280-524716/13A displayed a positive detection for mercury. The associated sample results were non-detect; qualification is not necessary.

Mercury by Method 7471B:

Preparation blank sample 280-524708/1-A exhibited a positive detection below the LOQ at 0.00792 mg/kg. The associated positive sample results less than the LOQ are qualified as "U" at either the LOQ or the LOD.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-05-WL004-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 38%. The associated base/neutral (B/N) extractable compounds were non-detect and are qualified as "UJ".

Sample NYOW-05-WL005-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 20%. The associated B/N extractable compounds were non-detect and are qualified as "UJ".

Sample NYOW-05-WL012-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 37%. The associated B/N extractable compounds were non-detect and are qualified as "UJ".

Sample WL-DUP-001_210114 exhibited a recovery less than the lower warning limit for terphenyl-d14 at 34%. The associated B/N extractable compounds were non-detect and are qualified as "UJ".

Sample NYOW-05-PH016-B exhibited surrogate recoveries less than the rejection threshold for 2-fluorophenol, nitrobenzene-d5, phenol-d5, and 2-fluorobiphenyl. The results from the reanalysis should be used for data interpretation.

SVOCs by Method 8270D with SIM:

Sample NYOW-05-PH017-1-C exhibited a recovery less than the lower warning limit for 2-fluorobiphenyl at 45%. The associated sample results are qualified as "UJ".

Sample PH-DUP-001_210114 exhibited recoveries less than the lower warning limit for terphenyl-d14 and fluoranthene-d10 at 50% and 52%, respectively. The associated sample results are qualified as "UJ".

Sample WL-DUP-002_210114 exhibited a recovery less than the lower warning limit for terphenyl-d14 at 47%. The associated positive detections are qualified as "J" and non-detects are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS 680-654296/13-A exhibited multiple recoveries less than the lower warning limits as shown in the table below. The associated sample results for NYOW-05-PH016-B RE were previously qualified; no further action is necessary. In addition, the recoveries for 1,4-dioxane (0%), benzaldehyde (1%) and hexachloroethane (6%) were less than the lower control limit and the sample results are qualified as "X".

| Analyte | LCS Recovery |
|---|---|
| 2-Chlorophenol | 19 |
| 2,2'-Oxybis(1-chloropropane) | 13 |
| Bis(2-chloroethyl) ether | 12 |
| Hexachlorocyclopentadiene | 22 |
| Nitrobenzene | 21 |
| N-Nitrosodi-n-propylamine | 28 |
| 2,4-Dichlorophenol | 37 |
| 2-Nitrophenol | 24 |
| Cresols, m- & p- | 33 |
| Phenol | 23 |
| 2-Methylphenol | 27 |
| Acetophenone | 24 |
| Bis(2-chloroethoxy)methane | 28 |
| Hexachlorobutadiene | 15 |

LCS 680-652805/11-A exhibited recoveries less than the lower warning limit as presented in the table below. The associated aqueous sample results are qualified as "UJ".

| Analyte | LCS Recovery |
|---|---|
| 4-Chloroaniline | 32 |
| 2,2'-Oxybis(1-chloropropane) | 37 |
| Bis(2-chloroethoxy)methane | 38 |
| Bis(2-chloroethyl) ether (2-Chloroethyl ether) | 40 |
| Acetophenone | 40 |

| Analyte | LCS Recovery |
|---|---|
| Isophorone | 41 |
| Nitrobenzene | 41 |
| 4-Chloro-3-methylphenol | 41 |
| N-Nitrosodi-n-propylamine | 42 |
| 2,4-Dichlorophenol | 42.60 |
| 2-Nitrophenol | 42.60 |
| 2,4,6-Trichlorophenol | 47.80 |
| Dibenzofuran | 49.40 |
| 2,4,5-Trichlorophenol | 49.60 |

SVOCs by Method 8270D with SIM:

LCS 280-523815/2-A exhibited a recovery below the lower warning limit for dibenz(a,h)anthracene at 43%. The associated aqueous sample results were non-detect and are qualified as “UJ”.

LCS/LCSD 280-525097/2-A and LCSD 280-525097/12-A exhibited recoveries less than the lower control limit for dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, benzo(g,h,i)perylene, benzo(a)pyrene, and benzo(k)fluoranthene. The associated sample results are for the reanalysis of sample NYOW-05-WL004-A. The initial analysis should be used for data interpretation; qualification is not necessary.

LCSD 280-524781/3-A exhibited recoveries greater than the upper warning limit for benzo(b)fluoranthene, benzo(a)anthracene, benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, chrysene, benzo(k)fluoranthene, and dibenz(a,h)anthracene. The associated sample results are for the reanalysis of aqueous samples. The initial analyses should be used for data interpretation; qualification is not necessary.

LCS 280-525048/2-A exhibited recoveries less than the lower control limit for benzo(a)pyrene and indeno(1,2,3-cd)pyrene at 46% and 48%, respectively. The associated sample results are for the reanalysis of soil sample NYOW-05-PH017-1-C. The initial analyses should be used for data interpretation; qualification is not necessary.

The LCS/LCSD associated with sample preparation batch 280-524781/3-A exhibited RPDs greater than the control limit for benzo(a)pyrene, benzo(b)fluoranthene, benzo(a)anthracene, benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, chrysene, benzo(k)fluoranthene, and dibenz(a,h)anthracene. The associated sample results are for the reanalysis of aqueous samples. The initial analyses should be used for data interpretation; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine

compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

MS sample 280-144607-H-1 exhibited multiple recoveries and RPDs outside of acceptance criteria. The spiked sample results were reported as part of a different SDG: qualification is not necessary.

PCBs by Method 8082A:

The MS/SD RPD for sample 280-144607-D-1-C was greater than the control limit for PCB-1260 at 74%. The MS sample was reported in a separate SDG; qualification is not necessary.

SVOCs by Method 8270D:

SD sample NYOW-05-SL017-1-A exhibited recoveries less than the lower warning limits for multiple analytes as shown in the table below. The associated sample results were non-detect and are qualified as “UJ”.

| Analyte | Recovery | Analyte | Recovery |
|---|---|---|---|
| Bis(2-chloroethyl) ether (2-Chloroethyl ether) | 26.46 | 1,2,4,5-Tetrachlorobenzene | 36.91 |
| 2,2'-Oxybis(1-chloropropane) | 29.31 | 2,4-Dichlorophenol | 37.99 |
| N-Nitrosodi-n-propylamine | 33.38 | Dibenzofuran | 42.74 |
| Nitrobenzene | 33.65 | di-n-Octyl phthalate | 43.69 |
| 2-Nitrophenol | 34.60 | Benzyl butyl phthalate | 44.37 |
| Biphenyl (Diphenyl) | 35.01 | Bis(2-ethylhexyl)phthalate | 44.78 |
| 2-Chloronaphthalene | 35.82 | | |

Multiple MS/SD RPDs for sample NYOW-05-SL017-1-A were greater than 20% as shown in the table below. The analyte concentrations were non-detect; qualification is not necessary.

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| 1,4-Dioxane | 1,120 | Cresols, m- & p- | 46 |
| Di-n-butylphthalate | 28 | Phenol | 47 |
| Atrazine | 31 | 2-Chlorophenol | 47 |
| 2,4-Dinitrotoluene | 31 | 4-Chloro-3-methylphenol | 48 |
| N-Nitrosodiphenylamine | 32 | Dibenzofuran | 49 |
| 4-Bromophenylphenyl ether | 33 | Benzaldehyde | 51 |
| Carbazole | 33 | 2,4-Dimethylphenol | 51 |
| Hexachlorobenzene | 33 | 2,2'-Oxybis(1-chloropropane) | 52 |
| Diethyl phthalate | 33 | Bis(2-chloroethoxy)methane | 52 |

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| Benzyl butylphthalate | 34 | 2,4,6-Trichlorophenol | 53 |
| 2,3,4,6-Tetrachlorophenol | 37 | Nitrobenzene | 54 |
| Dimethyl phthalate | 37 | Acetophenone | 55 |
| di-n-Octylphthalate | 38 | 2,4-Dichlorophenol | 55 |
| Bis(2-ethylhexyl)phthalate | 38 | Isophorone | 55 |
| 2,6-Dinitrotoluene | 40 | Bis(2-chloroethyl)ether | 55 |
| 2,4,5-Trichlorophenol | 43 | 2-Nitrophenol | 55 |
| Caprolactam | 43 | 1,2,4,5-Tetrachlorobenzene | 56 |
| 2-Methylphenol (o-Cresol) | 44 | 2-Chloronaphthalene | 58 |
| 4-Chlorophenylphenyl ether | 45 | Hexachlorobutadiene | 62 |
| 3,3'-Dichlorobenzidine | 49 | Hexachlorocyclopentadiene | 64 |
| N-Nitrosodi-n-propylamine | 49 | Hexachloroethane | 65 |

SVOCs by Method 8270D with SIM:

SD sample NYOW-05-SL017-1-A exhibited recoveries less than the lower control limit for benzo(b)fluoranthene at 47% and fluoranthene at 53%. The associated sample results are qualified as “J-”.

MS sample PH-DUP-001_210114 exhibited recoveries less than the lower warning limit for 1-methylnaphthalene (31%), 2-methylnaphthalene (31%), acenaphthene (42%), acenaphthylene (37%), and naphthalene (32%). The associated sample results were previously qualified on the basis of surrogate recoveries; no further action is necessary.

Metals by Method 6010C:

MS/SD sample NYOW-05-SL017-1-A exhibited recoveries outside of control limits for manganese, iron, and aluminum. The sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-05-SL017-1-A did not recover for calcium. In the MS, the sample concentration was greater than 4X the spiked amount. In the SD, the sample concentration was 3.9X the spiked amount. The positive detection for calcium is qualified as “J-“ on the basis of professional judgment. In addition, the recoveries of multiple analytes were below the lower warning limit as summarized below. The associated positive detections are qualified as “J-“ and non-detect are qualified as “UJ”.

| Analyte | MS Recovery | SD Recovery |
|---|---|---|
| Calcium | -100 | -126.1 |
| Magnesium | 50.74 | 39.13 |
| Barium | 72.22 | 74.05 |
| Zinc | 72.28 | 68.76 |
| Nickel | 75.53 | 76.63 |
| Lead | 76.51 | 74.57 |
| Cobalt | 76.51 | 77.79 |
| Silver | 76.98 | 78.52 |

| Analyte | MS Recovery | SD Recovery |
|---|---|---|
| Beryllium | 78.26 | 79.10 |
| Vanadium | 79.23 | 80.11 |
| Copper | 79.51 | 76.96 |
| Chromium | 80.47 | 80.82 |
| Sodium | 80.94 | 81.78 |

SD sample 280-144584-C-1-D exhibited recoveries greater than the upper control limit for aluminum and copper. The spiked sample volume did not originate from the site; qualification is not required.

**DUAL COLUMN IMPRECISION**

All sample results were non-detect; therefore, column comparisons were not performed.

**POST-DIGESTION SPIKE**

Metals by Methods 6010C, 6020A, and 7471B:

A post digestion spike (PDS) was performed for MS/SD sample NYOW-05-SL017-1-A. Aluminum, iron, and manganese did not recover. Barium, calcium, and silver recovered below the lower warning limit at 75%, 70%, and 78% respectively. The sample results for aluminum, calcium, iron, and manganese were greater than 4X the spiked amount in the MS; therefore, the PDS was not used to evaluate MS/SD recovery failures. The results for barium, calcium, and silver were previously qualified; no further action is required.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-SL017-1-A. Aluminum, calcium, iron, and magnesium %Ds were greater than 10% at 11%, 13%, 12%, and 15%, respectively. The associated sample results are qualified as “J”.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

A portion of sample WL-DUP-001_210114 was used for analysis, rather than testing the entire sample amount in the original container, due to the presence of sediments in the sample container. Consequently, the required solvent rinse of the original container could not be performed.

Batch precision information Is not available for preparation batch 654296 associated with the reanalysis of sample NYOW-05_PH016-B. Accuracy was demonstrated through the analysis of an acceptable LCS.

Samples NYOW-05-WL004-A, WL-DUP-001_210114, NYOW-05-WL005-A, and EB-02_210114 required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to analysis for PCBs.

Four field duplicate and parent sample pairs were collected and analyzed for all parameters (WL-DUP-001_210114 and NYOW-05-WL004-A, WL-DUP-002_210114 and NYOW-05-WL012-A, SL-DUP-001_210114 and NYOW-05-SL017-1-A, and PH-DUP-001_210114 and NYOW-05-PH017-1-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50% for soil samples or less than 30% for aqueous samples. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All analytes met the precision criteria for these field duplicate pairs with the exception noted below:

- WL-DUP-002_210114 collected from NYOW-05-WL012-A: dissolved iron

LOQs were slightly greater than PQLGs for mercury and SVOCs due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of results qualified as “X”. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 28 April 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM: 280-144607-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Total and Dissolved Metals by ICP SW-846 Method 6010C
- Total and Dissolved Metals by ICP-MS SW-846 Method 6020A
- Total and Dissolved Mercury (Hg) by SW-846 Method 7470A (groundwater and blank water)
- Hg by SW-846 Method 7471B (soil)
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144607 | 280-144607-1 | NYOW-05-WL001-A | 1/13/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, Dissolved ICP and ICP-MS Metals, Hg |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's

(EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 0.3°C, 0.4°C, 0.4°C, 2.4°C, and 3.0°C. All samples were initially extracted and analyzed within holding time.

Consistent with Bluestone's instruction, sample EB-01_210113 should have been logged for total metals instead of dissolved metals by the laboratory; the laboratory corrected the error.

Due to limited volume in the field, 1 of 4 amber glass 1L containers was received 3/4 full for sample NYOW-05-WL001-A. The container was marked and not used.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs by full scan and SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

The initial calibration analyzed for instrument CMSG on 1/28/2021 exhibited RRFs less than the minimum recommendations by the method and Module 1 for hexachlorobenzene and pentachlorophenol. The ICV RRFs (680-653661/9) were also below the method recommendations. A standard at or below the PQL was not subsequently analyzed. The associated sample results were non-detect and are qualified as “UJ”.

Metals by Method 6020A:

Low-level ICV (LLICV) 280-524751/11 exhibited a recovery greater than the upper control limit for antimony at 124%. The associated positive detections for dissolved antimony were less than the LLICV concentration and are qualified as “J+”.

LLICV 280-525253/15 exhibited a recovery greater than the upper control limit for antimony at 123%. The associated sample results are greater than the level spiked in the ICV and CCVs; qualification is not necessary.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

CCV 280-523925/15 exhibited a %D greater than the control limit with a negative bias for bromomethane at 26%. The associated aqueous sample results were non-detect and are qualified as “UJ”.

PCBs by Method 8082A:

The CCV analyzed on 1/27/21 at 03:40 (280-524458/3) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for all PCB 1016 and 1260 peaks. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 10:29 (280-524458/20) exhibited %Ds greater than the control limit with positive biases for the majority of PCB 1016 and 1260 peaks on the primary and secondary chromatography columns. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 15:18 (280-524458/32) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for the majority of PCB 1016 and 1260 peaks. The CCV did not bracket the analysis of investigative samples; qualification is not necessary.

The CCV analyzed on 1/27/21 at 19:43 (280-524458/43) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited a %D greater than the control limit on the primary chromatography column with a positive bias for PCB 1016 peak 1. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

SVOCs by Method 8270D:

CCV 680-653661/30 exhibited RRFs less than the method recommendation for hexachlorobenzene and pentachlorophenol. The associated sample results are for matrix spike sample NYOW-05-WL001-A; qualification of the matrix spike sample results is not necessary.

CCV 680-653957/2 exhibited %Ds greater than the control limit for 2,3,4,6-tetrachlorophenol (20.5%), 4-bromophenyl phenyl ether (22%), and pentachlorophenol (23.1%). The associated sample results are qualified as “UJ”. In addition, the RRF for hexachlorobenzene was less than the method and Module 1 recommendations; the associated sample results were previously qualified; no further action is necessary.

CCV 680-653661/10 exhibited a %D greater than the control limit for benzaldehyde at 23.8%. The associated sample results are for matrix spike sample NYOW-05-WL001-A; qualification is not necessary.

CCV 680-653957/3 exhibited a %D greater than the control limit for benzaldehyde at 24.3%. The associated sample results are qualified as “UJ”.

CCV 680-653957/31 exhibited a RRF less than the method and Module 1 recommendations for hexachlorobenzene; the associated sample results were previously qualified; no further action is necessary.

CCV 680-653493/3 exhibited %Ds greater than the control limit for with positive biases for phenol (21.8%), bis(2-chloroethyl)ether (48.9%), 2,2’-oxybis(1-chloropropane) (78.6%), isophorone (22%), butyl benzyl phthalate (21.7%), bis(2-ethylhexyl)phthalate (34.2%), and di-n-octyl phthalate (26.5%). The %D for 2,2’-oxybis(1-chloropropane) constitutes a gross exceedance for an opening CCV and the associated results are qualified as “X”. The associated sample results for the remaining compounds are qualified as “UJ”.

CCV 680-653493/29 exhibited a %D greater than the control limit for 2,2’-oxybis(1-chloropropane) at 61.2%. The associated sample results were previously qualified; no further action is necessary.

Metals by Method 6010C:

Low-level CCVs (LLCCV) associated with analysis batch 524791 exhibited recoveries greater than the upper control limit for sodium. The associated sample concentrations were greater than the level spiked in the ICV and CCVs; qualification is not necessary.

LLCCV 280-525300/65 exhibited a recovery greater than the control limit for lead. Lead was not reported from the associated analysis batch for the bracketed investigative samples; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, initial and continuing calibration blanks (ICB/CCB), and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

SVOCs by Method 8270D with SIM:

Equipment blank sample EB-02_210113 exhibited positive detections for pyrene (0.15 µg/L), fluoranthene (0.16 µg/L), benzo(k)fluoranthene (0.22 µg/L), benzo(a)anthracene (0.22 µg/L),

benzo(g,h,i)perylene (0.22 µg/L), indeno(1,2,3-cd)pyrene (0.27 µg/L), benzo(a)pyrene (0.29 µg/L), chrysene (0.45 µg/L), and benzo(b)fluoranthene (0.64 µg/L). The associated investigative sample results for NYOW-05-WL001-A were non-detect; qualification is not necessary.

Method blank sample 280-525097/1-A exhibited positive detections for benzo(k)fluoranthene (0.059 µg/L), phenanthrene (0.0717 µg/L), benzo(b)fluoranthene (0.0948 µg/L), benzo(a)anthracene (0.116 µg/L), chrysene (0.152 µg/L), pyrene (0.272 µg/L), and fluoranthene (0.283 µg/L). The associated investigative sample results for NYOW-05-WL001-A were non-detect; qualification is not necessary.

Metals by Method 6010C:

Preparation blank sample 280-524571/1-A exhibited positive detections less than the LOQ for zinc, aluminum, and sodium at 0.5860 mg/kg, 1.88 mg/kg, and 44.5 mg/kg, respectively. The associated sample results for zinc and aluminum were greater than the LOQ; qualification is not necessary. The results for sodium were below the LOQ and are qualified as “U” at the LOQ.

Preparation blank sample 280-524473/1-A exhibited a positive detection for iron at 37 µg/L. The associated sample results were non-detect; qualification is not required.

Metals by Method 6020A:

Preparation blank sample 280-524573/1-A exhibited a positive detection less than the LOQ for thallium at 0.0187 mg/kg. The associated soil sample results less than the LOQ were qualified as “U” at the LOQ.

Preparation blank sample 280-523818/1-A exhibited a positive detection for total chromium at 1.44 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

Preparation blank sample 280-524476/1-A exhibited a positive detection for thallium at 0.107 µg/L. The associated positive equipment blank sample result is not qualified on this basis.

Equipment blank sample EB-02_210113 exhibited positive detections for thallium and antimony below the LOQ at 0.3 µg/L and 0.69 µg/L, respectively. The associated positive detections for sample NYOW-05-WL001-A were less than the LOQ and are qualified as “U” at the LOQ.

The ICB and CCBs for analysis batch 524443 exhibited positive detections for antimony and thallium. The associated results for total antimony and thallium associated with the equipment blank sample were non-detect; qualification is not required.

The ICB and CCBs for analysis batch 524751 exhibited positive detections for antimony and thallium. The associated results for dissolved antimony and thallium associated with the equipment blank sample are not qualified on this basis. The results for sample NYOW-05-WL001-A were non-detect; qualification is not required.

The ICB and CCBs for analysis batch 525252 exhibited positive detections less than the LOQ for thallium. The associated soil sample results were either non-detect or were greater than the aqueous LOQ; qualification is not necessary.

The ICB for analysis batch 525253/14 exhibited a positive detection for antimony at 0.639 µg/L. Two CCBs were performed prior to sample analysis and were non-detect for antimony. Qualification is not necessary.

Mercury by Method 7470A:

Equipment blank sample EB-02_210113 displayed a positive detection below the LOQ for dissolved mercury at 0.039 µg/L. The associated result for sample NYOW-05-WL001-A was less than the LOQ and is qualified as "U" at the LOQ.

Preparation blank sample 280-524517/1-A exhibited a positive detection for total mercury at 0.0413 µg/L. The associated equipment blank sample was non-detect; qualification is not required.

CCB 280-524120/13A displayed a positive detection for mercury. The CCB did not bracket the analysis of investigative samples; qualification is not required.

CCB 280-524716/13A displayed a positive detection for mercury. The associated equipment blank sample result is not qualified on this basis.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-05-WL001-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 16%. The associated base/neutral (B/N) extractable compounds were non-detect and are qualified as "UJ".

SVOCs by Method 8270D with SIM:

Sample NYOW-05-WL001-A exhibited recoveries less than the lower warning limit for nitrobenzene-d5 and 2-fluorobiphenyl at 49% and 50%, respectively. The results are associated with sample reanalysis and the initial analysis results should be used for data interpretation; qualification is not necessary.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS 680-652805/11-A exhibited multiple recoveries less than the lower warning limits. The LCS is associated with the MS preparation batch for NYOW-05-WL001-A and not the investigative sample results; qualification is not required.

SVOCs by Method 8270D with SIM:

LCS 280-523815/2-A exhibited a recovery below the lower warning limit for dibenz(a,h)anthracene at 43%. The associated aqueous sample results were non-detect and are qualified as “UJ”.

LCS/LCSD 280-525097/2-A and LCSD 280-525097/12-A exhibited recoveries less than the lower control limit for dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, benzo(g,h,i)perylene, benzo(a)pyrene, and benzo(k)fluoranthene. The associated sample results are for the reanalysis of sample NYOW-05-WL001-A. The initial analysis should be used for data interpretation; qualification is not necessary.

LCS 280-523957/2-A exhibited recoveries less than the lower warning limits for benzo(g,h,i)perylene (45%), indeno(1,2,3-cd)pyrene (46%), dibenz(a,h)anthracene (49%), and benzo(a)pyrene (50%). The associated positive detections for soil sample results are qualified as “J-“ and non-detects are qualified as “UJ”.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

MS sample NYOW-05-WL001-A exhibited recoveries less than the lower warning limit for the analytes shown below. The associated sample results were non-detect and are qualified as “UJ”.

| Analyte | MS Recovery |
|---|---|
| Bromoform | 60.40 |
| 1,2-Dibromo-3-chloropropane | 61.60 |
| Carbon tetrachloride | 69.20 |
| trans-1,3-Dichloropropene | 69.20 |
| Dibromochloromethane | 69.60 |
| cis-1,3-Dichloropropene | 74.40 |
| 1,2-Dichloropropane | 76.40 |
| Ethylbenzene | 76.40 |
| m,p-Xylene | 76.40 |
| 1,4-Dichlorobenzene | 77.20 |
| Bromodichloromethane | 77.20 |
| Chlorobenzene | 78.80 |
| 1,2-Dichlorobenzene | 79.20 |
| 1,3-Dichlorobenzene | 79.60 |

SD sample NYOW-05-WL001-A exhibited recoveries less than the lower warning limit for the analytes shown below. The associated sample results were non-detect and are qualified as “UJ”.

| Analyte | SD Recovery |
|---|---|
| 1,1,2-Trichloro-1,2,2-trifluoroethane | 58.40 |
| Carbon tetrachloride | 62.80 |
| Cyclohexane | 64.40 |
| 1,1-Dichloroethene | 67.60 |
| Methylcyclohexane | 68.00 |
| 1,1,1-Trichloroethane | 73.20 |
| Tetrachloroethene | 73.60 |

MS/SD sample NYOW-05-WL001-A exhibited RPDs greater than the control limit for the analytes shown below. The associated sample results were non-detect; qualification is not necessary.

| Analyte | MS/SD RPD |
|---|---|
| Dibromochloromethane | 21 |
| 1,2-Dibromoethane | 21 |
| 1,3-Dichloropropane | 22 |
| Vinyl chloride | 22 |
| 1,2,4-Trichlorobenzene | 23 |
| 4-Methyl-2-pentanone | 23 |
| cis-1,3-Dichloropropene | 23 |
| trans-1,3-Dichloropropene | 23 |

| Analyte | MS/SD RPD |
|---|---|
| 2-Butanone | 23 |
| Methyl acetate | 24 |
| Acetone | 24 |
| 1,1,2,2-Tetrachloroethane | 24 |
| 2-Hexanone | 24 |
| 1,2,3-Trichlorobenzene | 26 |
| Trichlorofluoromethane | 26 |
| Bromoform | 26 |
| Dichlorodifluoromethane | 31 |
| 1,2-Dibromo-3-chloropropane | 33 |

PCBs by Method 8082A:

The MS/SD RPD for sample NYOW-05-WL001-A was greater than the control limit for PCB-1260 at 74%. The associated sample results were non-detect; qualification is not necessary.

MS sample NYOW-05-SL011-A exhibited a recovery greater than the upper warning limit for PCB-1260 at 143%. The associated sample result was non-detect; qualification is not required.

SVOCs by Method 8270D:

MS sample NYOW-05-WL001-A exhibited a recovery less than the lower warning limit for hexachlorobenzene at 49%. The associated sample result was non-detect and is qualified as "UJ".

Multiple MS/SD RPDs for sample NYOW-05-WL001-A were greater than 20% as shown in the table below. The analyte concentrations were non-detect; qualification is not necessary.

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| Benzaldehyde | 25 | Caprolactam | 33 |
| Hexachlorobenzene | 24 | di-n-Octylphthalate | 36 |
| Atrazine | 22 | 2,2'-Oxybis(1-chloropropane) | 52 |
| Benzyl butylphthalate | 23 | Bis(2ethylhexyl)phthalate | 39 |

MS sample NYOW-05-PH011-B exhibited a RPD greater than the control limit for 4,6-dinitro-2-methylphenol at 32%. The associated sample result was non-detect; qualification is not required.

SVOCs by Method 8270D with SIM:

MS sample NYOW-05-WL001-A exhibited recoveries less than the lower control limit for dibenz(a,h)anthracene (42%) and indeno(1,2,3-cd)pyrene (45%). The SD also exhibited recoveries less than the lower control limit for dibenz(a,h)anthracene (33%), benzo(g,h,i)perylene

(41%), indeno(1,2,3-cd)pyrene (41%), and benzo(a)pyrene (50%). The associated sample results were non-detect and are qualified as “UJ”.

Metals by Method 6010C:

MS/SD sample NYOW-05-PH011-B exhibited recoveries outside of control limits for iron, manganese, aluminum, and calcium. The sample concentration was greater than 4X the spiked amount; qualification is not required.

MS/SD sample NYOW-05-PH011-B exhibited recoveries greater than the upper warning limit for potassium at 119% and 117%, and magnesium at 133% and 144%. The associated positive detections are qualified as “J+”.

Metals by Method 6020A:

MS/SD sample NYOW-05-PH011-B exhibited a RPD greater than the control limit for antimony (29%). The associated sample result is qualified as “J”.

**DUAL COLUMN IMPRECISION**

PCBs by Method 8082A:

Confirmation column percent differences were less than 40%.

**POST-DIGESTION SPIKE**

Metals by Methods 6010C, 6020A, and 7471B:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-WL001-A. All analytes recovered within the acceptance criteria.

A PDS was performed for MS/SD sample NYOW-05-PH011-B. Aluminum, iron, and manganese did not recover. Calcium, nickel, and mercury recovered below the lower warning limit at 64%, 78%, and 59% respectively. The sample results for aluminum, calcium, iron, and manganese were greater than 4X the spiked amount in the MS; therefore, the PDS was not used to evaluate MS/SD recovery failures. The MS/SD recoveries of nickel and mercury were acceptable; qualification is not necessary.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-WL001-A. All %Ds met the acceptance criteria.

An ICP serial dilution was performed for sample NYOW-05-PH011-B. Aluminum, calcium, iron, and magnesium %Ds were greater than 10% at 34%, 36%, 37%, and 11%, respectively. The associated sample results are qualified as “J”.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

## INTERFERENCE CHECK SAMPLES

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Sample NYOW-05-WL001-A had sediment and a cloudy liquid present. The tip of the glassware broke during concentration of MS sample NYOW-05-WL001-A in SVOCs batch 652519; MS sample NYOW-05-WL001-A was re-extracted within holding time in preparation batch 652805. Accuracy for batch 652519 was demonstrated through performance of a SD and LCS.

The following samples could not be thoroughly homogenized in accordance with Method 3546 before subsampling was performed for SVOC SIM analysis due to the clay sample matrix: NYOW-05-SL011-A, NYOW-05-PH011-B, NYOW-05-PH011-C, NYOW-05-SL012-A, NYOW-05-PH012-B, NYOW-05-PH012-C, NYOW-05-SL013-A, NYOW-05-PH013-B, NYOW-05-PH013-C, PH-DUP-001_210113, NYOW-05-SL014-A, NYOW-05-PH014-B, NYOW-05-PH014-C, NYOW-05-SL015-A, NYOW-05-PH015-B, NYOW-05-PH015-C, NYOW-05-PH011-B, and NYOW-05-PH012-C. The reported results are representative of the subsample obtained.

Samples NYOW-05-WL001-A, EB-01_210113, EB-02_210113, NYOW-05-SL011-A, NYOW-05-SL012-A, NYOW-05-SL013-A, and NYOW-05-SL014-A, NYOW-05-SL015-A required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to analysis for PCBs.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210113 and NYOW-05-PH013-C). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All analytes met the precision criteria for this field duplicate pair.

Sample NYOW-05-WL001-A had LOQs slightly above project quantitation limit goals (PQLGs) for several method SVOC SIM analytes and PCBs. LOQs were slightly greater than PQLGs for SVOCs, PCBs, and metals due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of the results qualified as “X”. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 30 April 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM: 280-144550-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Volatile Organic Compounds (VOCs) by SW-846 Method 8260C
- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Polychlorinated Biphenyls (PCBs) by SW-846 Method 8082A
- Total and Dissolved Metals by ICP SW-846 Method 6010C
- Total and Dissolved Metals by ICP-MS SW-846 Method 6020A
- Total and Dissolved Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144550 | 280-144550-1 | NYOW-05-SL005-A | 1/12/21 | SVOCs, SVOCs with SIM, PCBs, ICP and ICP-MS Metals, Hg, %M |
| 280-144550 | 280-144550-2 | NYOW-05-PH005-B | 1/12/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, ICP and ICP-MS Metals, Hg, %M |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144550 | 280-144550-3 | NYOW-05-PH005-C | 1/12/21 | VOCs, SVOCs, SVOCs with SIM, PCBs, ICP and ICP-MS Metals, Hg, %M |
| 280-144550 | 280-144550-4 | NYOW-05-WL010-A | 1/12/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |
| 280-144550 | 280-144550-5 | NYOW-05-WL025-A | 1/12/21 | SVOCs, SVOCs with SIM, Dissolved ICP and ICP-MS Metals, Dissolved Hg |
| 280-144550 | 280-144550-6 | NYOW-05-SL001-A | 1/12/21 | SVOCs, SVOCs with SIM, PCBs, ICP and ICP-MS Metals, Hg, %M |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the

project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Six coolers were received by the laboratory at temperatures of 1.2°C, 4.1°C, 4.3°C, 4.6°C, 5.6°C, and 5.9°C. All samples were initially extracted and analyzed within holding time.

Samples EB-01_210112, EB-02_210112, NYOW-05-WL010-A, and NYOW-05-WL025-A were re-extracted and reanalyzed outside of the preparation holding time window for ***SVOC SIM***. The initial sample result should be used for data interpretation.

One of 16 soil 4oz jars was received broken for sample NYOW-05-SL003-A.

One of 5 soil 4oz jars was received with a crack in the side of the lid for sample NYOW-05-SL003-A. The sample was not compromised, and the lid was replaced.

The containers for samples NYOW-05-SL005-A and SL-DUP-001_210112 did not match the information listed on the Chain-of-Custody (COC). The COC indicated that there were 8 containers for each of these samples; however, only 4 containers were received for each sample. No Terra Core® kits were received for these samples, even though the COC had Terra Core® analysis marked. VOCs were not planned for this location.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | | X |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A bromofluorobenzene instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for VOCs (i.e., each 12-hour period). The tunes met the ion abundance criteria. A decafluorotriphenylphosphine instrument performance check was performed prior to the initial instrument calibrations and at the start of each sample analysis batch for SVOCs by full scan and SIM. The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

PCBs by Method 8082A:

ICV 280-525936/24 exhibited a percent difference (%D) greater than the control limit on the primary chromatography column with a negative bias for 1268 Peak 4 at 26%. The remaining four PCB-1268 peaks were within control. On the basis of professional judgment, qualification is not necessary.

ICV 280-525936/24 exhibited a %D greater than the control limit on the secondary chromatography column with a negative bias for 1268 Peak 4 at 28%. The remaining four PCB-1268 peaks were within control. On the basis of professional judgment, qualification is not necessary.

Metals by Method 6020A:

Low-level ICV 280-524751/11 exhibited a recovery greater than the upper control limit for antimony at 124%. The associated positive detection for dissolved antimony is qualified as “J+”.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

VOCs by Method 8260C:

Continuing calibration verification (CCV) 280-523925/15 exhibited a %D greater than the control limit with a negative bias for bromomethane at 26%. The associated equipment blank and trip blank sample results are qualified as “UJ”.

PCBs by Method 8082A:

The CCV analyzed on 1/27/21 at 03:40 (280-524458/3) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 10:29 (280-524458/20) exhibited %Ds greater than the control limit with positive biases for the majority of PCB 1016 and 1260 peaks on the primary and secondary chromatography columns. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 15:18 (280-524458/32) exhibited %Ds greater than the control limit on the primary and secondary chromatography columns with positive biases for the majority of PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 19:43 (280-524458/43) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited a %D greater than the control limit on the primary chromatography column with a positive bias for PCB 1016 peak 1. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 1/27/21 at 23:45 (280-524458/53) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for all PCB 1016 and 1260 peaks. The associated sample results were non-detect and are qualified as “UJ”.

The CCV analyzed on 2/8/21 at 13:20 (280-525936/3) exhibited %Ds greater than the control limit on the secondary chromatography column with positive biases for the majority of PCB 1016 and 1260 peaks. The associated sample results were for the reanalysis of sample NYOW-05-SL005-A; qualification is not necessary.

SVOCs by Method 8270D:

CCV 680-654041/2 exhibited %Ds greater than the control limit for 4-bromophenyl phenyl ether (21.6%) and pentachlorophenol (25.9%). The associated sample results are qualified as “UJ”.

CCV 680-654041/3 exhibited a %D greater than the control limit for benzaldehyde at 24.3%. The associated sample results are qualified as “UJ”.

CCVs 680-654041/26 and 680-654041/2 exhibited RRFs less than the minimum relative response factor recommended by method 8270D (0.100) for hexachlorobenzene at 0.0564 and 0.0579, respectively. A CCV was performed at the LOQ and found to be acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

CCV 680-653493/3 exhibited %Ds greater than the control limit for with positive biases for phenol (22.2%), bis(2-chloroethyl) ether (48.9%), isophorone (22%), butyl benzyl phthalate (21.7%), bis(2-ethylhexyl)phthalate (34.2%), 2,2’-oxybis(1-chloropropane) (78.6%) and di-n-octyl phthalate (26.5%). The associated 2,2’-oxybis(1-chloropropane) sample results are qualified as “X” and recommended for rejection. The associated positive sample results for the remaining compounds are qualified as “J” and non-detect sample results are qualified as “UJ”.

Closing CCV 680-653493/29 exhibited a %D greater than the control limit with positive bias for 2,2’-oxybis(1-chloropropane) at 61.2%. The associated results were previously qualified; no further action is necessary.

Metals by Method 6010C:

Low-level CCVs (LLCCVs) associated with analysis batch 524712 exhibited recoveries greater than the upper control limit for iron. The associated soil sample results are greater than the levels spiked in the ICV and CCVs; qualification is not necessary.

LLCCVs associated with analysis batch 524794 exhibited recoveries greater than the upper control limit for iron and sodium. The associated sample results are greater than the levels spiked in the ICV and CCVs; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, trip blanks, and equipment blanks with the exceptions noted below.

VOCs by Method 8260C:

Method blank samples 280-523674/3-A and 280-523895/3-A exhibited positive detections for methylene chloride at 1.65 µg/kg and 2.81 µg/kg, respectively. The associated sample results were non-detect; qualification is not required.

Method blank sample 280-523895/3-A exhibited a positive detection for 2-butanone at 8.37 µg/kg. The associated sample results were non-detect; qualification is not necessary.

Metals by Method 6010C:

Equipment blank sample EB-02_210112 displayed positive detections below the LOQ for dissolved calcium and magnesium at 110 µg/L and 30 µg/L, respectively. The associated sample results were greater than the LOQ; on the basis of professional judgment, qualification is not necessary.

Equipment blank sample EB-01_210112 displayed a positive detection below the LOQ for total calcium at 91 µg/L, respectively. Soil sample results are not qualified on the basis of aqueous equipment blanks.

Preparation blank sample 280-524467/1-A exhibited a positive detection below the LOQ for manganese at 0.111 mg/kg. The associated sample results were greater than the LOQ; on the basis of professional judgment, qualification is not necessary.

Preparation blank sample 280-524563/1-A exhibited positive detections below the LOQ for aluminum and calcium at 1.79 mg/kg and 28.4 mg/kg, respectively. The associated sample results were greater than the LOQ; on the basis of professional judgment, qualification is not necessary.

Preparation blank sample 280-524473/1-A exhibited a positive detection below the LOQ for iron at 37 µg/L. The associated sample results for dissolved iron less than the LOQ are qualified as “U” at the LOQ.

Metals by Method 6020A:

Preparation blank sample 280-524466/1-A exhibited a positive detection below the LOQ for thallium at 0.0137 mg/kg. The associated soil sample results less than the LOQ are qualified as "U" at the LOQ.

Preparation blank sample 280-523818/1-A exhibited a positive detection for total chromium at 1.44 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

Preparation blank sample 280-524476/1-A exhibited a positive detection for thallium below the LOQ at 0.0107 µg/L. The associated sample results were non-detect; qualification is not necessary.

Mercury by Method 7470A:

Continuing calibration blank (CCB) 280-524120/13-A exhibited a positive detection for mercury at 0.117 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

CCB 280-524716/13-A exhibited a positive detection for dissolved mercury at 0.029 µg/L. The associated investigative sample results were non-detect. The equipment blank exhibited a trace detection for dissolved mercury. The CCB was not used to qualify the equipment blank sample result; no further action is necessary.

Equipment blank sample EB-02_210112 displayed a positive detection for dissolved mercury at 0.027 µg/L. The associated results for samples NYOW-05-WL010-A and NYOW-05-WL025-A were below the LOQ and are qualified as "U" at the LOQ.

Preparation blank sample 280-524517/1-A exhibited a positive detection for total mercury at 0.0413 µg/L. The associated equipment blank sample was non-detect; qualification is not required.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-05-WL025-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 19%. The associated base/neutral (B/N) extractable compounds were non-detect and are qualified as "UJ".

Sample NYOW-05-WL010-A exhibited a recovery less than the lower control limit for B/N extractable surrogate terphenyl-d14 at 8%. In addition, B/N extractable surrogate nitrobenzene-d5 recovered below the lower warning limit at 11%. The sample extract was black and sticking to the sides of the vial; therefore, the laboratory did not perform re-extraction and reanalysis. Matrix

effects are evident on the sample chromatogram. The associated B/N sample results were non-detect and are recommended for rejection (i.e., “X” qualified).

Sample NYOW-05-PH003-B exhibited a surrogate recovery less than the lower warning limit for terphenyl-d14 at 49%. The associated B/N extractable compounds were non-detect and are qualified as “UJ”.

Sample NYOW-05-SL001-A exhibited a surrogate recovery less than the lower warning limit for 2,4,6-tribromophenol at 34%. The associated acid extractable compounds were non-detect and are qualified as “UJ”.

Sample NYOW-05-SL002-A exhibited a surrogate recovery less than the lower warning limit for nitrobenzene-d5 at 25%. The associated B/N extractable compounds were non-detect and are qualified as “UJ”.

SVOCs by Method 8270D with SIM:

Sample NYOW-05-WL010-A exhibited surrogate recoveries less than the lower control limit for terphenyl-d14 and fluoranthene-d10 at 30% and 32%, respectively. The sample was re-extracted and reanalyzed outside of the holding time window. The associated positive detections are qualified as “J-“ and non-detects are qualified “UJ”.

Sample NYOW-05-WL025-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 55%. The sample was re-extracted and reanalyzed outside of the holding time window. The associated positive detections are qualified as “J-“ and non-detects are qualified “UJ”.

Sample NYOW-05-SL005-A did not recover for nitrobenzene-d5. The sample was analyzed at a 10X dilution and the surrogate was diluted out; qualification is not required.

PCBs by Method 8082A:

Sample NYOW-05-SL005-A exhibited a recovery greater than the upper control limit for decachlorobiphenyl at 136%. The associated sample results were non-detect; qualification is not necessary.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D with SIM:

LCS 280-523815/2-A exhibited a recovery less than the lower warning limit for dibenz(a,h)anthracene at 43%. The associated sample results were non-detect and are qualified as “UJ”.

LCSD 280-524781/3-A exhibited recoveries greater than the upper warning limits for benzo(b)fluoranthene (138%), benzo(a)anthracene (141%), benzo(g,h,i)perylene (147%), indeno(1,2,3-cd)pyrene (162%), chrysene (171%), benzo(k)fluoranthene (178%), and dibenz(a,h)anthracene (188%). The associated sample results were non-detect and associated with the re-extraction batch for aqueous samples. Sufficient volume was not available to re-extract a third time; qualification is not necessary.

LCSD 280-524781/3-A exhibited RPDs greater than the control limit for benzo(b)fluoranthene (68%), benzo(a)pyrene (55%) benzo(a)anthracene (63%), benzo(g,h,i)perylene (80%), indeno(1,2,3-cd)pyrene (92%), chrysene (77%), benzo(k)fluoranthene (83%), and dibenz(a,h)anthracene (106%). The associated sample results were non-detect and associated with the re-extraction batch for aqueous samples. Sufficient volume was not available to re-extract a third time; qualification is not necessary.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

VOCs by Method 8260C:

MS/SD sample 280-144607-H-1 exhibited recoveries and RPDs outside of control limits. The spiked sample results were reported in a separate SDG; qualification is not necessary.

PCBs by Method 8082A:

The MS/SD RPD for sample 280-144607-D-1-C was greater than the control limit for PCB-1260 at 74%. The spiked sample results were reported in a separate SDG; qualification is not necessary.

SVOCs by Method 8270D:

MS sample NYOW-05-SL003-A exhibited a recovery less than the lower warning limit for atrazine at 46%. In addition, the SD exhibited recoveries less than the lower warning limit for hexachlorobenzene, dimethyl phthalate, diethyl phthalate, carbazole, and di-n-butylphthalate at 43%, 47%, 47%, 19%, and 50%, respectively. The associated sample results were non-detect and are qualified as “UJ”.

Multiple MS/SD RPDs for sample NYOW-05-SL003-A were greater than 20% as shown in the table below. The positive detection for dibenzofuran is qualified as “J”. The other analytes were not detected; qualification is not necessary.

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| Acetophenone | 20.05 | 2,4-Dinitrotoluene | 21.68 |

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| 4-Chlorophenyl phenyl ether | 20.07 | 4-Chloro-3-methylphenol | 22.67 |
| Hexachlorobenzene | 20.19 | Isophorone | 23.09 |
| Diethyl phthalate | 20.46 | Hexachlorobutadiene | 23.15 |
| Dibenzofuran | 20.79 | 2-Chloronaphthalene | 23.33 |
| Bis(2-ethylhexyl)phthalate | 20.83 | Bis(2-chloroethoxy)methane | 23.47 |
| Carbazole | 21.03 | 2,4,5-Trichlorophenol | 24.75 |
| 2,4-Dimethylphenol | 21.14 | 2,4-Dichlorophenol | 25.47 |
| Dimethyl phthalate | 21.37 | 2-Nitrophenol | 26.63 |
| di-n-Octyl phthalate | 21.61 | | |

Multiple MS/SD RPDs for sample NYOW-05-PH003-B were greater than 20% as shown in the table below. None of the analytes were detected; qualification is not necessary.

| Analyte | RPD | Analyte | RPD |
|---|---|---|---|
| Cresols, m- & p- | 20.78 | 2-Nitrophenol | 26.76 |
| N-Nitrosodi-n-propylamine | 21.53 | Nitrobenzene | 27.31 |
| 2-Chloronaphthalene | 22.59 | Phenol | 27.71 |
| Isophorone | 23.46 | Benzaldehyde | 28.32 |
| Bis(2-chloroethoxy)methane | 23.75 | 2-Chlorophenol | 28.57 |
| 2,4-Dimethylphenol | 24.62 | Bis(2-chloroethyl) ether (2-Chloroethyl ether) | 29.98 |
| Hexachlorocyclopentadiene | 24.86 | 2,2'-Oxybis(1-chloropropane) | 30.56 |
| 1,2,4,5-Tetrachlorobenzene | 25.23 | Hexachlorobutadiene | 34.48 |
| 2-Methylphenol (o-Cresol) | 25.52 | Hexachloroethane | 39.19 |
| Acetophenone | 26.53 | | |

SVOCs by Method 8270D with SIM:

MS/SD sample NYOW-05-SL003-A exhibited recoveries greater than the upper control limit for fluoranthene at 122% and 125%, pyrene at 126% and 134%, phenanthrene at 282% and 295%, naphthalene at 481% and 444%, 1-methylnaphthalene at 492% and 484%, and 2-methylnaphthalene at 622% and 606%. The SD recovery for chrysene was also greater than the upper control limit at 124%. The associated positive detections are qualified as “J+”.

Metals by Method 6010C:

MS sample NYOW-05-PH003-B did not recover for calcium and iron. The SD exhibited recoveries greater than the warning limits at 166% and 625%, respectively. The MS/SD RPDs were also greater than the control limits at 39% and 36%, respectively. The sample concentration was greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-05-PH003-B exhibited recoveries outside of warning limits for manganese at 25% and 136%, respectively. The MS/SD RPD was also greater than the control limit at 123%. The associated sample result is qualified as “J”.

MS/SD sample NYOW-05-PH003-B exhibited recoveries greater than control limits for aluminum at 333% and 1,050%, respectively. The MS/SD RPD was also greater than the control limit at 32%. The sample concentration was greater than 4X the spiked amount; qualification is not necessary.

MS sample NYOW-05-PH003-B exhibited recoveries less than the lower warning limit for magnesium at 66% and zinc at 73%. The associated sample results are qualified as “J-”.

MS sample NYOW-05-PH003-B exhibited a recovery greater than the upper warning limit for potassium at 155%. The associated sample results are qualified as “J+”.

MS sample NYOW-05-SL003-A exhibited recoveries outside of warning limits for iron, aluminum, and calcium. The MS/SD RPD for calcium was also greater than the control limit at 58%. The sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

SD sample NYOW-05-SL003-A exhibited recoveries outside of warning limits for iron, manganese, and aluminum. The sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS sample NYOW-05-SL003-A exhibited recoveries less than the lower warning limit for zinc (62%), manganese (69%), lead (79%), nickel (81%), cobalt (81%), and chromium (84%). The associated sample results are qualified as “J-”.

MS sample NYOW-05-SL003-A exhibited a recovery greater than the upper warning limit for magnesium at 157%. The MS/SD RPD was also greater than the control limit at 43%. The associated sample result is qualified as “J”.

Metals by Method 6020A:

MS sample NYOW-05-PH003-B exhibited a recovery less than the lower warning limit for antimony at 63%. The MS/SD RPD was also greater than the control limit at 35%. The associated sample result is qualified as “J.”

MS/SD sample NYOW-05-PH003-B exhibited RPDs greater than the control limit for arsenic (28%), cadmium (35%), selenium (36%), and thallium (38%). The associated sample results are qualified as “J”.

MS/SD sample NYOW-05-SL003-A exhibited recoveries greater than the upper warning limit for arsenic at 134% and 120%, respectively. The associated positive detection is qualified as “J+”.

**POST-DIGESTION SPIKE**

Metals by Methods 6010C and 6020A:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-SL003-A. Aluminum, iron, and manganese, exhibited recoveries less than the lower control limit; however, the sample concentrations were greater than 4X the spiked amount in the MS; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures. Arsenic recovered within the control limits at 88%.

A PDS was performed for MS/SD sample NYOW-05-PH003-B. Aluminum, iron, and manganese did not recover. Barium, calcium, chromium, cobalt, lead, magnesium, nickel, vanadium, and zinc recovered below the lower control limit. The results for aluminum and iron were greater than 4X the spiked amount in the MS; therefore, the PDS was not used to evaluate MS/SD recovery failures. The results for manganese, magnesium, and zinc were previously qualified. The MS/SD recoveries of barium, chromium, cobalt, lead, nickel, and vanadium were within warning limits; qualification is not necessary.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-SL003-A. Aluminum, calcium, and iron %Ds were greater than 10% at 11%, 15%, and 12%, respectively. The associated sample results are qualified as “J”.

An ICP serial dilution was performed for sample NYOW-05-PH003-B. Aluminum, barium, calcium, iron, and manganese %Ds were greater than 10% at 12%, 12%, 16%, 17%, and 15%, respectively. The associated sample results are qualified as “J”.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

The following samples could not be thoroughly homogenized before sub-sampling was performed for SVOC SIM analysis due to the sample matrix being clay: NYOW-05-PH005-B, NYOW-05-PH005-C, NYOW-05-PH001-C, NYOW-05-PH002-B, NYOW-05-PH002-C, NYOW-05-PH003-B, NYOW-05-PH004-C, and PH-DUP-001_210112. The reported concentrations are representative of the subsample obtained.

Samples NYOW-05-WL010-A and NYOW-05-WL025-A contained suspended sediment and presented as muddy.

Due to glassware breakage impacting the matrix spike, batch precision is not available for preparation batch SVOC 652519. Accuracy was demonstrated through performance of a MS and LCS.

A portion of samples NYOW-05-WL010-A and NYOW-05-WL025-A was used for analysis, rather than testing the entire sample amount in due to the presence of sediments in the sample container. As such, the required solvent rinse of the original container could not be performed for SVOC SIM.

Samples NYOW-05-SL005-A, NYOW-05-PH005-B, NYOW-05-PH005-C, NYOW-05-SL001-A, NYOW-05-PH001-B, NYOW-05-PH001-C, NYOW-05-SL002-A, NYOW-05-PH002-B, NYOW-05-PH002-C, NYOW-05-PH003-B, EB-01_210112, NYOW-05-PH003-C, NYOW-05-SL004-A, NYOW-05-PH004-B, NYOW-05-PH004-C, PH-DUP-001_210112, SL-DUP-001_210112, and NYOW-05-SL003-A required a sulfuric acid clean-up via EPA Method 3665A to reduce matrix interferences prior to analysis for PCBs.

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210112 and NYOW-05-PH001-C, and SL-DUP-001_210112 and NYOW-05-SL002-A). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. The following analytes did not meet the precision criteria and the results are qualified as “J”:

- PH-DUP-001_210112 and NYOW-05-PH001-C: Cobalt, iron, magnesium, chromium, vanadium, aluminum, potassium, barium, and arsenic.
- SL-DUP-001_210112 and NYOW-05-SL002-A: Chrysene, anthracene, benzo(b)fluoranthene, indeno(1,2,3-cd)pyrene, benzo(a)pyrene, benzo(a)anthracene, pyrene, fluoranthene, phenanthrene, benzo(g,h,i)perylene, magnesium, and calcium.

Sample NYOW-05-SL005-A did not meet project quantitation limit goals (PQLGs) for several method SVOC SIM analytes due to sample dilution. Sample NYOW-05-PH005-C did not meet project quantitation limit goals (PQLGs) for several metal analytes due to sample dilution. LOQs were slightly greater than PQLGs for SVOCs and metals due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of “X” qualified results. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 27 April 2021

**SUBJECT:** New York Ordnance Works Soil and Groundwater S2BVEM: 280-144501-1 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil and groundwater samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144501 | 280-144501-1 | NYOW-05-WL008-A | 1/11/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals |
| 280-144501 | 280-144501-2 | NYOW-05-WL006-A | 1/11/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals |
| 280-144501 | 280-144501-3 | NYOW-05-WL024-A | 1/11/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144501 | 280-144501-4 | EB-01_210111 | 1/11/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.0°C, 1.5°C, and 2.5°C.

Sample **NYOW-05-PH019-B** was reextracted 3 days past the preparation holding time window for ***SVOCs***. The reanalysis results should be used for data interpretation and the data are qualified as "UJ".

Samples EB-01_210111, EB-02_210111, NYOW-05-WL006-A, NYOW-05-WL008-A, and NYOW-05-WL024-A were extracted on the seventh day of the 7-day preparation holding time for ***SVOCs***. Qualification of the data is not necessary.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | | X |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs and SVOCs with SIM (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and

initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met.

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

CCV 680-653363/2 exhibited %Ds greater than the control limit for 2,2'-oxybis(1-chloropropane) at 27.9%, hexachlorobenzene at 21% and pentachlorophenol at 24.9%. The associated sample results were non-detect and are qualified as “UJ”.

CCV 680-653363/3 exhibited a %D greater than the control limit for caprolactam at 25.3%. The associated sample results were non-detect and are qualified as “UJ”.

CCV 680-653957/2 exhibited %Ds greater than the control limit for 2,3,4,6-tetrachlorophenol (20.5%), 4-bromophenyl phenyl ether (22%), and pentachlorophenol (23.1%). The associated sample results are qualified as “UJ”. In addition, the RRF for hexachlorobenzene was less than the method and Module 1 recommendations. A CCV was performed at the LOQ and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

CCVs 680-653957/3 and 680-653957/32 exhibited %Ds greater than the control limit for benzaldehyde at 24.3% and 23.1%, respectively. The associated sample results are qualified as “UJ”.

CCV 680-653957/31 exhibited a RRF less than the method and Module 1 recommendations for hexachlorobenzene. A CCV was performed at the LOQ and was acceptable; therefore, the sensitivity of the analytical system was demonstrated. The associated sample results are not qualified on this basis.

CCV 680-653493/3 exhibited %Ds greater than the control limit for bis(2-chloroethyl)ether (48.9%), phenol (22.2%), isophorone (22%), bis(2-ethylhexyl)phthalate (34.2%), butyl benzyl phthalate (21.7%), 2,2'-oxybis(1-chloropropane) (78.6%) and di-n-octyl phthalate (26.5%). The results for 2,2'-oxybis(1-chloropropane) are qualified as “X” and recommended for rejection. The associated sample results for the remaining compounds are qualified as “UJ”.

Closing CVC 680-653493/29 exhibited a %D greater than the control limit for 2,2'-oxybis[1-chloropropane]. The associated sample results were previously qualified; no further action is necessary.

## INTERNAL STANDARDS

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

## BLANK SAMPLE RESULTS

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

SVOCs by Method 8270D with SIM:

Method blank sample 280-523737/1-A exhibited positive detections for benzo(a)pyrene (0.0256 µg/L), dibenz(a,h)anthracene (0.0666 µg/L), benzo(a)anthracene (0.0692 µg/L), benzo(g,h,i)perylene (0.0735 µg/L), indeno(1,2,3-cd)pyrene (0.0760 µg/L), benzo(k)fluoranthene (0.11 µg/L), chrysene (0.118 µg/L), and benzo(b)fluoranthene (0.123 µg/L). The associated aqueous sample results were non-detect; qualification is not required.

Metals by Method 6010C:

Preparation blank sample 280-524368/1-A exhibited positive detections greater than the detection limit but less than the LOQ for calcium (30.3 mg/kg) and sodium (35 mg/kg). The associated positive detections for calcium were greater than the LOQ; qualification is not required. The associated soil sample results for sodium were less than the LOQ and are qualified as “U” at the LOQ.

Metals by Method 6020A:

Preparation blank sample 280-524370/1-A exhibited a positive detection for thallium less than the LOQ at 0.0084 mg/kg. The associated soil sample results that are less than the LOQ are qualified as “U” at the LOQ.

Preparation blank sample 280-523818/1-A exhibited a positive detection for chromium greater than the detection limit at 1.44 µg/L. The associated equipment blank sample result was non-detect; qualification is not required.

Continuing calibration blanks (CCBs) associated with analysis batch 280-524443 exhibited positive detections for thallium. The associated sample results were non-detect; qualification is not necessary.

Mercury by Method 7470A:

CCB 280-524120/13-A exhibited a positive detection for mercury at 0.117 µg/L. The associated sample results were non-detect; qualification is not necessary.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Sample NYOW-05-WL006-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 31%. The associated base/neutral (B/N) extractable sample results were non-detect and are qualified as “UJ”.

Sample NYOW-05-WL008-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 30%. The associated B/N extractable sample results were non-detect and are qualified as “UJ”.

Sample NYOW-05-WL024-A exhibited a recovery less than the lower control limit for terphenyl-d14 at 9%. The sample was not re-extracted and reanalyzed by the laboratory. The associated B/N extractable sample results were non-detect and are recommended for rejection (i.e., “X”-qualified).

Sample NYOW-05-PH019-B exhibited recoveries less than the lower control limit for surrogates 2-fluorophenol, nitrobenzene-d5, phenol-d5, and 2-fluorobiphenyl. The sample was reextracted 3 days past the preparation holding time window and the surrogates recovered within control. The reanalysis results should be used for data interpretation and are qualified as “UJ”.

SVOCs by Method 8270D with SIM:

Samples NYOW-05-WL006-A and NYOW-05-WL024-A exhibited recoveries less than the lower warning limit for terphenyl-d14 at 54% and 34%, respectively. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample EB-02_210111 exhibited a recovery less than the lower warning limit for nitrobenzene-d5 at 50%. The associated sample results were non-detect and are qualified as “UJ”.

Sample NYOW-05-WL024-A exhibited a recovery less than the lower warning limit for fluoranthene-d10 at 40% The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-PH019-B exhibited recoveries less than the lower warning limit for terphenyl-d14, fluoranthene-d10, and 2-fluorobiphenyl, at 51%, 47%, and 41%, respectively. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-SL018-A exhibited recoveries less than the lower warning limit for nitrobenzene-d5, 2-methylnaphthalnene-d10, and 2-fluorobiphenyl at 12%, 24%, and 34%, respectively. The associated positive detections are qualified as “J” and non-detects are qualified as “UJ”.

Sample NYOW-05-SL019-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 57%. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D with SIM:

LCS 280-523737/2-A exhibited recoveries less than the lower warning limits for indeno(1,2,3-cd)pyrene (22%), dibenz(a,h)anthracene (23%), benzo(g,h,i)perylene (24%), benzo(a)pyrene (36%), benzo(k)fluoranthene (45%), and benzo(b)fluoranthene (47%). The associated positive aqueous sample results were non-detect and are qualified as "UJ".

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

Several analytes failed the recovery criteria low for the SD of sample 280-144651-A-6-I. In addition, multiple MS/SD RPDs were greater than the control limit. The spiked sample results were reported in a separate SDG; qualification is not necessary.

SVOCs by Method 8270D with SIM:

SD sample NYOW-05-SL025-A exhibited recoveries greater than the upper warning limits for fluoranthene, pyrene, chrysene, and benzo(a)anthracene at 121%, 125%, 129%, and 139%, respectively. The associated sample results were positive detections and are qualified as "J+".

MS/SD sample NYOW-05-SL025-A exhibited RPDs greater than the control limit for chrysene, pyrene, and benzo(a)anthracene at 40%, 40%, and 52%, respectively. The associated sample results were previously qualified on the basis of SD recoveries; no further action is necessary.

Several analytes recovered outside of control limits for MS/SD sample 280-144497-AM-2-B. In addition, the MS/SD RPDs for multiple analytes were greater than the control limit. The spiked sample did not originate from the site; qualification is not necessary.

Metals by Method 6010C:

MS/SD sample NYOW-05-SL025-A exhibited recoveries outside of warning limits for iron, calcium, and aluminum. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-05-SL025-A exhibited recoveries outside of warning limits for the analytes shown below. The associated positive sample results were qualified as "J" or "J-", based on the direction of potential bias. The associated non-detect results are qualified as "UJ".

| Analyte | MS Recovery | SD Recovery | Qualifier |
|---|---|---|---|
| Zinc | 75 | 71 | J- |
| Manganese | 76 | 132 | J |
| Cobalt | 80 | 76 | J- |
| Lead | 80 | 75 | J- |
| Nickel | 81 | 77 | J- |
| Beryllium | 81 | 78 | J- |
| Silver | 82 | 78 | UJ |
| Chromium | 85 | 80 | J- |
| Magnesium | -- | 77 | J- |

**POST-DIGESTION SPIKE**

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-SL025-A. Aluminum, barium, calcium, iron, magnesium, and manganese recovered below the lower control limit. Aluminum, iron, and calcium concentrations were greater than 4X the spiked amount in the MS. Barium recovered within control in the MS/SD sample; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures. The results for magnesium and manganese were previously qualified; no further action is necessary.

Metals by Method 6020C:

A PDS was performed for MS/SD sample NYOW-05-SL025-A and all recoveries were acceptable.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-SL025-A. All %Ds met the acceptance criteria.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

## COMMENTS

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

No field duplicate sample pairs were collected as part of this SDG.

Samples NYOW-05-WL008-A, NYOW-05-WL006-A, and NYOW-05-WL024-A had sediment present for SVOC analysis. Samples NYOW-05-WL008-A and NYOW-05-WL006-A presented as cloudy. Sample NYOW-05-WL024-A appeared muddy.

Samples NYOW-05-PH025-B, NYOW-05-PH025-C, NYOW-05-SL018-A, NYOW-05-PH018-B, NYOW-05-PH018-C, NYOW-05-SL019-A and NYOW-05-PH019-C could not be thoroughly homogenized before sub-sampling was performed because of their clay matrix prior to extraction for SVOCs and SVOCs with SIM. The reported concentrations are representative of the subsample obtained.

MS/SD were prepared and analyzed at required batch frequency for preparation batch 280-525296 and analytical batch 280-526053 using samples from other sites that were placed on hold; therefore, no batch precision is available. The affected samples are NYOW-05-SL018-A and NYOW-05-PH019-B. Analytical accuracy was demonstrated through the performance of an LCS. A MS/SD was prepared for SVOCs preparation batch 652519; however, during concentration the tip of the tube broke off and extract was lost for the MS. Therefore, no batch precision is available. Analytical accuracy was demonstrated through the performance of an LCS.

Due to laboratory oversight, field filtered samples NYOW-05-WL008-A, NYOW-05-WL006-A, NYOW-05-WL024-A, and EB-01_210111 were logged and digested as total metals, instead of dissolved metals. The total digestion uses slightly more acid than the total recoverable digestion; however, the digestion procedure cannot solubilize more metals than are present in the filtered sample and the impact on the results is negligible.

LOQs were slightly greater than Project Quantitation Limit Goals (PQLGs) for SVOCs and metals due to percent moisture adjustments.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of results qualified as “X”. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 98%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 20 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144466-1Rev 2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144466 | 280-144466-1 | NYOW-05-SL006-A | 1/08/21 | SVOCs with SIM, ICP and ICP-MS Metals, Hg, %M |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 0.8°C, 0.9°C, and 0.9°C. Sample NYOW-05-PH021-C was re-extracted and analyzed beyond the extraction holding time for ***SVOC SIM***. The initial sample results should be used for data interpretation. Samples NYOW-05-PH006-B, NYOW-05-PH006-C, NYOW-05-PH023-B, NYOW-05-PH023-C, NYOW-05-PH024-B, NYOW-05-PH024-C, NYOW-05-SL006-A, NYOW-05-SL023-A, and NYOW-05-SL024-A were extracted between approximately 15 minutes and 3.6 hours beyond the preparation holding time for ***SVOC SIM***. The SVOC SIM preparation holding time is assessed in days, not hours; therefore, the holding times were met.

For method ***SVOC SIM***, sample EB-01_210108, a 1L amber unpreserved was received; however, the SOP requires a 250mL unpreserved amber. The laboratory was instructed to mix and pour off 250 mL from the 1L and extract. The laboratory was unable to perform a method-required solvent rinse of the glass container.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs and SVOCs with SIM (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

The initial calibration verification performed on 1/15/2021 at 18:07 (680-652287/9) exhibited a %D greater than the control limit for 2,4-dimethylphenol at 20.8%. The associated sample result for the equipment blank is qualified as “UJ”.

## CONTINUING CALIBRATION VERIFICATION

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verification (CCV) CCV 680-653140/2 exhibited %Ds greater than the control limit for 4-nitroaniline (20.8%), butyl benzyl phthalate (20.5%), and 2,3,4,6-tetrachlorophenol (25%). The associated sample results are qualified as “UJ”.

CCV 680-653140/33 was performed one minute outside of the 12-hour tune window. On the basis of professional judgment, qualification is not necessary. CCV 680-653140/34 was performed 25 minutes outside of the 12-hour tune window. The CCV %Ds met acceptance criteria. The associated non-detect sample results for target compounds of the CCV (atrazine, benzaldehyde, and caprolactam) are qualified as “UJ” on the basis of professional judgment.

CCV 680-653109/19 exhibited a RRF less than the minimum relative response factor recommended by method 8270D (0.7000) for bis(2-chloroethyl)ether at 0.6808. A CCV was performed at the LOQ and found to be acceptable; therefore, the sensitivity of the analytical

system was demonstrated. Given that the response was only marginally below the method RRF, the associated soil sample results are not qualified on this basis.

Metals by Method 6010C:

CCV 280-524555/33 and 280-524555/46 exhibited recoveries greater than the upper control limit for aluminum at 111% and 112%, respectively. The bracketed soil sample results are positive detections and are qualified as “J+”.

Low-level CCV (LLCCV) 280-524555/35 exhibited a recovery greater than the upper control limit for sodium at 129%. The associated sodium results for samples bracketed by the LLCCV were greater than the level spiked in the ICV and CCVs; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals by Method 6010C:

Preparation blank sample 280-524144/1-A exhibited positive detections greater than the detection limit but less than the LOQ for calcium (24.3 mg/kg), manganese (1.32 mg/kg), aluminum (11.5 mg/kg), and iron (31.7 mg/kg). The associated positive detections were greater than the LOQ; qualification is not required.

Preparation blank sample 280-524144/1-A exhibited a positive detection greater than the detection limit but less than the LOQ for sodium at 80.7 mg/kg. The associated sample results were less than the LOQ and are qualified as “U” at the LOQ.

Equipment blank sample EB-01_210108 exhibited a positive detection for calcium above the detection limit but below the LOQ at 84 µg/L. Soil samples are not qualified on the basis of aqueous equipment blanks.

Metals by Method 6020A:

Preparation blank sample 280-523897/1-A exhibited a positive detection for thallium greater than the detection limit at 0.0048 mg/kg. The associated soil sample results that are less than the LOQ are qualified as “U” at the LOQ.

Preparation blank sample 280-523818/1-A exhibited a positive detection for chromium greater than the detection limit at 1.44 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

Initial calibration blank (ICB) 280-524443/13 exhibited positive detections for antimony and thallium. The associated equipment blank sample results were non-detect; qualification is not required.

Continuing calibration blanks (CCBs) 280-524443/46 and 280-524443/59 exhibited positive detections for thallium. The associated equipment blank sample result was non-detect; qualification is not necessary.

CCBs 280-524556/62, 280-524556/74, and 280-524556/101 exhibited positive detections for thallium below the LOQ. The associated positive detections were greater than the aqueous LOQ; qualification is not required.

Mercury by Method 7470A:

CCB 280-524120/13-A exhibited a positive detection for mercury at 0.117 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

**SURROGATE RECOVERIES**

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D with SIM:

Samples NYOW-05-SL006-A, NYOW-05-SL024-A, and SL-DUP-001_210108 DL did not recover (i.e., 0%) for any of the five surrogate compounds. The samples were analyzed at 20X, 40X, and 20X dilutions, respectively, and the surrogates were diluted out. Qualification is not necessary.

Sample NYOW-05-PH024-B exhibited recoveries less than the lower warning limits for fluoranthene-d10 and terphenyl-d14 at 52% and 51%, respectively. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-PH024-C exhibited a recovery less than the lower warning limit for terphenyl-d14 at 55%. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-SL023-A did not recover for nitrobenzene-d5, 2-methylnaphthalene-d10, and fluoranthene-d10. In addition, the recovery of 2-fluorobiphenyl was less than the lower warning limit at 57%. The sample was analyzed at a 20X dilution factor; qualification is not necessary.

Sample SL-DUP-001_210108 exhibited recoveries less than the lower warning limits for 2-fluorobiphenyl and terphenyl-d14 at 41% and 42%, respectively. The associated sample results are positive detections and are qualified as “J-“.

Sample PH-DUP-001_210108 exhibited recoveries less than the lower warning limits for fluoranthene-d10 and terphenyl-d14 at 52% and 49%. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-SL021-A did not recover for nitrobenzene-d5, terphenyl-d14, and fluoranthene-d10. The sample was analyzed at a 10X dilution; qualification is not necessary.

Sample NYOW-05-PH021-C exhibited recoveries less than the lower control limit for fluoranthene-d10 and terphenyl-d14 at 51% and 48%, respectively. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

Sample NYOW-05-SL020-A exhibited a recovery less than the lower warning limit for terphenyl-d14 at 55%. The associated positive detections are qualified as “J-“ and non-detects are qualified as “UJ”.

**LABORATORY CONTROL SAMPLES**

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

LCS 680-652136/3-A did not recover (i.e., 0%) for 3,3’-dichlorobenzidine. The associated equipment blank sample result is qualified as “X” and recommended for rejection.

SVOCs by Method 8270D with SIM:

LCSD 280-523256/3-A exhibited a recovery less than the lower warning limit for indeno(1,2,3-cd)pyrene at 47.7%. The associated equipment blank sample result (EB-01_210108) is qualified as “UJ”.

LCS 280-523208/2-A exhibited recoveries less than the lower warning limits for naphthalene (11%), 2-methylnaphthalene (11%), 1-methylnaphthalene (11%), acenaphthylene (13%), acenaphthene (14%), fluorene (25%), phenanthrene (47%), anthracene (48%), and indeno(1,2,3-cd)pyrene (48%). The associated positive detections for sample NYOW-05-PH021-C are qualified as “J-“ and non-detects are qualified as “UJ”.

**MATRIX SPIKE/MATRIX SPIKE DUPLICATES**

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SD RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs by Method 8270D:

MS sample NYOW-05-PH021-C exhibited recoveries less than the lower warning limits for hexachlorobenzene (45%), 4-bromophenyl phenyl ether (45%), di-n-butyl phthalate (47%), and 2,4-dinitrotoluene (47%). The associated sample results were non-detect and are qualified as "UJ".

The MS/SD RPDs for sample NYOW-05-PH021-C were greater than the control limit (i.e., 20%) for every analyte *except* 2,3,4,6-tetrachlorophenol, 4,6-dinitro-2-methylphenol, 4-chloro-3-methylphenol, 4-chloroaniline, caprolactam, carbazole, diethyl phthalate, and hexachloroethane. The associated sample results were non-detect; qualification is not necessary.

Metals by Method 6010C:

MS/SD sample NYOW-05-SL022-A exhibited recoveries outside of warning limits for iron, manganese, and aluminum. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

MS/SD sample NYOW-05-SL022-A exhibited RPDs greater than the control limit for iron at 30% and manganese at 109%. The associated sample results are qualified as "J".

MS sample NYOW-05-SL022-A exhibited a recovery greater than the upper warning limit for potassium (132%). The MS/SD RPD for potassium was also greater than the control limit at 26%. The associated positive detection is qualified as "J+". The MS exhibited a recovery less than the lower warning limit for zinc at 82%. The associated sample result is qualified as "J-".

MS sample NYOW-05-SL022-A exhibited a recovery greater than the upper control limit for calcium at 384%. The SD sample did not recover for calcium. The MS/SD RPD was greater than the control limit at 92%. The associated positive detection is qualified as "J".

MS sample NYOW-05-SL022-A exhibited a recovery greater than the upper control limit for magnesium at 146%. The SD recovery was less than the lower warning limit at 36%. The MS/SD RPD was greater than the control limit at 37%. The associated positive detection is qualified as "J".

SD sample NYOW-05-SL022-A exhibited a recovery greater than the upper warning limit for barium at 122%. The MS/SD RPD was greater than the control limit at 23%. The associated sample result is qualified as "J+".

SD sample NYOW-05-SL022-A exhibited recoveries less than the lower warning limit for magnesium at 36%, lead at 76%, sodium at 80%, beryllium at 81%, cobalt at 81%, and chromium at 82%. The associated sample results are qualified as "J-" with the exception of sodium which was previously "U" qualified at the LOQ based on blank contamination and magnesium which also had a MS recovery greater than the warning limit. The result for sodium is qualified as "UJ" and the result for magnesium is qualified as "J".

MS/SD sample NYOW-05-PH021-C exhibited recoveries outside of warning limits for magnesium, calcium, iron, manganese, and aluminum. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

SD sample NYOW-05-PH021-C exhibited a recovery greater than the upper control limit for zinc at 203%. The MS/SD RPD was also greater than the control limit at 50%. The associated positive detection is qualified as “J+”.

MS/SD sample NYOW-05-PH021-C exhibited a RPD greater than the control limit for manganese at 36%. The associated positive detection is qualified as “J”.

Metals by Method 6020A:

MS/SD sample NYOW-05-PH021-C exhibited RPDs greater than the control limit for thallium, selenium, and cadmium at 23%, 22%, and 23%, respectively. The associated sample result for selenium was non-detect and is qualified as “UJ”. The positive detections for cadmium and thallium were qualified as “J”.

**POST-DIGESTION SPIKE**

Metals by Method 6010C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-SL022-A. Aluminum, barium, calcium, copper, iron, magnesium, manganese, and zinc recovered below the lower control limit. Aluminum, iron, and manganese concentrations were greater than 4X the spiked amount in the MS. Copper recovered within control in the MS/SD sample; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures. The results for barium, calcium, magnesium, and zinc were previously qualified; no further action is necessary.

Metals by Method 6020C:

A PDS was performed for MS/SD sample NYOW-05-PH021-C and all recoveries were acceptable. The associated sample results were previously qualified as “UJ”; no further action is necessary.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-SL022-A. The %Ds for aluminum (44%), calcium (46%), iron (46%), magnesium (13%), and manganese (18%) exceeded the control limit. The associated sample results were previously qualified; no further action is necessary.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits with the exceptions noted below.

Metals by Method 6020A:

Arsenic recovered above the upper control limit for CRI 280-524443/15 at 122%. The associated equipment blank sample result was non-detect; qualification is not necessary.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

Samples NYOW-05-PH021-C, NYOW-05-PH006-C, NYOW-05-PH024-C, NYOW-05-PH023-C, NYOW-05-PH021-B, NYOW-05-PH022-C, and NYOW-05-PH020-C could not be thoroughly homogenized before sub-sampling was performed because of their clay matrix prior to extraction for SVOCs and SVOCs with SIM.

Due to laboratory error, batch precision associated with SVOC SIM soil batch 523271 is not available. The MS/SD were extracted but the parent sample was not. A LCSD was not performed. Accuracy was demonstrated through acceptable performance of an LCS.

Two field duplicate and parent sample pairs were collected and analyzed for all parameters (PH-DUP-001_210108 and NYOW-05-PH022-B, and SL-DUP-001_210108 and NYOW-05-SL023-A). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. The following analytes did not meet the precision criteria:

- PH-DUP-001_210108 and NYOW-05-PH022-B: benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, lead, and calcium (qualified as “J”).
- SL-DUP-001_210108 and NYOW-05-SL023-A: calcium (qualified as “J”).

Samples NYOW-05-SL006-A, NYOW-05-SL021-A, NYOW-05-SL023-A, NYOW-05-SL024-A, and SL-DUP-001_210108 did not meet project quantitation limit goals (PQLGs) for several method SVOC SIM analytes due to sample dilution. LOQs were slightly greater than PQLGs for SVOCs and metals due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of the result recommended for rejection. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 April 2021

**SUBJECT:** New York Ordnance Works Soil S2BVEM: 280-144370-1 (Revision 1)

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in January 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins/TestAmerica (Eurofins), of Denver, CO (DoD ELAP Certificate # 2907.01) and Eurofins of Savannah, GA (DoD ELAP Certification #L2463) by the methods specified below.

- Semi-Volatile Organic Compounds (SVOCs) by SW-846 Method 8270D
- SVOCs with SIM by SW-846 Method 8270D
- Metals by ICP SW-846 Method 6010C
- Metals by ICP-MS SW-846 Method 6020A
- Mercury (Hg) by SW-846 Method 7470A
- Hg by SW-846 Method 7471B
- Percent Moisture (%M) by ASTM Method D2216

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported. A summary table presenting the results that were qualified as a result of this validation, the qualifiers applied, and the reason codes associated with the qualifications is presented as an attachment to this report.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-144370 | 280-144370-1 | NYOW-05-SL010-A | 1/7/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals, Hg, %M |
| 280-144370 | 280-144370-2 | NYOW-05-PH010-B | 1/7/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals, Hg, %M |
| 280-144370 | 280-144370-3 | NYOW-05-PH010-C | 1/7/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals, Hg, %M |
| 280-144370 | 280-144370-4 | NYOW-05-SL009-A | 1/7/21 | SVOCs, SVOCs with SIM, ICP and ICP-MS Metals, Hg, %M |

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Department of Defense *Data Validation Guidelines Module 1* (May 11, 2020), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (January 2017), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 2B electronic and manual validation (S2BVEM) and include review of quality control results and instrument calibration.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT AND HOLDING TIMES

The investigative samples were received in good condition, properly preserved on ice. Two coolers were received by the laboratory at temperatures of 0.9°C and 1.4°C. All samples were extracted and analyzed within holding time.

Three of the four amber 1L glass bottles were received three-fourths full for equipment blank sample EB-01_210107 (280-144370-14). The container with the least volume was marked "Do Not Use". For method 8270D SIM, sample EB-01_210107 was received in 1L amber unpreserved but requires a 250mL unpreserved amber. The laboratory was instructed to mix and pour off 250 mL from the 1L and extract. The laboratory was unable to perform a method-required solvent rinse of the glass container.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## GC/MS INSTRUMENT PERFORMANCE CHECK

A decafluorotriphenylphosphine instrument performance check was performed prior to the initial calibration and at the start of the sample analysis batch for SVOCs and SVOCs with SIM (i.e., each 12-hour period). The tunes met the ion abundance criteria.

## INITIAL CALIBRATION AND INITIAL CALIBRATION VERIFICATION

Instrument calibration summaries, including average relative response factors (RRFs), calibration factors (CFs), percent relative standard deviations (%RSDs), coefficients of determination, and

initial calibration verification results and frequencies were subject to review. Minimum calibration levels were also verified. All calibration criteria were met with the exceptions noted below.

SVOCs Method 8270D:

The initial calibration verification performed on 12/14/2020 at 17:31 (680-648435/9) exhibited %Ds greater than the control limit for benzyl butyl phthalate at 30.4%, 3,3'-dichlorobenzidine at 21.3%, bis(2-ethylhexyl) phthalate at 26.8%, and di-n-octyl phthalate at 26.7%. The associated sample results are qualified as "UJ".

**CONTINUING CALIBRATION VERIFICATION**

The continuing calibration RRFs, CFs, percent differences (%Ds), and frequencies were subject to review. All calibration criteria were met with the exceptions noted below.

SVOCs by Method 8270D:

Continuing calibration verification (CCV) 680-651917/2 exhibited %Ds greater than the control limit for hexachlorobenzene (27.4%), butyl benzyl phthalate (32.4%), bis(2-ethylhexyl) phthalate (34%), and di-n-octyl phthalate (31%). The associated sample results are qualified as "UJ".

CCV 680-651917/2 and CCV 680-651917/31 exhibited RRFs less than the minimum relative response factor recommended by method 8270D for hexachlorobenzene (0.100) at 0.0971 and 0.0938, respectively. However, the RRFs were greater than minimum RRF recommended by the NFG (0.05). Given that the responses were only marginally below the method RRFs and were acceptable based on the validation guidelines, the associated soil sample results are not qualified or recommended for rejection on this basis. The results were previously qualified as estimated based on the CCV %D.

CCV 680-651917/3 exhibited a %D greater than the control limit for atrazine at 20.7%. The associated sample results were non-detect and are qualified as "UJ".

CCV 680-652004/2 exhibited %Ds greater than the control limit for acetophenone (27.4%), nitrobenzene (26.2%), isophorone (23.7%), 2,4-dimethylphenol (25.2%), 4-chloroaniline (27.6%), 4-chloro-3-methylphenol (20.9%), bis(2-chloroethoxy)methane (25.2%), 2-nitroaniline (20.7%), 4-bromophenyl phenyl ether (29.8%), hexachlorobenzene (36.1%), pentachlorophenol (32.9%), butyl benzyl phthalate (25.3%), and bis(2-ethylhexyl)phthalate (26.2%). The associated sample equipment blank sample results are qualified as "UJ".

CCV 680-652004/3 exhibited a %D greater than the control limit for atrazine at 23.1%. The associated equipment blank sample result was non-detect and is qualified as "UJ".

Metals by Method 6010C:

Low-level CCV (LLCCV) 280-524477/21 exhibited a recovery greater than the upper control limit for lead at 126%. The associated lead results for samples bracketed by the LLCCV are greater than the level spiked in the ICV and CCVs; qualification is not necessary.

LLCCV 280-524477/21 exhibited recoveries greater than the upper control limit for calcium and sodium at 125% and 127%, respectively. The associated calcium and sodium concentrations were greater than the level spiked in the ICV and CCVs; qualification is not necessary.

LLCCV 280-524555/102 exhibited a recovery greater than the upper control limit for calcium at 126%. The associated calcium results for samples bracketed by the LLCCV are greater than the level spiked in the ICV and CCVs; qualification is not necessary.

Metals by Method 6020A:

LLCCV 280-524422/109 exhibited a recovery greater than the upper control limit for cadmium at 123%. The associated cadmium results for samples bracketed by the LLCCV are greater than the level spiked in the ICVs and CCVs; qualification is not necessary.

**INTERNAL STANDARDS**

Internal standard areas and retention times were reviewed and were determined to be within the associated control limits. All samples, standards, and QC samples were spiked with internal standards as required by the methods.

**BLANK SAMPLE RESULTS**

The criteria for evaluation of blanks applies to laboratory method or preparation blanks, continuing calibration blanks, and equipment blanks. Method blanks were prepared and analyzed with each batch. All target analytes were not detected in the method blanks, continuing calibration blanks, and equipment blanks with the exceptions noted below.

Metals Method 6010C:

Preparation blank sample 280-523813/1-A exhibited positive detections greater than the LOD but less than the LOQ for manganese (0.219 mg/kg), zinc (1.13 mg/kg), calcium (17.4 mg/kg), and aluminum (2.04 mg/kg). The associated positive detections were greater than the LOQ; qualification is not required.

Metals Method 6020A:

Preparation blank sample 280-523818/1-A exhibited a positive detection for chromium at 1.44 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

Mercury Method 7470A:

Continuing calibration blank (CCB) 280-524120/13-A exhibited a positive detection for mercury at 0.117 µg/L. The associated equipment blank sample result was non-detect; qualification is not necessary.

## SURROGATE RECOVERIES

Surrogates were added to all field and QC samples. All surrogate percent recoveries were within the acceptance criteria with the exceptions noted below.

SVOCs Method 8270D with SIM:

Samples NYOW-05-SL007-A and NYOW-05-SL008-A did not recover for any of the five surrogate compounds. The samples were each analyzed at 20X dilutions due to sample matrix effect on the internal standard and the surrogates were diluted out. Qualification is not necessary.

Sample NYOW-05-PH007-C exhibited a recovery less than the lower control limit for base/neutral extractable surrogate terphenyl-d14 at 55%. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

Sample PH-DUP-001_210107 exhibited a recovery less than the lower control limit for base/neutral extractable surrogate 2-fluorobiphenyl at 40%. The associated positive detections are qualified as "J-" and non-detects are qualified as "UJ".

## LABORATORY CONTROL SAMPLES

Laboratory Control Sample/Control Sample duplicates (LCS/LCSD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The LCS/LCSD relative percent differences (RPDs) were also reviewed to determine compliance. All LCS/LCSD met the acceptance criteria with the exceptions noted below.

A LCSD was not performed for SVOC prep batch 651802 and SVOC SIM preparation batch 523067. MSD were analyzed to assess precision.

SVOCs Method 8270D:

LCS/LCSD 680-651906/10-A/11-A did not recover (i.e., 0%) for 3,3'-dichlorobenzidine. The associated equipment blank sample result is qualified as "X" and recommended for rejection.

LCS/LCSD 680-651906/10-A/11-A exhibited RPDs greater than the control limit for hexachlorocyclopentadiene (27%), 2,4-dimethylphenol (20%), caprolactam (21%), diethyl phthalate (22%), butyl benzyl phthalate (22%), 4-bromophenyl phenyl ether (22%), nitrobenzene (23%), bis(2-chloroethoxy)methane (24%), 2,2'-oxybis(1-chloropropane) (25%), di-n-octyl phthalate (30%), hexachlorobenzene (30%), 4-nitroaniline (22%), pentachlorophenol (27%), and bis(2-ethylhexyl)phthalate (32%). The associated equipment blank sample results were non-detect; qualification is not required.

SVOCs Method 8270D with SIM:

LCSD 280-523256/3-A exhibited a recovery less than the lower warning limit for indeno(1,2,3-c,d)pyrene at 47.7%. The associated equipment blank sample result (EB-01_210107) is qualified as "UJ".

## MATRIX SPIKE/MATRIX SPIKE DUPLICATES

Matrix spike/spike duplicate (MS/SD) were evaluated to determine compliance with method frequency and analytical recovery criteria. The MS/SDs RPDs were also reviewed to determine compliance. All MS/SD recoveries and RPDs were within acceptance criteria with the exceptions noted below.

SVOCs Method 8270D:

MS/SD sample 680-193548-A-3-S exhibited recoveries and RPDs outside of control limits. The sample volume did not originate from the Site; qualification is not necessary.

SVOCs Method 8270D with SIM:

MS sample NYOW-05-SL010-A exhibited a recovery less than the lower control limit for chrysene at 53%. The associated sample result is qualified as "J-".

SD sample NYOW-05-SL010-A exhibited recoveries less than the lower control limit for naphthalene, 1-methylnaphthalene, benzo(b)fluoranthene, and pyrene at 23%, 27%, 35%, and 45%, respectively. In addition, the SD did not recover (i.e., 0%) for phenanthrene and chrysene. The associated sample results were positive detections and are qualified as "J-".

Metals Method 6010C:

MS/SD sample NYOW-05-SL010-A exhibited recoveries outside of control limits for iron, manganese, and aluminum. The associated sample concentrations were greater than 4X the spiked amount; qualification is not necessary.

SD sample NYOW-05-SL010-A did not recover manganese. The associated sample result is a positive detection and is qualified as "J-".

SD sample NYOW-05-SL010-A exhibited a recovery greater than the upper warning limit for calcium at 128%. The associated positive detection is qualified as "J+".

MS/SD sample NYOW-05-SL010-A exhibited RPDs greater than the control limit for magnesium (24%), aluminum (25%), calcium (33%), and manganese (57%). The associated sample results for aluminum and magnesium are qualified as "J". The results for calcium and manganese were previously qualified; no further action is necessary.

Metals Method 6020A:

MS/SD sample NYOW-05-SL010-A exhibited a RPD greater than the control limit for antimony at 25%. The associated sample result is non-detect and is qualified as "UJ".

## POST-DIGESTION SPIKE

Metals by 6020C:

A post-digestion spike (PDS) was performed for MS/SD sample NYOW-05-SL010-A. Aluminum, iron, manganese, and silver exhibited recoveries less than the lower control limit; however,

aluminum, iron, and manganese concentrations were greater than 4X the spiked amount in the MS. Silver recovered within control in the MS/SD sample; therefore, the post-digestion spike was not used to evaluate MS/SD recovery failures.

A PDS was performed in conjunction with the equipment blank's aqueous sample batch on a non-Site sample. The results were not used to assess equipment blank sample results.

**ICP SERIAL DILUTION**

An ICP serial dilution was performed for sample NYOW-05-SL010-A and all %Ds were below 10% for methods 6010C and 6020A.

**LOW-LEVEL CHECK STANDARD**

Low-level check standards for methods 6010C and 6020A were performed using the low-level CCV standard. All recoveries were within the control limits.

**INTERFERENCE CHECK SAMPLES**

Interference check samples A and AB recoveries were evaluated and met the acceptance criteria.

**COMMENTS**

Percent moisture is outside of Eurofins field of accreditation for solid matrices at the Denver laboratory. All percent solids results were greater than 30%.

One field duplicate and parent sample pair was collected and analyzed for all parameters (PH-DUP-001_210107 and NYOW-05-PH007-B). For sample results that are greater than 5X the LOQ, the RPD must be less than 50%. For sample results less than 5X the LOQ, the absolute difference must be less than ±LOQ. All analytes met the precision criteria for this field duplicate pair.

Samples NYOW-05-SL007-A and NYOW-05-SL008-A did not meet project quantitation limit goals (PQLGs) for several method SVOC SIM analytes due to sample dilution. LOQs were slightly greater than PQLGs for SVOCs and metals due to percent moisture adjustments.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical methods with the exception of errors discussed above. If a given analytical parameter is not mentioned above, that means that all specified criteria were met for that analytical parameter. All data are considered usable, as qualified, with the exception of the result recommended for rejection. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 99%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148313-2 Revision 1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148313-2 | 280-148313-1 | NYOW-B-SL050-A | 5/05/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January

2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.7°C, 2.7°C, and 3.1°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148313-1.

## COMMENTS

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Signed:

Emily Strake, CEP
Technical Director/Chemist

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the

project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 1.7°C, 3.4°C, 3.6°C, 3.7°C, 4.3°C, 4.3°C, and 5.5°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148345-1.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for CEC (SL-DUP-001_210506 collected from NYOW-B-SL047-A and PH-DUP-001_210506 collected from NYOW-B-PH046-C). The RPD must be less than 50% when at least one result is greater than the LOQ. Both field duplicate pairs met the precision criteria for CEC.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148419-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 3.7°C, 4.9°C, 5.7°C, and 5.9°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148419-1.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for CEC (PH-DUP-001_210507 collected from NYOW-B-PH041-C). The RPD must be less than 50% when at least one result is greater than the LOQ. The field duplicate pair did not meet the precision criteria for CEC with an RPD of 87%. The associated sample results are qualified as “J” as shown in the table below.

| Sample | Analyte | Result | Qualifier |
|---|---|---|---|
| NYOW-B-PH041-C | CEC | 4.3 | J |
| PH-DUP-001_210507 | CEC | 1.7 | J |

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

[3]PH-DUP-002_210510 collected from NYOW-B-PH021-C
[4]PH-DUP-003_210510 collected from NYOW-B-PH026-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.6°C, 0.8°C, 2.1°C, 2.9°C, 3.1°C, 4.0°C, and 4.7°C. All requested target analytes were reported.

The container for sample NYOW-B-PH026-C did not list the sample time. The time was logged in accordance with the COC.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC with the sample time exception noted above. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148471-1.

## COMMENTS

No field blanks were collected as part of this SDG.

Four field duplicate and parent sample pairs were collected and analyzed for CEC (SL-DUP-001_210510 collected from NYOW-B-SL037-A, PH-DUP-001_210510 collected from NYOW-B-PH036-C, PH-DUP-002_210510 collected from NYOW-B-PH021-C, and PH-DUP-003_210510 collected from NYOW-B-PH026-C). The RPD must be less than 50% when at least one result is greater than the LOQ. All field duplicate pairs met the precision criteria for CEC.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.4°C, 1.2°C, 1.4°C, 2.2°C, 2.8°C, 3.0°C, and 3.8°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148501-1.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for CEC (SL-DUP-001_210511 collected from NYOW-B-SL027-A and PH-DUP-001_210511 collected from NYOW-B-PH031-C). The RPD must be less than 50% when at least one result is greater than the LOQ. Both field duplicate pairs met the precision criteria for CEC.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148576-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148576-2 | 280-148576-1 | NYOW-B-SL029-A | 5/12/2021 | CEC |
| 280-148576-2 | 280-148576-2 | NYOW-B-PH029-B | 5/12/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 2.0°C, 3.0°C, 3.7°C, 4.3°C, and 4.7°C. All requested target analytes were reported.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

Signed:

Emily Strake, CEP
Technical Director/Chemist

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148576-1.

## COMMENTS

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

[3]PH-DUP-002_210513 collected from NYOW-B-PH018-C

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.7°C, 2.0°C, 3.5°C, 3.6°C, 3.7°C, 4.8°C, and 5.3°C. All requested target analytes were reported.

The container for sample SL-DUP-001_210513 had the date at the end of the sample ID in a different order than the ID listed on the COC. The date was logged in accordance with the COC.

All samples were analyzed within the holding time period.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC with the sample ID exception noted above. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148628-1.

## COMMENTS

No field blanks were collected as part of this SDG.

Three field duplicate and parent sample pairs were collected and analyzed for CEC (SL-DUP-001_210513 collected from NYOW-B-SL017-A, PH-DUP-001_210513 collected from NYOW-B-PH018-B, and PH-DUP-002_210513 collected from NYOW-B-PH018-C). The RPD must be less than 50% when at least one result is greater than the LOQ. Field duplicate PH-DUP-001_210513 did not meet the precision criteria for CEC with an RPD of 136%. The associated sample results are qualified as “J” as shown in the table below.

| Sample | Analyte | Result | Qualifier |
|---|---|---|---|
| NYOW-B-PH018-B | CEC | 1.7 | J |
| PH-DUP-001_210513 | CEC | 9.0 | J |

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

| 280-148718-2 | 280-148718-15 | NYOW-B-PH008-B | 5/17/2021 | CEC |
| 280-148718-2 | 280-148718-16 | NYOW-B-PH008-C | 5/17/2021 | CEC |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.9°C, 3.1°C, 3.6°C, 3.7°C, and 4.7°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

The sample ID on one 8-ounce sample container was written as NYOW-B-PH00-B. The sample was logged as NYOW-B-PH008-B, in accordance with the COC.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC with the sample ID exception noted above. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148718-1.

## COMMENTS

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. No qualifications were applied as a result of this validation. All data are considered usable, as qualified by the laboratory. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148774-2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins Xenco (Eurofins), of Corpus Christi, TX (Texas NELAP Certificate # T104704210-19-23) by the method specified below.

- Cation Exchange Capacity (CEC) by SW-846 Method 9081

Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |

[2]SL-DUP-001_210518 collected from NYOW-B-SL007-A

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's

(EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the methods employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as “X” should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.3°C, 2.3°C, 2.6°C, 3.1°C, and 4.3°C. All requested target analytes were reported.

All samples were analyzed within the holding time period.

The sample ID on one 8-ounce sample container was written as NYOW-B-PH006. The sample was logged as NYOW-B-PH006-B, in accordance with the COC.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All sample identification labels are unique and match the COC with the sample ID exception noted above. All results were reported in units of mEq/100g. The samples were reported on a dry weight basis and percent solids data are reported in SDG 280-148774-1.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for CEC (PH-DUP-001_210518 collected from NYOW-B-PH011-C and SL-DUP-001_210518 collected from NYOW-B-SL007-A). The RPD must be less than 50% when at least one result is greater than the LOQ. Neither field duplicate pair met the precision criteria with RPDs equivalent to 78% and 68% for PH-DUP-001_210518 and SL-DUP-001_210518, respectively. The associated sample results are qualified as “J” as shown in the table below.

| Sample | Analyte | Result | Qualifier |
|---|---|---|---|
| PH-DUP-001_210518 | CEC | 1.1 | J |
| NYOW-B-PH011-C | CEC | 2.5 | J |
| SL-DUP-001_210518 | CEC | 19 | J |
| NYOW-B-SL007-A | CEC | 9.4 | J |

All soil sample LOQs met the project quantitation limit goal (PQLG) for CEC.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 June 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148318-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148318-1 | 280-148318-1 | NYOW-B-SL050-A | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-2 | NYOW-B-PH050-B | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-3 | NYOW-B-PH050-C | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-4 | NYOW-B-SL049-A | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-5 | NYOW-B-PH049-B | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-6 | NYOW-B-PH049-C | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-7 | NYOW-B-SL048-A | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-8 | NYOW-B-PH048-B | 5/5/2021 | Grain Size |
| 280-148318-1 | 280-148318-9 | NYOW-B-PH048-C | 5/5/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January

2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Three coolers were received by the laboratory at temperatures of 1.7°C, 2.7°C, and 3.1°C. All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified by the laboratory. No qualifiers were applied as a result of this validation. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the

project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 1.7°C, 3.4°C, 3.6°C, 3.7°C, 4.3°C, 4.3°C, and 5.5°C. All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for grain size (SL-DUP-001_210506 collected from NYOW-B-SL047-A and PH-DUP-001_210506 collected from NYOW-B-PH046-C). The RPD must be less than 50% for each soil type. Gravel did not meet the precision criteria for SL-DUP-001_210506 (RPD = 77%). Gravel and coarse sand did not meet the precision criteria for PH-DUP-001_210506 with RPDs of 185% and 112%, respectively. Results greater than 0% are qualified as “J” as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| SL-DUP-001_210506 | Gravel | 5.4 | J |
| NYOW-B-SL047-A | Gravel | 2.4 | J |
| PH-DUP-001_210506 | Gravel | 1.0 | J |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 June 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148421-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148421-1 | 280-148421-1 | NYOW-B-SL041-A | 5/7/2021 | Grain Size |
| 280-148421-1 | 280-148421-2 | NYOW-B-PH041-B | 5/7/2021 | Grain Size |
| 280-148421-1 | 280-148421-3 | NYOW-B-PH041-C | 5/7/2021 | Grain Size |
| 280-148421-1 | 280-148421-4 | [1]PH-DUP-001_210507 | 5/7/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Four coolers were received by the laboratory at temperatures of 3.7°C, 4.8°C, 5.7°C, and 5.9°C. All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

One field duplicate and parent sample pair was collected and analyzed for grain size (PH-DUP-001_210507 collected from NYOW-B-PH041-C). The RPD must be less than 50% for each soil type. Gravel did not meet the precision criteria with an RPD of 89%. Results greater than 0% are qualified as “J” as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| PH-DUP-001_210507 | Gravel | 0.5 | J |
| NYOW-B-PH041-C | Gravel | 1.3 | J |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.6°C, 0.8°C, 2.1°C, 2.9°C, 3.1°C, 4.0°C, and 4.7°C. All requested target analytes were reported.

The container for sample NYOW-B-PH026-C did not list the sample time. The time was logged in accordance with the COC.

Sample PH-DUP-002_210510 had a cracked lid and appeared as though water had entered the sample container. The laboratory proceeded with analysis. The results for grain size are qualified as "X" and recommended for rejection.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Four field duplicate and parent sample pairs were collected and analyzed for grain size (SL-DUP-001_210510 collected from NYOW-B-SL037-A, PH-DUP-001_210510 collected from NYOW-B-PH036-C, PH-DUP-002_210510 collected from NYOW-B-PH021-C, and PH-DUP-003_210510 collected from NYOW-B-PH026-C). The RPD must be less than 50% for each soil type. Gravel

did not meet the precision criteria for PH-DUP-001_210510 (RPD = 77%). Results greater than 0% are qualified as “J” as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| PH-DUP-001_210510 | Gravel | 18.7 | J |
| NYOW-B-PH036-C | Gravel | 8.3 | J |
| PH-DUP-002_210510 | All | -- | X |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified, with the exception of the rejected results. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 96%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.4°C, 1.2°C, 1.4°C, 2.2°C, 2.8°C, 3.0°C, and 3.8°C. All requested target analytes were reported.

Samples NYOW-B-PH024-C and NYOW-B-PH025-B appeared as though cooler water had entered the sample container. The laboratory proceeded with analysis. The results for grain size are qualified as "X" and recommended for rejection.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for grain size (SL-DUP-001_210511 collected from NYOW-B-SL027-A and PH-DUP-001_210511 collected from NYOW-B-PH031-C). The RPD must be less than 50% for each soil type. Gravel and silt did not meet the precision criteria for PH-DUP-001_210511 with RPDs of 57% and 70%, respectively. Results greater than 0% are qualified as "J". All qualified results are presented in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| PH-DUP-001_210511 | Gravel | 40.6 | J |
| NYOW-B-PH031-C | Gravel | 22.7 | J |
| PH-DUP-001_210511 | Silt | 7.2 | J |
| NYOW-B-PH031-C | Silt | 14.9 | J |
| NYOW-B-PH024-C | All | -- | X |

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| NYOW-B-PH025-B | All | -- | X |

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified, with the exception of the rejected results. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 91%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 July 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148579-1 Revision 2

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148579-1 | 280-148579-1 | NYOW-B-SL029-A | 5/12/2021 | Grain Size |
| 280-148579-1 | 280-148579-2 | NYOW-B-PH029-B | 5/12/2021 | Grain Size |
| 280-148579-1 | 280-148579-3 | NYOW-B-PH029-C | 5/12/2021 | Grain Size |
| 280-148579-1 | 280-148579-4 | NYOW-B-SL030-A | 5/12/2021 | Grain Size |
| 280-148579-1 | 280-148579-5 | NYOW-B-PH030-B | 5/12/2021 | Grain Size |

| 280-148579-1 | 280-148579-15 | NYOW-B-PH013-C | 5/12/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 2.0°C, 3.0°C, 3.7°C, 4.3°C, and 4.7°C. All requested target analytes were reported.

Sample NYOW-B-PH030-C was received with a broken lid which was replaced at receipt. The contents did not appear to be compromised and the laboratory proceeded with the analysis.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | X | |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified by the laboratory. No qualifiers were applied as a result of this validation. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Seven coolers were received by the laboratory at temperatures of 0.7°C, 2.0°C, 3.5°C, 3.6°C, 3.7°C, 4.8°C, and 5.3°C. All requested target analytes were reported.

Sample SL-DUP-001_210513 had the date at the end of the sample ID written in a different order than the COC. The sample was logged in accordance with the COC.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Three field duplicate and parent sample pairs were collected and analyzed for grain size (SL-DUP-001_210513 collected from NYOW-B-SL017-A, PH-DUP-001_210513 collected from NYOW-B-PH018-B, and PH-DUP-002_210513 collected from NYOW-B-PH018-C). The RPD must be less than 50% for each soil type.

Coarse sand did not meet the precision criteria for SL-DUP-001_210513 and PH-DUP-001_210513 with RPDs of 120% and 100%, respectively. Coase sand and medium sand did not meet the precision criteria for PH-DUP-002_210513 at 200% and 74%, respectively  Results greater than 0% are qualified as “J”  and results reported as equal to 0% are qualified as “UJ” as shown in the table below:

| Sample | Soil Type | Result | Qualifier |
|---|---|---|---|
| SL-DUP-001_210513 | Coarse Sand | 0.1 | J |
| NYOW-B-SL017-A | Coarse Sand | 0.4 | J |
| PH-DUP-001_210513 | Coarse Sand | 0.3 | J |
| NYOW-B-PH018-B | Coarse Sand | 0.1 | J |
| PH-DUP-002_210513 | Coarse Sand | 0.4 | J |
| NYOW-B-PH018-C | Coarse Sand | 0 | UJ |
| PH-DUP-002_210513 | Medium Sand | 1.3 | J |
| NYOW-B-PH018-C | Medium Sand | 0.6 | J |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's (EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.9°C, 3.1°C, 3.6°C, 3.7°C, and 4.7°C. All requested target analytes were reported.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |

| Verification Criteria | Yes | No |
|---|---|---|
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | X | |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

**SAMPLE RESULTS**

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

**COMMENTS**

No field blanks were collected as part of this SDG.

No field duplicates were collected as part of this SDG.

**OVERALL ASSESSMENT OF THE DATA**

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified by the laboratory. No qualifiers were applied as a result of this validation. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

# DATA VALIDATION REPORT

**TO:** Michael Badeau, Bluestone Environmental Group

**FROM:** Emily Strake, Bluestone Environmental Group

**DATE:** 14 June 2021

**SUBJECT:** New York Ordnance Works Soil S1VM: 280-148770-1

---

This memorandum presents the findings of an analytical data validation of the data generated from the analysis of soil samples collected in May 2021 by Bluestone Environmental Group, Inc. (Bluestone) at the New York Ordnance Works site located in Baldwinsville, NY (the Site). The samples were analyzed by Eurofins TestAmerica (Eurofins), of Seattle, WA (Certification #L2236) by the method specified below.

- ASTM D422, Grain Size Distribution

Grain Size Distribution is a non-accredited analytical parameter at Eurofins Seattle location. Table 1, below, summarizes the sample delivery group (SDG), laboratory and client sample identification numbers, sample collection dates, and analytical parameters subject to review. All requested target analytes were reported.

**TABLE 1: SAMPLE SUMMARY**

| SDG | Laboratory Sample ID | Client Sample ID | Sample Date | Analytical Parameters |
|---|---|---|---|---|
| 280-148770-1 | 280-148770-1 | NYOW-B-SL011-A | 5/18/2021 | Grain Size |
| 280-148770-1 | 280-148770-2 | NYOW-B-PH011-B | 5/18/2021 | Grain Size |
| 280-148770-1 | 280-148770-3 | NYOW-B-PH011-C | 5/18/2021 | Grain Size |

## VALIDATION OVERVIEW

This data validation was performed in accordance with the U.S. Department of Defense *General Data Validation Guidelines* (September 16, 2019), the U.S. Environmental Protection Agency's

(EPA) *National Functional Guidelines for Inorganic Superfund Methods Data Review* (January 2017), the *Uniform Federal Policy Quality Assurance Project Plan* (December 2020), and the specifics of the method employed.

Validation includes review of the analytical data to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. The items subject to review are consistent with Stage 1 manual validation (S1VM) and include review of sample results forms, holding times, preservation, sample documentation (including the chain of custody form) and field quality control.

As a result of the review process, the following qualifiers may be assigned to the data in accordance with the General Data Validation Guidelines and best professional judgment:

**U –** The analyte was not detected and was reported as less than the limit of detection (LOD).

**J –** The reported result was an estimated value with an unknown bias.

**J+ –** The result was an estimated quantity, and the result may be biased high.

**J- –** The result was an estimated quantity, and the result may be biased low.

**UJ –** The analyte was not detected and was reported as less than the LOD. However, the associated numerical value is approximate.

**X –** The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

If any validation qualifiers are assigned, these qualifiers supersede laboratory-applied qualifiers. Data that are not qualified as a result of this data validation are considered acceptable on the basis of the items subject to review. Data that are qualified as "X" should be reviewed by the project team to determine if the data should be accepted or rejected. Data that are otherwise qualified due to minor data quality anomalies are usable, as qualified.

## SAMPLE RECEIPT, HOLDING TIMES, AND PRESERVATION

The investigative samples were received in good condition, properly preserved on ice. Five coolers were received by the laboratory at temperatures of 1.3°C, 2.3°C, 2.6°C, 3.1°C, and 4.3°C. All requested target analytes were reported.

Sample SL-DUP-001_210518 had the sample date listed as 5/17/21 on the container; however, the COC listed 5/18/21. The correct sample date is 5/18/21 and the sample was logged in accordance with the COC.

Sample NYOW-B-PH011-C did not have a date or time listed on the container. The sample was logged in accordance with the COC.

Sample NYOW-B-PH006-B was labeled on the container as sample “PH006-B”. The sample was logged in accordance with the COC.

## CASE NARRATIVE AND SAMPLE DOCUMENTATION CHECKLIST

| Verification Criteria | Yes | No |
|---|---|---|
| Were issues noted with sample receipt? | | X |
| Were all samples documented correctly on the COC? | X | |
| Did samples listed on the COC match the sample labels? | | X |
| Were samples relinquished properly on the COC? | X | |
| Were all samples properly preserved? | X | |
| Were all samples analyzed within the specified holding time? | X | |

## SAMPLE RESULTS

All project parameters identified in the QAPP and listed on the COC were analyzed and reported. The reported units (%) are accurate and reflect the project requirements. No project action limits or detection limits are associated with Grain Size Distribution.

## COMMENTS

No field blanks were collected as part of this SDG.

Two field duplicate and parent sample pairs were collected and analyzed for grain size (PH-DUP-001_210518 collected from NYOW-B-PH011-C and SL-DUP-001_210518 collected from NYOW-B-SL007-A). The RPD must be less than 50% for each soil type. All soil types met the precision criteria for each field duplicate and parent sample pair.

## OVERALL ASSESSMENT OF THE DATA

On the basis of this evaluation, the laboratory appears to have followed the specified analytical method. All data are considered usable, as qualified by the laboratory. No qualifiers were applied as a result of this validation. In addition, analytical completeness, defined as the percentage of analytical results that are judged to be valid, is 100%.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-148313-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 183 results (42.76%) out of the 428 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The samples were received on 5/6/2021 9:45 AM.
The temperatures of the 3 coolers at receipt time were 1.7ºC, 2.7ºC and 3.1ºC. Samples sent to Eurofins Seattle for TOC analysis arrived at temperatures of 4.2ºC and 3.3ºC.

| Analytical Method | Data Reviewer Comment |
|---|---|
| BNASIMD | Samples NYOW-B-SL050-A[4X], NYOW-B-PH049-B[10X] and NYOW-B-SL048-A[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly. The following samples in preparation batch 280-536786 and analytical batch 280-537438 were diluted to bring the concentration of target analytes within the calibration range: NYOW-B-SL050-A and NYOW-B-PH049-B. |

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

**Quality Control Outliers for test method BNASIMD, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-536786/1-A (LB)/ MB 280-536786/1-A | Benzo (a)anthracene | 4.330 | < 1.8 | < 10 | ug/kg | U/None* | L | |
| MB 280-536786/1-A (LB)/ MB 280-536786/1-A | Benzo(a)pyrene | 2.330 | < 1.5 | < 10 | ug/kg | U/None* | L | |
| MB 280-536786/1-A (LB)/ MB 280-536786/1-A | Benzo (b)fluoranthene | 2.580 | < 2.4 | < 10 | ug/kg | U/None* | L | |

| MB 280-536786/1-A (LB)/ MB 280-536786/1-A | Pyrene | 4.570 | < 2.2 | < 10 | ug/kg | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCSD 280-535528/3-A (BD)/ LCSD 280-535528/3-A | Naphthalene | 139.8 | 38 - 111 | 10 - 200 | percent | J/None | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the LCS Recovery for BNASIMD**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B | N | Naphthalene | 10.0 | 1.20 J Q | 1.20 J | | ug/kg | C/Z/I/TR |
| NYOW-B-PH048-C | N | Naphthalene | 9.80 | 24.0 Q | 24.0 J | | ug/kg | C/Z/I |
| NYOW-B-PH049-B | N | Naphthalene | 10.0 | 0.870 J Q M | 0.870 J | + | ug/kg | C/Z/TR |
| NYOW-B-PH050-B | N | Naphthalene | 10.0 | 5.80 J Q | 5.80 J | + | ug/kg | C/Z/TR |
| NYOW-B-SL048-A | N | Naphthalene | 11.0 | 12.0 Q | 12.0 J | | ug/kg | C/Z/I |
| NYOW-B-SL050-A | N | Naphthalene | 11.0 | 32.0 Q | 32.0 J | + | ug/kg | C/Z |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, LCS RPD**

The objective of laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. LCS/LCSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory control sample/laboratory control sample duplicate RPD results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | 1-Methylnaphthalene | 0.1480 | < 0.1 | < 0.1 | ug/l | J/None | Z | |
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | Acenaphthene | 0.1710 | < 0.1 | < 0.1 | ug/l | J/None | Z | |
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | Fluorene | 0.1590 | < 0.1 | < 0.1 | ug/l | J/None | Z | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, LCS RPD**

The objective of laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. LCS/LCSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory control sample/laboratory control sample duplicate RPD results that were outside of the acceptance criteria are listed below.

**Qualified Results associated with the LCS RPD for BNASIMD**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B | N | Naphthalene | 10.0 | 1.20 J Q | 1.20 J | | ug/kg | C/Z/I/TR |
| NYOW-B-PH048-C | N | Naphthalene | 9.80 | 24.0 Q | 24.0 J | | ug/kg | C/Z/I |
| NYOW-B-PH049-B | N | Naphthalene | 10.0 | 0.870 J Q M | 0.870 J | + | ug/kg | C/Z/TR |
| NYOW-B-PH050-B | N | Naphthalene | 10.0 | 5.80 J Q | 5.80 J | + | ug/kg | C/Z/TR |
| NYOW-B-SL048-A | N | Naphthalene | 11.0 | 12.0 Q | 12.0 J | | ug/kg | C/Z/I |
| NYOW-B-SL050-A | N | Naphthalene | 11.0 | 32.0 Q | 32.0 J | + | ug/kg | C/Z |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B (MS)/ 280-148313-8MS | Fluoranthene | 119.7 | 55 - 119 | 10 - 200 | percent | J/None | M | |
| NYOW-B-PH048-B (MS)/ 280-148313-8MS | Pyrene | 119.1 | 55 - 117 | 10 - 200 | percent | J/None | M | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS Recovery for BNASIMD**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B | N | Fluoranthene | 10.0 | 15.0 J1 | 15.0 J | | ug/kg | M/I |
| NYOW-B-PH048-B | N | Pyrene | 10.0 | 16.0 J1 | 16.0 J | | ug/kg | M/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, Prep Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| EB-01_210505 (EB)/ 280-148313-10 | | 8.230 | < 7 | < 14 | days | J/UJ | H2 | Prep Exceeds UWL |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, Prep Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B (N)/ 280-148313-8 | | 14.84 | < 14 | < 28 | days | J/UJ | H2 | Prep Exceeds UWL |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH048-B (N)/ 280-148313-8 | Nitrobenzene-d5 | 41.00 | 44 - 125 | 10 - 125 | percent | J/UJ | I | |
| NYOW-B-PH048-C (N)/ 280-148313-9 | 2-Fluorobiphenyl | 40.00 | 46 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-B-PH048-C (N)/ 280-148313-9 | Nitrobenzene-d5 | 38.00 | 44 - 125 | 10 - 125 | percent | J/UJ | I | |
| NYOW-B-PH049-C (N)/ 280-148313-6 | Fluoranthene-d10 | 105.0 | 55 - 101 | 10 - 101 | percent | J/None | I | |
| NYOW-B-PH050-C (N)/ 280-148313-3 | 2-Fluorobiphenyl | 40.00 | 46 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-B-PH050-C (N)/ 280-148313-3 | Nitrobenzene-d5 | 37.00 | 44 - 125 | 10 - 125 | percent | J/UJ | I | |
| NYOW-B-SL048-A (N)/ 280-148313-7 | Nitrobenzene-d5 | 37.00 | 44 - 125 | 10 - 125 | percent | J/UJ | I | |
| NYOW-B-SL048-A (N)/ 280-148313-7 | Fluoranthene-d10 | 103.0 | 55 - 101 | 10 - 101 | percent | J/None | I | Diluted Out |
| NYOW-B-SL049-A (N)/ 280-148313-4 | 2-Fluorobiphenyl | 43.00 | 46 - 115 | 10 - 115 | percent | J/UJ | I | |
| NYOW-B-SL050-A (N)/ 280-148313-1 | Nitrobenzene-d5 | 32.00 | 44 - 125 | 10 - 125 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-SL050-A (MS)/ 280-148313-1MS | Chromium | 82.91 | 85 - 113 | 10 - 200 | percent | J/UJ | M | |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Beryllium | 22.32 | < 20 | < 20 | rpd | J/UJ | D | |
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Calcium | 61.95 | < 20 | < 20 | rpd | J/UJ | D | |
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Chromium | 20.07 | < 20 | < 20 | rpd | J/UJ | D | |
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Cobalt | 21.86 | < 20 | < 20 | rpd | J/UJ | D | |
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Nickel | 20.94 | < 20 | < 20 | rpd | J/UJ | D | |
| NYOW-B-SL050-A (SD)/ 280-148313-1MSD | Sodium | 20.66 | < 20 | < 20 | rpd | J/UJ | D | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the MS RPD for SW6010C**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-SL050-A | N | Beryllium | 0.540 | 0.360 J J1 | 0.360 J | - | mg/kg | M/D/TR |
| NYOW-B-SL050-A | N | Calcium | 110 | 30000 J1 | 30000 J | | mg/kg | D/A |
| NYOW-B-SL050-A | N | Chromium | 3.80 | 11.0 J1 | 11.0 J | - | mg/kg | M/D |
| NYOW-B-SL050-A | N | Cobalt | 1.10 | 7.10 J1 | 7.10 J | - | mg/kg | M/D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, Total, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| EB-01_210505 (EB)/ 280-148313-10 | Barium | 1.000 | < 0.82 | < 10 | ug/l | U/None* | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, Total, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-536276/1-A (LB)/ MB 280-536276/1-A | Iron | 85.50 | < 22 | < 100 | ug/l | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6020A, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Modified Qualifiers for test method SW6020A, Total**

| FieldSample ID / LabSample ID | Type | Analyte | LOQ | Lab Result | ADR Result | Modified Result | Reason |
|---|---|---|---|---|---|---|---|
| EB-01_210505 280-148313-10 | EB | Antimony | 6.00 | 1.00 U | 1.00 U | 1.00 UJ | V6 |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| A | Serial dilution |
| C | LCS Recovery |
| D | MS RPD |
| H2 | Prep Hold Time |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |

**Reason Code Definitions**

| Code | Definition |
|---|---|
| M2 | Post Spike |
| TR | Trace Level Detect |
| V | Equipment Blank |
| V2 | CCV |
| V6 | Low Level Calibration Verification |
| Z | LCS RPD |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |

**Bias**

| | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

**Review Questions**

| Method: BNASIMD (GC/MS-SIM Analysis by SW8270D) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | | • | | EB-01_210505 was extracted one day past the holding time period. |
| Were all requested target analytes reported? | • | | | |
| Was the GC/MS system properly tuned based on method criteria? | • | | | |
| Was instrument tuning completed every 12 hours during sample analysis? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | | • | | CCV 280-537291/3 exhibited a %D > 20% for dibenz(a,h)anthracene at 22.0%. The associated EB sample result is qualified as "UJ". The reanalysis results for sample NYOW-B-SL048-A are not used for data interpretation. |
| Were Internal Standard retention times and area criteria within method requirements? | • | | | |
| Were internal standards spiked for every sample, standard, and QC sample? | • | | | |
| Were surrogate recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was a method blank prepared and analyzed with each batch? | • | | | |
| Were target analytes in the method blank less than MDL? | | • | | See QC Outliers. MB associated with sample RE/RA. |
| Were target analytes in the field blank less than MDL? | • | | | |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | |
| Were LCS/LCSD recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was the LCS/LCSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| Was a MS/MSD pair prepared with each batch? | | • | | MS/SD not performed for aqueous batch 536125. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was the MS/MSD RPD within project acceptance limits? | • | | | |
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | | | • | |
| Were QAPP specified laboratory PQLs achieved? | • | | | |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |
| Were DoD QSM corrective actions followed if deviations were noted? | | • | | CCV CAs not performed. |
| Were any data recommended for rejection (exclusion) in the data validation process? | | • | | |

**Review Questions**

| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | | • | | CCVL associated with batch 280-537531 recovered (135%) above the upper control limit for Pb. Detections less than the level of the CCV are qualified as "J+". |
| Were ICB/CCBs run at the required frequency and within acceptance criteria? | • | | | |
| Did the ICSA have any non-target interferents above the MDL? | • | | | ICSA associated with batch 280-537531 exhibited a detection for barium greater than the LOD at 13.1 ppb. The laboratory confirmed via ICP/MS that barium is a trace contaminant in the ICSA standard at 12.4 ppb.<br>ICSA associated with batch 280-536668 exhibited a detection for barium greater than the LOD at 13 ppb. The laboratory confirmed via ICP/MS that barium is a trace contaminant in the ICSA standard at 12.4 ppb. |
| Were the ICSA/ICSAB recoveries within QAPP acceptance limits? | • | | | |
| Was a method blank prepared and analyzed with each batch? | • | | | |
| Were target analytes in the method blank less than MDL? | | • | | MB 280-536276/1-A exhibited a positive detection for iron at 85.5 ug/L. Associated EB sample results non-detect. |
| Were target analytes in the field blank less than MDL? | | • | | EB-01_210505, Barium = 1.0 ug/L. Soil sample results are not qualified based on aqueous EB contamination. |
| Was the laboratory duplicate RPD within project acceptance limits? | | | • | |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | • | | | |
| Was a MS/MSD pair prepared with each batch? | | • | | MS/SD not performed for aqueous batch 536276. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was the MS/MSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| Were the post spike recoveries within project acceptance limits? | | • | | Al (-70%), Ba (70%), Ca (61%), Fe (-283%), Pb (74%), Mn (-204%). Lead results are qualified as "J". |
| Were the serial dilution RPD values within project acceptance limits? | | • | | Al (14%), Ca (17%), Fe (18%), Pb (21%), Mg (17%), Mn (20%). |

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Final UFP QAPP, Remedial Investigation/Feasibility Study, New York Ordnance Works and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Bluestone Environmental Group, Inc., Malvern, PA; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-148345-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 252 results (27.97%) out of the 901 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

The samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 1.7ºC, 3.4ºC, 3.6ºC, 3.7ºC, 4.3ºC, 4.3ºC and 5.5ºC.

| Analytical Method | Data Reviewer Comment |
|---|---|
| BNASIMD | Samples NYOW-B-SL047-A[4X], SL-DUP-001_210506[4X], NYOW-B-SL046-A[4X], NYOW-B-SL045-A[4X] and NYOW-B-SL044-A[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.<br>The following sample in preparation batch 280-535673 and analytical batch 280-536905 was diluted due dark viscous extract and an abundance of non-target analytes: NYOW-B-SL044-A. Elevated reporting limits are provided.<br>The following sample in preparation batch 280-535673 and analytical batch 280-537056 were diluted to bring the concentration of target analytes within the calibration range: NYOW-B-SL046-A. Elevated reporting limits are provided.<br>The following samples in re-extraction batch 280-537185 and analytical batch 280-537439 were diluted to bring the concentration of target analytes within the calibration range: NYOW-B-SL047-A, SL-DUP-001_210506, and<br>NYOW-B-SL045-A. Elevated reporting limits are provided.<br>The following sample in re-extraction batch 280-537185 and analytical batch 280-537439 was diluted due to dark viscous extract: NYOW-B-SL044. Elevated reporting limits are provided.<br>The following sample in re-extraction batch 280-537185 and analytical batch 280-537560 was diluted to bring the concentration of target analytes within the calibration range: NYOW-B-SL046-A. Elevated reporting limits are provided. |

Reviewed by Emily Strake, Technical Director/ Data Validator, Bluestone

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

**Quality Control Outliers for test method BNASIMD, Equipment Blank**

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| EB-01_210506 (EB)/ 280-148345-21 | Benzo (k)fluoranthene | 0.03200 | < 0.022 | < 0.096 | ug/l | U/None* | V | |
| EB-01_210506 (EB)/ 280-148345-21 | Dibenz (a,h)anthracene | 0.03200 | < 0.027 | < 0.096 | ug/l | U/None* | V | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-535673/1-A (LB)/ MB 280-535673/1-A | Benzo(a)pyrene | 1.940 | < 1.5 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Benzo (a)anthracene | 2.840 | < 1.8 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Benzo(a)pyrene | 2.160 | < 1.5 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Benzo (b)fluoranthene | 3.310 | < 2.4 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Chrysene | 3.170 | < 2 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Fluoranthene | 6.110 | < 2 | < 10 | ug/kg | U/None* | L | |
| MB 280-537185/1-A (LB)/ MB 280-537185/1-A | Pyrene | 4.950 | < 2.2 | < 10 | ug/kg | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

**Qualified Results associated with the Lab Blank for BNASIMD**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH044-B | N | Benzo(a)pyrene | 11.0 | 4.10 J M Q | 4.90 U | | ug/kg | L |
| NYOW-B-PH044-C | N | Benzo(a)pyrene | 11.0 | 2.00 J Q | 4.70 U | | ug/kg | L |
| NYOW-B-PH047-C | N | Benzo(a)pyrene | 10.0 | 1.80 J M Q | 4.40 U | | ug/kg | L |
| NYOW-B-SL042-A | N | Benzo(a)pyrene | 12.0 | 7.40 J Q M | 12.0 U | | ug/kg | L |
| NYOW-B-SL044-A | N | Benzo(a)pyrene | 110 | 86.0 J D Q | 110 U | | ug/kg | L |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, LCS Recovery**

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCS 280-535673/2-A (BS)/ LCS 280-535673/2-A | Benzo (g,h,i)perylene | 27.83 | 49 - 127 | 10 - 200 | percent | J/UJ | C | |
| LCS 280-535673/2-A (BS)/ LCS 280-535673/2-A | Benzo (k)fluoranthene | 52.33 | 56 - 123 | 10 - 200 | percent | J/UJ | C | |
| LCS 280-535673/2-A (BS)/ LCS 280-535673/2-A | Dibenz (a,h)anthracene | 34.33 | 50 - 129 | 10 - 200 | percent | J/UJ | C | |
| LCS 280-535673/2-A (BS)/ LCS 280-535673/2-A | Indeno(1,2,3-c,d)pyrene | 29.83 | 49 - 130 | 10 - 200 | percent | J/UJ | C | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, LCS RPD**

The objective of laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. LCS/LCSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory control sample/laboratory control sample duplicate RPD results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | 1-Methylnaphthalene | 0.1480 | < 0.1 | < 0.1 | ug/l | J/None | Z | |
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | Acenaphthene | 0.1710 | < 0.1 | < 0.1 | ug/l | J/None | Z | |
| LCSD 280-536125/3-A (BD)/ LCSD 280-536125/3-A | Fluorene | 0.1590 | < 0.1 | < 0.1 | ug/l | J/None | Z | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-SL046-A (MS)/ 280-148345-5MS | Anthracene | 171.2 | 50 - 114 | 10 - 200 | percent | J/None | M | |

**Qualified Results associated with the MS RPD for BNASIMD**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-SL046-A | N | Pyrene | 45.0 | 350 D J1 | 350 J | - | ug/kg | D/I |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method BNASIMD, Prep Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| EB-01_210506 (EB)/ 280-148345-21 | | 7.250 | < 7 | < 14 | days | J/UJ | H2 | Prep Exceeds UWL |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, Prep Hold Time**

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method BNASIMD, Surrogate**

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| EB-01_210506 (EB)/ 280-148345-21 | 2-Fluorobiphenyl | 48.00 | 53 - 106 | 10 - 106 | percent | J/UJ | I | |
| EB-01_210506 (EB)/ 280-148345-21 | Nitrobenzene-d5 | 54.00 | 55 - 111 | 10 - 111 | percent | J/UJ | I | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-536688/1-A (LB)/ MB 280-536688/1-A | Zinc | 1.300 | < 0.4 | < 8 | mg/kg | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW6010C, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, MS RPD**

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW6010C, Total, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-536276/1-A (LB)/ MB 280-536276/1-A | Iron | 85.50 | < 22 | < 100 | ug/l | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW7470A, Total, Lab Blank**

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| MB 280-536171/1-A (LB)/ MB 280-536171/1-A | Mercury | 0.03500 | < 0.027 | < 0.2 | ug/l | U/None* | L | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

**Quality Control Outliers for test method SW9060A, Field Duplicate RPD**

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| PH-DUP-001_210506 (N)/ 280-148345-8 | Total Organic Carbon | 170.4 | < 50 | < 50 | rpd | J/None | D3 | |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

**Qualified Results associated with the Field Duplicate RPD for SW9060A**

| FieldSample ID | Type | Analyte | LOQ | Lab Result | Qualified Result | Bias | Units | Reason |
|---|---|---|---|---|---|---|---|---|
| NYOW-B-PH046-C | N | Total Organic Carbon | 4000 | 30000 | 30000 J | | mg/kg | D3 |
| PH-DUP-001_210506 | FD | Total Organic Carbon | 4000 | 2400 J | 2400 J | | mg/kg | D3/TR/D |

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

**Quality Control Outliers for test method SW9060A, MS Recovery**

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

| Sample ID/ Lab Sample ID | Analyte | Result | Warning Limits | Control Limits | Units | Qualifier | Reason Code | Comment |
|---|---|---|---|---|---|---|---|---|
| PH-DUP-001_210506 (MS)/ 280-148345-8MS | Total Organic Carbon | 0.000 | 46 - 130 | 10 - 200 | percent | J/X | M | Parent not found |
| PH-DUP-001_210506 (SD)/ 280-148345-8MSD | Total Organic Carbon | 0.000 | 46 - 130 | 10 - 200 | percent | J/X | M | Parent not found |

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

**Reason Code Definitions**

| Code | Definition |
|---|---|
| A | Serial dilution |
| B2 | CCB |
| C | LCS Recovery |
| D | MS RPD |
| D3 | Field Duplicate RPD |
| H2 | Prep Hold Time |
| I | Surrogate recovery outside project limits. |
| L | Lab Blank |
| M | MS Recovery |
| M2 | Post Spike |
| TR | Trace Level Detect |
| V | Equipment Blank |
| V6 | Low Level Calibration Verification |
| Z | LCS RPD |

**Flag Code and Definitions**

| Flag | Definition |
|---|---|
| J | Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria. |
| U | Undetected: The analyte was analyzed for, but not detected. |
| UJ | The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria. |

| Bias | |
|---|---|
| - | The result may be biased low |
| + | The result may be biased high |
| Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result | |

**Review Questions**

| Method: BNASIMD (GC/MS-SIM Analysis by SW8270D) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | | • | | See QC Outliers for RE/RA preparation holding time exceedances. The initial sample results should be used for data interpretation. The equipment blank sample was extracted on the seventh day and is not qualified. |
| Were all requested target analytes reported? | • | | | |
| Was the GC/MS system properly tuned based on method criteria? | • | | | |
| Was instrument tuning completed every 12 hours during sample analysis? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | | • | | CCV 280-537291/3 exhibited a %D greater than 20% for dibenz(a,h)anthracene at 22%. There are no associated investigative samples. |
| Were Internal Standard retention times and area criteria within method requirements? | • | | | |
| Were internal standards spiked for every sample, standard, and QC sample? | • | | | |
| Were surrogate recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was a method blank prepared and analyzed with each batch? | • | | | |
| Were target analytes in the method blank less than MDL? | | • | | See QC Outliers. |
| Were target analytes in the field blank less than MDL? | | • | | See QC Outliers. Soil sample results are not qualified on the basis of aqueous equipment blank sample results. |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | |
| Were LCS/LCSD recoveries within project acceptance limits? | | • | | See QC Outliers.<br>LCSD 280-535673/3-A exhibited RPDs > 40% for benzo(a)pyrene (42%), benzo(g,h,i)perylene (91%), dibenz(a,h)anthracene (79%), and indeno (1,2,3-cd)pyrene (91%). |
| Was the LCS/LCSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| Was a MS/MSD pair prepared with each batch? | | • | | MS/SD not performed for aqueous sample batch. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | See QC Outliers. |
| Was the MS/MSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | • | | | |
| Were QAPP specified laboratory PQLs achieved? | | • | | Several PAHs had LOQs > PQLGs for sample NYOW-B-SL044-A due to sample dilution. |

**Review Questions**

| Method: BNASIMD (GC/MS-SIM Analysis by SW8270D) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |
| Were DoD QSM corrective actions followed if deviations were noted? | | • | | CCV CAs not performed. |
| Were any data recommended for rejection (exclusion) in the data validation process? | | • | | |

**Review Questions**

| Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | • | | | |
| Were all requested target analytes reported? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | | • | | CCVL 280-537270/122 and CCVL 280-537270/150 exhibited recoveries less than 80% for silver at 77% and 78%, respectively. Non-detect results are qualified as "UJ" and detections less than the level of the CCV are qualified as "J-". |
| Were ICB/CCBs run at the required frequency and within acceptance criteria? | • | | | |
| Did the ICSA have any non-target interferents above the MDL? | • | | | The ICSA associated with batch 280-537270 had results for Ba greater than the LOD. The initial ICSA result (12.4 ppb) was > LOD (2 ppb). The laboratory verified using ICP-MS that Ba is a trace impurity in the ICSA standard at 12.4 ppb. |
| Were the ICSA/ICSAB recoveries within QAPP acceptance limits? | • | | | |
| Was a method blank prepared and analyzed with each batch? | • | | | |
| Were target analytes in the method blank less than MDL? | | • | | MB 280-536276/1-A exhibited a detection for iron at 85.5 ug/L.<br>MB 280-536688/1-A exhibited a detection for zinc at 1.3 mg/kg. |
| Were target analytes in the field blank less than MDL? | • | | | |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | • | | | |
| Was a MS/MSD pair prepared with each batch? | | • | | Aqueous MS/SD not performed. |
| Were MS/MSD recoveries within project acceptance limits? | | • | | See QC Outliers. ADR recoveries do not match laboratory recoveries; however, the qualifiers do not change. |
| Was the MS/MSD RPD within project acceptance limits? | | • | | See QC Outliers. |
| Were the post spike recoveries within project acceptance limits? | | | • | PDS not performed for either soil MS/SD sample. For NYOW-B-SL046-A, Mg was previously qualified as "J+"; no further qualification is necessary.<br>For NYOW-B-PH046-B, no MS/SD recoveries were <30%. M2 reason codes were appended to the data. |

**Review Questions**

| Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry) | | | | |
|---|---|---|---|---|
| Review Questions | Yes | No | NA | Comment |
| Were the serial dilution RPD values within project acceptance limits? | | • | | NYOW-B-SL046-A exhibited RPDs > 10% for Al (13%), Ca (15%), Fe (15%), Mn (14%). The associated sample results are qualified as "J". |
| If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits? | • | | | |
| Were QAPP specified laboratory PQLs achieved? | | • | | The cobalt LOQ for sample NYOW-B-SL043-A was slightly greater than the PQLG. The result was a positive detection. |
| Have all Laboratory Case Narrative comments/findings been addressed in the data review process? | • | | | |
| Were DoD QSM corrective actions followed if deviations were noted? | | • | | PDS not performed for MS/SD recovery anomalies. |
| Were any data recommended for rejection (exclusion) in the data validation process? | | • | | |

**Review Questions**

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

| Review Questions | Yes | No | NA | Comment |
|---|---|---|---|---|
| Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests? | • | | | |
| Were samples preserved properly and received in good condition? | • | | | |
| Were holding times met? | • | | | |
| Were all requested target analytes reported? | • | | | |
| Was the system properly tuned based on method criteria? | • | | | |
| Was the Calibration within acceptance criteria? | • | | | |
| Were the required minimum levels of calibration standards used in the initial calibration? | • | | | |
| Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis? | • | | | |
| Were all reported analytes for the ICV within the required criteria? | • | | | |
| Were CCVs run at the required frequency and within acceptance criteria? | • | | | |
| Were ICB/CCBs run at the required frequency and within acceptance criteria? | | • | | CCB 280-536644/29, /35, /47, and /60 exhibited detections for thallium ranging from 0.09 ug/L to 0.122 ug/L. The associated equipment blank sample result was non-detect.<br>ICB 280-536928/15 exhibited a detection for Sb less than the LOQ at 0.403 ug/L. The associated equipment blank sample result was non-detect.<br>CCB 280-537461/48 exhibited a positive detection below the LOQ for Sb at 0.421 ug/L. The associated sample results less than the LOQ are qualified as "U". |
| Did the ICSA have any non-target interferents above the MDL? | • | | | The ICSA associated with batch 280-536644 had results for Cr greater than the LOD. The initial ICSA result (1.925 ppb) was > LOD (1.8 ppb). The vendor acknowledges that Cr is a trace impurity in the ICSA standard.<br>The ICSA associated with batch 280-536928 had results for Cr > LOD. The initial ICSA result (1.9 ppb) was > LOD (1.8 ppb) and the closing ICSA result (2.00<br>ppb) was > LOD. The vendor acknowledges that Cr is a trace impurity in the ICSA standard. |
| Were the ICSA/ICSAB recoveries within QAPP acceptance limits? | • | | | |
| Was a method blank prepared and analyzed with each batch? | • | | | |
| Were target analytes in the method blank less than MDL? | • | | | |
| Were target analytes in the field blank less than MDL? | • | | | |
| Was an LCS/LCSD pair prepared and analyzed with each batch? | • | | | |
| Were LCS/LCSD recoveries within project acceptance limits? | • | | | |
| Was the LCS/LCSD RPD within project acceptance limits? | • | | | |
| Was a MS/MSD pair prepared with each batch? | | • | | Aqueous MS/SD not performed. |
| Were MS/MSD recoveries within project acceptance limits? | • | | | |
| Was the MS/MSD RPD within project acceptance limits? | • | | | |
