ES. EXECUTIVE SUMMARY

This Hazardous Toxic and Radioactive Waste (HTRW) Remedial Investigation (RI) Report presents the results of the activities completed at the Iona Island Naval Ammunition Depot Formerly Used Defense Site (FUDS), located in Stony Point, Rockland County, New York (FUDS Project Number C02NY074402) (**Figure ES-1**). The HTRW RI is being conducted to characterize the nature and extent of hazardous substances in environmental media at the Iona Island Naval Ammunition Depot FUDS attributable to historical Department of Defense (DoD) operations and to evaluate potential risk to human health and ecological receptors.

The Iona Island Naval Ammunition Depot FUDS consists of approximately 124 acres of land and inland water. The Navy used the site as an Ammunition Depot from 1900 to 1947. Activities included preparing, assembling, maintaining, inspecting, testing, and issuing ammunition; however, there was no manufacturing conducted on site. Iona Island Naval Ammunition Depot was deactivated in 1947. The former depot was excessed by the Navy in 1957 and transferred to the General Services Administration (GSA). The GSA conveyed the FUDS property to Palisades Interstate Park Commission (PIPC) in 1965. The PIPC currently utilizes a portion of Iona Island as a storage facility; however, the property is closed to the public and use is restricted to park purposes only. The FUDS is part of the much larger Hudson River National Estuarine Research Reserve, a Significant Coastal Fish and Wildlife Habitat Area and National Natural Landmark.

Investigations have been ongoing at Iona Island since 1992. Previous investigations identified areas of concern (AOCs) located in the locations/footprints of former buildings/structures where various contaminants related to the facilities or from historical processes during the site's commission as an ammunition depot have been detected or may be present in environmental media (**Figure ES-2**). The former buildings/structures and foundations were demolished/ removed by the PIPC between 1965 and 1972. Two previous investigations include the 1996 Data Collection Activities (Greeley-Polhemus 1997) and 2007 Site Inspection (Alion Science and Technology 2008), which reported widespread detections of metals and polycyclic aromatic hydrocarbons (PAHs) in surface soil and/or subsurface soil.

Based on the results of previous investigations, historical DoD operations at the Iona Island Naval Ammunition Depot FUDS may have resulted in the release of contaminants to environmental media at concentrations that may pose a risk to human and ecological receptors. Existing data from previous investigations were insufficient to evaluate nature and extent of contaminants in environmental media attributable to historical DoD operations and to evaluate whether concentrations of contaminants pose an unacceptable risk to human health and/or the environment. Much of the existing data were generated from biased sampling designs and there is an insufficient quantity of data to make the evaluations on nature and extent of contaminants and risk to human health and the environment. The HTRW RI was proposed to address these insufficiencies and is the first comprehensive investigation of the Iona Island Naval Ammunition Depot FUDS. A two-phased investigation approach was conducted as part of the HTRW RI to facilitate data collection, evaluation, and discussion as discussed in the paragraphs below.

Phase I was conducted to evaluate the presence/absence and/or nature and extent of hazardous substances in onsite soil within the FUDS boundary, evaluate the source-pathway-receptor interactions, and evaluate the subsequent risk to human and ecological receptors. Phase I field activities were completed in March and April 2020 and consisted of onsite and background incremental sampling methodology (ISM) soil sampling and a shoreline reconnaissance along Iona Island to evaluate the source-pathway-receptor interactions. A total of 30 onsite Phase I Decision Units (DUs) encompassing approximately 25 acres of Iona Island were sampled during Phase I to evaluate preliminary contaminants of potential concern (COPCs) in soil identified during the project planning stage (**Figure ES-3**). These preliminary COPCs included target analyte list (TAL) metals, PAHs, polychlorinated biphenyls, volatile organic compounds (benzene, toluene, ethylbenzene, and xylenes), and/or explosives residues as based on previous investigations and prior usage of former buildings/structures. In addition, 8 background DUs were sampled within Bear Mountain State Park were sampled to establish background soil concentrations for metals and PAHs.

Of the onsite 30 DUs sampled during Phase I, 27 DUs (approximately 22 acres total) encompassed AOCs in the upland area of Iona Island where upland soil is present (DU-1 through DU-7, DU-9 through DU-16, DU-20, DU-21 through DU-23, DU-25, and EXDU-1 through EXDU-7) (**Figure ES-3**). The remaining 3 DUs (approximately 3 acres total) encompassed AOC #16 – Area D (Former Dump Area) within the marsh area between Iona and Round Islands where hydric soil is present (DU-17, DU-18, and DU-19).

Metals and PAHs were detected in upland surface soil (0-6 inches [in.] below ground surface [bgs]) at concentrations above background. In addition, metals and PAHs were detected in hydric surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at DU-17, DU-18, and DU-19 established within the marsh area between Iona and Round Islands to evaluate AOC #16 – Area D (Former Dump Area). Preliminary evaluations of analytical results indicated potential risk to terrestrial ecological receptors (plants and soil invertebrates in upland soil and (plants, soil invertebrates, and insectivorous birds and mammals at AOC #16 – Area D [Former Dump Area]). Although pH data were evaluated in onsite upland and hydric soil during Phase I, additional physical parameter data (grain size, total organic carbon [TOC], cation exchange capacity [CEC], redox potential) were needed to evaluate bioavailability of metals and PAHs to terrestrial receptors as part of the Refined Screening-Level Ecological Risk Assessment (RSLERA).

Contaminant migration pathways to the Hudson River and Iona Marsh shorelines were not identified within the upland area during Phase I. Therefore, TAL metals and PAHs in upland soil were unlikely to be transported to the shoreline and be present in shoreline media at concentrations that may pose risk to human health or aquatic ecological receptors. However, preferential surface water migration pathways were identified during the Phase I shoreline reconnaissance leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines (**Figure ES-4**). These pathways included tidal flow to the Hudson River and two defined surface water channels leading to Iona Marsh (riprap filled drainage swale and tidal wetland swale). Based on the results of Phase I, further investigation was needed to evaluate contaminant migration pathways to the Hudson River and Iona Marsh shorelines and evaluate

whether metals from AOC #16 – Area D (Former Dump Area) were present in shoreline media at concentrations that may pose risk to human health and/or aquatic ecological receptors.

The Phase II field investigation was conducted to close data gaps identified after completion of Phase I and support development of the Human Health Risk Assessment (HHRA) and Ecological Risk Assessment (ERA). Phase II field activities were conducted in April 2022 and included onsite surface water and sediment sampling for TAL metals to evaluate the potential for inorganic constituents to impact the shoreline environment (**Figure ES-4**). Background surface water and sediment sampling was conducted to establish background concentrations for metals. In addition, Phase II included the collection of physical parameters in soil and sediment to evaluate bioavailability of contaminants to ecological receptors. Groundwater was not encountered nor sampled during previous investigations or during field activities conducted during Phase I; therefore, groundwater sampling was not conducted during Phase II. Phase II analytical results indicated metals in shoreline sediment at concentrations above background, particularly along the Hudson River shoreline adjacent to the northeastern boundary of AOC #16 – Area D (Former Dump Area).

The HHRA and ERA (comprised of a screening level ecological risk assessment [SLERA] and RSLERA) were completed using Phase I and Phase II analytical data to evaluate whether FUDS eligible site-related contaminants of potential concern and/or contaminants of potential ecological concern detected in onsite media affected by past DoD usage pose unacceptable risk to human health or terrestrial and aquatic ecological receptors.

The HHRA concluded that based upon potential receptors and their current or reasonably anticipated future exposures at the site, lead in sediment located along the Hudson River shoreline (IHRS-DU-01) adjacent to AOC #16 – Area D (Former Dump Area) presented potential concerns for recreational users.

The ERA concluded that in the Former Dump Area soil exposure area, plants, soil invertebrates, insectivorous mammals, insectivorous birds, and herptiles are potentially at risk from metals (chromium, copper, lead, mercury, and/or zinc), with risk being driven by avian exposure to lead. This risk potentially extends to two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and two species of insectivorous birds which are New York State listed species of special concern (i.e. cerulean warbler and golden-winged warbler). In the Iona Island Hudson Shoreline sediment exposure area, plants, benthic invertebrates, demersal fish, herptiles and insectivorous birds are potentially at risk from metals (antimony, cadmium, copper, lead, nickel and zinc), with risk being driven by exposure to lead. This risk from sediment potentially extends to two species of endangered demersal fish (juvenile sturgeon) (i.e. Atlantic sturgeon, short-nosed sturgeon).

Ecological risk from soil in the Former Dump Area is mitigated for common species by the small spatial extent of the area (< 2 acres), dense phragmites stands and twice daily inundation during tidal cycles; population level effects are unlikely from soils in this area. Similarly, population level risk is unlikely for common species due to the small extent of sediment in shoreline areas immediately adjacent to the Former Dump Area. The attenuation of risk these factors is not as

clear for the two listed bats species, two listed bird species and two endangered fish species (listed because of preferred riverine habitat by the Former Dump Area for a juvenile life stage), as value is put on a single individual in these instances.

The conclusions of the SLERA/RSLERA show that potential risks are confined to a small area of the site with a sharply defined lateral extent of contamination due to island topography and the Hudson River, as well as a sharply defined vertical extent of contamination due to bedrock at approximately three (3) ft bgs based on test pitting and shoreline bathymetric data. Size notwithstanding, based upon current nature and extent information, the Former Dump Area represents on-going source area due to the presence of ash from the former on-site incinerator, as encountered during test pitting.

In accordance with USACE's Environmental Quality Risk Assessment Handbooks, Volumes 1 (human health) (USACE 1999), and 2 (environmental evaluation) (USACE 2010), baseline risk assessments must be completed for the FUDS (USACE 2022). The HHRA and the SLERA/RSLERA meet the definition of baseline risk assessments (USEPA 2001); therefore, the RI is complete.

It is recommended that this project proceed directly to an FS, rather than spend time and resources determining a less conservative cleanup number by conducting a Baseline Ecological Risk Assessment. The conclusion of this RI is that the portion of this FUDS, known as the Former Dump Area, indicates potentially significant risk. Based upon its small size, and sharply defined boundaries for the contamination, this FUDS should proceed to a FS to evaluate the appropriate remedy to address these risks (USEPA 2001). The FS will consider State applicable or relevant and appropriate requirements associated with both the environment and human health. A letter will be sent to the New York State Department of Environmental Conservation / New York State Department of Health requesting the state's proposed list of applicable or relevant and appropriate requirements.

1. INTRODUCTION

This Remedial Investigation (RI) Report presents the results of the RI conducted at the Iona Island Naval Ammunition Depot Formerly Used Defense Site (FUDS), located in Stony Point, Rockland County, New York, in support of the Hazardous Toxic and Radioactive Waste (HTRW) project (FUDS Project Number [No.] C02NY074402) (hereinafter referred to as the HTRW RI) (**Figure 1-1**).

The Navy used the Site as an Ammunition Depot from 1900 to 1947, with the major effort consisting of assembling naval ammunition for World War II. Although no ammunition was manufactured at Iona Island, various types of explosives were assembled on site. Activities included preparing, assembling, maintaining, inspecting, and testing ammunition; storing bulk explosives, ammunition, and ordnance material; and issuing ammunition to the fleet, shore establishments, armed merchantmen, transport, and district forces (U.S. Army Geospatial Center [USAGC] 2018).

The former depot was excessed by the Navy in 1957 and transferred to the General Services Administration (GSA). GSA conveyed the FUDS property to the Palisades Interstate Park Commission (PIPC) in 1965. The majority of buildings and structures, including building foundations, were demolished and removed by PIPC between November 1965 and December 1973 (USAGC 2018).

Historical Department of Defense (DoD) operations at the Iona Island Naval Ammunition Depot FUDS may have resulted in the release of contaminants to environmental media at concentrations that may pose a risk to human health and ecological receptors. The HTRW RI was proposed to characterize the nature and extent of hazardous substances in environmental media at the Iona Island Naval Ammunition Depot FUDS attributable to historical DoD operations and evaluate potential risk to human health and ecological receptors.

The USACE conducted the HTRW RI under the Defense Environmental Restoration Program (DERP) for FUDS (DERP-FUDS) and in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) as amended by the Superfund Amendment and Reauthorization Act, and the National Oil and Hazardous Substances Contingency Plan (National Contingency Plan). The FUDS program performs cleanup of properties that were formerly owned by, leased to, or otherwise possessed by the United States and under the jurisdiction of the Secretary of Defense prior to October 1986. Only DoD-generated eligible contamination, which occurred before the transfer of the property to private owners or federal, state, or local governments, is eligible for DERP FUDS response. Types of contamination that may be eligible for DERP FUDS response include CERCLA hazardous substances or pollutants or contaminants, military munitions, petroleum, oil, and lubricants (POL), or unsafe conditions posed by buildings or structures. Metals that are listed as CERCLA hazardous substances under Title 40 of the Code of Federal Regulations (CFR) Table 302.4—List of Hazardous Substances and Reportable Quantities (40 CFR 302.4, updated 23 February 2024) include antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel,

selenium, silver, thallium, and zinc (EPA 2024). Metals that are not a CERCLA hazardous substance (e.g., manganese) are not eligible for DERP FUDS response.

There are three projects at the Iona Island Naval Ammunition Depot FUDS:

- C02NY074401 Containerized (CON) HTRW project, which include response actions at an area of an eligible FUDS property to address:

  — Underground storage tanks (USTs), aboveground storage tanks (ASTs), transformers, hydraulic systems, investigative-derived waste, abandoned inactive monitoring wells, etc. Response actions for drums containing hazardous substances, pollutants, and contaminants are performed under the HTRW project category.

  — Incidental removal of contaminated soil resulting from a leaking UST or other container.

  — Long-term corrective actions required by Resource Conservation and Recovery Act (RCRA) Subtitle I, involving significant soil and groundwater response actions following UST closure/removal actions.

- C02NY074402 HTRW project, which includes environmental response actions at an area of an eligible FUDS property as the result of historical DoD operations related to hazardous substances, pollutants, and contaminants as defined in CERCLA; POL; DoD-unique materials; hazardous wastes or hazardous waste constituents; low-level radioactive materials or low-level radioactive wastes and explosive compounds released to soil, surface water, sediments, or groundwater as a result of historical DoD operations.

- C02NY074403 Military Munitions Response Program (MMRP) project, which include response actions at an area of an eligible FUDS property related to military munitions and explosives of concern (MEC) and their munition constituent (MC) as the result of historical DoD operations at FUDS.

This report addresses the C02NY074402 HTRW project. The FUDS CON/HTRW project was closed out in 2012. The MMRP project was addressed under a separate MMRP RI completed in 2022 (EA). A Decision Document has been completed and approved for the MMRP project and that project is now closed. The HTRW RI was completed by EA Engineering, P.C. and its affiliate EA Science and Technology (EA)[1] as the prime contractor for the U.S. Army Corps of Engineers (USACE) Baltimore District under Contract No. W912DR-15-D-0014, Delivery Order No. W912DR18F0587. Work was completed under the oversight of the USACE Baltimore and New England Districts in accordance with the Performance Work Statement dated 20 June 2018 issued with the TO.

[1]EA Engineering, P.C. is affiliated with EA Engineering, Science, and Technology, Inc., PBC who does business as EA Science and Technology in State of New York

1.1 PROBLEM IDENTIFICATION

Investigations have been ongoing at the at the Iona Island Naval Ammunition Depot FUDS since 1992. Two previous investigations (the 1996 Data Collection Activities [Greeley-Polhemus Group, Inc. (Greeley-Polhemus) 1997] and 2007 Site Inspection [Alion Science and Technology Corporation (Alion) 2008]) reported widespread detections of metals and polycyclic aromatic hydrocarbons (PAHs) in surface soil and/or subsurface soil.

Existing data from previous investigations were insufficient to evaluate nature and extent of contaminants in environmental media attributable to historical DoD operations and to evaluate whether concentrations of contaminants pose an unacceptable risk to human health and/or ecological receptors. Much of the existing data were generated from biased sampling designs and there is an insufficient quantity of data to make the evaluations on nature and extent of contaminants and risk to human health and the environment. The HTRW RI was proposed to address these insufficiencies and is the first comprehensive investigation of the Iona Island Naval Ammunition Depot FUDS.

Based on previous documents, aerial photographs, and available information, 19 areas of concern (AOCs) were identified as eligible for further inclusion in the C02NY074402 HTRW project. These FUDS-eligible AOCs encompass the locations/footprints of former buildings/structures where contaminants related to the former buildings/structures and/or historical processes conducted during the site's commission as an ammunition depot may be present, including 16 former buildings, 4 former ASTs[2], a former dump area, 2 former coal storage areas[3], and 3 former transformer locations[4] (**Figure 1-2 and Table 1-1**):

- AOC #1: Former Building 103 – Paint and Oil Storage
- AOC #2: Former Building 121 – Incinerator
- AOC #3: Former Building 123 – Garage Building
- AOC #4: Former Buildings 124 to 128 – Sewage Disposal Plant (and Suspected Outfall)

[2]The ASTs themselves are not the AOCs. The FUDS-eligible AOCs are the former AST locations/footprints. The ASTs were removed but the sites were not formally closed and were not included in the Containerized (CON) HTRW project at the Site (C02NY074401) which was closed out in 2012.
[3]PAH detections owing to particles of coal are not addressed under CERCLA as coal is considered a product rather than a hazardous waste. However, PAH detections released from coal particles and absorbed on to (e.g., subsurface) soils would be actionable under CERCLA. The chemical analyses that were done during previous investigations did not distinguish PAH contamination absorbed on to soils from PAHs in coal particles.
[4] The transformers themselves are not the AOCs. The FUDS-eligible AOCs are the former transformer locations/ footprints. Although the transformers may have contained PCBs, FUDS response is not normally undertaken unless there is evidence of transformer leakage/spills prior to transfer from DoD jurisdiction. While there is no record of transformer leackage/spills, confirmation via sampling of soil for PCBs was not previously conducted at the locations/footprints of the former transformers.

- AOC #5: Former Building 207 – Marine Garage Building
- AOC #6: Former Building 213 – Paint Locker for Building 202
- AOC #7: Former Building 215 – Garage Building
- AOC #8: Former Building 219 – Garage Building
- AOC #9: Former Building 220 – Garage Building
- AOC #10: Former Building 406 – Tin, Electrical, and Annealing Shop Building
- AOC #11: Former Building 407 – Paint Shop and Pipe Shop
- AOC #12: Former Building 410 – Power House
- AOC #13: Area A – One Former Fuel Oil AST (2,500 gallons [gals]); located near Former Building 233[2]
- AOC #14: Area B – One Former Fuel Oil AST (size unknown); located near Dock 131[2]
- AOC #15: Area C – Two Former Fuel Oil ASTs (size unknown); located near Former Building 417[2]
- AOC #16: Area D – Former Dump Area
- AOC #17: Area E – Former Coal Trestle and Storage Area; located near Former Building 410[3]
- AOC #18: Area F – Former Coal Storage Area; located near Former Building 215[3]
- AOC #19: Three Former Transformers – T1 northwest of Building 406, T2 near Area D, and T3 northeast of Building 220[4].

Activities conducted at the former buildings/structures and potential AOC-specific contaminants related to those activities have been interpreted based on building names presented in the Archives Search Report (ASR) (USACE 1997) and Historical Photographic Analysis (HPA) (USAGC 2018). The former buildings/structures and foundations were demolished/removed by PIPC between 1965 and 1972 (USAGC 2018). The locations of the former buildings/structures and foundations have been identified based on historical documentation/records, historical drawings, and aerial photographs that were georeferenced within geographic information system (GIS) software.

In addition to the above listed AOCs, a review of additional former buildings was conducted during preparation of the HTRW RI Uniform Federal Policy (UFP)-Quality Assurance Project Plan (QAPP) (EA 2020a) at the request of USACE to identify locations where filling or possible spilling of explosive-containing materials could have occurred. Seven former explosive storage and filling operations buildings were identified as having potential for exposure risk from remaining explosives residues in environmental media to human and ecological receptors (**Figure 1-2 and Table 1-2**). Information regarding utilities, piping, building sumps, or other additional release pathways for explosives at these locations is not available. The buildings have been demolished and associated slabs removed, and the underlying soil has been reworked. Although these buildings were not included in the HTRW project, the presence of explosives material in soil at these former building locations has not been previously evaluated. Therefore, these areas (listed below) were included in the Phase I investigation at the request of USACE to confirm the presence/absence of explosives constituents in soil and to evaluate potential exposure risk from remaining explosives residues to human and ecological receptors:

- Building 609 – Mine Loading Plant
- Building 506 – Filling House #3 (Bombproof)
- Building 503 – Filling House #6
- Building 404 – Filling House #1
- Building 307 – Filling House #5
- Building 306 – Filling House #2
- Building 202 – Shell House #5 & D Plant.

1.2 RI PURPOSE, SCOPE, AND OBJECTIVES

The ultimate objective of the Iona Island Naval Ammunition Depot FUDS Project process is to complete a Decision Document, in compliance with CERCLA, as amended, that will lead to close out of the Site. The purpose of this HTRW RI is to determine whether further response actions, pursuant to CERCLA and the National Oil and Hazardous Substances Pollution Contingency Plan, is warranted at the Iona Island Naval Ammunition Depot FUDS in support of the C02NY074402 HTRW Project. The objective of the HTRW RI is to collect environmental analytical data at the Iona Island Naval Ammunition Depot FUDS that are scientifically defensible and representative of site conditions to:

- Evaluate the nature and extent of potential impacts associated with former structures and/or operations
- Evaluate potential risks to human health and ecological receptors

- Complete a future feasibility study (FS), if required, identifying the most feasible alternative for remedial action, if necessary.

Specific goals for the HTRW RI are as follows:

- At the 19 HTRW AOCs, evaluate the nature and extent of contaminants associated with historical DoD operations in environmental media at concentrations above human health and/or ecological screening criteria values

- At the 7 additional former buildings identified as having potential for exposure risk from remaining explosives residues to human or ecological receptors, evaluate the presence or absence of explosives in surface and subsurface soil at concentrations above screening criteria values

- Update/refine the HTRW project site-specific human health and ecological (terrestrial and aquatic) Conceptual Site Models (CSMs)

- Prepare human health and ecological risk assessments to evaluate whether the environmental impacts associated with historical DoD operations at the former buildings/structures included in this HTRW RI pose an unacceptable risk to human health or the environment.

If the RI concludes no unacceptable risk to human health and the environment, then the FUDS property will proceed to No Action via a Proposed Plan and Decision Document; however, if potential significant risk to human health and/or ecological receptors is identified, the FUDS property will proceed to a FS followed by a Proposed Plan and Decision Document.

1.3 REPORT ORGANIZATION

The organization of this HTRW RI provides a framework to assist the reader in understanding the progression of the investigation. The outline of this report is as follows:

Section 1 Introduction—This section introduces the project, including authorization, project purpose and scope, location and setting, site history, environmental investigations performed to date, and physical setting.

Section 2 Conceptual Site Model—This section presents the CSMs for human health, terrestrial ecological receptors, and aquatic ecological receptors. These CSMs provided the basis for identifying data collection needs during implementation of the HTRW RI.

Section 3 HTRW RI Field Activities—This section provides an overview of the field activities and tasks conducted during each phase of the HTRW RI.

Section 4 Data Usability—This section presents the results of the Phase I and Phase II data quality assessment.

Section 5 Site Physical Characteristics Discussion—This section presents the results of the Phase I shoreline reconnaissance physical parameter data collected during each phase of the HTRW RI, as well as an evaluation of representativeness for soil and sediment background sampling locations.

Section 6 Nature and Extent of Contamination—This section presents the contaminant concentration analytical results for soil, surface water, and sediment samples collected during each phase of the HTRW RI, as well as comparisons to screening criteria and background concentrations.

Section 7 Contaminant Fate and Transport—This section presents an evaluation of environmental fate and transport mechanisms necessary to determine the potential for continued presence of contaminants and offsite migration, as well as an evaluation of bioavailability of contaminants in onsite soil and sediment to ecological receptors.

Section 8 Human Health and Ecological Risk Assessments—This section presents a discussion of the human health risk assessment (HHRA) and ecological risk assessment (ERA) (including the Screening-Level Ecological Risk Assessment (SLERA) and Refined Screening-Level Ecological Risk Assessment [RSLERA]) prepared to evaluate potential risk to human and ecological receptors exposed to onsite environmental media.

Section 9 Conclusion and Recommendations—This section provides a summary of and conclusions for the HTRW RI.

Section 10 References— Lists the literature referenced in this document.

Appendixes A through H provide supporting information used in the preparation of this HTRW RI. Appendix A presents field documentation and field photographs. Appendix B presents laboratory analytical reports. Appendix C presents data validation reports. Appendix D presents data usability assessment (DUA) reports. Appendix E presents the Phase I shoreline reconnaissance memorandum. Appendix F presents the background comparison data. Appendix G presents the HHRA. Appendix H presents the ERA.

1.4 SITE BACKGROUND

1.4.1 Location and Setting

The Iona Island Naval Ammunition Depot FUDS property consists of approximately 124 acres of land and inland water located on Iona Island and Round Island along the west side of the Hudson River, in the Town of Stony Point, Rockland County, New York (**Figure 1-1**). Iona Island is located within the Lower Hudson River Valley region, which includes all of Putnam, Rockland, and Westchester counties and is considered part of the downstate New York region

due to its geographical and cultural proximity to New York City. According to the U.S. Census Bureau 2019 population estimate for Rockland County, New York, the population density is approximately 1637 persons per square mile.

Iona Island is in Bear Mountain State Park on the east side of U.S. 202/Route 9W, 6 miles south/downstream of West Point Military Academy, 1 mile south/downstream of the Bear Mountain Bridge, and 41.2 miles upstream from New York Harbor. Iona Island is bordered on the east by the Hudson River; on the northwest by the mouth of Doodletown Bight, an expanse of shallows and mudflats; and on the west and southwest by Iona Marsh, a tidal marsh that occupies one mile between Iona Island and the mainland. Active River Subdivision (CSX Transportation) railroad tracks parallel the western shoreline of the Hudson River. The Iona Marsh Shoreline located along the west side of Iona Island is divided by the railroad embankment.

The southeastern part of Iona Island, known as Round Island, was once cut-off by marshes and was attached to Iona Island with fill in the early 20th century (New York State Department of Environmental Conservation [NYSDEC] and U.S. Department of Commerce 1992). The hill on the western side of Iona Island, south of the railroad tracks, was also once treated as separate and referred to as Courtland Island. The shoreline areas of the island and adjoining marshes are located within the Hudson River.

Iona Island is connected to the mainland by a narrow two-lane road off U.S. 202/Route 9W near Doodletown. A non-climbable steel fence on top of a rubble wall and the River Subdivision (CSX Transportation) railroad track embankment separates Iona Island and the FUDS from Iona Marsh. The FUDS is accessed by crossing active River Subdivision (CSX Transportation) railroad tracks and entering through an unmanned gate during normal working hours.

1.4.2 Current Site Usage

PIPC currently utilizes a portion of Iona Island as a storage facility; however, the property is closed to the public and use is restricted to park operations and maintenance purposes only. The FUDS property is part of the much larger Hudson River National Estuarine Research Reserve, a Significant Coastal Fish and Wildlife Habitat Area and National Natural Landmark.

1.4.3 Operational History

The following history of operational use was obtained from the Naval Ammunition Depot Iona Island FUDS HPA prepared by USAGC in 2018.

Prior to use by the military, Iona Island was utilized as a resort hotel during the Civil War. There was no documented evidence available of past use of ordnance-related items on the island prior to use by the military. The Navy acquired Iona Island from the L.H. Mace Brokerage Company of New York City in 1899 for construction of the Iona Island Naval Ammunition Depot. In 1942, an additional approximately 13 acres of marshland, Round Island, was purchased and used for ammunition storage (USACE 1997).

In 1903, at least one 13-inch (in.) shell exploded between Shell Houses 3 and 4 (former Buildings 210 and 209, respectively) on Iona Island (see MMRP RI for additional info; EA 2021). The explosion destroyed Shell Houses 3 and 4, and their contents, and damaged Shell Houses 1 and 2 (former Buildings 115 and 116, respectively) (USACE 1997). Some of the contents of the explosion thought to be included were 13-in. shells that may have been thrown out from the point of the explosion as far as 1,250 feet (ft). Other munitions stored in the area during the time of the explosion included 1-pounders, 6-pounders, and 6-in. ammunition. It is expected that the explosion involved black powder rather than high explosives.

During World War I, almost all the depth bombs and ammunition used in the Atlantic area passed through Iona. In 1914, work increased by approximately 14 percent. All submarines were sent to Iona Island to be filled with explosives, in addition to the regular work conducted there. In 1915, over 2 million pounds of powder were made up in charges and about 327 carloads of material were handled during the year with large shipments made by transport, tug, and barge. A 1919 annual report to the Secretary of the Navy states that most of the 14-in. ammunition for the Army and Navy Railroad battery was prepared at Iona Island.

After World War I, although Iona Island was one of two of the Navy's main depots on the east coast, a program of reducing personnel and material and keeping active work to a minimum was followed under the United States' general program of limitation of arms treaty. In the 1930s, Iona Island supplied ammunition of calibers to the fleet for service allowances, target practice, and reserve war requirements.

Between 1941 and 1945, the major activity conducted on Iona Island was assembling naval ammunition for World War II. More than 2,300 Navy ships and 2,300 merchant ships received their ammunition from Iona Island during World War II. In addition, 77 bases, 500 shore stations and 700 foreign naval ships were serviced with ammunition.

After World War II, use of the island as an ammunition depot became obsolete because of lack of expansion room to accommodate new types of ammunition. In 1947, the Department of the Navy decided to deactivate the Iona Island Naval Ammunition Depot and made the property available for restricted lease. The FUDS was re-designated as an Annex to the United States Naval Ammunition Depot, Earle, New Jersey, and in 1957, declared the Annex excess. In 1955 and 1960, the GSA utilized the Iona Island Naval Ammunition Depot FUDS through a permit for stockpiling materials such as rubber and copper. In 1960, the GSA received official jurisdiction of the property and other agencies under GSA control utilized the property for record storage during the 1960s. These agencies included the following: Maritime Administration, Atomic Energy Commission, Civil Service Commission, Army Corps of Engineers, and the Navy's Bureau of Ships. The Maritime Administration also conducted occasional trans-shipments of heavy freight at the main wharf on an occasional basis. On 30 March 1965, Iona Island was deemed evacuated after the last load of stockpiled materials left the property. In 1965, the PIPC acquired both Iona and Round islands (USACE 1997).

1.4.4 Site Layout History

At the time of purchase in 1899, Iona Island consisted of 116 acres of rough, rocky, and partly wooded ground and 13 acres of marsh. The Island was transformed into an ordnance depot, first called Naval Magazine, and changed prior to World War I to United States Naval Ammunition Depot (USAGC 2018).

Iona began as a relatively small installation. By 1902 the following buildings had been constructed: four magazines, two fixed ammunition houses, four shell houses (fixed ammunition), three storehouses, one power house with steam, electric, and air-compressing plant, three storehouses; six hose houses, one pumphouse, one testing laboratory and telephone exchange, one locomotive house, a tin, electrical and annealing shop, one house for gunner's residence (inspectors quarters), four double cottages for principal employees, an administrative building, gatehouse, and a stable and barn. In 1903, one shipping house and two magazines were built. By 1910, four additional hose houses, two filling houses (one bombproof), three magazines (one for bulk Explosive D), one quilting house, one primer house, one tank repair house, one pump house located by the dock, a paint and oil storage building, paint and pipe shop, labor office and dispensary, a garage and greenhouse were built. By 1920, an ammunition box storage building and cartridge case storage buildings were built, one hose house, two fuse houses, eight magazines including two subsurface magazines, one gun-cotton magazine and a dynamite magazine, one shell house and D plant, one shipping house, one storehouse, powder tank storage, a water storage standpipe with 188,000 gallon capacity, stone crusher, a heating plant for filling houses No. 2 and No. 5, a paint and oil locket, blacksmith shop, one personnel quarters and a marine barracks, a time-clock house, wagon shed, lumber shed, garden tool house, garage and cow barn.

In 1924, a total of 106 buildings including two water storage tanks and one water storage standpipe were present on Iona Island (USACE 1998). In the late 1920s through the 1930s, various programs of maintenance and remodeling were carried out by the Bureau of Yards and Docks in addition to other several buildings being built. For example, ten magazine buildings were remodeled for fireproofing; three black-powder magazines and a railroad track to serve them were ordered; and two water tanks were provided, the water system enlarged, and two engine-driven generators installed. In addition, a 0.85-acre dump area is first identified between Round Island and Iona Island on a 1930-dated U.S. Navy layout plan (USAGC 2018).

Round Island, the southernmost portion of the depot, was utilized by the Navy for ammunition storage. The Navy partially filled in the area between Iona Island and Round Island to provide a connection between the two islands. Subsurface magazines were quarried out of rock on Round Island, and the rock removed was used to create a blast barrier between the magazine storage and the depot activities on Iona Island (Bluestone Environmental Group, Inc. [Bluestone] 2018).

In 1951 when the depot was deactivated, there were 146 buildings on the Island (USAGC 2018). A 22 June 1965 letter presented in the ASR provides information on the site layout at the time of DoD transfer to PIPC; the roads on the Island were in poor condition, with many of the buildings not served by roads. Instead, buildings served by railroad with spurs from the West Shore

Railroad leading to each warehouse and to the pier. Most buildings had been built between 1914 and 1918 and were made of brick while additional buildings constructed in 1941 were made of concrete faced cinder block. Most buildings had no natural or artificial lighting, heating, or other utilities; they were large, open warehouses with high ceilings and no partitions or separation of floors. Several homes were also present on the Island, and previously served as residences for naval officers. The homes were vacant but well maintained. Redevelopment for industrial or warehousing use would have required extensive renovation of buildings, clearance of structures, and construction of roads, parking lots, and new sewer system and utility lines (USACE 1998).

Most buildings and structures were demolished and removed between November 1965 and December 1973 (USAGC 2018). It is possible that fill material was used during regrading following demolition and excavation/removal of foundations, and that surface and subsurface soil was significantly reworked/mixed across much of the former operations area. The FUDS has remained undeveloped since its transfer from DoD ownership to PIPC in 1965. PIPC developed demolition plans for the remaining buildings and for construction of a recreational park; however, the plans to develop the Island into a recreational park were not executed. The only construction that occurred on the Island was the parking lot located directly west of Iona Island and outside of the FUDS boundary. The contract plans illustrate the locations of the former buildings, which PIPC removed except for a few buildings which currently remain onsite. The plans also illustrate a fill area (believed to be building demolition debris) that currently provides access between Iona Island and Round Island (Alion 2008) (**Figure 1-2**).

Original structures still standing include Building 201 (Empty Projectile Magazine); Building 212 (former Marine Barracks); Building 217 (Fire Station and Labor Office), Building 222 (Miscellaneous Storage Building), Building 508 (Bag Charge Magazine); and Building 603 (Pyrotechnic Magazine) (Bluestone 2018) (**Figure 1-2**). Building 222 (Store House) is utilized by Bear Mountain State Park for shipping and receiving. Building 212 is in disrepair but has not been demolished due to concerns with asbestos. The old roads in the main part of the former depot (near former Buildings 123 and 410) are still accessible by vehicle. The fill area between Round Island and Iona Island is vegetated; however, solid ground allows the area to be traversable by foot.

1.5 PREVIOUS INVESTIGATIONS

1.5.1 Initial Site Visit (USACE 1992)

USACE New York District performed an initial site visit on 30 October 1992. According to the Preliminary Assessment (USACE 1992), there was potential groundwater and soil contamination from a fuel oil spill at a former AST, coal storage, a former dump area, an incinerator, and former buildings used as a garage, paint storage, and sewage treatment plant. No damage to flora or fauna, or evidence of illegal or unauthorized dumping, was observed during the site visit.

The discussion of the initial site visit in the Revised Site Survey Summary Sheet (USACE 1995), listed the following remaining structures as beneficially used by the present owner: Building 201 (Empty Projectile Magazine); Building 212 (former Marine Barracks); Building 217 (Fire

Station and Labor Office); Building 222 (Miscellaneous Storage Building); Building 508 (Bag Charge Magazine); and Building 603 (Pyrotechnic Magazine). These buildings are still visible on current aerial photographs of the site and are identified as "remaining structures (not FUDS eligible)" on **Figure 1-2**.

1.5.2 Data Collection Activities (Greeley-Polhemus 1997)

In October 1996, Greeley-Polhemus and Smith Technology Corporation, under contract to USACE New York District, conducted data collection activities at Iona Island Naval Ammunition Depot in Stony Point, New York (Greeley-Polhemus 1997). The data collection report was submitted in April 1997. Eight AOCs specific to the Iona Island Naval Ammunition Depot FUDS were targeted for investigation, including three former AST locations.

Ten soil samples were collected from the following locations for select analytes (**Figure 1-3**):

- Paint and Oil Storage Building 103; one shallow soil boring (currently designated AOC #1)
- Incinerator Building 121; one shallow soil boring (currently designated AOC #2)
- Sewage Disposal Plant Buildings 124 to 128; one shallow soil boring (currently designated AOC #4)
- Paint Shop and Pipe Shop Building 407; one shallow soil boring (currently designated AOC #11)
- Power House Building 410; one shallow soil boring (currently designated AOC #12)
- One former fuel-oil AST at Dock 131; one shallow soil boring (currently designated AOC #14 – Area B)
- Two former fuel-oil ASTs at Building 417; two shallow soil borings (currently designated AOC #15 – Area C)
- Former dump area, two shallow soil borings (currently designated AOC #16 – Area D).

A stainless steel, hand-driven soil coring device was used to collect soil samples at each location from 0.0 to 2.0 ft below ground surface (bgs). Screening of the soil samples with a photoionization detector did not indicate contamination. Visual inspection of the soil samples also did not suggest the presence of contamination; however, some debris (plastic, metal, bricks, etc.) was observed on the ground surface at the former Incinerator Building site (AOC #2) and at the Former Dump Area (AOC #16).

Soil samples were analyzed for the following compounds (**Table 1-3**):

- RCRA metals, Target Compound List (TCL) semi-volatile organic compounds (SVOCs), TCL volatile organic compounds (VOCs), and TCL polychlorinated biphenyls (PCBs) at the former Paint and Oil Storage Building 103 (AOC #1), Sewage Disposal Plant Buildings 124 to 128 (AOC #4), and Paint Shop and Pipe Shop Building 407 (AOC #11), and AOC #16 – Area D (Former Dump Area) soil samples

- RCRA metals and TCL SVOCs at the former Incinerator Building 121 (AOC #2) soil samples

- TCL SVOCs and TCL VOCs at the former Power House Building 410 (AOC #12) soil samples

- TCL SVOCs and benzene, toluene, ethylbenzene, and xylene (BTEX) at the former fuel AST sites soil borings (AOCs #13, #14, and #15).

Metals (arsenic, barium, cadmium, total chromium, lead, mercury, and silver), SVOCs (dinitrotoluenes [DNTs], di-n-butylphthalate, phenol, and PAHs), and one PCB (Aroclor 1260) were detected in the soil at concentrations exceeding NYSDEC Recommended Soil Cleanup Objectives, as published on 16 November 1992 (not specified as residential or industrial). Maximum concentrations of barium, cadmium, total chromium, lead, mercury, and silver were detected in the samples collected near Former Building 121 (Incinerator) (AOC #2) and the AOC #16 – Area D (Former Dump Area). Arsenic was detected at a maximum concentration in the sample from former Building 103 (Paint and Oil Storage Building) (AOC #1).

SVOC detections (primarily PAHs) were widespread; however, the sum of the detected SVOC concentrations did not exceed the 1992 RSCO of 500 milligrams per kilogram (mg/kg) for total SVOCs in any sample (Greeley-Polhemus 1997). SVOCs (primarily 2,4-dinitrotoluene, 2,6-dinitrotoluene, and PAHs) were detected in samples from AOC #16 – Area D (Former Dump Area) and former Building 410 (Power House) (AOC #12). Aroclor 1260 exceeded the RSCO of 1 mg/kg in one of the two samples from the AOC #16 – Area D (Former Dump Area). Except for typical laboratory contaminants, VOCs were not detected in the soil samples.

Greeley-Polhemus recommended evaluating site risks based on the Relative Risk Site Evaluation Program and conducting sampling to further delineate metals and SVOC contamination (Greeley-Polhemus 1997).

1.5.3 Military Munitions Response Program Site Inspection (Alion 2008)

Alion, with support from EA, performed an MMRP site investigation (SI) in 2007/2008 under contract to the U.S. Army Engineering and Support Center in Huntsville and USACE Baltimore District (Alion 2008). The scope of the SI was restricted to the evaluation of the presence of material potentially presenting an explosive hazard, MEC, munitions debris (MD), and/or MC related to historical use of the FUDS prior to transfer.

The MMRP SI included a qualitative reconnaissance of Iona Island and Round Island, using both visual observations and analog geophysics (magnetometer), to identify material potentially presenting an explosive hazard, MEC, or MD, as well as visual indicators of suspect areas impacted by munitions including distressed vegetation, stained soil, targets, and visual metallic debris. The qualitative reconnaissance addressed the former 1903 explosion area; the eastern shorelines along the former dock areas; areas where ordnance items were historically observed at low tide; and at AOC #16 – Area D (Former Dump Area) located between Iona Island and Round Island. The total estimated acreage subject to the qualitative reconnaissance was approximately 14.9 acres. No MEC or MD was visually observed during the field event. Geophysical anomalies encountered during the reconnaissance were attributed to surface/cultural debris (Alion 2008).

MC sampling was conducted within the approximately 124.2-acre FUDS Munitions Response Site (MRS)-01 1903 explosion area (**Figure 1-4**). MRS-01 is centered between former Buildings 209 and 210. The MRS radius extends outward 1,250 ft based on the kick-out radius of 13-in. shells (USACE 2004). The 1,250-ft radius of the MRS was determined as part of the ASR (USACE 1997) and was based on DoD 6055.09-STD, DoD Ammunition and Explosives Safety Standards, dated October 1992.

In December 2007, a total of 23 surface soil samples (including 5 background samples) were collected from the 1903 Explosion MRS using a 7-point wheel composite method, from 0 to 2 in. bgs (Alion 2008). Five sediment samples (including 3 background samples) were also collected. The background samples were collected from an area west and upgradient of the FUDS boundary and outside of the limits of the 1903 Explosion Area. Background locations selected were from areas deemed unimpacted by past DoD or current owner operations and were of similar soil characteristics as the biased soil samples. There was no observed visual or magnetic evidence of MEC, MD, or other military-related disturbance at background sample locations.

Prior to sampling, research was conducted to focus the list of analytes to MC potentially associated with the munitions used when the FUDS was active (Alion 2008). As a result, the soil and sediment samples were analyzed for the following (**Table 1-4 and Table 1-5**):

- Select Target Analyte List (TAL) Metals – antimony, copper, lead, nickel, and zinc (EPA Method 6010B) and mercury (EPA Method 7471A). Iron was also a munitions constituent, but was not analyzed during the SI sampling event, because it is not a CERCLA hazardous substance (Alion 2008; EPA 2024).

- Explosives – 2,4,6- Trinitrotoluene (TNT); 4-amino (AM)-2,6- DNT; 2-AM-4,6-DNT; 2,4-DNT; 2,6-DNT; 2-nitrotoluene; 3-nitrotoluene; 4-nitrotoluene (EPA Method 8330A); and nitroglycerin (EPA Method 8330).

No surface water or groundwater samples were collected. Screening-level human health and ecological risk assessments were performed using the 2007 MC sampling and analysis results. Chemical concentrations were compared to applicable human health criteria (residential for soil,

residential and industrial for sediment), ecological screening criteria, and background concentrations.

Two explosives (2,4,6-TNT and 4-AM-2,6-DNT) were detected at one location, II-EA-SS-02-08, in the central portion of the Iona Island Naval Ammunition Depot FUDS, but at concentrations below applicable human health and ecological screening criteria in one of the 18 surface soil samples (II-EA-SS-02-08). The other 10 explosives were not detected above laboratory reporting limits. There were no explosives detected in the sediment samples (Alion 2008).

Only a qualitative comparison was done between the maximum and average concentrations and the background results. Lead concentrations exceeded background concentrations and human health screening criteria in sediment samples but were below the industrial soil criteria in surface soil samples. Antimony, copper, and lead exceeded background concentrations and associated ecological screening criteria values in surface soil. In sediment, antimony, copper, lead, nickel, and zinc exceeded background concentrations and ecological screening criteria.

The SI recommended that a RI/FS be performed for both MEC/MD and MC, based on historical discoveries of MD, potential for MEC/MD to remain on site, and potential for risks to human health and ecological receptors from metals MC in surface soil and sediment (Alion 2008).

1.5.4 Explosives Residue Risk Evaluation (EA 2020a)

In January 2019 during development of the HTRW RI UFP-QAPP (EA 2020a), EA conducted a review of former buildings/structures at the Iona Island Naval Ammunition Depot FUDS at the request of USACE to identify locations where filling or possible spilling of explosive-containing materials could have occurred (EA 2019). EA reviewed previous documents including the ASR (USACE 1998) and HPA (USAGC 2018) and, based on limited information available (e.g., building titles), identified 20 former buildings as locations where filling or possible spilling of explosive-containing materials could have occurred (**Table 1-2**). These buildings have not been previously investigated. Based on further review and input from USACE, 7 of these 20 former buildings were identified as locations with potential for exposure risk from remaining explosives residues in environmental media to human and ecological receptors (**Figure 1-2**). PIPC conducted a site walk and confirmed there are no foundations or slabs remaining at these former building locations:

- Building 609 – Mine Loading Plant
- Building 506 – Filling House #3 (Bombproof)
- Building 503 – Filling House #6
- Building 404 – Filling House #1

- Building 307 – Filling House #5
- Building 306 – Filling House #2
- Building 202 – Shell House #5 & D Plant.

1.6 PHYSICAL SETTING

1.6.1 Regional Climate

The climate in Rockland County, New York is classified as humid continental and subjected to some modification by the Atlantic Ocean. Minimum temperatures average 22.9 degrees Fahrenheit (°F) in the winter and maximum temperatures average 82.3 °F in the summer [U.S. Department of Commerce, National Oceanic and Atmospheric Administration (NOAA) 2021]. Mean monthly air temperatures below 40 °F occur from December through March and freeze dates with temperatures below 28 °F generally occur from late October to mid-April. Precipitation averages from 35 to 49 in. annually, with over half of the precipitation (26.14 in.) falling between May and October (U.S. Department of Commerce, NOAA 2021). Annual snowfall averages 26 in.

The predominant wind direction varies throughout the year, with wind most often from the north from March to April, from the west from April to August, from the south for from August to September, from the north from September to October, and from the west from October to March. The average hourly wind speed varies seasonally, with an average wind speed of more than 5.8 miles per hour from November to April and an average of 4.2 miles per hour from April to November (Weather Spark 2023).

1.6.2 Physiography and Topography

Iona Island is a bedrock island in the Hudson Highlands physiographic province of the New England Uplands. The surface of the New England Upland slopes southeastward from maximum inland altitudes around 2,200 ft above mean sea level (amsl) to approximately 400 to 500 ft at its riverine edge (USACE 1998). The Hudson Highlands is part of a northeast-trending mountain mass extending from Pennsylvania to Connecticut. The Hudson River cuts through the Hudson Highlands in a 15 mile long relatively straight, north/south-oriented, narrow, steep-sided gorge with bedrock flanks between West Point and Peekskill, New York. Channel width in the Hudson Highlands region is less than 0.6 miles (Yozzo et al. 2005). Maximum relief is about 1,600 ft where the Hudson River dissects the Hudson Highlands. Topography in the Hudson Highlands region is relatively rugged with prevalent bedrock-controlled landforms (New York State Department of Transportation 2013). Erosional and depositional effects of glaciation are widespread and conspicuous in upland areas of the Hudson Highlands region.

Former buildings and structures were located within the upland area of Iona Island, which has rocky terrain with varying degrees of slopes (**Figure 1-5**). Elevations within the upland area

range from about 0 ft National Geodetic Vertical Datum 1988 (NAVD88) along the immediate shoreline to 84 ft NAVD88 in the northern portion of the island.

AOC #16 – Area D (Former Dump Area) is confined to a low-lying, tidally influenced marsh area between Round and Iona Island. This area is bounded to the northeast by the Hudson River and to the southwest by a fill area emplaced by the PIPC following Navy transfer of the FUDS in 1965. Surface elevations within this low-lying marsh area range from 0 ft amsl at the Hudson River shoreline to 2 ft amsl (EA 2020b). Elevations within the fill area to the southwest range from 2 to 5 ft amsl. Elevations rise steeply along the bedrock wall of Round Island to the southeast and along Iona Island to the northwest.

An intertidal marsh (Iona Marsh) encompasses approximately 225 acres between Iona Island and the western shore of the Hudson River. Radiocarbon analysis of the peat indicates that the marsh began to form at least 6,000 years ago, behind Iona Island, in what is believed to have been an old channel of the Hudson River (Yozzo et al. 2005). Surface elevations within the marsh range from 0 ft to approximately 7 ft amsl.

1.6.3 Hudson River Bathymetry

Steep bedrock shorelines confine the Hudson River for much of its tidal reach. The bedrock knobs of Iona Island project approximately 84 ft above the river, and bedrock dives down under Iona Marsh, where sediments are more than 100 ft deep (U.S. Department of Commerce, NOAA and NYSDEC. 1982). Tidal shallows extend north of Iona Marsh (Doodletown Bight), east of Iona Marsh and south of Round Island, and west of AOC #16 – Area D (Former Dump Area) (**Figure 1-6**).

A review of the depth chart of the Hudson River (USACE New York District 2018 and NOAA National Centers for Environmental Information [NCEI] 2022), and visual observations of the shoreline during the MMRP RI DGM shoreline survey (EA 2021) indicates that there is a shallow bedrock shelf extending from the eastern side of Iona Island out into the Hudson River. The shelf extends eastward into the river channel, with depths ranging from 0 to approximately -10 ft shoreline below the river surface. The shelf along the shoreline of AOC #16 – Area D (Former Dump Area) extends 250 to 350 ft into the Hudson River channel before sloping steeply downward to a depth of approximately -95 ft below the river surface. Northwest of AOC #16 – Area D (Former Dump Area) the shelf narrows to less than 100 ft along the majority of the eastern shoreline of Iona Island.

1.6.4 Surface Water Drainage

The Hudson River originates in the Adirondack Mountains of Upstate New York, and flows southward 315 miles to the Atlantic Ocean at New York Harbor, between New York City and Jersey City. Maximum river depths are found in the Hudson Highlands between West Point and Peekskill, New York, with the deepest point of 196 ft at West Point (Yozzo et al. 2005). The lower half of the Hudson River from Troy to New York Harbor, a distance of 125.5 miles, is an estuary (drowned river valley) affected by semidiurnal tides, with two highs and two lows

occurring within a 25-hour period. The tidal range averages approximately 2.9 ft. Intertidal marshes along the Hudson River including Iona Marsh, and the low-lying marsh area between Iona Island and Round Island, are inundated with water twice daily during high tide and during storm events.

Salinity zones in the Hudson are determined by a combination of hydrographic factors, primarily the tidal surge of saline water upriver from the Atlantic Ocean and the magnitude of freshwater flow into the upper estuary. Freshwater flow in the Hudson estuary follows a typical seasonal pattern, with highest flow during the spring and lowest flow during late summer and early fall under an average runoff regime the salt front (0.5 parts per trillion) reaches Newburgh, New York, by late summer/early fall. During conditions of high freshwater runoff, usually during spring, the salt front may be pushed downriver as far as the Bronx, New York (Yozzo et al. 2005).

The section of the Hudson River at Iona Island is very narrow and deep, with strong currents and a rocky bottom substrate. The width of the Hudson River at Iona Island is approximately 0.3 mile east of Iona Island, and the river in this area has a depth of approximately 165 ft. Tidal influence at Iona Island is approximately 3.5 ft, and shorelines may not be accessible during high-tide conditions (Alion 2008).

Iona Island is separated from the mainland by Doodletown Brook on the west and north and Snake Hole Creek on the south (**Figure 1-7**). Doodletown Brook originates in Bear Mountain State Park, draining an area of approximately 2.9 square miles, and is the principal tributary to Iona Marsh west of Iona Island (Yozzo et al. 2005). Doodletown Brook flows east and north approximately 1,960 ft from the Bear Mountain State Park shoreline to Doodletown Bight. Snake Hole Creek originates in the low marshes southwest of Iona Island and flows approximately 5,190 ft southwesterly, southeast, and finally east to the Hudson River. The Creek divides Iona Island Marsh into Salisbury Meadow on the west side and Ring Meadow on the east side. The shoreline between Iona Island and Round Island adjacent to Ring Meadow was infilled by PIPC after Navy transfer of the Island in 1965.

1.6.5 Shoreline Environment

The western and southern portions of Iona Island are separated from the adjacent marshes by the active River Subdivision (CSX Transportation) railroad tracks (**Figure 1-7**). The low-lying marsh area between Iona Island and Round Island is separated from Ring Meadow by an area of fill emplaced by PIPC following transfer of the FUDS from the Navy in 1965 (**Figure 1-2**).

The eastern and northern shorelines along the Hudson River and Doodletown Bight consist primarily of riprap, gravel, cobbles, boulders, and exposed bedrock (USACE 1998 and Alion 2008). A limited area of exposed sand and gravel shoreline area is present along the Hudson River shoreline extending northwest from at AOC #16 – Area D (Former Dump Area). This shoreline area changes to cobbles and boulders (riprap) extending southward along Round Island. A retaining wall spans the Hudson River shoreline north of AOC #16 - Area D (Former Dump Area). Aerial photographs and orthoimagery indicate that the wall is not present along the

shoreline in the area between AOC #14 - Area B and AOC #15 - Area C (**Figure 1-2**); exposed shoreline with gravel, cobbles, and boulders is visible in this area on recent orthoimagery.

1.6.6 Geology

Field notes from the 1996 investigation document overburden at Iona Island as fill material overlying fine to coarse sand, with some silt and gravel. Bedrock is either exposed at ground surface or encountered depths up to approximately 25 in. bgs (USACE 1998).

The bedrock of the New England Upland and Hudson Highlands is folded, faulted, and includes metamorphosed sediments that have been intruded by numerous plutonic masses (USACE 1998). The rock is resistant to erosion and forms rocky knobs on Iona Island that project 100 ft above the Hudson River, and hills that rise more than 1,000 ft within 0.5 miles of the island (Bear Mountain). Based on the bedrock geology map for the Lower Hudson, bedrock at Iona Island consists primarily of biotite-quartz-plagioclase paragneiss (Fisher et al. 1970).

1.6.7 Hydrogeology

Groundwater at and near Iona Island is found in both overburden and underlying bedrock. It is possible that perched water (possibly intermittent based on precipitation) is present above the less permeable bedrock. Shallow groundwater is likely influenced by the Hudson River.

Crystalline bedrock of the Hudson Highlands acts as a relatively poor aquifer. Groundwater in the gneiss and granitic rocks only occurs in fractures and joints (Heisig 2010). The majority of fractures are pervasive, shallow to moderately dipping toward the southwest. Occasional steeply dipping faults are also present. Bedrock groundwater at Iona Island is likely encountered at depths greater than 6 ft as based on the rock outcrop soil description reported in the Rockland County Soil Survey (Bonnell 1990).

Groundwater recharge is primarily from infiltration of local precipitation, with downward seepage of water through overburden into underlying bedrock and/or direct infiltration of precipitation on exposed bedrock surfaces. Upward seepage of water from bedrock also recharges surficial deposits in low-lying areas. Shallow groundwater flow in surficial deposits and weathered bedrock likely follows topography with discharge to surface water bodies (e.g., Hudson River). Due to the crystalline nature of the bedrock, groundwater flow in bedrock is restricted to joint and fracture systems that generally trend northeast-southwest (Olcott 1995). Based on the bedrock orientation, local bedrock groundwater flow is to the southwest, with local bedrock groundwater likely discharging to the marsh area southwest of the site.

Groundwater usage in the Hudson Highlands is largely limited to domestic wells along the periphery of the parklands. Maximum yields of wells completed in the crystalline rocks rarely exceed 70-gals per minute, and limited aquifer storage in crystalline rock makes such wells susceptible to decreased yields during dry periods unless they are in hydraulic connection with surface water (Heisig 2010).

1.6.8 Soil

Most of the land surface of Iona Island has been filled, built on at one point in time, and/or paved (USACE 1998). Native soil remaining at Iona Island is derived from glacial till and is shallow, acidic, and nutrient poor (Yozzo et al. 2005). The following soil mapping units were located on and immediately adjacent to Iona Island (Soil Survey Staff, Natural Resources Conservation Service, United States Department of Agriculture 2018).

- Chatfield-Rock outcrop complex; 4 to 16 percent slopes
- Hollis-Rock outcrop complex; 35 to 60 percent slopes
- Ipswich mucky peat; 0 to 2 percent slopes, very frequently flooded.

The Chatfield-Rock outcrop is the primary native soil at Iona Island and is classified as well-drained gravelly-sandy loam soil, 20 to 40 in. deep to the restrictive feature. Hollis-Rock outcrop, classified as somewhat excessively drained with 8 to 23 in. to the restrictive feature, is found in upland area west of Iona Island that divides Iona Marsh from Doodletown Bight. Ipswich mucky peat is found in Iona Marsh and is classified as very poorly drained, with more than 80 in. to the more restrictive feature, and up to 59 in. of muck and mucky peat (Soil Survey Staff, Natural Resources Conservation Service, United States Department of Agriculture 2018).

While soil at AOC #16 – Area D (Former Dump Area) is mapped as Chatfield-Rock outcrop complex, hydric soil is present in this area. Hydric soil is defined as soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part. This terrestrial environment is separate from the remainder of Iona Island, which includes upland soil (not designated as poorly drained, very poorly drained, alluvial, or flood plain).

1.6.9 Sediment

In general, muddy sediments dominate the Hudson Highlands section of the Hudson River, where Iona Island is located, and there is a complicated pattern of dynamic and depositional environments between the non-depositional bedrock outcrops, which are found along the river margins (Nitsche et al. 2007). At Iona Island, the eastern shoreline of the Hudson River is a high energy environment while the western shoreline and tidal marsh area is a low energy/depositional environment. Sediments in the tidal marshes and shallows west of Iona Island consist of peat and silt and are more than 100 ft deep (U.S. Department of Commerce, NOAA and NYSDEC. 1982).

1.6.10 Ecological Habitats

The mainland of Iona Island and the elevated topography area southwest of Iona Island dividing Iona Marsh and Doodletown Bight is classified as terrestrial habitat ((**Figure 1-5**). The upland

terrestrial areas of the island consist of deciduous, rocky woodland communities including oaks (*Quercus* spp.), ashes (*Fraxinus* spp.), birches (*Betula* spp.), willows (*Salix* spp.), red maple (*Acer rubrum*), and elms (*Ulmus* spp.). Compaction of soil and site disturbance have resulted in a significant presence of invasive species (estimated at 60 percent of the vegetation on the island) including multiflora rose (*Rosa multiflora*), autumn olive (*Elaeagnus umbellate*), Norway maple (*Acer platanoides*), oriental bittersweet (*Celastrus orbiculatus*), and black swallow-wort (*Vincetoxicum nigrum*) (Yozzo et al. 2005).

The woodlands are maintained for their value as cover, perch sites, and buffer zones. Towards the center of the island, where historical buildings once stood, open grasslands and low-lying shrubs dominate the landscape. Resident wildlife species that occurs in the general vicinity of Iona Island include muskrat (*Ondatra zibethicus*), white-tailed deer (*Odocoileus virginianus*), box turtle (*Terrapene carolina*), northern water snake (*Nerodia sipedon*), timber rattlesnake (*Crotalus horridus*), red fox (*Vulpes vulpes*), rat snake (*Pantherophis* spp.), and green frog (*Rana clamitans*) (Yozzo et al. 2005). These species may or may not be present on the Iona Island.

The low-lying area that separates Iona Island and Round Island was filled in the early 20th century. A Navy dumping area is located along the Hudson River side of the islands (AOC #16 – Area D (Former Dump Area) (**Figure 1-2**). In addition, an area of fill on the western shoreline was placed by PIPC following Navy transfer of the FUDS in 1965. The low-lying area between Iona Island and Round Island classifies, according to US Fish & Wildlife Service Cowardin et al. (1979) wetlands classification system, as a Riverine system comprised of persistent emergent vegetation (*Phragmites australis* and cattails [*Typha angustifolia*]), tidally influenced, and regularly flooded by oligosaline waters (0.5-5 parts per thousand) (**Figure 1-8**). However, based on field observations, this area is dominated by persistent emergent vegetation such as *Phragmites* and cattails (*Typha angustifolia*) and not woody shrubs, making it a Palustrine persistent emergent tidal regularly flooded system. Hydric soil in this area is inundated/saturated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation, including cattail and common reed (*Phragmites australis*). There is also a small (0.35 acre) freshwater emergent wetland on the western side of the Island (palustrine, emergent, persistent, semi-permanently flooded) (USFWS 2018a).

The intertidal marsh (Iona Marsh) that encompasses approximately 225 acres between Iona Island and the western shore of the Hudson River is one of the largest, undeveloped tidal wetlands on the Hudson River (Yozzo et al. 2005). The National Wetlands Inventory (USFWS 2018a) classifies the marsh as an estuarine and marine wetland (E2EM1N6 – estuarine, intertidal, emergent, persistent, regularly flooded, oligohaline 0.5–5 parts per thousand salinity). Tidal mudflats submerged aquatic vegetation beds, and small areas of rocky uplands also occur in the area. In Doodletown Bight, the northern portion of Iona Island Marsh, mudflats are visible at low tide (Yozzo et al. 2005).

Vegetation within Iona Marsh is dominated by narrow leaf cattail (*Typha angustifolia*) with common reed (*Phragmites australis*) and swamp rose mallow (*Hibiscus moscheutos*). Crack willow (*Salix fragilis*) is present at the mouth of Doodletown Brook within the tidal swamp. Compaction of soil and site disturbance have resulted in a significant presence of invasive

species (estimated at 60 percent of the vegetation on the Island). Recent wetland restoration has been conducted in Iona Island Marsh west of the Island, with approximately 50 percent of the marsh restored from invasive species (including *Phragmites australis*) to native vegetation such as narrow-leaf cattail (Bluestone 2018).

Iona Island Marsh is especially important for marsh-nesting birds. Probable or confirmed breeding species include herons, least bittern (*Ixobrychus exilis*), Canada goose (*Branta canadensis*), mallard (*Anas platyrhynchos*), wood duck (*Aix sponsa*), Virginia rail (*Rallus limicola*), belted kingfisher (*Ceryle alcyon*), marsh wren (*Cistothorus palustris*), and red-winged blackbird (*Agelaius phoeniceus*). Large concentrations of herons, waterfowl and shorebirds occur during spring and fall migrations (March–April and September–November, respectively). The Island is considered a bald eagle sanctuary (Levine 2011).

The Hudson River is classified as estuarine and marine deep water (estuarine, subtidal, unconsolidated bottom, subtidal, oligohaline 0.5–5 parts per thousand salinity) (USFWS 2018a). Benthic macroinvertebrates such as snails and amphipods are common among the rocks and boulders along the Hudson River shoreline. Migratory birds including osprey (*Pandion haliaetus*) and bald eagles (*Haliaeetus leucocephalus*) are found along the Hudson River shoreline of Iona Island. Here they hunt for the more than 200 species of fish that populate the Hudson River, which serves as a nursery ground for important species such as sturgeon, striped bass, and American shad (Levine 2011).

1.6.11 Threatened and Endangered Species

Under the Endangered Species Act of 1973 (ESA), threatened species are species that may become endangered if conditions surrounding the species begin, or continue, to deteriorate. Endangered species are species whose prospects for survival in an area are assumed to be in immediate danger because of a loss or change in habitat, over-exploitation, predation, competition, or disease. In addition to threatened and endangered species, the state of New York also identifies species of special concern as any species that does not meet the criteria of an endangered or threatened species but is particularly vulnerable and could easily become an endangered, threatened, or extirpated species. Special concern species are established by policy, not by regulation, and are used for planning and informational purposes; they do not have the legal weight of endangered and threatened species. There are several protected species that may occur at the site and these species and their status are provided in **Table 1-6.** Additionally, there are 10 migratory birds of conservation concern known to use the Island as habitat.

Atlantic sturgeon (*Acipenser oxyrhynchus*) and shortnose sturgeon (*Acipenser brevirostrum*) are classified as Endangered by National Marine Fisheries Service and are protected in the State of New York (NOAA 2023a; NYSDEC 2019). These species of sturgeon live primarily in the ocean but migrate to coastal rivers for spawning. In New York, spawning and nursery grounds for juveniles are located in the Lower Hudson River, such as near Iona Island (Edinger et al. 2014). As adults, they will spend time at the fresh water/salt-water interface, which fluctuates near Iona Island. Sturgeon are known to shelter in deep holes (i.e., deep Hudson River channel),

and in their adult and juvenile life stages foraging occurs in mucky substrate for crustaceans, worms, and mollusks (NOAA 2023b). Suitable foraging habitat would be expected in the estuaries surrounding Iona Island.

1.6.12 Land Use and Demography

Iona Island Marsh was designated a National Natural Landmark in 1974 by the National Park Service. Iona Island is currently under the administration of the PIPC and maintained by staff of Bear Mountain State Park. Public use of the island is limited to educational outings and history tours. Site access is limited to authorized employees of Bear Mountain State Park who use a few of the remaining buildings for storage, to researchers who work in the marsh areas, and to guided tour groups six to eight times per year between May and October. The island is partially fenced, and the main gate is unmanned, which allows for limited access to Iona Island from Bear Mountain State Park. Boating along the Hudson River is open to the public, and because the shoreline of Iona Island is not fenced, there is potential for recreational users of the Hudson River to access the island via the shoreline. Additionally, the island has been historically used for camping. The Boy Scouts have previously used the Site for activities.

In 1965, when GSA conveyed the property to the PIPC, it was under a "restrictive clause" (park purposes only) (USACE 1995). The majority of Iona Island is currently open space. There is a parking lot and scenic overlook located directly west of Iona Island. While PIPC developed plans for construction of a recreational park and while some stormwater sewers were partially installed, these plans were not fully executed. In addition, although a developer has proposed plans for constructing an environmental center/nature center, these plans have not been approved. There are no current plans to develop the island for recreational purposes and no anticipated future use of the site other than its current use as a conservation area. There are no anticipated construction plans other than the possibility of converting existing buildings for use or constructing a new storehouse.

Subsurface utilities information at the Iona Island Naval Ammunition Depot FUDS is not available. Previous investigation documents including the ASR (USACE 1997) and HPA (USAGC 2018) did not include information on utilities, piping, building sumps, wash-out areas, or wastewater retention ponds. Two potential sewer discharge pipes were identified in historical installation layout maps from 1934 and 1947 (USAGC 2018). One 10-in. diameter discharge pipe reportedly extended offshore into the Hudson River in the area between Iona Island and Round Island. A second discharge pipe identified as an outfall sewer on trestle reportedly extended off the shoreline in the area southeast of Building 201.

A description of Iona Island from 1937 presented in the ASR (USACE 1997) states that a fresh water supply consisted of a rainwater collection system into two reservoirs of 2,000,000-gal capacity connected by equalizer pipe, which was pumped and stored in two steel tanks with a combined capacity of 4,200,000 gals. The Iona Island War Diary from 1945 presented in the ASR states that on 10 December a new water supply system involving a pipeline to Doodletown was placed in partial use pending completion of some final pump house piping. This system had

sufficient capacity to furnish this Depot with its entire freshwater requirements under normal operating conditions (USACE 1997).

Shallow overburden groundwater at Iona Island is not used as a potable or non-potable water source. Bedrock groundwater and surface water at Iona Island are not used as a potable water source. In the 1990s, the water supply line that supplied Iona Island broke (near NYS Route 9W) on the causeway. Bear Mountain State Park did not repair the waterline break and a bedrock well was installed (March 1997) behind the existing storehouse (Building 222). During well installation, bedrock fracking was used to get the well to yield water. Per Charlie Tonneson, Bear Mountain Park Engineering Department, this new well is not treated and is used for non-potable purposes only (bottled water is brought on Iona Island for drinking purposes).

Land use surrounding Iona Island is recreational and military, with Bear Mountain State Park along the western shore of the Hudson River and Camp Smith Military Reservation along the eastern shore. The site is also surrounded by the Iona Island/Doodletown Bird Conservation Area (NYSDEC 2017). For the portions of the adjacent Bear Mountain State Park that are open to the public, recreational opportunities include hiking, boating, and bird watching. There is no public canoeing or kayaking allowed in the marshes surrounding Iona Island. Access to the marsh is limited to guided canoe and kayak trips.

Iona Island is part of the much larger Hudson River National Estuarine Research Reserve and Significant Coastal Fish and Wildlife Habitat Area, managed under New York's Coastal Management Program. In addition, the Iona Island Marsh became a registered National Natural Landmark in 1974.

1

2. CONCEPTUAL SITE MODEL

As defined in EM 200-1-12 – *CSMs*, a CSM describes sources of contamination, as well as complete, potentially complete, or incomplete exposure pathways; current, determined, or reasonably anticipated future use of property; and potential receptors (USACE 2012b). The CSM is used as a planning tool to integrate information from a variety of resources, to evaluate the information with respect to project objectives and data needs, and to evolve through an iterative process of further data collection or action.

The CSM is broken out into three sections: Potential Sources, Interactions, and Receptors with complete, potentially complete, and incomplete exposure pathways identified for each receptor. Each section is discussed below.

- **Potential Sources**—Sources are those areas and/or media where contaminants related to former DoD activities entered (or may have entered) the environment.

- **Interactions**—Interactions encompass release mechanisms, transport, and exposure pathways. Interactions describe ways that receptors come into contact with contaminants related to former DoD activities. This can include physical transportation of the contaminants and transfer from one media to another through various processes such that media other than the source area can become contaminated. Interactions also include exposure routes (such as ingestion, inhalation, and dermal contact) for each receptor.

- **Receptors**—A receptor is an organism (human or ecological) that is able to make contact with contaminants related to former DoD activities. The pathway evaluation must consider both current and reasonably anticipated future land use, as receptors are determined on that basis. Human receptor subcategories include current and/or future site workers, construction workers, contractors, visitors/recreational users, and trespassers. Ecological receptors include biota such as nesting and migratory birds, mammals, reptiles, amphibians, fish, invertebrates, and plants.

In general, an exposure pathway consists of the following components:

- Source and mechanism of chemical release to the environment (e.g., spill)

- Environmental transport medium (e.g., surface soil)

- Point of contact with the contaminated medium (exposure point)

- Exposure route at the exposure point (e.g., dermal contact with surface soil).

If all four components are present (or potentially present), the pathway is considered complete (or potentially complete). Each pathway defines a unique mechanism by which potential

receptors are directly or indirectly exposed to contaminants. The following definitions are used to identify exposure pathways:

- ***Complete Pathway***—There are confirmed exceedances of screening criteria and background concentrations, and there is confirmed receptor and media interaction (i.e., a source, migration route, and receptor must be identified). Exposure is evaluated quantitatively.

- ***Potentially Complete Pathway***— Under current site conditions, there is confirmed receptor and media interaction that may be anticipated in the future; however, the exposure, either due to the type of receptor or the nature of the source, may be limited or has not been confirmed. Exposure is evaluated quantitatively. The potentially complete pathway arises in the following instances:

  — There are confirmed exceedances of screening criteria and background concentrations, but the receptor may not significantly interact with the media.

  — No data were collected for the specific media; however, there are confirmed exceedances of screening criteria and background concentrations in neighboring media (e.g., no surface water or sediment samples were collected; however, there was an exceedance of screening criteria and background concentrations in soil).

- ***Incomplete Pathway***—There is no receptor and media interaction or there are no exceedances of screening criteria or background concentrations.

The preliminary CSM for the Naval Ammunition Depot Iona Island FUDS was developed during the MMRP SI and updated during the planning phases of the HTRW RI based on site-specific data and historical information including literature reviews, aerial photographs, maps, training manuals, technical manuals, and field observations.

2.1 HTRW SOURCE AREAS

Source areas at the Iona Island FUDS include the 19 AOCs identified as being eligible for further inclusion in the HTRW project and the 7 former explosive storage and filling operations buildings where filling or possible spilling of explosive-containing materials could have occurred. The 19 AOCs were identified in previous investigations and include the locations/footprints of 16 former buildings, 4 former ASTs, a former dump area, 2 former coal storage areas, and 3 former transformers where contaminants related to the facilities or from historic processes during the site's commission as an ammunition depot may be present (**Table 1-1 and Figure 1-2**). The 7 former explosive storage and filling operations buildings were identified in 2020 during development of the UFP-QAPP (EA 2020a) as having potential for exposure risk from remaining explosives residues in environmental media to human and ecological receptors (**Table 1-2**).

2.2 PRELIMINARY CONTAMINANTS OF POTENTIAL CONCERN

This HTRW RI was conducted in accordance with the CERCLA process, and relies on applicable federal requirements, regulations, and guidance documents. Therefore, previous discrete analytical sample data (Section 1.5) were evaluated during development of the UFP-QAPP (EA 2020a) to identify analytes in soil and sediment with concentrations above EPA screening criteria and background concentrations (**Tables 1-3 to 1-5**). The following screening criteria were used to evaluate previous analytical data:

- EPA Industrial and Residential Soil Regional Screening Levels (RSLs) with hazard quotients (HQ) adjusted from 1 to 0.1 (updated May 2019) (EPA 2019). A restrictive clause is in place for the island stating that it shall only be used for park purposes; therefore, residential development is unlikely to occur at the Site (USACE 1995). However, EPA Residential Soil RSLs were included to assess exposure to potential child receptors at Iona Island, including site visitors during nature walks and potential campers.

- EPA Region 4 Ecological Soil Screening Levels (EcoSSLs) (February 2005 through April 2008), as presented in the EPA Region 4 ERA Supplemental Guidance, Scientific Support Section Superfund Division EPA Region 4, March 2018 (EPA 2018).

- EPA Region 4 Marine/Estuarine Sediment Screening Benchmarks (EPA 2018).

Preliminary contaminants of potential concern (COPCs) were identified for each source area (19 AOCs and 7 former explosive storage and filling operations buildings) during development of the UFP-QAPP (EA 2020a) based on a review of historical use of each source area, the evaluation of previous discrete analytical sample data against EPA screening criteria and background concentrations, and further evaluation of potential contaminant presence in the environment (**Table 1-1**). A comprehensive list of preliminary COPCs identified for this HTRW RI during UFP-QAPP development (EA 2020a) included TAL metals, PAHs, BTEX, PCBs, and explosives residues. **Table 1-1** provides a summary of preliminary COPCs for each of the 19 AOCs. Explosives residues were considered the preliminary COPCs for the 7 former explosive storage and filling operations buildings.

2.3 RELEASE MECHANISMS

Release mechanisms include those physical processes that contribute to the introduction and distribution of a contaminant in the environment.

The primary release mechanisms for site contaminants from former buildings/structures at the Iona Island FUDS during operational use included spills, direct releases to the ground, and improper disposal including dumping. These primary release mechanisms may have resulted in contamination of soil at and/or beneath former buildings/structures.

Contaminants in surface and shallow subsurface soil may have been transported to a range of exposure media (including air, subsurface soil, groundwater, surface water, and sediment) through secondary and tertiary release mechanisms. Secondary release mechanisms from surface and shallow subsurface soil to other media include the following:

- Surface and subsurface soil removal/reworking
- Leaching and infiltration from surface soil into the subsurface via gravity and/or percolation of precipitation/surface water
- Overland runoff and erosion to the shoreline
- Volatilization and/or wind erosion.

The majority of buildings and structures, including building foundations, were demolished and removed by PIPC between November 1965 and December 1973, and imported fill may have been placed over much of the former operational areas (USAGC 2018). Contaminants in surface and subsurface soil were likely mobilized beyond the footprint of the AOCs during demolition of former buildings/structures and reworking of surface and subsurface soil.

Potential contaminants may have leached/infiltrated from surface soil into the subsurface through gravity and/or percolation of precipitation/surface water, thus migrating to the subsurface soil and groundwater. Leaching/infiltration may be ongoing if a soil source is present at Iona Island, particularly at AOC #16 - Area D (Former Dump Area). In addition, contaminants may have been transported along the surface via overland runoff and erosion and ultimately deposited in shoreline sediments; these release mechanisms may be historically significant but are unlikely to contribute to current exposure pathways due to the vegetated nature of the soil.

Volatilization and/or wind erosion was potentially historically significant but are unlikely to contribute to current exposure pathways due to the time since release, chemical properties of the contaminants including volatility of some of the VOCs, and the significant amount of vegetative cover present throughout the site.

Tertiary release mechanisms from contaminated secondary media may include the following:

- Discharge from groundwater to sediment and surface water
- Infiltration from subsurface soil and shallow groundwater to deeper bedrock groundwater. Uptake of contaminants from abiotic media (e.g., soil, sediment, and surface water) into prey tissue that is consumed by wildlife.

2.4 FATE AND TRANSPORT PATHWAYS

Contaminants released through deposition may have remained in surface soil by adsorbing to soil particles. When released to the environment, contaminants such as some metals and PAHs tend to sorb to soil, sediment, and other organic materials. Reworking of surface and subsurface soil during demolition was likely a major pathway for contaminants that may have been bound to soil particles, such as metals and PAHs, to be widely dispersed across the former operational area. In addition, demolition and regrading potentially released and mixed lead-based paint particles into the soil. While metals may generally sorb/bond to soils, very fine paint chips/particles would result in a more sporadic hit-or-miss distribution of contamination.

The types of contaminants previously detected or potentially present in site soils would be bound to soil particles but could be released in the liquid phase in response to changes in the chemical environment of the soil solution. Desorption would be dependent on the solubility of the individual chemical and the properties of the soil. Natural processes such as adsorption, ion exchange, complexation, and precipitation can cause constituents to become immobilized.

Contaminants in soil could also migrate via advective transport (bulk movement) or desorption (leaching) with the flow of surface water or groundwater toward the adjacent marshes and the Hudson River. Contaminants with high solubility in the upland area may be mobilized during precipitation events. If upland soils have lower organic carbon, some contaminants could leach from that soil, and flow towards the river and sediment that may have higher organic carbon to which the contaminant can adsorb. In addition, contaminants with high solubility at AOC #16 – Area D (Former Dump Area) within the low-lying marsh area between Iona Island and Round Island may be mobilized during tidal and storm water inundation. Once mobilized, contaminants could be transported to the shoreline via advective transport (bulk movement) or as particulate complexes. However, vegetation, particularly the *Phragmites australis* root system within the low-lying marsh area between Iona Island and Round Island, would limit advective transport of soil and contaminants.

Once released into the liquid phase, a contaminant can move freely to a living organism. Some toxic forms of metals (e.g., lead) accumulate in plants, while others (e.g., mercury) accumulate in animal tissue. Contaminants that are bioaccumulated in plants or animals become available to the higher organisms that feed on them. The fate and behavior of contaminants in soil and sediment are determined by retention/release processes, which regulate the concentration of metals in the soil solution and thus their bioavailability. Physical properties, such as pH, texture, ion exchange capacity, soil organic matter content, and porosity influence bioavailability.

2.5 HUMAN HEALTH EXPOSURE

Iona Island is part of the Hudson River National Estuarine Research Reserve and is under the administration of PIPC. The majority of the Island is open space. Bear Mountain State Park employees are present on the island and access buildings used as storage areas at the property. Additionally, researchers are also present on the island and working in the marshes.

Iona Island is currently used by a limited number of recreational canoers who must obtain a permit for access. The site recreational use is limited to educational outings and history tours (6-8 times per year with approximately 50 people). Additionally, the island has been historically used for camping. The Boy Scouts have previously used the Site for activities.

Currently, there are no barriers to restrict access to the shoreline of the Island and trespassers are a possibility. In addition, because the shoreline is not fenced, there is a potential for kayakers or other boaters to visit the site along the shoreline from the Hudson River.

The future use of Iona Island is anticipated to remain consistent with current use and will continue to be maintained by park employees and be used as an area for research. Hypothetical future plans for Iona Island may include recreational use and construction of a nature or retreat center; however, these plans are not currently approved. Communication with the Director of Development and Special Projects at PIPC indicates that construction or redevelopment is unlikely at the site for the foreseeable future; however, it is possible that existing structures could be renovated or improved. Potential future work could involve repair to existing foundations.

In the 1990s, the water supply line that supplied Iona Island broke (near NYS Route 9W) on the causeway. Bear Mountain State Park did not repair the waterline break and a bedrock well was installed (March 1997) behind the existing storehouse (Building 222). According to the Bear Mountain Park Engineering Department, this new well is not treated and is used for non-potable purposes only (bottled water is brought on Iona Island for drinking purposes). The well is under pressure to obtain water due to low water yields. As a result, groundwater is not used as a potable water source on Iona Island; therefore, there is no potential exposure to contaminants in groundwater used as drinking water for current users. In addition, in 1965, when GSA conveyed the property to the PIPC, it was under a "restrictive clause" (park purposes only) (USACE 1995). Therefore, Iona Island will not be developed for commercial or residential use in the future, and there is no potential exposure to contaminants in groundwater used as drinking water for future users.

Based upon the current use and reasonably anticipated future use of the Iona Island, the following potential human receptors were identified for onsite media:

- Current and future Bear Mountain State Park employees (park personnel)
- Future construction workers
- Current and future researchers
- Current and future recreational User
- Current and future trespassers
- Current and future Boy Scouts/campers.

The sections below identify the major routes of exposure and their applicability to each of the identified receptors.

2.5.1 Park Personnel

The park personnel are assumed to be adults who work for the PIPC. Park personnel may perform maintenance activities such as grass mowing, site inspections, and general maintenance of the buildings. The park personnel are not expected to dig or perform other excavation activities. Therefore, contact is limited to surface soil. These workers may also perform maintenance or similar activities within Iona Marsh and along the Hudson River shoreline. Therefore, there is a potential for contact to sediment within these areas. The following exposure pathways are considered complete or potentially complete for the park personnel:

- Incidental ingestion of surface soil, sediment, and/or surface water
- Dermal contact with surface soil, sediment, and/or surface water
- Inhalation of windblown particulates from surface soil.

The particulate pathway assumes contaminants are attached to soil particles and become airborne through wind action. Due to the moisture content of sediment, particulates in sediment are not expected to become airborne.

2.5.2 Researcher

Researchers are assumed to be adults working at the site on a limited or part-time basis. They are not full-time employees with PIPC. The researcher is assumed to work or plant within AOC #16 – Area D (Former Dump Area) and Iona Marsh, so contact with soil within AOC #16 – Area D (Former Dump Area) and sediment within the marsh areas is expected. Sediment within the marsh is assumed as a contact similar to soil. Plantings within the marsh are assumed within the top 6 inches of soil, which is considered to be within surface soil. The researchers are not expected to dig or perform other subsurface activities. Therefore, contact is limited to surface soil. The following exposure pathways are considered complete or potentially complete for the researcher:

- Incidental ingestion of surface soil
- Dermal contact with surface soil
- Inhalation of windblown particulates from surface soil.

The particulate pathway assumes contaminants are attached to soil particles and become airborne through wind action.

2.5.3 Construction Worker

Construction workers are assumed to be adults working at the site during short-term construction projects (i.e., 1 year or less). They are expected to dig and perform other subsurface activities, including installation of utilities. Therefore, contact to both surface soil and subsurface soil is expected. Because the construction worker performs excavation activities, they may contact perched groundwater. These workers are not expected to contact sediment within the marsh area/wetlands. The following exposure pathways are considered complete or potentially complete for the construction worker:

- Incidental ingestion of surface and subsurface soil and perched groundwater
- Dermal contact with surface and subsurface soil and groundwater
- Inhalation of windblown particulates from surface and subsurface soil
- Inhalation of VOCs (if present) in the air of a trench.

2.5.4 Recreational Users

The recreational user represents a multiple age-range family that may visit the site from canoeing or access from the State Park. The adult recreational user is assumed to be over 18 years of age. The adolescent recreational user is assumed from 6 to 16 years. The child recreational user is assumed from 2 to 6 years. Recreational users younger than 2 years of age are not anticipated due to site access and site conditions that are not conducive to playgrounds or other play areas. The recreational user is representative of other low frequency receptors that may visit the site during tours or other group events. Risk results for the recreational user are protective of other low frequency visitors. The recreational user is not expected to dig or perform other subsurface activities; therefore, contact is limited to surface soil. Additionally, recreational users may contact sediment and surface water within the marsh area/wetlands or along the Hudson River shoreline. The following exposure pathways are considered complete or potentially complete for the recreational user:

- Incidental ingestion of surface soil, sediment, and surface water
- Dermal contact with surface soil, sediment, and surface water
- Inhalation of windblown particulates from surface soil.

The particulate pathway assumes contaminants are attached to soil particles and become airborne through wind action. Due to the moisture content of sediment, particulates in sediment are not expected to become airborne.

2.5.5 Trespasser

The trespasser represents a receptor who may visit the site while boating along the eastern shoreline (Hudson River) or western shoreline or hiking in the state park. A trespasser is not expected to dig or perform other subsurface activities. The following exposure pathways are considered complete or potentially complete for the trespasser:

- Incidental ingestion of soil, sediment, and/or surface water
- Dermal contact with soil, sediment, and/or surface water
- Inhalation of windblown particulates from soil.

The particulate pathway assumes contaminants are attached to soil particles and become airborne through wind action. Due to the moisture content of sediment, particulates in sediment are not expected to become airborne.

2.5.6 Boy Scout/Camper

The Boy Scouts are assumed at an age from 5 to 18 years who would visit the site to camp and may perform other activities, such as planting or clean-up. The Boy Scout may contact surface soil, subsurface soil, and sediment within the marshes/wetlands. While the Boy Scout/camper may contact subsurface soil, they are not assumed to have significant contact with shallow groundwater. Any subsurface contact is expected to be from digging and is likely limited to soil. Any digging is not expected to produce large holes or trenches, which is likely expected with a construction worker, which would allow for groundwater to accumulate. The following exposure pathways are considered complete or potentially complete for the Boy Scout/camper:

- Incidental ingestion of soil, sediment, and/or surface water
- Dermal contact with soil and sediment, and/or surface water
- Inhalation of windblown particulates from soil.

The particulate pathway assumes contaminants are attached to soil particles and become airborne through wind action. Due to the moisture content of sediment, particulates are not expected to become airborne.

2.6 ECOLOGICAL EXPOSURE

The sections below present the terrestrial and aquatic receptors identified for inclusion in the CSM and major routes of exposure and their applicability to each of the identified receptor groups.

2.6.1 Terrestrial Receptors.

Terrestrial plants, invertebrates, birds, mammals, and herptiles are the primary ecological receptor categories that could be exposed to contaminants in soil. Potential terrestrial receptors are based on feeding guilds. Representative categories include the following:

- Terrestrial plant community
- Terrestrial invertebrate community, as represented by earthworms (*Lumbricus terrestris*)
- Populations of herbivorous mammals (feeding on plants), as represented by meadow vole (*Microtus pennsylvanicus*)
- Populations of insectivorous mammals (feeding on insects, worms, and other invertebrates), as represented by short-tailed shrew (*Blarina brevicauda*)
- Populations of insectivorous birds (feeding on insects, worms, and other invertebrates), as represented by American robin (*Turdus migratorius*)
- Populations of predatory (carnivorous) mammals (feeding on other animals), as represented by red fox (*Vulpes vulpes*)
- Populations of predatory (carnivorous) birds (feeding on other animals), as represented by red-tailed hawk (*Buteo jamaicensis*)
- Populations of herptiles (i.e., amphibians and reptiles).

2.6.2 Terrestrial Exposure Pathways

Plants may absorb constituents from surface and subsurface soil via roots. They may also absorb constituents from air or airborne particles through the stomata in leaves, although the waxy surfaces of leaves may limit this exposure. Soil invertebrates may ingest constituents in soil and also may be exposed to constituents in soil through direct contact. Some plant roots may exist in deeper soil layers and invertebrates such as earthworms have the potential to burrow deeper into the soil. Therefore, exposure pathways linking plants and soil invertebrates to surface and subsurface soil are complete and relevant for assessment. As part of the base of the food web, plants and invertebrates also provide food/prey items for foraging by upper-trophic level wildlife (e.g., birds and mammals).

The major exposure route for wildlife (i.e., birds, mammals, and herptiles) is ingestion of constituents in contaminated media (EPA 2007a). The surface water ingestion pathway is a complete but not significant exposure pathway as constituents tend to bind to suspended sediments and settle out of the water column. Surface water ingestion is not likely to be a risk driving exposure route. Wildlife may ingest constituents by incidentally ingesting soil while

grooming or foraging. Some constituents may bioaccumulate in animal tissues. Therefore, wildlife may also ingest constituents through the prey items that they consume as food. Ingestion of constituents in soil and/or food are considered complete exposure pathways for wildlife.

Wildlife may be exposed to constituents in air, surface water, or soil via direct contact during foraging. Birds and mammals have protective outer coverings (feathers and fur) that prevent or limit the dermal absorption of constituents from environmental media (EPA 2007a, U.S. Army Center for Health Promotion and Preventative Medicine [USACHPPM] 2004). EPA guidance identifies that, in most cases, dermal exposures are likely to be less significant than exposures through ingestion, and their evaluation involves considerable uncertainty (EPA 2007a, USACHPPM 2004). Therefore, the dermal exposure route is considered complete but not significant for birds and mammals and therefore is not quantitatively evaluated in the ERA. Since herptiles may be more sensitive to dermal exposure (Weir et al. 2010), the dermal exposure route is considered a complete exposure pathway for herptiles.

Some mammals burrow into the soil to create dens and burrows which serve, not only as a home for these species, but also benefit the environment by aerating the soil. As a result, these mammals may be exposed to and incidentally ingest both surface and subsurface soil. Foxes have been observed on the island and likely burrow in dens, which were observed during a site visit in October 2018. As such, mammals are assumed to burrow and be exposed to both surface and subsurface soil.

Inhalation is a complete pathway for wildlife that may inhale constituents that have volatilized or that are adsorbed to airborne particulates. EPA guidance indicates that, in general, the inhalation pathway is complete but not significant compared to ingestion pathways (EPA 2007a) and therefore is not quantitatively evaluated in the ERA.

In summary, the following terrestrial exposure pathways are complete and quantitatively evaluated in the ERA:

- Direct contact to constituents in soil for plants
- Ingestion and direct contact to constituents in soil for soil invertebrates and herptiles
- Ingestion of constituents in soil and food for wildlife (birds, mammals, and herptiles).

2.6.3 Aquatic Receptors

Aquatic organisms such as plants, aquatic life, benthic invertebrates, herptiles, and aquatic-feeding mammals and birds are the primary ecological receptors that could be exposed to contaminants in sediment and surface water. Potential aquatic receptors are based on feeding guilds and availability of wildlife exposure models. Representative categories include the following:

- Aquatic plant community
- Benthic invertebrate community
- Aquatic life (zooplankton, demersal fish, and large pelagic fish)
- Populations of herbivorous mammals (feeding on aquatic plants), as represented by muskrat (*Ondatra zibethicus*)
- Populations of herbivorous birds (feeding on aquatic plants), as represented by mallard duck (*Anas platyrhynchos*)
- Populations of insectivorous birds (feeding on benthic invertebrates), as represented by lesser scaup (*Aythya affinis*)
- Populations of piscivorous mammals (feeding on fish), as represented by river otter (*Lontra canadensis*)
- Populations of piscivorous birds (feeding on fish), as represented by great blue heron (*Ardea herodias*)
- Populations of herptiles (i.e., amphibians and reptiles).

2.6.4 Aquatic Exposure Pathways

Sediments are ingested by benthic invertebrates, demersal (bottom-feeding) fish, pelagic fish (within the water column) and incidentally by wildlife (i.e., bird, mammals, and herptiles) that feed in the aquatic environment. These receptors are also directly exposed to the sediment. Pelagic fish exposure to sediment is complete but not significant compared to exposure captured by demersal fish exposure to sediment and this exposure pathway is not quantitatively evaluated. EPA guidance indicates that dermal exposures from direct contact are likely to be less significant than exposures through ingestion for birds and mammals due to protective outer coverings (EPA 2007a, USACHPPM 2004). Therefore, the sediment dermal exposure route is considered complete but not significant for birds and mammals. Since herptiles may be more sensitive to dermal exposure (Weir et al. 2010), the dermal exposure route is considered a complete exposure pathway for herptiles.

Food web models are typically not conducted for benthic invertebrates as exposure parameters are not readily available in EPA's Wildlife Exposure Factors Handbook (1993) or for fish due to the lack of site fidelity (see Section 2.1.6.2 of the ERA in **Appendix H** for more information). Sediment quality criteria are expected to be protective of benthic invertebrates and fish via all exposure routes.

Aquatic and wetland plants have root systems that are also directly exposed to sediment. Areas with dense *Phragmites* root mats will limit wildlife exposure to sediment. Desorption of constituents from sediment to the water column can occur, impacting water column invertebrates (i.e., zooplankton) and pelagic (predacious) fish.

Demersal and pelagic fish as well as aquatic-feeding wildlife (e.g., birds, mammals, and herptiles) may ingest constituents through the prey items that they consume as food. For instance, insectivorous birds and demersal fish consume benthic invertebrates; herbivorous birds and mammals consume wetland aquatic plants; pelagic fish, large piscivorous mammals (e.g., river otter), and birds (e.g., bald eagle and heron) consume fish; and herptiles may consume any of the aquatic biota items. Ingestion of constituents in sediment and aquatic biota are considered complete exposure pathways for aquatic wildlife and are evaluated quantitatively in the food web models.

Ingestion of aquatic biota is considered complete for fish, but this pathway is not evaluated quantitatively in the food web models due to fish being transient in nature. Moreover, modeling exposures and ultimate associations with toxicity for aquatic receptors is limited. For example, US EPA's Aquatox model is available but is limited to organic contaminants and is therefore not applicable for sites impacted by heavy metals such as Iona Island and the Hudson River. Additionally, another model available for quantifying exposure/toxicity to aquatic receptors is US EPA's Web-ICE; however, this is limited to acute exposure scenarios as outputs focus on acute endpoints (i.e. mortality), thus the application of such a model for legacy impacted sediments will not yield applicable information for an exposure characterization of persistent contaminants from sediments, such as the case for Iona Island sediment at the Hudson River littoral zone. Finally, in the context of contaminant exposures, food web models are unlikely the most representative exposure route as fish are predominantly exposed at the gill-water interface (Evans 1987). Ingestion of aquatic biota is considered a complete but not significant exposure pathway for demersal and pelagic fish. For more information on how exposure is evaluated for aquatic receptors by taxa see Section 2.1.6.2 of the ERA in **Appendix H** for more information.

Ingestion and direct contact with surface water is a complete pathway for each of the aquatic receptors (aquatic plants [direct contact only], benthic invertebrates, zooplankton, demersal fish, pelagic fish, and wildlife [birds, mammals, and herptiles]). The surface water ingestion pathway is a complete but not significant exposure pathway for wildlife as constituents tend to bind to suspended sediments and settle out of the water column. Surface water ingestion is not likely to be a risk driving exposure route. Benthic invertebrate and aquatic plant exposure to surface water is complete but not significant compared to exposure to sediment. Surface water quality criteria are expected to be protective of benthic invertebrates, fish, and aquatic plants via all exposure routes.

As discussed above, EPA guidance indicates that dermal exposures from direct contact are likely to be less significant than exposures through ingestion for wildlife (birds and mammals) due to protective outer coverings (EPA 2007a, USACHPPM 2004). The direct contact exposure pathway for surface water was considered complete but not significant and was not quantitatively evaluated for birds and mammals. Since herptiles may be more sensitive to dermal

exposure (Weir et al. 2010), the dermal exposure route is considered a complete exposure pathway for herptiles.

In summary, the following aquatic exposure pathways are considered complete and quantitatively evaluated in the ERA:

- Direct contact to sediment for aquatic plants
- Ingestion and direct contact to sediment for benthic invertebrates
- Ingestion and direct contact to sediment and surface water for demersal fish and herptiles
- Ingestion and direct contact to surface water for zooplankton and pelagic fish
- Ingestion of constituents in sediment and food for aquatic wildlife (birds, mammals, and herptiles).

3. HTRW RI ACTIVITIES

This HTRW RI was conducted to characterize the nature and extent of impacts to environmental media associated with 19 AOCs identified as being eligible for further investigation under the FUDS HTRW project, and to assess potential exposure pathways and risk to human receptors and/or ecological receptors. HTRW RI field activities were conducted in accordance with the UFP-QAPP (EA 2020a), the UFP-QAPP Addendum (EA 2022b), and the Accident Prevention Plan (EA 2019a). These documents present the plans for conducting work at the site in a safe manner and in a way that allowed the generation of data that meet project data quality objectives (DQOs).

A two-phased approach (Phase I and Phase II) was employed during the HTRW RI to facilitate data collection, evaluation, and discussion. Each phase included field investigation activities with collection of samples for onsite field screening and offsite laboratory analysis, data validation, evaluation of data usability, data analysis, and evaluation of potential impacts to human health and ecological receptors. Phase I and Phase II field activities are detailed under Sections 3.1 and 3.3 below.

3.1 PHASE I FIELD ACTIVITIES

Phase I was conducted to evaluate the presence/absence and/or nature and extent of hazardous substances in onsite soil within the FUDS boundary, evaluate the source-pathway-receptor interaction, and evaluate the subsequent risk to terrestrial receptors. The Phase I investigation, including investigation areas, media to be sampled, sampling locations, and analytes to be sampled, was designed in 2018-2020 based on the history of former buildings/structures and results of previous investigations, which have been ongoing at Iona Island since 1992. A UFP-QAPP was prepared to implement the HTRW RI, including specific procedures for execution of the technical field sampling, laboratory analytical procedures, quality assurance (QA), quality control (QC), and the assessment of oversight planning that will help ensure the quality of the investigation (EA 2020a).

Phase I field investigation and data analysis activities were conducted in 2020-2021 in accordance with the UFP-QAPP (EA 2020a). Field activities consisted of onsite and background soil sampling and a shoreline reconnaissance along Iona Island. Specific goals for Phase I included the following:

- Characterize contaminant concentrations in surface soil (from 0 to 6 in. bgs) and shallow subsurface soil (from 6 to 36 in. bgs or refusal) associated with the former buildings/ structures evaluated under the HTRW RI, including TAL metals; PAHs; BTEX, PCBs, and/or explosives residues

- Establish regional background metals and PAH concentration ranges in soil

- Evaluate whether contaminants concentrations in onsite soil related to historical DoD activities present a potential risk to human health and/or terrestrial ecological receptors

- Evaluate the source-pathway-receptor interaction, including identifying potential areas of sediment accumulation that could be suitable for sampling along the shoreline; identifying potential pathways that lead to the shoreline environment (i.e., channels, drainage ditches, culverts, sewage outfalls/discharge pipes, etc.); evaluating whether there are barriers to overland transport from Iona Island to the shoreline (e.g., the railroad); and conducting a receptor and resource inventory evaluation

- Evaluate the physical characteristics (total organic carbon [TOC] and grain size) of shoreline sediment and evaluate the potential for sediment to accumulate contaminants. Sediment consisting of fine-grained particles and high organic matter (i.e., high TOC) are more likely to present a "sink" for historical contaminants and serve as a source of exposure to organisms, as opposed to coarser-grained particles (e.g., sand and gravel) with low TOC that are less likely to accumulate historical contaminants.

Phase I field activities were completed in March-April 2020. The Phase I investigation area at Iona Island covered the majority of the former operational area, the eastern (Hudson River) and western (Iona Marsh) shorelines of Iona Island, and the eastern and western sides of the active River Subdivision (CSX Transportation) railroad tracks. Onsite field activities completed during Phase I are summarized in the list below. A copy of the Phase I field book/field notes and the Phase I photographic log is presented in **Appendix A**.

- Onsite surface soil (0-6 in. bgs) and subsurface soil (6 to maximum of 36 in. bgs) sampling using incremental sampling methodology (ISM) to evaluate the presence/absence and nature/extent of contaminants in onsite soil related to former DoD activities. Soil sampling was conducted using ISM to reduce data variability and increase sample representativeness

- Background soil sampling using ISM in Bear Mountain State Park outside the influence of the Iona Island Naval Ammunition Depot FUDS to establish regional background concentrations of metals and PAHs

- Field screening of soil samples for pH to support development of the ERA; pH was determined in the field through field screening due to time constraints regarding sample holding times for pH analysis

- Completion of a shoreline reconnaissance survey to identify potential pathways that lead to the shoreline environment, evaluate whether there are barriers to overland transport from Iona Island to the shoreline, and conduct a receptor and resource inventory evaluation

- Collection of discrete sediment samples along the Hudson River and Iona Marsh for analysis of TOC and grain size to identify physical characteristics of sediment and evaluate whether sediments could be a potential "sink" for site-related contaminants.

Several metals are naturally occurring in soil. In addition, PAHs are also present in the environment from both natural sources (e.g., forest fires) and human activities (e.g., petroleum products). Therefore, Phase I included a background soil investigation to establish regional background metal and PAH concentration ranges in surface and subsurface soil.

3.1.1 Pre-Investigation Field Activities

Equipment and supplies for the Phase I investigation were transported to the site on 9 March 2020. Pre-investigation field activities were conducted from 9 to 13 March 2020 and included a MEC surface sweep, brush/vegetation reduction, and flagging of sampling locations. Decision unit (DU) grid corners were located in the field with a hand-held global positioning system unit and marked with high-visibility flagging and stakes.

3.1.2 ISM Soil Sampling

Phase I soil sampling was conducted from 16 to 20 March 2020 and 30 March through 1 April 2020. The Phase I soil investigation area encompassed the 19 AOCs eligible for further inclusion in the HTRW project. The investigation also included the 7 former explosive storage and filling operations buildings that were identified as having potential for exposure risk from remaining explosives residues in environmental media to human and ecological receptors (**Figure 3-1**). In addition, previous investigations indicated that PAHs and metals were likely mobilized beyond the footprints of former buildings/structures during demolition and subsequent reworking of surface and subsurface soil. Those areas where elevated concentrations of PAHs and metals were previously detected in surface and/or subsurface soil were also investigated during Phase I.

3.1.2.1 Establishment of Soil Decision Units

A total of 32 onsite DUs (DU-1 through DU-25, EXDU-1 through EXDU-7) were established to evaluate contaminants in soil during Phase I (**Figure 3-1**). 26 of these onsite DUs, including DU-1 through DU-19 and EXDU-1 through EXDU-7, were established to address contamination originating from former buildings, AOC #16 – Area D (Former Dump Area), and former coal storage areas, and to further evaluate locations where elevated concentrations of contaminants were detected during previous investigations. These 26 DUs were sized at approximately 1-acre each (200 ft x 200 ft or 100 x 400 ft) as this represents the smallest area for which human or ecological receptors may be exposed. The American robin, which represents the insectivorous bird guild in the ERA, has an extremely small foraging range that is essentially equivalent to 1-acre. Likewise, a potential researcher in the area may only be exposed to an acre. The remaining 6 onsite DUs, including DU-20 through DU-25, were sized at 60 ft x 60 ft DUs to evaluate the presence/absence of contaminants in the footprints of significantly smaller structures, including former fuel oil ASTs and former transformer locations (**Figure 3-1**).

In addition to onsite DUs, 8 non-contiguous background DUs (BADU-1 through BADU-8) were established in Bear Mountain State Park outside the influence of the Iona Island Naval Ammunition Depot FUDS to collect background samples for metals and PAHs (**Figure 3-2**). Each background DU was located in the same soil type as the Phase I investigation area (Chatfield-rock outcrop complex, rolling) and sized at approximately 1-acre (200 x 200 ft). Onsite and background DUs were established following the procedures in the UFP-QAPP (EA 2020a).

A summary of each onsite and background DU and the rationale for its establishment is presented in the bulletized list below. DU boundaries were modified during pre-investigation activities (Section 3.1.1 of this RI report) based on conditions encountered in the field (i.e., presence of exposed bedrock limiting soil sample collection). Photographs of conditions of onsite and background DUs are presented in **Appendix A**.

- DU-1: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #17 – Area E (Former Coal Trestle and Storage Area) and AOC #10 – Former Building 406 (Tin, Electrical and Annealing Shop Building). Potential AOC-specific contaminants for AOC#10 include metals and SVOCs. Potential AOC-specific contaminants for AOC#17 include metals (specifically arsenic, cadmium, and mercury) and SVOCs.

- DU-2: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #17 – Area E (Former Coal Trestle and Storage Area). Potential AOC-specific contaminants for AOC#17 include metals (specifically arsenic, cadmium, and mercury) and SVOCs.

- DU-3: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #12 – Former Building 410 (Power House) and AOC #11 – Former Building 407 (Paint Shop and Pipe Shop). Potential AOC-specific contaminants for AOC#12 include PAHs and metals (such as arsenic, cadmium, and mercury).

- DU-4: 200 ft x 200 ft DU established to evaluate potential metals and PAH contamination in surface soil (0-6 in. bgs) and subsurface soil (6–36 in. bgs) at previous sampling location II-EA-SD-02-01(which had elevated concentrations of antimony, copper, lead, and mercury) and previous sampling location IX407-B1 (which had elevated concentrations of arsenic, lead, and fluoranthene).

- DU-5: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6-36 in. bgs) at AOC #3 – Former Building 123 Garage Building) and previous sampling location II-EA-SS-02-06 (which had elevated concentrations of antimony, copper, lead, mercury, and zinc). Potential AOC-specific contaminants for AOC#3 include metals and SVOCs.

- DU-6: 200 ft x 200 ft DU established to evaluate potential metals contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of previous sampling locations II-EA-SS-02-09 (which had an elevated concentration of copper) and EA-SS-02-03 (which had elevated concentration of lead).

- DU-7: 200 ft x 200 ft DU established to evaluate potential metals contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of previous sampling location II-EA-SS-02-08 (which had elevated concentrations of copper, lead, and zinc).

- DU-8: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #5 – Former Building 207 (Marine Garage Building). The DU is contained by existing Buildings 201, 212, and 222. Potential AOC-specific contaminants for AOC#5 include metals and SVOCs.

- DU-9: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #8 – Former Building 219 (Garage Building) and AOC #9 – Former Building 220 (Garage Building). Potential AOC-specific contaminants for AOC#8 and AOC #9 include metals and SVOCs.

- DU-10: 200 ft x 200 ft DU established to evaluate potential metals contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity previous sampling location II-EA-SS-02-14 (which had elevated concentration of copper).

- DU-11: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #18 – Area F (Former Coal Storage Area). Potential AOC-specific contaminants for AOC#18 include metals (such as arsenic, cadmium, and mercury) and SVOCs.

- DU-12: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #6 – Former Building 213 (Paint Locker for Building 202) and AOC #7 – Former Building 215 (Garage Building). Potential AOC-specific contaminants for AOC#6 and AOC #7 include metals and SVOCs.

- DU-13: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #1 – Former Building 103 (Paint and Oil Storage) and previous sampling location IX-103-B1 (which had elevated concentrations of arsenic, cadmium, lead, fluoranthene, and pyrene). Potential AOC-specific contaminants for AOC#1 include metals and SVOCs.

- DU-14: 200 ft x 200 ft DU established to evaluate potential metals contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of previous sampling location II-EA-SS-02-13 (which had elevated concentrations of lead and mercury).

- DU-15: 200 ft x 200 ft DU established to evaluate potential metals contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of previous sampling location II-EA-SS-02-15 (which had elevated concentrations of lead and mercury).

- DU-16: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #4 – Former Buildings 124-128 (Sewage Disposal Plant). Potential AOC-specific contaminants for AOC#4 include metals and SVOCs.

- DU-17: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at and in the vicinity of AOC #2 – Former Building 121 (Incinerator), AOC #16 – Area D (Former Dump Area), and previous sampling locations IX-121-B1 (which had elevated concentrations of arsenic, cadmium, lead, fluoranthene, and pyrene) and II-EA-SD-02-02 (which had elevated concentrations of antimony, copper, lead, nickel, and zinc). Potential AOC-specific contaminants for AOC #2 include residual organics and metals, and PAHs from incomplete combustion. Potential AOC-specific contaminants for AOC #16 are unknown, but could include SVOCs, PCBs, explosives, and metals.

- DU-18: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at AOC #16 – Area D (Former Dump Area) and in the vicinity of previous sampling locations IX DMP-B22 (which had elevated concentrations of arsenic, cadmium, total chromium, lead, silver, 2,4-DNT, 2,6-DNT, and Aroclor 1260) and IXDMP-B1 (which had elevated concentrations of lead and Aroclor 1260). Potential AOC-specific contaminants for AOC #16 are unknown, but could include SVOCs, PCBs, explosives, and metals.

- DU-19: 200 ft x 200 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at AOC #16 – Area D (Former Dump Area) and in the vicinity of previous sampling location II-EA-SS-02-16 (which had elevated concentrations of antimony, copper, lead, mercury, and zinc). Potential AOC-specific contaminants for AOC #16 are unknown, but could include SVOCs, PCBs, explosives, and metals.

- DU-20: 60 ft x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at a former AST located near former Building 233 (AOC #13 – Area A). Potential AOC-specific contaminants include BTEX and PAHs.

- DU-21: 60 ft x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at a former AST located near former Dock 131 (AOC #14 – Area B). Potential AOC-specific contaminants include BTEX and PAHs.

- DU-22: 60 x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at two former ASTs located near former Building 407 (AOC #15 – Area C). Potential AOC-specific contaminants include BTEX and PAHs.

- DU-23: 60 ft x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at former transformer T1 (AOC #19). Potential AOC-specific contaminants include PCBs.

- DU-24: 60 ft x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6–36 in. bgs) at former transformer T2 (AOC #19). Potential AOC-specific contaminants include PCBs.

- DU-25: 60 x 60 ft DU established to evaluate potential contamination in surface soil (0–6 in. bgs) and subsurface soil (6-36 in. bgs) at former transformer T3 (AOC #19). Potential AOC-specific contaminants include PCBs.

- EXDU-1: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 609 – Mine Loading Plant.

- EXDU-2: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 506 – Filling House #3.

- EXDU-3: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 503 – Filling House #6.

- EXDU-4: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 404 – Filling House #1.

- EXDU-5: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 307 – Filling House #5.

- EXDU-6: 200 ft x 200 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 306 – Filling House #2.

- EXDU-7: 100 ft x 400 ft DU established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 202 – Shell House #5 and D Plant.

- BADU-1: 200 ft x 200 ft DU located in Bear Mountain State Park northwest of the intersection of Perkins Memorial Drive and Seven Lakes Drive.

- BADU-2: 200 ft x 200 ft DU located in Bear Mountain State Park north of the intersection of Perkins Memorial Drive and Seven Lakes Drive.

- BADU-3: 200 ft x 200 ft DU located in Bear Mountain State Park south of the intersection of Perkins Memorial Drive and Seven Lakes Drive.

- BADU-4: 200 ft x 200 ft DU located in Bear Mountain State Park southeast of the intersection of Perkins Memorial Drive and Seven Lakes Drive.

- BADU-5: 200 ft x 200 ft DU located in Bear Mountain State Park north of Seven Lakes Drive and west of Suffren Bear Mountain Trail.

- BADU-6: 200 ft x 200 ft DU located in Bear Mountain State Park at the intersection of Suffren Bear Mountain Trail and Seven Lakes Drive.

- BADU-7: 200 ft x 200 ft DU located in Bear Mountain State Park south of Seven Lakes Drive and southwest of the Suffren Bear Mountain Trail intersection.

- BADU-8: 200 ft x 200 ft DU located in Bear Mountain State Park south of Seven Lakes Drive and southeast of the Suffren Bear Mountain Trail intersection.

3.1.2.2 ISM Soil Sampling Methods

ISM surface soil (0–6 in. bgs) incremental samples were collected from 30 of the 32 onsite DUs and from each background DU (**Table 3-1**). While separate surface soil (0–6 in. bgs) incremental samples were proposed to be collected within each onsite DU (DU-1 through DU-25 and EXDU-1 through EXDU-7), two DUs (DU-8 and DU-24), were not sampled during Phase I (**Figure 3-1**). DU-8 was not sampled due to the presence of debris observed within the DU that was not related to historical DoD operations, including numerous rusted and deteriorating 55-gal drums, deteriorating pallets, piles of roofing shingles, and chain-link fencing. PIPC has accepted responsibility for the drums/debris observed at DU-8 and the NYSDEC concurs that the PIPC is responsible for this area. DU-24 was not sampled as the majority of the DU consisted of exposed bedrock with little to no soil cover.

Subsurface soil depths were initially evaluated when attempting to collect surface soil increments across each DU (i.e., advancing the ISM sampling tool to 6 in. bgs). Following completion of surface soil sampling, a minimum of 5 hand-auger borings were advanced in each DU to evaluate subsurface soil conditions. Boring locations were advanced in areas where there was no evidence of bedrock or hardscapes. Subsurface soil with depth greater than 12 in. bgs were only encountered at 5 onsite DUs (DU-17 through DU-21) (**Table 3-2**). At the remaining onsite and background DUs, shallow subsurface soil was limited to a maximum of 12 in. bgs; and therefore,

no subsurface soil samples were collected from these DUs. In addition, subsurface soil was not collected at background DUs due to the presence of exposed/shallow bedrock and shallow depth to refusal (less than 12 in. bgs) throughout the DUs.

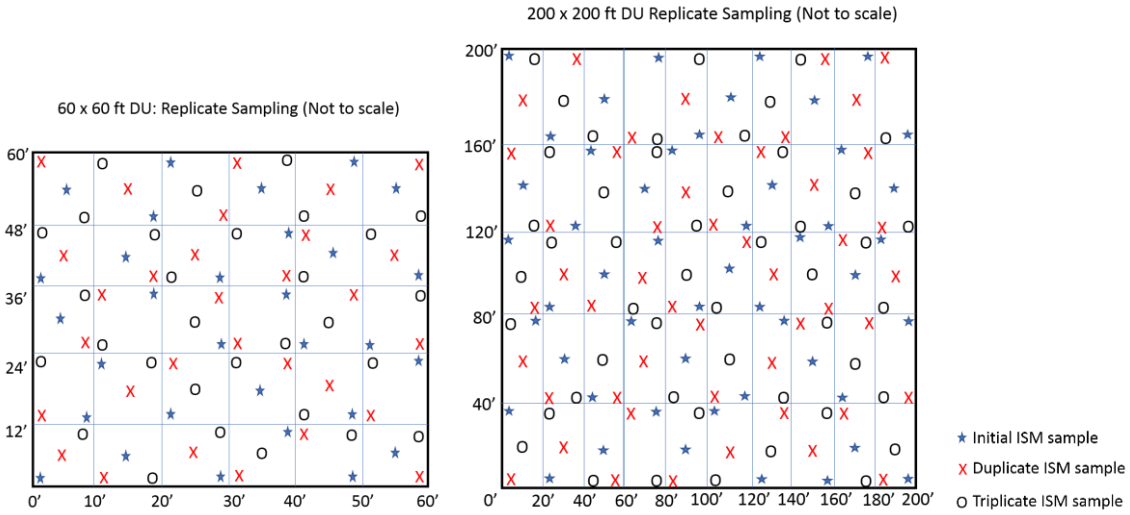
ISM soil samples at onsite DUs were collected in triplicate (initial ISM sample plus two additional samples) for the purpose of calculating the 95% upper confidence limit (UCL) of the mean (95UCL) at each DU using statistical tests. Single incremental samples were collected from each of the 8 background DUs to provide a background dataset of 8 samples. Each ISM soil sample was prepared by collecting multiple increments of soil within a DU and physically combining these increments into a single sample, referred to as the "incremental sample." ISM soil samples collected from the approximately 1-acre (200 x 200 or 100 x 400 ft) sized DUs (DU-1 through DU-19, EXDU-1 through EXU-7, and BADU-1 through BADU-8) were comprised of 50 increments of soil. Each ISM soil sample collected from the smaller 60 x 60 ft DUs (DU-20 through DU-25) was comprised of 30 increments of soil.

3.1.2.2.1 Surface Soil Sampling (0-6 in. bgs)

Surface soil ISM samples were collected from depths of 0-6 in. bgs using random sampling within grid pattern methodology (Interstate Technology Regulatory Council [ITRC] 2020), while avoiding concrete, exposed bedrock, pavement, shallow depth to refusal, and other features that inhibited collection of a surface soil increment. Each 60 ft x 60 ft DU was subdivided in the field into 30 grid cells, each approximately 10 ft x 12 ft in area, and each approximately 1-acre sized (200 ft x 200 ft or 100 ft x 400 ft) DU was subdivided into 50 grid cells, each approximately 20 ft x 40 ft in area. Surface soil increments were collected from random locations within grid cells (i.e., varying between the four corners or center of each grid box) in order to generate an unbiased estimate of the mean and variance. Triplicate incremental samples collected within each onsite DU were comprised of soil increments taken from different, randomly selected locations within each gridded area. Increments for each sample were not collected from the same locations or co-located together. Examples of surface soil increment locations are presented below.

Surface soil increments were collected from each grid cell using a dedicated incremental sampling tool with plungers collecting soil approximately equivalent to a specified volume of soil. The depth of each increment of soil was approximately 6 in., which was the length of the incremental sampling tool's sampling plunger attachment. Each of the increments of soil for the 200 x 200 ft DUs (50 increments for 1 ISM sample) was approximately 20 grams, to provide a total weight of 1 kilogram of soil for 1 incremental sample. Each of the increments of soil for the 60 x 60 ft DUs (30 increments for 1 ISM sample) was approximately 33 grams, to provide a total weight of 1 kilogram of soil for 1 incremental sample.

Upon collection, increments for each ISM soil sample were placed into 5-gal buckets with sample-dedicated bucket liners. Following collection of the desired number of increments, the increments were combined into the "incremental sample." Surface soil from each onsite and background ISM sample was screened for pH in the field using a pH meter as detailed in Section 3.4.1 of this RI report.



A total of 90 onsite ISM surface soil samples (initial and replicates) and 8 background ISM surface soil samples were collected for offsite laboratory analysis of TAL metals, mercury, PAHs, PCBs, and/or explosives residues as detailed in the bulletized list below and presented in **Table 3-1**. Samples for offsite laboratory analysis were placed in individual labeled Ziploc bags, each containing approximately 1 kg of soil. Additional volume was included for QA/QC samples (matrix spike [MS]/ matrix spike duplicate [MSD]). Sample handling and management and offsite laboratory analysis are further detailed in Section 3.5 of this RI report.

- TAL metals (excluding mercury) by EPA Method 6010C/6020A from DU-1 through DU-7, DU-9 through DU-19, and BADU-1 through BADU-8
- Mercury by EPA Method 7471B from DU-1 through DU-5, DU-9, DU-11 through DU-19 and BADU-1 through BADU-8
- PAHs by EPA Method 8270D selected ion monitoring (SIM) from DU-1 through DU-5, DU-9, DU-11 through DU-13, DU-16 through DU-19, DU-20 through DU-22, and BADU-1 through BADU-8
- PCBs by EPA Method 8082A from DU-17 through DU-19, DU-23, and DU-25
- Explosives residues by Method 8330B from DU-17 through DU-19 and EXDU-1 through EXDU-7.

3.1.2.2.2 Subsurface Soil Sampling (6 to maximum 36 in. bgs)

Shallow subsurface soil samples (6 to maximum of 36 in. bgs) were collected from 5 DUs where soil depth was greater than 12 in. bgs (DU-17 through DU-21). Subsurface soil ISM samples were comprised of soil increments taken from separate sets of randomly located borings

advanced within each DU using a hand auger. Areas that inhibited collection advancement of the hand auger (concrete, exposed/shallow bedrock, and pavement) were avoided during sampling.

For each of the approximately 1-acre (200 x 200 ft) sized DUs (DU-17 through DU-19), a single incremental sample was comprised of 50 soil increments taken from a total of 5 borings (10 soil increments per boring). For each of the smaller 60 x 60 ft DUs (DU-20 and DU-21), a single incremental sample was comprised of 30 soil increments taken from a total of 3 borings (10 increments per boring). Increments for subsurface soil triplicate samples (initial ISM sample plus two additional samples) from each DU were not collected from the same borings or co-located together. Additional borings were advanced to collect each incremental sample. Therefore, a total of 15 borings were advanced and sampled in each approximately 1-acre (200 x 200 ft) sized DU (5 borings per each incremental sample) and 9 total borings were advanced and sampled within in each smaller 60 x 60 ft DU) (3 borings per each incremental sample).

Upon collection, increments for each ISM sample were placed into 5-gal buckets with sample-dedicated bucket liners. Following collection of the desired number of increments, the increments were combined into an "incremental sample." Subsurface soil from each ISM sample were screened for pH in the field using a pH meter as detailed in Section 3.4.1 of this RI report.

A total of 16 onsite ISM subsurface soil samples (initial and replicates) were collected for offsite laboratory analysis of TAL metals, mercury, PAHs, PCBs, explosives residues, and/or BTEX as detailed in the bulletized list below and presented in **Table 3-1**. Samples for offsite laboratory analysis of TAL metals, PAHs, PCBs, and explosives residues were placed in individual labeled Ziploc bags, each containing approximately 1 kg of soil. Additional volume was included for QA/QC samples (MS/MSD).

Samples for BTEX analysis were collected in the field using 5-gram Terra Core samplers. Increments for each ISM sample were combined into laboratory-preserved jars containing methanol. Increments for subsurface soil triplicate sample (initial ISM sample plus two additional samples) from each DU were not co-located together or combined in the same sample jars. Separate laboratory-preserved jars containing methanol were used for each triplicate sample. Additional volume was included for MS/MSD samples in separate laboratory-preserved jars containing methanol. QA/QC samples including methanol field blanks and trip blanks were submitted with BTEX samples. Sample handling and management and offsite laboratory analysis are further detailed in Section 3.5 of this RI report.

- TAL metals (excluding mercury) by EPA Method 6010C/6020A from DU-17 through DU-19
- Mercury by EPA Method 7471B from DU-17 through DU-19
- PAHs by EPA Method 8270D SIM from DU-17 through DU-21
- PCBs by EPA Method 8082A from DU-17 through DU-19

- Explosives residues by Method 8330B from DU-17 through DU-19

- BTEX by EPA Method 8260B from DU-20 and DU-21.

3.1.3 Shoreline Reconnaissance (EA 2020c)

A shoreline reconnaissance survey was conducted from 6 to 7 April 2020 (EA 2020c, **Appendix E**). The survey was conducted by EA field biologists, including a state certified forest professional and professional wetland scientist with 15 years of experience conducting habitat surveys, flora and fauna surveys, and similar assessments. EA field biologists documented potential upland and aquatic receptors and evaluated whether the benthos provides suitable habitat for aquatic organisms. The shoreline reconnaissance survey was conducted along four reconnaissance areas (**Figure 3-3**):

- Recon Area 1 – Hudson River Shoreline located on the east side of Iona Island

- Recon Area 2 – Iona Marsh Shoreline located along the west side of Iona Island and divided by a railroad embankment which supports the active River Subdivision (CSX Transportation) railroad tracks

- Recon Area 3 – Western Shoreline between Iona and Round Island (southwest side of Iona Island and western portion of Round Island) including the low portion of land between the two islands

- Recon Area 4 – River Subdivision (CSX Transportation) railroad track embankment (west and east side).

The extent of the reconnaissance areas along the Hudson River Shoreline (Recon Area 1) and the Iona Marsh Shoreline (Recon Area 2) was based off of the location of former buildings/structures and site topography, which would influence the direction of overland flow/transport of contaminants from Iona Island to the shoreline. The western FUDS boundary between Iona and Round Island was considered a separate recon area to evaluate potential overland transport from AOC #16 – Area D (Former Dump Area) and the presence of potential transport pathways (drainage swales, channels, outfalls, etc.) in this area. The FUDS boundary was evaluated in this area, rather than the Iona Marsh shoreline, as a non-DOD fill area is located southwest of the FUDs boundary along the Iona marsh shoreline; this area was filled by PIPC following transfer of the FUDS from the Navy in 1965, and therefore, was not subject to investigation under the FUDS program. The eastern and western sides of the active River Subdivision (CSX Transportation) railroad tracks was evaluated in order to identify potential pathways (i.e., conduits, channels, etc.) that could allow for overland transport from Iona Island to the shoreline beneath the railroad.

The shoreline reconnaissance survey in Recon Areas 1 through 4 was conducted on foot during low tide. In addition, reconnaissance along the shoreline in Recon Areas 1 and 2 included a

survey by boat during high tide. Potential transport pathways to the shoreline (e.g., swales, culverts, channels, outfalls, discharge pipes, etc.), and the type of material/environment encountered along the shoreline (i.e., man-made structures such as riprap or retaining walls; exposed bedrock; gravel, cobble, or boulder shorelines) was documented and photographed.

A receptor and resource inventory evaluation were conducted along the shoreline. Observed wetland plant species and aquatic receptors were documented and photographed during the shoreline reconnaissance. In addition, upland, avian, and aquatic wildlife was documented to determine potential ecological receptors at the site. Wildlife observations included incidental observations and did not include a formal survey for specific species.

3.1.4 Discrete Sediment Sampling

Discrete sediment grab samples were collected during the Phase I shoreline reconnaissance, with samples collected along the shoreline in Recon Areas 1, 2, and 3 as presented in the bulletized list below (**Figure 3-3**). Samples were not collected within Recon Area 4.

- Three sediment samples (SD-04, SD-05, and SD-06) along the Hudson River Shoreline in Recon Area 1
- Three sediment samples (SD-01, D-02, and SD-03 along the Iona Marsh shoreline in Recon Area 2
- One sediment sample (SD-07) along the Iona Marsh shoreline in Recon Area 3.

Each sediment sample was collected using disposable scoops and placed into individual laboratory supplied sample containers. New disposable scoops were used at each sample location so as to avoid cross-contamination. Used scoops were bagged and disposed of as general debris/trash.

The 7 discrete sediment samples were collected for offsite laboratory analysis of physical parameters as presented in the bulletized list below. Sample collection information is presented in **Table 3-1**. Sample handling and management and offsite laboratory analysis are further detailed in Section 3.5 of this RI report.

- TOC by Walkley-Black
- Grain size by ASTM International (ASTM) D422 (sieve and hydrometer).

3.2 PHASE I DATA GAPS

Phase I data and analytical results indicated widespread, elevated concentrations of metals and PAHs in soil throughout the upland area of Iona Island (see Section 6.3.1 of this RI report for more detail) and within AOC #16 – Area D (Former Dump Area) in the low-lying area between

Iona and Round Islands (see Section 6.3.2 of this RI report for more detail). In addition, surface water pathways were identified leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines (see Section 5.1.2 of this RI report for more detail). The following data gaps were identified following completion of Phase I:

- The bioavailability of metals and PAHs in onsite soil was not evaluated during Phase I. Although pH data were evaluated in soil during Phase I, additional physical parameter data (grain size, TOC, cation-exchange capacity [CEC]), and redox potential) were needed to evaluate bioavailability of metals and PAHs to terrestrial receptors as part of the RSLERA in the ERA.

- While contaminant migration pathways leading from the upland area to the Hudson River and Iona Marsh shorelines were not identified during Phase I, defined surface water and potential contaminant migration pathways were identified leading from AOC #16 – Area D (Former Dump Area) both shorelines. These pathways include transport to the Hudson River shoreline during high tide and storm events, and transport to the Iona Marsh shoreline via a riprap filled drainage swale and tidal wetland swale. These pathways and potential impacts to shoreline media (surface water and sediment) were not evaluated during Phase I. Additional data were needed to evaluate the surface water migration pathways, determine if metals in soil at AOC #16 – Area D (Former Dump Area) were present in shoreline media, and to evaluate risk to human health and ecological receptors.

- Background surface water and sediment data were not collected or analyzed during Phase I. Regional background/upstream concentrations of metals in surface water and sediment and statistical comparisons of onsite and background metals concentrations were critical to determine whether metals in shoreline media at Iona Island could be attributed to former DoD activities.

Multi-media sampling was needed to close data gaps identified after completion of Phase I. Phase II was planned and implemented to close data gaps identified after completion of Phase I and support decision making.

3.3 PHASE II FIELD ACTIVITIES

Phase II was conducted to further evaluate contaminant migration pathways to the shoreline environment, evaluate impacts to shoreline media, evaluate the subsequent risk to aquatic receptors, and support development of the HHRA and ERA. The Phase II investigation, including media to be sampled, sampling locations, and analytes to be sampled, was designed in 2021-2022 based on the Phase I results. A UFP-QAPP addendum was prepared to present Phase II investigative procedures and data collection activities, laboratory analytical and reporting procedures, and QA/QC measures and assessments that would be used to confirm that data are of known quality sufficient to meet project objectives for Phase II (EA 2022b).

Phase II field activities were conducted in accordance with the UFP-QAPP Addendum (EA 2022b) and consisted of onsite soil sampling and onsite and background sediment and surface water sampling. Specific goals for Phase II included the following:

- Evaluate bioavailability of metals and PAHs in onsite soil to further evaluate potential risk to terrestrial receptors and support development of the RSLERA in the ERA

- Confirm whether metals in soil at AOC #16 – Area D (Former Dump Area) related to historical DoD activities are being transported to the Hudson River and Iona Marsh shorelines via surface water migration pathways identified during Phase I

- Establish regional background metals concentration ranges in surface water and sediment

- Evaluate whether contaminant concentrations in surface water and/or sediment related to historical DoD activities present a potential risk to human health and/or aquatic ecological receptors

- Evaluate bioavailability of metals in sediment to support development of the RSLERA in the ERA

- Assess the potential for toxicity to sediment-dwelling organisms to support development of the ERA.

Phase II field activities were completed in April 2022. The Phase II investigation area at Iona Island included select Phase I DUs; the extent of AOC #16 – Area D (Former Dump Area); the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area); and the outlets of two surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to Iona Marsh (including a riprap filled drainage swale and tidal wetland swale). Phase II investigation areas are presented on **Figure 3-4**, **Figure 3-5**, and **Figure 3-6.** Onsite field activities completed during Phase II are summarized in the bulletized list below. A copy of the Phase II field book/field notes and the Phase II photographic log is presented in **Appendix A**.

- Surface soil (0-6 in. bgs) sampling using ISM for analysis of physical parameter data (grain size, TOC, oxidation-reduction potential [ORP], and CEC to assess bioavailability of metals and PAHs across Iona Island and within each soil environment, and to support development of the ERA (**Figure 3-4**); note that soil ORP was determined in the field through field screening due to time restraints regarding sample holding times for ORP analysis

- Surface water sampling for metals and physical parameter data (hardness and water quality parameters including pH, temperature, specific conductance, dissolved oxygen [DO], ORP, turbidity, and salinity) to evaluate the migration pathways from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines, evaluate geochemistry, and support development of the risk assessments (**Figure 3-5**)

- Shoreline sediment sampling using ISM for analysis of metals and physical parameter data (grain size, TOC, pH, and ORP) to evaluate whether metals from AOC #16 – Area D (Former Dump Area) were present in sediment at the endpoints of surface water migration pathways at concentrations that may pose risk to human health and/or ecological receptors, assess bioavailability of metals in sediment, and support development of the ERA (**Figure 3-6**); note that sediment pH and ORP were determined in the field through field screening due to time restraints regarding sample holding times for pH and ORP analysis

- Collection of discrete sediment for analysis of acid volatile sulfide (AVS)/simultaneously extracted metals (SEM) to assess the potential for toxicity to sediment-dwelling organisms and support development of the ERA (**Figure 3-6**)

Several metals are naturally occurring in sediment and surface water. In addition, the shoreline of Iona Island is part of the Hudson River PCB Superfund Site which encompasses nearly 200 miles of the Hudson River from Hudson Falls, New York, to the Battery in New York City (EPA 2017a). Additionally, the Hudson River is impacted with contaminants from upstream sources, including industrial facilities, as well as other pollutants from urban and agricultural runoff, and sewage and stormwater discharge. Although industrial discharges have been reduced, pollution from urban and agricultural runoff and sewage and stormwater discharge continues, and a legacy of past pollution remains in river sediment. Therefore, it was understood that shoreline surface water and sediment at Iona Island are likely impacted by contamination from the Hudson River (non-DoD impacts).

Active River Subdivision (CSX Transportation) railroad tracks parallel the western shoreline of the Hudson River, and the Iona Marsh Shoreline located along the west side of Iona Island is divided by the railroad embankment. Contaminants associated with the railroad may include metals, PAHs, and pesticides associated with normal railroad operations; petroleum products dropped or spilled from trains including oil, lubricants, and diesel; coal ash from engines; creosote from railroad ties; and PAHs from exhaust. Areas along the railroad tracks are likely to have been affected by normal operation of the rail line, with residual levels of contamination in media adjoining the railroad right-of-way.

Due to the potential for metals to naturally occur in sediment, and due to the potential for shoreline media to be impacted by contaminants in the Hudson River and/or normal operations of the railroad that parallels the western shoreline of the river, a background surface water and sediment investigation was conducted to determine whether metals in shoreline media at Iona Island can be attributed to former DoD activities. Con Hook, located approximately 3 miles upstream of Iona Island on the western side of the Hudson River, was selected to represent background surface water and sediment concentrations. Con Hook has similar depositional environments to Iona Island, with approximately 7 acres of upland habitat and another 12 acres of a *Phragmites*-dominated tidal marsh (Con Hook Marsh) (**Figure 3-7**). The Active River Subdivision (CSX Transportation) railroad tracks parallels the western boundary of Con Hook Marsh. Similar to Iona Marsh, Con Hook Marsh adjoining the railroad right-of-way may be impacted by contaminants associated with normal operation of the rail line.

3.3.1 ISM Surface Soil Bioavailability Parameter Sampling

Phase II ISM surface soil sampling was conducted on 18-19 April 2022. Two separate terrestrial environments with different soil types were identified at Iona Island. These areas include the upland area (upland soil) and the low-lying marsh area between Iona and Round Islands (hydric soil) (**Figure 1-5**). Eight select Phase I soil DUs were targeted during Phase II for physical parameter sampling, with DUs selected to provide reasonable spatial coverage/ representation both within each terrestrial environment and across Iona Island. Five separate Phase I upland soil DUs (DU-4, DU-7, DU-9, DU-11, and DU-13) were selected to be representative of the upland area (**Figure 3-4**). Each of the three Phase I DUs within the marsh area between Round and Iona Island (DU-17, DU-18, and DU-19 encompassing AOC #16 – Area D [Former Dump Area]) were selected to be representative of hydric soil conditions (**Figure 3-4**). From a topographic and physical features point-of-view, the physical parameters within the 8 DUs selected for Phase II are representative of all conditions at Iona Island and can be used to represent conditions across the island. Physical parameter results would therefore be used to conduct a sitewide evaluation of bioavailability, as well as to conduct an evaluation on a DU-by-DU basis.

DU grid corners were located in the field with a hand-held global positioning system unit and marked with high-visibility flagging and stakes prior to sampling. ISM surface soil samples at each approximately 1-acre (e.g., 200 x 200 ft) sized DU were collected in triplicate (initial ISM sample plus two additional samples) for the purpose of calculating the 95UCLs using statistical tests. Each ISM surface soil sample was comprised of 50 increments of equal volume to estimate the reasonable unbiased estimate of concentrations across each DU, which is consistent with Phase I soil sampling. Surface soil increments were collected at a depth of 0–6 in. bgs using plungers capable of collecting sediment equivalent to approximately 20 g in volume, to produce a single sediment sample equivalent to approximately 1 kg.

Upon collection, increments for each ISM sample were placed into 5-gal buckets with sample-dedicated bucket liners. Following collection of the desired number of increments, the increments were combined into the "incremental sample." Onsite ISM soil samples were screened for ORP in the field as detailed in Section 3.4.2 of this RI report. Soil geological characteristics including color, moisture, texture, grain size, sorting, lithology, etc. were recorded for each DU.

A total of 24 onsite surface soil samples (initial and replicates), were collected for offsite laboratory analysis of physical parameters as presented in the bulletized list below. Sample collection information is presented in **Table 3-2**. Samples for offsite laboratory analysis were placed in individual labeled Ziploc bags, each containing approximately 1 kg of soil. Additional volume was included for QA/QC samples (MSMSD). Sample handling and management and offsite laboratory analysis are further detailed in Section 3.5 of this RI report.

- TOC by Walkley-Black
- Grain size by ASTM D422 (sieve and hydrometer)

- CEC by EPA SW-846 Method 9081

3.3.2 Surface Water Sampling

Phase II onsite surface water sampling was conducted on 19-20 April 2022. Onsite areas targeted for investigation during Phase II included the source area at AOC #16 – Area D (Former Dump Area) and surface water migration pathway endpoints (Hudson River shoreline adjacent to AOC #16 – Area D [Former Dump Area] and Iona Marsh at the outlets of the riprap filled drainage swale and tidal wetland swale) (**Figure 3-5**). Surface water sampling times were dependent on tidal fluctuations as follows:

- Source area (AOC #16 – Area D [Former Dump Area]): sampling during tidal inundation (rising or high tide) to capture potential metals leaching from soil to surface water

- Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area): sampling during high/receding tide to capture water flowing from AOC #16 – Area D (Former Dump Area) to the Hudson River

- Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale): sampling during receding tide to capture potential flow from AOC #16 – Area D (Former Dump Area) to the marsh.

Background surface water sampling was conducted at Con Hook upstream from Iona Island on 21 April 2022. A boat was required to access Con Hook; therefore, surface water sampling at Con Hook was conducted at low tide concurrent with background sediment sampling to limit the number of trips to and time spent at Con Hook.

Surface water samples were collected using discrete sampling methods. For discrete sampling, sample sizes of at least 20 are typically needed to compare mean site concentrations with mean background concentrations using hypothesis tests for centrality. Therefore, 20 discrete samples were collected from each onsite area targeted for investigation during Phase II (source area, Hudson River shoreline, and Iona Marsh shoreline) and for each background depositional environment (Hudson River and Con Hook Marsh shorelines) to ensure the sample sizes for discrete samples were adequate for normality tests (**Figure 3-5 and Figure 3-7**). Sample collection information is presented in **Table 3-2**. A total of 60 onsite and 40 background surface water samples were collected for offsite laboratory analysis as follows:

- 20 onsite samples within AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20)

- 20 onsite samples along the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (IHRS-SW-01 through IHRS-SW-20)

- 20 onsite samples along the Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale (10 samples at each outlet location) (RRDS-SW-01 to RRDS-SW-10 and TWS-SW-01 through TWS-SW-10).

- 20 background samples at Con Hook along the Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20)

- 20 background samples at Con Hook along the marsh shoreline (CHMS-SW-01 through CHMS-SW-20).

Surface water samples were collected within the middle of the surface water column at each sampling location. Surface water samples collected from within AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20) varied from 3-4 inches below the water surface to approximately 1 foot below the water surface. Onsite and background samples collected along the Hudson River shoreline (Iona Island Hudson River shoreline samples IHRS-SW-01 through IHRS-SW-20 and Con Hook Hudson River shoreline samples CHHRS-SW-01 through CHHRS-SW-20) were collected from a depth of approximately 3-4 inches below the water surface. Onsite and background samples collected along the marsh shorelines (Iona Marsh shoreline samples RRDS-SW-01 through RRDS-SW-10 and TWS-SW-01 through TWS-SW-10 and Con Hook marsh shoreline samples CHMS-SW-01 through CHMS-SW-20) were collected from a depth of approximately 3-4 inches below the water surface.

Surface water samples from each location were collected for analysis of dissolved metals and hardness using a peristaltic pump (2001 GeoTech Geopump) and dedicated sample tubing. Samples were collected into pre-preserved bottles provided by the analytical laboratory. Dissolved metals samples were filtered in the field using 0.45-micron filters. New filters and tubing were used at each sample location so as to avoid cross-contamination. Used filters and tubing were bagged and disposed of as general debris/trash. Surface water quality parameters were recorded at each surface water sampling location following sample collection using a submersible water quality meter as detailed in Section 3.4.3 of this RI report.

Surface water samples were submitted for offsite laboratory analysis of dissolved metals and hardness. Analytical methods are presented in the bulletized list below. Additional volume was included for QA/QC samples (MS/MSD), and field duplicates were collected at a rate of 5 percent (1 per 20 samples) (**Table 3-2**). Sample handling and management and offsite laboratory analysis are further detailed in Section 3.5 of this RI report.

- Dissolved (field filtered) TAL metals by EPA Methods 6010C/6020A

- Dissolved (field filtered) mercury by EPA Method 7470A

- Hardness by SM2340B.

3.3.3 ISM Sediment Sampling Tasks

Onsite Phase II ISM sediment sampling was conducted on 19 April 2022. Onsite areas targeted for investigation during Phase II included the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) and the outlets of the riprap filled drainage swale and tidal wetland swale (**Figure 3-6**). ISM sediment sampling was conducted at low tide when shoreline sediment was exposed.

Background Phase II ISM sediment sampling was conducted on 21 April 2022 (background sampling) during low tide conditions. Background sampling locations are presented on **Figure 3-7**.

3.3.3.1 Establishment of Sediment Decision Units

Three sediment DUs, each sized at approximately 0.5-acre, were established for conducting sediment sampling at Iona Island, as presented below (**Figure 3-6**). DUs were located at the ends of preferential flow pathways from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines. The approximately 0.5-acre size of these DUs was established as this represents the smallest area for which ecological receptors may be exposed. The muskrat, which represents herbivorous aquatic mammals in the ERA, has an approximately 0.5-acre foraging range.

- IHRS-DU-01 along the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) to evaluate whether metals have been transported to the Hudson River shoreline and accumulated in shoreline sediment

- RRDS-DU-01 along the Iona Marsh shoreline at outlet of the riprap filled drainage swale to evaluate whether metals from AOC #16 – Area D (Former Dump Area) have been transported via the swale to the marsh shoreline and accumulated in marsh sediment

- TWS-DU-01 along the Iona Marsh shoreline at outlet of the tidal wetland swale to evaluate whether metals from AOC #16 – Area D (Former Dump Area) have been transported via the swale to the marsh shoreline and accumulated in marsh sediment.

Two background DUs were established at Con Hook, with one DU on the Con Hook Hudson River shoreline (CHHRS) and one DU on the Con Hook marsh shoreline (CHMS) to evaluate background concentrations in sediment from each depositional environment. Each background DU consisted of eight non-contiguous sampling units (SUs) (CHHRS-SU-01 through CHHRS-SU-08 and CHMS-01 through CHMS-08) (**Figure 3-7**). Due to spatial constraints along the shoreline at Con Hook, each SU was sized at 0.15 acres (162 x 40.5 ft along the CHHRS and 81 ft x 81 ft along the CHMS).

3.3.3.2 ISM Sediment Sampling Methods

ISM samples at each onsite sediment DU were collected in triplicate (initial ISM sample plus two additional samples) for the purpose of calculating 95UCLs for each DU using statistical tests. Single incremental samples were collected from each of the SUs, to provide a background dataset of 8 ISM samples for each sediment DU (8 from CHHRS and 8 from CHMS).

Sediment increments were collected at each onsite DU and each background SU using the simple random sampling approach (ITRC 2020). Each onsite and background ISM sediment sample consisted of 50 increments of equal volume of sediment to allow for sufficient estimation of the reasonable unbiased estimate of concentrations across each onsite DU and each background SU. Increments for each sediment ISM sample were collected at a depth of 0–6 in. bgs, which is representative of the biological active zone.

Increments of equal volume were collected using a dedicated incremental sampling tool with plungers collecting soil equivalent to approximately 33.3 g in volume, which provided a total weight of 1 kg of sediment. Triplicate incremental samples collected within each onsite DU were comprised of sediment increments taken from different, randomly selected locations. Increments for each individual sample were placed into 5-gal buckets with sample-dedicated bucket liners. Following collection of the desired number of increments, the increments were combined into an "incremental sample."

Onsite and background ISM sediment samples were screened for pH and ORP in the field as detailed in Sections 3.4.1 and 3.4.2 of this RI report. Sediment geological characteristics including color, moisture, texture, grain size, sorting, lithology, etc. were recorded for each sediment DU.

A total of 9 onsite ISM sediment samples (initial and replicates) and 16 background ISM sediment samples (8 from CHHRS and 8 from CHMS) were collected for offsite laboratory analysis of metals and physical parameters. Analytical methods are presented in the bulletized list below. Sample collection information is presented in **Table 3-2**. Samples for offsite laboratory analysis were placed in individual labeled Ziploc bags, each containing approximately 1 kg of soil. Additional volume was included for QA/QC samples (MS/MSD). Sample handling and management and offsite laboratory analysis are detailed in Section 3.5 of this RI report.

- TAL metals by EPA Methods 6010C/6020A
- Mercury by EPA Method 71471B
- TOC by Walkley-Black
- Grain size by ASTM D422 (sieve and hydrometer).

3.3.4 Discrete Sediment AVS/SEM Sampling Tasks

The AVS/SEM analytical method is predicated on maintaining anoxic conditions required to sustain metal sulfide concentrations. Exposure of sediment samples to oxygen during sample collection and analysis can result in false positive assertions of metal bioavailability. Samples must be placed in sample jars with zero headspace immediately upon collection. Therefore, sediment samples could not be collected using ISM, which would expose sediment to oxygen during collection.

Discrete sediment AVS/SEM sampling was conducted on 19 April 2022 at low tide when sediment was exposed. Three discrete sediment samples were collected from each onsite sediment DU established for ISM sediment sampling (**Figure 3-6**). Each discrete sediment sample was collected from 0-6 in. bgs using disposable scoops and immediately placed into individual laboratory supplied sample containers. New disposable scoops were used at each sample location to avoid cross-contamination. Used scoops were bagged and disposed of as general debris/trash.

A total of 9 onsite discrete sediment samples were collected for offsite laboratory analysis of AVS/SEM by SM 4500-S2D and EPA Method 6010D. Additional volume was included for QA/QC samples (MS/MSD), and field duplicates were collected at a rate of 5 percent (1 per 20 samples). Sample collection information is presented in **Table 3-2**. Sample handling and management and offsite laboratory analysis are detailed in Section 3.5 of this RI report.

3.4 FIELD SCREENING

The following subsections detail field screening methods for soil pH and ORP, sediment pH and ORP, and surface water quality parameters (pH, temperature, specific conductance, DO, ORP, turbidity, and salinity). Calibration forms for the pH, ORP, and water quality meters are provided in **Appendix A**. Phase I pH results pH results were recorded by hand in the field book. Phase II onsite soil ORP results, onsite and background sediment pH and ORP results, and background water quality parameters were recorded electronically and uploaded directly into a sample collection tracker (excel file). Copies of the field book and electronic sample collection tracker are provided in **Appendix A**.

3.4.1 Soil and Sediment pH

pH for each Phase I ISM surface and subsurface soil sample and each Phase II ISM sediment sample was determined in the field due to time restraints regarding sample holding times. pH was measured using a pH (Oakton pH 50) meter in accordance with EPA Method 9045D “Soil and Waste pH”. The pH meter was calibrated in accordance with the manufacturer’s guidance prior to field screening. To measure soil pH, approximately 20 grams of well composited sample was mixed with 20 milliliters (mL) of deionized water and thoroughly homogenized. The suspension was allowed to rest to allow most of the suspended clay to settle out from the suspension. The pH meter was then used to measure the pH of soil.

3.4.2 Soil and Sediment ORP

ORP for each Phase II ISM soil and sediment sample was determined in the field due to time restraints regarding holding times. ORP was measured with an ORP meter (Milwaukee MW500 PRO ORP Meter) equipped with a double junction ORP electrode probe with a platinum sensor. The ORP meter was calibrated in accordance with the manufacturer's guidance prior to field screening. To measure field ORP, approximately 20 grams of well composited sample was mixed with 20 mL of deionized water and thoroughly homogenized. The suspension was allowed to rest to allow most of the suspended clay to settle out from the suspension. The ORP probe was then used to measure the field ORP. Standard hydrogen electrode corrected values were calculated based on the field ORP values and ORP meter electrode/filling solution (silver/silver chloride with 3.5 molar potassium chloride gel electrolyte).

3.4.3 Surface Water Quality Parameters

Surface water quality parameters were recorded in the field following using a submersible water quality meter (2016 YSI ProDSS) capable of measuring pH, temperature, specific conductance, DO, ORP, turbidity, and salinity. The water quality meter was calibrated daily prior to sampling activities in accordance with the manufacturer's guidance prior. The water quality meter probe was submerged and water quality parameters were allowed to stabilize before parameters were recorded.

3.5 SAMPLE HANDLING AND MANAGEMENT

Each sample collected for offsite laboratory analysis was assigned a unique alpha-numeric code to assist in the tracking of samples and to facilitate retrieval of analytical results. Sample bags/containers were labeled with weatherproof sample labels and waterproof ink containing the following information:

- Sample identification
- Sampling date and time
- Name of sampler
- Analysis requested
- Preservation technique.

Samples collected for offsite laboratory analysis were packaged and shipped in a manner that ensured the safety and accountability of each sample, and the procedures implemented were in accordance with applicable federal and local requirements. Samples were placed in clean, bubble wrap lined coolers. Double-bagged ice was packed around the samples, and a temperature blank was included with samples as required to document laboratory receipt temperature. A completed

chain-of-custody form was placed in a sealed plastic bag and taped to the inside lid of one of the coolers for each shipment. Coolers were sealed with tape and a custody seal was attached to protect the integrity of the samples. Environmental samples were then shipped to the analytical laboratories via overnight delivery service. Chain of custody forms are included in laboratory analytical reports presented in **Appendix B**. **Table 3-1** includes the laboratory report identifier for each sample collected during Phase I. Table 3-2 includes the laboratory report identifier for each sample collected during Phase II.

3.6 OFFSITE LABORATORY ANALYSIS

Upon receipt of analytical samples, the laboratories logged the samples into their laboratory information management systems and sent the work orders to EA for review and correction of any issues, if there were any (e.g., typos in sample names). Laboratory data were generated in accordance with the UFP-QAPP (EA 2020a) and UFP-QAPP Addendum (EA 2022b). Separate laboratory analytical reports were provided for each sample delivery group. Laboratory reports are included in **Appendix B**.

3.6.1 Phase I Analytical Samples

Phase I laboratory analytical services for ISM soil sample processing; analysis of ISM soil samples for TAL metals by EPA Methods 6010C/6020A, mercury by EPA Method 7471B, PAHs by EPA Method 8270D SIM, PCBs by EPA Method 8082A, explosives residues by Method 8330B, and BTEX by EPA Method 8260B; and analysis of discrete sediment samples for TOC by Walkley-Black and grain size by ASTM D422 were provided by laboratories holding DoD ELAP accreditation for specific matrix and analysis as follows:

- Eurofins TestAmerica in St. Louis, Missouri: processing of ISM soil metals (including mercury), Aroclor PCBs, and explosives residue samples via air drying and grinding
- Eurofins Test America in Denver, CO: analysis of ISM soil metals (including mercury), Aroclor PCBs, and explosives residue samples
- Eurofins TestAmerica, Denver, CO: processing and analysis of ISM soil BTEX samples
- Katahdin Analytical Services, LLC, Scarborough, ME: analysis of discrete sediment TOC and grain size samples.

ISM soil samples collected for analysis of PAHs, TAL metals, PCBs, and explosives samples were shipped to TestAmerica St Louis for processing. Samples were first air dried and disaggregated and then a slabcake was created and subsampled to create subsamples for different grinding methods, consistent with ISM methodology, as described in the laboratory SOP for subsampling. A subsample for analysis of TAL metals, PAH, and PCBs samples was ground using a rolling ball mill with steel paint cans and ceramic cylinders (90 percent burundum) as grinding media. A subsample for analysis of explosives was ground using a puck mill. Milling

durations were consistent between samples and consistent with ITRC guidance (ITRC 2020). The ground subsamples were formed into slabcakes and subsampled again to create aliquots for specific analyses. Following completion of sample processing, PAHs, TAL metals, PCBs, and explosives samples were shipped to Eurofins TestAmerica Denver, CO for analysis by EPA Method 8270D, EPA Method 6010C/6020A, EPA Method 7471B, EPA Method 8082A, and Method 8330B.

ISM soil samples collected for analysis of BTEX were shipped directly to Eurofins TestAmerica Denver for processing and analysis by EPA Method 8260B. These samples were not air dried or ground.

Discrete sediment samples collected for analysis of TOC and grain size were shipped directly to Katahdin Analytical Services, LLC for analysis by Walkley-Black and ASTM D422 (sieve and hydrometer).

Phase I samples were logged as part of 10 sample delivery groups. Field QC samples for Phase I included ISM triplicate soil samples, one methanol field blank collected with BTEX samples, and one VOC trip blank shipped with BTEX samples. Extra volume for site-specific MS/MSDs was submitted and analyzed, and the laboratories analyzed QC samples consistent with the requirements of the UFP-QAPP (EA 2020a).

3.6.2 Phase II Analytical Samples

Phase II laboratory analytical services for analysis of TAL metals by EPA Methods 6010C/6020A, mercury by EPA Method 7470/7471B, AVS/SEM by SM 4500-S2D and EPA Method 6010D, TOC by Walkley-Black, and grain size by ASTM D422 were provided by laboratories holding DoD ELAP accreditation for specific matrix and analysis. Laboratory analytical services for ISM processing via ball milling, CEC by EPA SW-846 Method 9081, and hardness by Method 2340B were performed by laboratories approved by the USACE chemist as presented in the UFP QAPP Addendum (EA 2022b).

- Eurofins TestAmerica in Canton, OH: processing of ISM physical parameters (TOC, grain size, and CEC) samples; and processing of ISM sediment metals (including mercury) and physical parameter (TOC and grain size) samples

- Eurofins TestAmerica, Denver, CO: analysis of ISM sediment metals (including mercury) samples discrete surface water dissolved metals (including mercury) and hardness samples

- Eurofins TestAmerica, Corpus Christi, TX: analysis of ISM soil CEC samples

- Eurofins Lancaster Laboratories, Inc., PA: analysis of discrete sediment AVS/SEM samples

- Katahdin Analytical Services, LLC, Scarborough, ME: analysis of ISM soil and sediment TOC and grain size samples.

ISM soil samples collected for analysis of TOC, grain size, and CEC were shipped to Eurofins TestAmerica Canton for processing. Each ISM soil sample was air dried, disaggregated, formed into a slabcake, and sub-sampled in accordance with ISM methodology to create aliquots for analysis of TOC, grain size, and CEC. Aliquots for TOC analysis were ground using a rolling ball mill with steel paint cans and ceramic cylinders (90% burundum) as grinding media and sieved per the analytical method. Milling durations were consistent between samples and consistent with ITRC guidance (ITRC 2020). Aliquots for grain size and CEC were not ground/milled, as grinding would change sample grain size and adsorption capacity. Following completion of sample processing, grain size and TOC aliquots generated from sample preparation were shipped to Katahdin Analytical Services, LLC, Scarborough, ME for analysis by Walkley-Black and ASTM D422 (sieve and hydrometer). CEC aliquots were shipped to Eurofins TestAmerica, Corpus Christi, TX for analysis by EPA SW-846 Method 9081.

Discrete surface water samples collected for analysis of dissolved metals (including mercury) and hardness samples were shipped directly to Eurofins TestAmerica Denver for analysis by EPA Methods 6010C/6020A EPA Method 7470A, and SM2340.

ISM sediment samples collected for analysis of metals (including mercury), TOC, and grain size, were shipped to Eurofins TestAmerica Canton for processing. Each ISM soil sample was air dried, disaggregated, formed into a slabcake, and subsampled for a grain size aliquot. The remainder of the sample was sieved and ground using a rolling ball mill with steel paint cans and ceramic cylinders (90% burundum) as grinding media. Milling durations were consistent between samples and consistent with ITRC guidance (ITRC 2020). The ground sample was then formed into a slabcake and subsampled to create aliquots for metals/mercury and TOC analysis. Following completion of sample processing, aliquots for metals (including mercury) analysis were shipped to Eurofins TestAmerica Denver for analysis by EPA Methods 6010C/6020A and EPA Method 71471B. Grain size and TOC aliquots generated from sample preparation were shipped to Katahdin Analytical Services, LLC, Scarborough, ME for analysis by Walkley-Black and ASTM D422 (sieve and hydrometer).

Discrete sediment samples collected for analysis of AVS/SEM were shipped directly to Eurofins Lancaster Laboratories, Inc., PA for analysis by SM 4500-S2D and EPA Method 6010D.

Phase II samples were logged as part of 20 sample delivery groups. Field QC samples for Phase II included ISM triplicate soil and sediment samples and field duplicates for discrete samples collected at a rate of 1 per 20 samples for each media. Extra volume for site-specific MS/MSDs was submitted and analyzed, and the laboratories analyzed QC samples consistent with the requirements of the UFP-QAPP (EA 2020a).

3.7 ANALYTICAL DATA MANAGEMENT AND VALIDATION

Analytical data were managed in the FUDS Online Chemical Database (FUDSChem) per the requirements specified in the New England District Data Management Plan to ensure data deliverables follow Performance Work Statement data requirements (USACE New England District, 2016). Prior to each phase of field sampling, an eQAPP within FUDSChem was created; the eQAPPs were fully compliant with the project UFP-QAPP (EA 2020a) and UFP-QAPP Addendum (EA 2022b), incorporating methods, sample types, and quality specifications (limit of detection [LOD], limit of quantitation [LOQ], holding time, QC sample acceptance limits, etc.). The pre-population of sampling event information was performed prior to initiation of each phase of field activities to ensure accurate database field matching and status tracking within FUDSChem. Data uploaded to FUDSChem prior to initiation of each phase of field activities included spatial information pertaining to DUs (northing, easting, elevation of the center of each DU, and keyhole markup language files for each DU), discrete sample location information, sample identification information, sample type, matrix, methods, etc. Following completion of sampling, chain-of-custody documents (ChemFields) were entered within FUDSChem using pre-populated data and information contained in the eQAPPs.

Data reporting requirements included QA/QC reviews of the data by the laboratory prior to data upload into the FUDSChem database. When the laboratories loaded the staged electronic data deliverables (SEDD) files into FUDSChem, they were automatically checked against the sample chains-of-custody to ensure that the correct sample designations and analyses were included. If any non-conformances were found, the SEDD was corrected and re-checked before it was accepted into the FUDSChem database.

Grain size data were not uploaded via SEDD, but instead were included in the PDF laboratory reports uploaded to the FUDSChem library. These data did not undergo the validation procedures described below but were evaluated separately for usability in accordance with the UFP-QAPP (EA 2020a) and UFP-QAPP Addendum (EA 2022b) for non-chemical data. Field screening data were also evaluated for usability. Field equipment calibration information was checked for accuracy, results of field screening data were reviewed for reviewed for anomalous results, and QC checks of results tables were performed before upload to FUDSChem.

Stage 2B Validation Electronic and Manual (S2BVEM) was completed using the FUDSChem software as discussed below. Validation was performed in accordance with the DoD Quality Systems Manual (QSM) Version 5.3 (DoD and DOE 2019) and DoD General Data Validation Guidelines (DoD 2019) with associated modules where available at the time of validation.

Once a SEDD was successfully uploaded and certified by the analytical laboratories in FUDSChem, an Automated Data Review process was automatically initiated. The ADR performed a Stage 2A data validation by comparing the SEDD to the approved eQAPP, summarizing QC outliers in an ADR Report, and applying data validation qualifiers to associated results. The EA Project Chemist and Data Manager then performed a Stage 2B data validation, which included reviewing the Stage 2A validation report against the PDF laboratory report, verifying/modifying qualifiers applied during the Stage 2A review, and manually reviewing QC

elements that were not included in the Stage 2A review. Stage 2A validation evaluates sample specific information and Stage 2B evaluates instrument performance as described in the DoD General Data Validation Guidelines (DoD 2019).

Data validation reports were prepared to summarize the data validation findings. The data validation reports were uploaded to the FUDSChem library for USACE chemist-approval. Approved data validation reports are presented in **Appendix C**. Section 4 of this RI report summarizes the findings of the data validation. DUA Reports in **Appendix D** present an assessment of data quality in terms of precision, accuracy, representativeness, completeness, comparability, and sensitivity.

3.8 RISK ASSESSMENTS

The purpose of the RI is to characterize the site by analyzing site data; assess contaminant nature and extent; evaluate potential risks to human health and the environment; and, in light of those risks, identify and screen alternatives for long-term remedial actions. One of CERCLA's primary mandates for remedial action is to attain cleanup that provides protection of human health and the environment. Risk assessments are used as tools to evaluate potential human health or ecological risks posed by exposure to COPCs and contaminants of potential ecological concern (COPECs). Both an HHRA and ERA were prepared using data collected during this HTRW RI (**Section 8**). The HHRA was prepared using data collected during this RI to evaluate the potential for adverse effects to human health from exposure to site-related COPCs detected in media affected by past site use (**Section 8.3**). The ERA was prepared to evaluate the potential for adverse effects to ecological receptors exposed to site-related COPECs (**Section 8.4**).

CERCLA identifies a detailed process for assessing risk that includes the use of a human health risk range of 10^{-4} to 10^{-6} as acceptable exposure levels for carcinogenic risks and a hazard index (HI) of 1 for non-carcinogenic risks. A HQ of 1 is used as a prediction of potential ecological risks.

3.9 DEVIATIONS FROM THE UFP-QAPP

The following presents deviations from the UFP-QAPP (EA 2020a) and UFP QAPP Addendum (EA 2022b) that relate to the collection of validated data:

- Soil at DU-8 was not sampled during Phase I due to the presence of debris that was not related to historical DoD operations, including numerous rusted and deteriorating 55-gal drums, deteriorating pallets, piles of roofing shingles, and chain-link fencing.

- DU-24 was not sampled during Phase I as the majority of the area consists of exposed bedrock with little to no soil cover.

- Subsurface soil was not collected at the following DUs during Phase I, due to refusal at less than 12 in. bgs: DU-01, DU-02, DU-03, DU-04, DU-05, DU-06, DU-07, DU-09,

DU-10, DU-11, DU-12, DU-13, DU-14, DU-515, DU-16, DU-22, DU-23, and DU-25 (see Section 3.1.2.2 of this RI report for more detail). This change did not impact data quality or usability.

- Subsurface soil was not collected during Phase I at BADU-1 through BADU-8 as the depth to refusal was less than 12 in. bgs. Surface soil was used as a surrogate to subsurface soil for background comparison purposes. This change did not impact data quality or usability.

- During Phase I, the ISM soil preparation was sent to Eurofins TestAmerica in St. Louis, Missouri, instead of Eurofins TestAmerica in Denver, Colorado. The change occurred because Eurofins TestAmerica's ISM preparation laboratory in Denver, Colorado, was over capacity at the time of sample collection. This change did not impact data quality or usability.

- One Phase II triplicate sample collected from DU-11 (IINY-DU-11C) was screened in the field for pH and ORP. However, the sample was misplaced and was not shipped to the analytical laboratory for analysis of TOC, CEC, and grain size. Laboratory analytical results are not available for this triplicate sample. Results from the two other samples collected from DU-11 (IINY-DU-11A and IINY-DU-11B) were used to evaluate bioavailability of metals in soil at DU-11. This change did not impact data quality or usability.

This page intentionally left blank

4. DATA VALIDATION

This section presents the results of the Phase I and Phase II data quality assessment. Sample collection information for Phase I is presented in **Table 3-1**. Sample collection information for Phase II is presented in **Table 3-2**. Field screening and offsite laboratory analytical data collected during this RI included the following:

- Phase I ISM soil pH field screening data
  - 90 onsite ISM surface soil samples (initial and replicate) collected from 30 DUs (DU-1 through DU-7, DU-9 through DU-23, DU-25, EXDU-1 through EXDU-7)
  - 15 onsite ISM subsurface soil samples (initial and replicate) collected from 5 DUs (DU-17 through DU-22)
  - 8 background ISM surface soil samples (initial samples only) collected from background DUs in Bear Mountain State Park (BADU-1 through BADU-8) (initial samples only)
- Phase I ISM soil analytical data for TAL metals by EPA Method 6010C/6020A and mercury by EPA Method 7471B
  - 54 onsite ISM surface soil samples (initial and replicate) from 18 DUs (DU-1 through DU-7 and DU-9 through DU-19)
  - 9 onsite ISM subsurface soil samples (initial and replicate) from 3 DUs (DU-17 through DU-19)
  - 8 background ISM surface soil samples (initial samples only) from background DUs in Bear Mountain State Park (BADU-1 through BADU-8)
- Phase I ISM soil analytical data for PAHs by 8270D SIM
  - 48 onsite ISM surface soil samples (initial and replicate) from 16 DUs (DU-1 through DU-5, DU-9, DU-11 through DU-13, DU-16 through DU-19, DU-20 through DU-22)
  - 15 onsite ISM subsurface soil samples (initial and replicate) from 5 DUs (DU-17 through DU-22)
  - 8 background ISM surface soil samples (initial samples only) from background DUs in Bear Mountain State Park (BADU-1 through BADU-8)
- Phase I ISM soil analytical data for PCBs by EPA Method 8082A

— 15 ISM surface soil samples (initial and replicate) from 5 DUs (DU-17 through DU-19, DU-23, and DU-25)

— 9 ISM subsurface soil samples (initial and replicate) from 3 DUs (DU-17 through DU-19)

- Phase I ISM soil analytical data for explosives residues by Method 8330B

  — 30 ISM surface soil samples (initial and replicate) from 10 DUs (DU-17 through DU-19 and EXDU-1 through EXDU-7)

  — 9 onsite ISM subsurface soil samples (initial and replicate) from 3 DUs (DU-17 through DU-19)

- Phase I ISM soil analytical data for BTEX by Method 8260B

  — 6 onsite ISM subsurface soil samples (initial and replicate) from 2 DUs (DU-21 and DU-22)

- Phase II ISM soil field screening data for ORP and analytical data for TOC by Walkley-Black, grain size by ASTM D422 (sieve and hydrometer), and CEC by EPA SW-846 Method 9081

  — 24 onsite samples (initial and replicate) from 8 DUs (DU-4, DU-7, DU-9, DU-11, DU-13, DU-17, DU-18, and DU-19)

- Phase II discrete surface water sample analytical data for dissolved TAL metals by EPA Methods 6010C/6020A, dissolved mercury by EPA Method 7470A, and hardness by (SM2340B and water quality parameter field screening data (including pH, temperature, specific conductance, DO, ORP, turbidity, and salinity)

  — 20 onsite samples from AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20)

  — 20 onsite samples from the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (IHRS-SW-01 through IHRS-SW-20)

  — 10 onsite samples from Iona Marsh at the outlet of the riprap filled drainage swale (RRDS-SW-01 through RRDS-SW-10)

  — 10 onsite samples from Iona Marsh at the outlet of the tidal wetland swale (TWS-SW-01 through TWS-SW-10)

  - 20 background samples along the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20)

  - 20 background samples along the Con Hook Marsh shoreline (CHHRS-SW-01 through CHHRS-SW-20)

- Phase I discrete sediment analytical data for TOC by Walkley-Black and grain size by ASTM D422 (sieve and hydrometer)

  - 7 onsite samples (SD-01 through SD-07)

- Phase II ISM sediment field screening data for pH and ORP and laboratory analytical data for TAL metals by EPA Method 6010C/6020A, mercury by EPA Method 7471B, TOC by Walkley-Black, and grain size by ASTM D422 (sieve and hydrometer)

  - 9 onsite ISM samples (initial and replicate) from 3 onsite DUs (IHRS-SED-01, RRDS-SED-01, and TWS-SED-010)

  - 8 background ISM samples (initial samples only) from the Con Hook Hudson River shoreline (CHHRS-SU-01 through CHHRS-SU-08)

  - 8 background samples collected from the Con Hook marsh shoreline (CHMS-SU-01 through CHMS-SU-08)

- Phase II discrete sediment laboratory analytical data for AVS/SEM by SM 4500-S2D and EPA Method 6010D

  - 9 sample locations from 3 onsite DUs (IHRS-SED-01, RRDS-SED-01, and TWS-SED-010).

Laboratory analytical reports for Phase I soil and sediment samples and Phase II surface water, and sediment samples are presented in **Appendix B**. Analytical data packages were validated as described in Section 3.7 of this RI report, to confirm that the required laboratory components were included, QA/QC requirements were performed, and DQOs were met. Data validation reports are presented in **Appendix C**. DUA reports for Phase I and Phase II are presented in **Appendix D**. Note that both a DUA report and a FUDSChem DUA were included for Phase II. A FUDSChem DUA was not included for Phase I as the requirement was instituted after Phase I was completed.

4.1 ANALYTICAL RESULTS DATA QUALIFIERS

The analytical data were qualified and appropriately flagged during data validation. The qualifications were made by assessing the results submitted by the laboratory in terms of the technical requirements of the analytical methods (including QA/QC criteria) and data validation

requirements. Qualifiers that were applied during data validation are discussed in detail in each data validation report. The DUA focused on results that were qualified due to QC issues. The following qualifiers were applied to the reported data:

- No qualifier: The analyte was positively identified at the specified numerical value exceeding the LOQ, and no data quality issues necessitating validation were identified
- U: The analyte was not detected at a level greater than or equal to the associated numerical value (LOD or LOQ)
- J: The analyte was positively identified, and the associated numerical value is the approximate concentration of the analyte in the sample
- UJ: The analyte was not detected; however, the associated numerical value (LOD or LOQ) is approximate and may be inaccurate or imprecise
- "-": Result may be biased low. May be applied to J or UJ qualified data
- "+": Result may be biased high. May be applied to J or UJ qualified data
- R: The data are unusable. The sample results are rejected due to serious deficiencies in meeting the QC criteria. The analyte may or may not be present in the sample.

U-qualified data were reported to either the LOQ or the LOD. The laboratory LOD is defined as the lowest concentration for reliable reporting of a non-detect of a specific analyte in a specific matrix with a specific method at 99 percent confidence (DoD 2017). The smallest concentration that produces a quantitative result with known and recorded precision and bias is known as the LOQ. Method detection limits (MDLs) (e.g., the smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration with 99 percent confidence, as provided for each analyte by the laboratory) are reported along with the LODs and LOQs in the laboratory analytical reports. Non-detect (U-qualified) data are typically reported to the LOD. Results that are reported to the LOQ are due to blank contamination, or due to the LOD and LOQ having the same value (e.g., for a few explosives residues). Note that under the QSM, it is acceptable that the LOD and LOQ are equal in some cases, because the definitions of these two limits yield potential overlap. Results were reported to the LOQ instead of the LOD due to blank contamination and are in accordance with the National Functional Guidelines as indicated on worksheet #36 of the UFP-QAPP (EA 2020a) and UFP-QAPP Addendum (EA 2022b). National Functional Guidelines guidance indicates to qualify results less than the LOQ to the LOQ and qualify them as "U".

Analytical results reported at estimated concentrations between the DL and LOQ were qualified as estimated (J) with a qualifier reason code of TR (trace). Various data were also qualified as estimated (J or UJ) during data validation due to minor QC issues that affect the precision and/or accuracy of the data, as follows:

- Precision
  - MS/MSD relative percent difference (RPD) outside control limits (qualifier reason code = D)
  - Laboratory replicate RPDs outside control limits (qualifier reason code = D1)
  - Field duplicate (FD) RPDs outside control limits (qualifier reason code = D3)
  - Dual column RPDs outside QC limits (qualifier reason code = P1).
- Accuracy/Bias
  - Serial dilutions outside QC limits (qualifier reason code = A)
  - Sample preservation/collection requirement not met (qualifier reason code = P)
  - Improper preparation/extraction (qualifier reason code = P2)
  - Percent recovery (%R) outside QC limits in LCSs (qualifier reason code = C)
  - %R outside QC limits in MS/MSDs (qualifier reason code = M)
  - %R outside QC limits in the post digestion spike (qualifier reason code = M2)
  - Surrogate %R outside QC limits (qualifier reason code = I)
  - Continuing calibration verification percent difference (%D) outside QC limits (qualifier reason code = V2)
  - Detections in the laboratory blank (blank contamination) (qualifier reason code = L)
  - Exceedance of test hold time (qualifier reason code = H1)
  - PAH Extraction outside of the maximum hold time (qualifier reason code = H2).

Analytical data that were qualified during data validation were considered during the interpretation of the data for the HHRA and SLERA/RSLERA, and potential impacts of the estimated values are addressed in the data uncertainty sections within the HHRA (**Appendix G**) and SLERA/RSLERA (**Appendix H**).

4.2 PHASE I ANALYTICAL RESULTS DATA QUALITY REVIEW

Data quality indicators of precision, accuracy/bias, representativeness, completeness, comparability, and sensitivity (PARCCS) were used to validate and assess project data. The DUA in **Appendix D** covers each of the PARCCS parameters in detail. Of the 3,848 Phase I results that were reported, 1,058 were qualified during validation as presented in the following insert.

Insert 4-1. Summary of Phase I Results Qualified During Validation

Analyte Group	Total Results	Rejected Results	Qualified Results	J Qualified Detected Results	Qualified Results Greater than LOQ	Bias of Qualified Results		
						Low Bias	High Bias	Unknown Bias
Metals	1,624	0	100	83	73	28	32	40
PAHs	1,278	1	660	652	544	632	14	14
Explosives	663	0	232	5	3	186	0	46
PCBs	240	0	67	17	5	7	0	60
BTEX	36	0	0	0	0	N/A	N/A	N/A
TOC	7	0	0	0	0	N/A	N/A	N/A

Overall, 27.5 percent of the Phase I dataset was qualified due to data quality issues and is considered usable. The PAH data were more heavily impacted during data validation than data for other analytes due to holding times associated with ISM preparation and surrogate recovery. One result (dibenz[a,h]anthracene at BADU-4) was qualified as R (rejected) due to a major QC issue affecting accuracy (0 percent recovery in the surrogate, qualifier reason code = I) and is not considered usable. The number of J qualified data in this dataset is relatively high due to the nature of the soil samples, which resulted in analytical interferences as well as ISM sample processing challenges. Reasons for qualification are discussed in detail in **Appendix D**. However, based on evaluation against the project DQOs specified in the UFP-QAPP (EA 2020a), the Phase I data, as qualified, with the exception of one rejected result for dibenz(a,h)anthracene at BADU-4, are usable for the intended purposes of the RI, including use in HHRA and SLERA/RSLERA. The sensitivity objectives set forth in the project UFP-QAPP were met (EA 2020a). Some metals and explosives were reported with LODs and/or LOQs greater than the project action limits, consistent with the UFP-QAPP (EA 2020a).

The single rejected result for dibenz(a,h)anthracene in the background dataset was R qualified (rejected) due to a major QC issue. Only the 7 usable background results for dibenz(a,h)anthracene were used to calculate a background 95UCL for dibenz(a,h)anthracene. The number of 7 usable background samples is larger than the minimum number of 3 samples recommended by ITRC to conduct a two-sample hypothesis test comparing the onsite mean to the background mean. The estimated minimum significant difference (i.e., gray region) of the hypothesis test is 0.4 standard deviations of the between increment error at the 95% confidence level with power of 90%. In addition, the rejected dibenz(a,h)anthracene result was not used in the background evaluation or in risk assessments. The potential impacts of data qualified as estimated values and of cases where the LODs and LOQs exceeded screening values are addressed in uncertainty discussions in the HHRA and ERA.

4.3 PHASE II ANALYTICALRESULTS DATA QUALITY REVIEW

Data quality indicators of precision, accuracy/bias, representativeness, completeness, comparability, and sensitivity (PARCCS) were used to validate and assess project data. The DUA in **Appendix D** covers each of the PARCCS parameters in detail. Of the 3,126 results that were reported, 200 were qualified as estimated (J or UJ) or non-detect (U) during validation due to QC issues as presented in the following insert. Of the results not qualified during validation, 2,315 results were reported with no data quality concerns, of which 1,169 results were non-detects and 1,146 results were detections. The remaining 611 results were qualified as estimated (J-qualified) due to trace concentrations reported between the MDL and LOQ.

Insert 4-2. Summary of Results Qualified During Validation

Method/Analyte Group	Total Results	Rejected Results	Qualified Results	J - Qualified Detected Results	Qualified Results Greater than LOQ	Bias of Qualified Results		
						Low Bias	High Bias	Unknown Bias
SM2340B/Water Hardness	105	0	1	1	1	0	0	1
AVS	10	0	10	0	0	0	0	10
SW6010C/Metals	680	0	85	5	12	0	7	78
SW6010D/SEM	50	0	11	11	10	4	0	7
SW6020A/Metals	2,080	0	53	32	27	16	4	33
SW7470A/SW7471B/ Mercury	130	0	0	0	0	0	0	0
SW9081/CEC	23	0	23	23	23	0	0	23
WBLACK/TOC	48	0	17	17	17	0	1	16

Overall, 6.4 percent of the dataset was qualified due to data quality issues and is considered usable. The metals data by SW6010C were more heavily impacted during data validation than data for other analytes. Iron was the most impacted metal due to laboratory blank contamination. Overall, the percentage of data qualified was substantially less for Phase II than for the Phase I dataset (6.4 percent versus 27.5 percent). Reasons for data qualification included sample preparation and handling issues encountered during analyses by multiple laboratories, matrix interferences, and detections of metals in laboratory blanks associated with surface water samples. The sensitivity objectives set forth in the project UFP-QAPP Addendum were met (EA 2022b). Some metals were reported with LOQs greater than the project action limits, consistent with the UFP-QAPP Addendum (EA 2022b).

Initial CEC analytical results for Phase II soil reported by the analytical laboratory (Eurofins TestAmerica, Corpus Christi, TX) ranged from 1,500 to 1,800 milliequivalents per 100 grams of soil (meq/100g). Typical values should be 0 to 100 meq/100g. These results were deemed abnormally high by several orders of magnitude by the EA ecological risk assessor. The analytical laboratory was informed of the issue with analytical results, which made the initial data unusable. The analytical laboratory conducted an internal audit and identified a discrepancy stemming from incorrect labeling for reagents used during the preparation of the samples. A corrective action was implemented, CEC samples were re-analyzed, and results were presented

in a revised laboratory report. CEC Results were qualified as estimated due to issues with sample handling and due to due to lab replicate RPDs outside QC limits. The results from the reanalysis were determined to be usable with J qualification. Despite the data qualifications and uncertainties, CEC results from the re-analysis were typical of the range of CEC observed in New York Soil (Cornell University 2007). In addition, CEC results were not used in any quantitative calculations. In the ERA, the CEC results were incorporated into a qualitative discussion about the site-specific bioavailability of metals.

No results were rejected during data validation. Based on valuation against the project DQOs specified in the UFP-QAPP Addendum (EA 2022b), the Phase II data are considered usable as qualified for the intended purposes of the RI, including use in HHRA and SLERA/RSLERA. The potential impacts of data qualification and of cases where the LODs and LOQs exceeded screening values are addressed in uncertainty discussions in the HHRA and ERA.

4.4 FIELD SCREENING DATA QUALITY REVIEW

Field calibration forms and field logs were reviewed and verified. Field calibration checks, including end-of-day checks, met criteria and indicated that instrument calibration was stable. There are no data quality issues based on field calibration records.

Field screening results (pH, ORP, and surface water quality parameters) were reviewed and verified to ensure correct reporting of information and completeness. No errors were noted, although two ORP measurements (one for soil and one for sediment) were noted to be anomalous relative to other results from the same DU. All data were determined to be usable for the intended purposes. Details are provided in **Appendix D2**.

5. SITE PHYSICAL CHARACTERISTICS AND PHYSICAL PARAMETER RESULTS DISCUSSION

This Section presents site physical characteristics as observed during implementation of Phase I and Phase II field activities, and physical parameter field screening and analytical results for onsite and background media as presented in the bulletized text below. Onsite physical characteristics and physical parameter field screening and analytical results supplement the physical setting information presented in Section 1.6 of this RI Report.

- Results of the Phase I shoreline reconnaissance
- Observations recorded during Phase I and Phase II sampling activities (for example, soil depth and soil and sediment physical characteristics including color, moisture, texture, grain size, sorting, lithology, etc.)
- Phase I and Phase II soil physical parameter field screening and analytical results (pH, ORP, TOC, grain size, and CEC)
- Phase II surface water parameter field screening and analytical results (temperature, pH, specific conductivity, DO, ORP, turbidity, salinity, and hardness)
- Phase II sediment physical parameter field screening and analytical results (pH, ORP, TOC, and grain size).

This section also presents an evaluation of background representativeness for soil samples collected from Bear Mountain State Park and surface water and sediment collected from Con Hook.

5.1 PHASE I SHORELINE RECONNAISSANCE

The Phase I shoreline reconnaissance was conducted to document potential upland and aquatic receptors and evaluate whether the benthos provides suitable habitat for aquatic organisms. The reconnaissance was conducted along four reconnaissance areas (**Figure 3-3**):

- Recon Area 1 – Hudson River Shoreline
- Recon Area 2 – Iona Marsh Shoreline
- Recon Area 3 – Western Shoreline between Iona and Round Island
- Recon Area 4 – River Subdivision (CSX Transportation) railroad track embankment (west and east side).

The following sections present a summary of observations from the Phase I shoreline reconnaissance. The results of the shoreline reconnaissance survey are detailed in the Final Iona Island Shoreline Reconnaissance Survey Technical Memorandum that was submitted to USACE on 15 April 2020 (**Appendix E**).

5.1.1 Shoreline Observations

The majority of Recon Area 1 along the Hudson River shoreline consists of a non-contiguous stone river wall approximately 1,100 ft in length and 6 ft in height (**Figure 5-1**). Three large breaks were identified where the wall had partially collapsed, and small gaps between the stones were also observed along the length of the wall where the Hudson River passes through the wall at high tide and forms pockets of water behind the wall. The majority of the area along the river wall consists of exposed bedrock and gravel with the exception of some small pockets of sediment deposition. Areas of cobble boulder-sized stone were observed at the northern and southern ends of the river wall as well as at the identified wall breaks. The large stones were mostly submerged during high tide but exposed during low tide. The majority of the substrate in these areas consisted of cobble and course-grained sand. A coarse sand and gravel beach area was observed along the shoreline of AOC #16 – Area D (Former Dump Area). Glass fragments and beach glass were observed throughout the sand and gravel beach area.

Recon Area 2 Iona Marsh shoreline was divided by a railroad embankment which supports the active River Subdivision (CSX Transportation) railroad tracks (**Figure 3-3**). The western side of the railroad tracks south of the entrance road to Iona Island consists of a tidal marsh dominated by cattails (Typha spp.), while the area north of the entrance road is dominated by common reed (*Phragmites australis*). The eastern side of the railroad tracks is dominated by an extremely dense monotypic stand of common reed (*Phragmites australis*). Fine-grained sediment bottom was observed within the marsh.

Recon Area 3 consisted of the shoreline area on the southwest side of Iona Island and western portion of Round Island, including the low-lying area between the two islands (**Figure 3-3**). The area has been altered with historic fill and disturbance. A mix of Phragmites tidal wetland was noted on the southern and western end of Recon Area 3 (**Figure 5-1**). A tidal wetland swale consisting of various plant species was observed at the northern edge of Recon Area 3, and a riprap filled drainage swale was observed at the southern end of Recon Area 3.

Recon Area 4 along the railroad track embankment primarily consists of riprap along an upland embankment. Scrub-shrub upland was observed along the edge of the riprap in the northern portion of Recon Area 4. A transition from riprap to existing marsh associated with Recon Area 2 was noted at the southern end of Recon Area 4.

5.1.2 Surface Water Drainage Pathways

Surface water drainages were not noted in Recon Area 1 (Hudson River Shoreline) or Recon Area 2 (Iona Marsh Shoreline) (**Figure 3-3**). In addition, no culverts were identified beneath the railroad embankment in Recon Area 4 (River Subdivision [CSX Transportation] railroad track

embankment [west and east side]) that could connect drainage from Iona Island on the east of the railroad embankment to the marsh on the western side of the railroad embankment. One hydrological connection through the railroad embankment was noted outside the project area at an embankment opening (i.e., shallow bridge) south of Round Island.

Preferential surface water drainage pathways were noted in Recon Area 3 (western shoreline between Iona and Round Island) (**Figure 5-1**). The southern end of Iona Island in Recon Area 3 appears to drain down towards a low point between Iona Island and Round Island. This area slopes slightly to the southeast to a riprap filled drainage swale that directs flow to the south, towards the tidal marsh associated with Recon Area 2. In addition, a tidal wetland swale identified along Recon Area 3 appears to convey flow to the west toward the tidal marsh associated with Recon Area 2. Metal debris (e.g., rebar, old fencing, and other metal pieces) were observed in the riprap filled drainage swale.

An isolated wetland depression was noted just north of Recon Area 3 on the north side of the Iona Island perimeter road (**Figure 5-1**). This depression appears to collect surface runoff from Iona Island; however, there was no culvert observed beneath the road that connected this depression to the tidal wetland swale within Recon Area 3.

5.1.3 Wildlife and Vegetation Observations

Wildlife and vegetation observed during the Phase I RI shoreline reconnaissance was documented to determine potential ecological receptors at the site. Only incidental observations were included. A formal survey for specific species was not conducted. In general, the observations made are consistent of what would be expected for the habitat areas described in Section 1.6.10 of this RI report. **Table 5-1** presents a list of wildlife observations along with the general recon area depicting where each species was identified. No stressed vegetation (terrestrial plant community) was observed during the shoreline reconnaissance. In addition, based on wildlife observations, Island has a thriving bird and mammal population (**Appendix E**).

Common reed *(Phragmites australis)* and cattail (*Typha angustifolia*) were the dominant aquatic vegetation. The upland habitat consists primarily of invasive species including Japanese barberry (*Berberis thunbergii*), multiflora rose (*Rosa multiflora*), wineberry (*Rubus phoenicolasius*), and Japanese honeysuckle (*Lonicera japonica*). Other dominant species located within the upland areas included maples (*Acer spp.*), *Forsythia spp*., devil's walking stick (*Aralia spinosa*), and red cedar (*Juniperus virginiana*). Milkweed (*Asclepias syriaca*) was also identified.

5.2 PHASE I AND PHASE II ONSITE SOIL PHYSICAL PARAMETERS

The Phase I and Phase II ISM onsite soil physical parameters results for each sample collected during this RI are presented in the following tables:

- **Table 5-2**: Soil observations (including soil depth to refusal and geologic description) and pH field screening results for each Phase I triplicate sample

- **Table 5-3**: ORP, TOC, CEC, and grain size analytical results for each Phase II triplicate sample collected.

Of the 32 onsite soil DUs established to evaluate soil at Iona Island, 29 were established in the upland terrestrial environment of Iona Island where upland soil is present (DU-1 through DU-16, DU-20 through DU-25, and EXDU-1 through EXDU-7). DU locations are presented in **Figure 3-1**. Note that DU-8 and DU-24 were not sampled during this RI, as discussed in Section 3.1.2.2 and summarized in Section 3.9 of this RI report. The remaining 3 DUs were established within the marsh area between Iona and Round Islands at AOC #16 – Area D (Former Dump Area) where hydric soil is present (DU-17, DU-18, and DU-19). Physical parameter results for each environment are discussed in the subsections below. Summary statistics (mean, median, and range) for upland soil, AOC #16 – Area D (Former Dump Area) surface soil, and sitewide surface soil physical parameters (pH, ORP, TOC, CEC, and grain size percentages) are presented in **Table 5-4**.

5.2.1 Upland Soil Physical Parameters

The subsections below present the soil physical characteristics for the upland area based on observations during Phase I and Phase II sampling, soil field screening sample results, and soil analytical results.

5.2.1.1 Physical Characteristics Observations

Soil encountered across the upland area of Iona Island during the Phase I investigation was shallow, with a depth to refusal ranging from 6 to 12 in. bgs (**Table 5-2**). Refusal in the majority of DUs was encountered at less than 8 in. bgs. Deeper soil in the upland portion of Iona Island was encountered at DU-20 and DU-21, where refusal was encountered at 18 and 24 in. bgs, respectively). DU locations are presented in **Figure 3-1**.

Surface soil in the upland area of Iona Island was described as brown, dry silt with varying amounts of organic material and trace amounts of coarser-grained material (ranging from very fine sand to coarse gravel). Based on physical observations, surface soil was classified as ML (silt) and OL (organic silt) using the Unified Soil Classification System (USCS) (ASTM 2006). Subsurface soil in upland DUs (i.e., DU-20 and DU-21) was described as brown, dry silt with trace fine- to coarse-grained sand and fine- to coarse-grained gravel. Surface soil was classified as ML (silt) using the USCS (ASTM 2006).

5.2.1.2 pH Field Screening Results

Surface soil pH in the upland area of Iona Island ranged from 5.4 to 7.5 (**Table 5-4**). The mean pH in upland surface soil for each DU is depicted on **Figure 5-2**.

5.2.1.3 ORP Field Screening Results

Upland surface soil field ORP results ranged from 225 to 402 mV, while calculated standard hydrogen electrode corrected ORP results ranged from 430 to 607 mV (**Table 5-4**). One upland surface soil ORP reading at DU-07 (field ORP of 402 mV and calculated standard hydrogen electrode corrected ORP of 607 mV) was elevated compared to the replicate samples at DU-07 (field readings of 307 and 310 mV and calculated standard hydrogen electrode corrected ORP values of 512 to 515 mV) (**Table 5-3**). This elevated reading was also outside the range of ORP values for the remaining 14 upland ORP field screening values (field readings of 225 to 322 mV and calculated standard hydrogen electrode corrected ORP values of 430 to 527 mV).

5.2.1.4 Grain Size Analytical Results

Surface soil grain size across the upland DUs sampled during Phase II (DU-04, DU-07, DU-09, DU-11, and DU-13) was characterized by silt, medium sand, and fine sand with lesser amounts of gravel, clay, and coarse sand (**Table 5-4**). Based on grain size analysis, surface soil is classified as silty sand (SM) to sandy silt (ML) using the USCS (ASTM 2006).

5.2.1.5 TOC Analytical Results

TOC concentrations in upland surface soil ranged from 13,000 to 46,000 mg/kg (**Table 5-4**).

5.2.1.6 CEC Analytical Results

CEC re-analysis results for upland soil ranged from 23 meq/100g at DU-11 to 39 meq/100g at DU-13 (**Table 5-4**). Analytical results were similar to estimated CEC in soils typical for New York State agricultural land (12-25 meq/100g) (Cornell University 2007).

5.2.2 AOC #16 – Area D (Former Dump Area) Soil Physical Parameters

The subsections below present the soil physical characteristics for AOC #16 – Area D (Former Dump Area) based on observations during Phase I and Phase II sampling, soil field screening sample results, and soil analytical results.

5.2.2.1 Physical Characteristics Observations

Refusal/bedrock was not encountered in AOC #16 – Area D (Former Dump Area) during this RI or during previous investigations (see Section 1.5 of this RI report). Test pits excavated in AOC #16 – Area D (Former Dump Area) during the MMRP intrusive investigation could not go beyond 3 to 4 ft bgs inches due to test pits filling with water (EA 2021). Borings advanced during this RI in DU-17, DU-18, and DU-19 within AOC #16 – Area D (Former Dump Area) were terminated at 3 ft bgs.

Surface soil in the marsh area between Iona and Round Islands (AOC #16 – Area D (Former Dump Area) was described as dark brown, moist, moderately to well sorted silt with organic

material and trace fine-grained sand. Based on physical observations, surface soil was classified as ML (silt) and OL (organic silt) using the USCS (ASTM 2006).

Subsurface soil consisted of fill material that varied from black, very moist, poorly sorted sand at DU-17 to dark brown to dark grey (with a bluish tint), well sorted silt with trace fine-grained sand (DU-18 and DU-19). Subsurface soil at DU-17 was classified as SW (well-graded sand) while subsurface soil at DU-18 and DU-19 was classified as ML (silt) using the USCS (ASTM 2006).

Burn pit material and debris (including ash and foundry sand) was noted in test pits excavated in AOC #16 – Area D (Former Dump Area) during the MMRP intrusive investigation (EA 2021). This material potentially originates from a former incinerator (Former Building 121) that was located near the Hudson River shoreline immediately north/northwest of AOC #16 – Area D (Former Dump Area) within DU-17.

5.2.2.2 pH Field Screening Results

pH of surface soil within AOC #16 – Area D (Former Dump Area) ranged from 7.1 to 8.0. pH in subsurface soil within AOC #16 – Area D (Former Dump Area) ranged from 7.0 to 8.1 (**Table 5-4**).

5.2.2.3 ORP Field Screening Results

Field ORP values for surface soil from AOC #16 – Area D (Former Dump Area) ranged from 275 to 300 mV, while calculated standard hydrogen electrode corrected ORP values ranged from 480 to 505 mV (**Table 5-4**).

5.2.2.4 Grain Size Analytical Results

Surface soil grain size in AOC #16 – Area D (Former Dump Area) was characterized primarily by silt, medium sand, and fine sand with lesser amounts of coarse sand, gravel, and clay. Surface soil at DU-18 was coarser-grained than that of DU-17 and DU-19, with higher percentages of medium sand and lower percentages of silt noted in two of the three triplicate samples (**Table 5-4**). Based on grain size analysis, soil at AOC #16 – Area D (Former Dump Area) was classified using the USCS (ASTM 2006) as follows:

- DU-17: SM/GM (silty sand and silty sand with gravel)
- DU-18: SM and SP-SM (silty sand and poorly graded sand with silt)
- DU-19: SM (silty sand).

5.2.2.5 TOC Results

TOC concentrations in AOC #16 – Area D (Former Dump Area) surface soil ranged from 25,000 to 300,000 mg/kg (**Table 5-4**). TOC concentrations at DU-18 (120,000 to 300,000 mg/kg) were an order of magnitude higher than those in DU-17, DU-19 mg/kg (25,000 to 47,000 mg/kg) (**Table 5-3**).

5.2.2.6 CEC Analytical Results

CEC results for surface soil within AOC #16 – Area D (Former Dump Area) ranged from 30 meq/100g at DU-18 to 91 meq/100g at DU-18. With the exception of DU-18, analytical results were similar to estimated CEC in soils typical for New York State agricultural land (12-25 meq/100g) (Cornell University 2007).

5.3 PHASE I AND PHASE II GROUNDWATER OBSERVATIONS

Groundwater was not encountered in upland areas during the Phase I and Phase II soil sampling. AOC #16 – Area D (Former Dump Area) is influenced by the Hudson River and inundated with water twice daily during high-tide and during storm events, with soil saturated to ground surface.

5.4 PHASE II SURFACE WATER PHYSICAL PARAMETERS

Surface water was collected from three onsite areas for field screening of water quality parameters (temperature, pH, specific conductivity, DO, ORP, turbidity, and salinity) and analysis of hardness. Onsite areas included the following (**Figure 3-5**):

- AOC #16 – Area D (Former Dump Area)
- Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area)
- Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale.

Water quality parameter results for each area are summarized in the lists below. Surface water quality parameters for each sample collected within each area are presented in **Table 5-5**. Summary statistics (mean, median, and range) of water quality parameters from each onsite area are presented in **Table 5-6** for comparison purposes.

- AOC #16 – Area D (Former Dump Area)
  - Temperature: 9.31 to 12.7 degrees Celsius
  - pH: 6.65 to 7.69

  - Specific Conductivity: 0.1849 to 0.3789 MilliSiemens per centimeter (mS/cm)
  - DO: 7.18 to 11.27 milligrams per liter (mg/L)
  - Field ORP: 58.9 to 236.5 mV
  - Standard Hydrogen Electrode ORP: 258.9 to 436.5 mV
  - Turbidity: 10.11 to 88.4 nephelometric turbidity units (NTU)
  - Salinity: 0.11 to 0.25 ppt
  - Hardness (as CaCO3): 53 to 75 mg/L.
- Hudson River adjacent to AOC #16 – Area D
  - Temperature: 9.6 to 10.3 degrees Celsius
  - pH: 7.68 to 7.78
  - Specific Conductivity: 0.1705 to 0.1804 mS/cm
  - DO: 11 to 11.9 mg/L
  - Field ORP: 149.1 to 172.3 mV
  - Standard Hydrogen Electrode ORP: 349.1 to 372.3 mV
  - Turbidity: 89.45 to 109.8 NTU
  - Salinity: 0.12 to 0.13 ppt
  - Hardness (as CaCO3): 59 to 82 mg/L
- Iona Marsh
  - Temperature: 11.7 to 13.6 degrees Celsius
  - pH: 7.57 to 8.01
  - Specific Conductivity: 0.181 to 0.3397 mS/cm
  - DO: 9.95 to 11.64 mg/L

— Field ORP: 154.8 to 228 mV

— Standard Hydrogen Electrode ORP: 354.8 to 428 mV

— Turbidity: 63.94 to 112.31 NTU

— Salinity: 0.12 to 0.21 ppt

— Hardness (as CaCO3): 67 to 93 mg/L.

5.5 PHASE I DISCRETE SEDIMENT GRAIN SIZE AND TOC RESULTS

Seven discrete sediment samples were collected along the Hudson River and Iona Marsh shorelines (SD-1 through SD-7) during Phase I analysis of TOC and grain to evaluate whether sediments could be a potential "sink" for site-related contaminants. Phase I discrete sediment sampling locations are presented in **Figure 5-1**. TOC and grain size results for each discrete sediment sample collected during Phase I, as well as summary statistics (mean, median, and range) for the Hudson River shoreline and Iona Marsh shoreline, are presented in **Table 5-7**. A summary of results for each shoreline is presented in the subsections below.

5.5.1 Hudson River Shoreline

Grain size results for discrete Hudson River shoreline samples (SD-04, SD-05, and SD-06) indicate that Hudson River shoreline sediment consists primarily of medium to fine sand with lesser amounts of gravel and coarse sand. Hudson River shoreline sediment samples were classified as SW (well-graded sand) using the USCS (ASTM 2006).

TOC in Hudson River shoreline sediment ranged from 960 to 31,000 mg/kg.

5.5.2 Iona Marsh Shoreline

Grain size results for discrete Iona Marsh shoreline samples (SD-01, SD-02, SD-03, and SD-07) indicate that marsh shoreline sediment consists of mostly silt. Iona Marsh shoreline sediment samples were classified as ML (silt) using the USCS (ASTM 2006).

TOC concentrations in marsh sediment ranged from 62,000 to 110,000 mg/kg).

5.6 PHASE II ISM SEDIMENT PHYSICAL PARAMETER RESULTS

pH, ORP, grain size, and TOC data was collected from the Hudson River and Iona Marsh shorelines as follows (**Figure 3-6):**

- Hudson River shoreline adjacent to the northeastern boundary of AOC #16 – Area D (Former Dump Area) (IHRS-DU-01)

- Iona Marsh shoreline at the outlets of the riprap filled drainage swale (RRDS-DU-01) and tidal wetland swale (TWS-DU-01).

Table 5-8 presents the Phase II onsite ISM sediment pH, ORP, grain size, and TOC results for each triplicate sample in each onsite sediment DU. **Table 5-9** presents summary statistics (mean, median, and range) of each physical parameter (pH, ORP, TOC, and grain size percentages) for sediment from each shoreline (Hudson River and Iona Marsh) for comparison purposes. A summary of Phase II ISM sediment physical parameters for each shoreline is presented in the subsections below. **Table 5-10** presents the AVS/SEM analytical results for each sample collected from each shoreline.

5.6.1 Hudson River Shoreline Sediment

The subsections below present the Hudson River Shoreline characteristics based on observations during Phase II sampling, sediment field screening sample results, and sediment analytical results.

5.6.1.1 Physical Characteristics Observations

A small sand and gravel beach encompassing approximately 0.2 acres is located along the Hudson River shoreline at the northeastern edge of AOC #16 – Area D (Former Dump Area). The beach area is exposed at low tide and inundated twice daily during high tide and during storm events. The northwestern edge of the beach area along AOC #16 – Area D (Former Dump Area) terminates at the river wall that extends northwestward along the Iona Island shoreline. The southeastern edge of the beach terminates along Round Island approximately 240 ft beyond downstream from AOC #16 – Area D (Former Dump Area).

5.6.1.2 pH Field Screening Results

pH in sediment along the Iona Island Hudson River shoreline ranged from 6.6 to 6.9 (**Table 5-8** and **Table 5-9**).

5.6.1.3 ORP Field Screening Results

Field ORP measurements from Iona Island Hudson River shoreline sediment were 493, 512, and 754 mV, while calculated standard hydrogen electrode corrected ORP results were 698, 717, and 959 mV (**Table 5-8** and **Table 5-9**). The 754-mV field screening value (959 mV calculated standard hydrogen electrode corrected ORP value) was elevated compared to the replicate readings and is likely anomalous.

5.6.1.4 Grain Size Analytical Results

Hudson River shoreline sediment grain size was characterized by medium sand with lesser amounts of coarse sand, fine sand, and gravel (**Table 5-8** and **Table 5-9**). Based on grain size analysis, sediment was classified as SP (poorly-graded sand) using the USCS (ASTM 2006).

This is consistent with sediment observed in the sand and gravel each area along the Hudson River shoreline at the northeastern edge of AOC #16 – Area D (Former Dump Area).

5.6.1.5 TOC Analytical Results

TOC concentrations in sediment along the Iona Island Hudson River shoreline ranged from 2,600 to 4,500 mg/kg (**Table 5-8** and **Table 5-9**).

5.6.1.6 AVS/SEM Analytical Results

AVS/SEM analytical results from the Hudson River Shoreline ranged from 25,747 to 55,778 micromoles per grams organic carbon (µmol/g_{oc}) (**Table 5-10**).

5.6.2 Iona Marsh Shoreline

The subsections below present the Iona Marsh Shoreline characteristics based on observations during Phase II sampling, sediment field screening sample results, and sediment analytical results.

5.6.2.1 Physical Characteristics Observations

Sediment along the Iona Marsh shoreline at the outlets of both the riprap filled drainage swale and tidal wetland swale was described as dark brown silt with organic material and very fine-grained sand. Based on physical observations, sediment was classified as ML (silt) using the USCS (ASTM 2006).

5.6.2.2 pH Field Screening Results

pH in Iona Marsh sediment ranged from 7.0 to 7.4 (**Table 5-9**), with similar pH sediment in sediment from both drainage outlet locations (7.1 to 7.3 at the outlet of the riprap filled drainage swale and 7.0 to 7.4 at the outlet of the tidal wetland swale; **Table 5-8)**.

5.6.2.3 ORP Field Screening Results

Field ORP in Iona Marsh sediment ranged from 296 to 342 mV, while calculated standard hydrogen electrode corrected ORP results ranged from 501 to 547 (**Table 5-9**). Field and calculated standard hydrogen electrode corrected ORP in sediment were similar at both drainage outlet locations (**Table 5-8**):

- Field ORP ranging from 310 to 342 mV at the outlet of the riprap filled drainage swale and from 296 to 333 mV at the outlet of the tidal wetland swale.

- Calculated standard hydrogen electrode corrected ORP results ranging from 515 to 547 mV at the outlet of the riprap filled drainage swale and from 501 to 538 mV at the outlet of the tidal wetland swale (**Table 5-8**).

5.6.2.4 Sediment Grain Size Analytical Results

Iona Marsh shoreline sediment grain size was characterized by silt and clay at each drainage outlet location (**Table 5-8** and **Table 5-9**). This is consistent with physical observations and the classification of Iona Marsh shoreline as ML (silt) using the USCS (ASTM 2006).

5.6.2.5 Sediment TOC

TOC concentrations in Iona Marsh shoreline sediment ranged from 60,000 to 88,000 mg/kg (**Table 5-8**). TOC concentrations at the outlet of the riprap filled drainage swale (73,000 to 88,000 mg/kg) were slightly higher than concentrations at the outlet of the riprap filled drainage swale (60,000 to 64,000 mg/kg) (**Table 5-8**).

5.6.2.6 Sediment AVS/SEM

AVS/SEM analytical results for Iona Marsh sediment ranged from -6 to 9 µmol/g_{oc} at the outlet of the riprap filled drainage swale and from -0.5 to 12 at the outlet of the tidal wetland swale (**Table 5-10**).

5.7 BACKGROUND SOIL REPRESENTATIVENESS

Background soil sampling was conducted to establish regional background metals and PAH concentration ranges in soil. Metals and PAH background concentrations were obtained from 8 DUs established in Bear Mountain State Park. Background DU locations are presented in **Figure 3-2**. A comparison of background and onsite soil physical properties (i.e., soil type, soil depth) and geochemical properties (i.e., soil pH and elemental ratios) was conducted to evaluate whether background soil was an accurate representative of onsite soil. The following subsections present the background physical and geochemical property results and comparisons to onsite soil.

5.7.1 Background Soil Physical Properties Comparisons

Depth to refusal and soil physical parameters for each background DU in Bear Mountain State Park are presented in **Table 5-2**. Depth to refusal in background sampling locations was less than 12 inches. Surface soil types in background DUs were described as brown, slightly moist silt with organics, trace clay and very fine-grained sand (OL USCS classification) (ASTM 2006).

Logged surface soil data from background DUs was directly compared with logged surface soil data from onsite DUs to determine if soil types were comparable. Soil depth and soil type in background DUs were similar to the soil depth and soil type observed in onsite upland DUs presented in Section 5.2.1.1 of this RI report (depth less than 12 inches and SM and OL

classification [ASTM 2006]). Soil depth and type differed from that at AOC #16 – Area D (Former Dump Area) (depth greater than 3 ft bgs, ML soil classification [ASTM 2006]).

5.7.2 Background Soil pH Comparisons

pH values in background surface soil ranged from 5.9 to 6.7 (**Table 5-2**). Background soil pH means, medians, and ranges were compared to onsite soil pH means, medians, and ranges. These values were consistent with pH values for onsite upland soil (**Table 5-4)**. However, background pH values were less than pH means, medians, and ranges for AOC #16 – Area D (Former Dump Area) soil.

5.7.3 Background Soil Elemental Ratios Comparisons

Elemental ratios (calcium to magnesium, aluminum to iron, and nickel to total chromium) were used to further compare background and onsite soil. The background and onsite elemental ratio ranges, means, and medians, as well as box plots visualizing the relationship between background and onsite soil, are presented in **Figure 5-3** (calcium to magnesium), **Figure 5-4** (aluminum to iron), and **Figure 5-5** (nickel to total chromium). Based on elemental ratios, background soil is similar to onsite upland soil. However, soil elemental ratios for background soil were not consistent with elemental ratios for AOC #16 – Area D (Former Dump Area) soil.

5.7.4 Background Soil Representativeness Conclusions

Based on soil background soil physical and geochemical properties comparisons, background soil was representative of onsite upland soil.

Physical soil properties, pH, and soil elemental ratios differed between background soil and AOC #16 – Area D (Former Dump Area) soil. AOC #16 – Area D (Former Dump Area) is a fill area with observed burn pit material and debris (including ash and foundry sand). It is not expected that background native soil would be consistent with or representative of fill material. However, comparisons could still be made to determine if metals and PAH concentrations in AOC #16 – Area D (Former Dump Area) soil were consistent or less than background.

5.8 BACKGROUND SURFACE WATER REPRESENTATIVENESS

Background surface water sampling was conducted to determine regional background metals concentrations. Metals concentrations in surface water were obtained from Con Hook along both the Hudson River and marsh shorelines. Background surface water sampling locations are presented in **Figure 3-7**.

Comparisons of background surface water quality parameters (pH, temperature, specific conductance, DO, ORP, turbidity, salinity, and hardness) was conducted to evaluate whether background shoreline environments at Con Hook were accurate representatives of onsite areas investigated during Phase II (Iona Island Hudson River shoreline adjacent to AOC #16 – Area D [Former Dump Area] and Iona Marsh shoreline at the outlets of the riprap filled drainage swale

and tidal wetland swale). A quantitative statistical approach (statistical hypothesis tests) was used to compare onsite and background water quality parameter data. Evaluations were conducted for each depositional environment. Water quality parameter means, medians, and ranges from the Con Hook Hudson River shoreline were compared those from the Iona Island Hudson River shoreline. Water quality parameter means, medians, and ranges from the Con Hook Marsh shoreline were compared to those from the Iona Marsh shoreline.

Table 5-5 presents surface water quality parameter data for each sample collected from the Con Hook Hudson River and Con Hook marsh shorelines. **Table 5-6** presents summary statistics of surface water quality parameters for each background shoreline, as compared to surface water quality parameters from the Iona Island Hudson River and Iona Marsh shorelines.

5.8.1 Con Hook Hudson River Shoreline Surface Water Representativeness

Surface water quality parameter results for the Con Hook Hudson River shoreline are summarized in the list below (**Table 5-5** and **Table 5-6**).

- Temperature: 9.6 to 10.9 degrees Celsius
- pH: 7.47 to 7.91
- Specific Conductivity: 0.125 to 0.2384 mS/cm
- DO: 11.06 to 11.69 mg/L
- Field ORP: 96.4 to 194.8 mV
- Standard Hydrogen Electrode ORP: 296.4 to 394.8 mV
- Turbidity: 42.7 to 237.1 NTU
- Salinity: 0.11 to 0.12 ppt
- Hardness (as CaCO3): 69 to 74 mg/L.

Box plots visualizing the relationship between onsite and background Hudson River shoreline surface water quality parameters are presented in **Figure 5-6**. Surface water quality parameters from the Iona Island Hudson River shoreline were either within the range of or similar to those from the Con Hook Hudson River shoreline. Therefore, Con Hook Hudson River shoreline background locations were representative of the Iona Island Hudson River shoreline.

5.8.2 Con Hook Marsh Shoreline Surface Water Representativeness

Surface water quality parameter results for the Con Hook marsh shoreline are summarized in the list below (**Table 5-5** and **Table 5-6**).

- Temperature: 10.5 to 14.8 degrees Celsius
- pH: 6.52 to 7.57
- Specific Conductivity: 0.1794 to 0.693 mS/cm
- DO: 2.67 to 10.85 mg/L
- Field ORP: 52.7 to 193.9 mV
- Standard Hydrogen Electrode ORP: 252.7 to 393.9 mV
- Turbidity: 8.8 to 639 NTU
- Salinity: 0.11 to 0.43 ppt
- Hardness (as CaCO3): 31 to 120 mg/L.

Box plots visualizing the relationship between background and onsite marsh shoreline surface water quality parameters are presented in **Figure 5-7**. Surface water quality parameters from the Iona Marsh shoreline were either within the range of or similar to those from the Con Hook marsh shoreline. Therefore, the Con Hook marsh surface water background locations were representative of onsite Iona Island shoreline.

5.9 BACKGROUND SEDIMENT REPRESENTATIVENESS

Background sediment sampling was conducted to determine regional background metals concentrations. Metals concentrations in sediment were obtained from DUs at Con Hook along both the Hudson River and marsh shorelines. Background sediment sampling locations are presented in **Figure 3-7**. Comparisons of background and onsite shoreline and sediment observations (shoreline conditions, vegetation, and sediment types) and sediment physical parameter data (pH, ORP, TOC, and grain size) was conducted to evaluate whether background shoreline environments at Con Hook were accurate representatives of onsite areas investigated during Phase II (Iona Island Hudson River shoreline adjacent to AOC #16 – Area D [Former Dump Area] and Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale).

Background representativeness was determined for each depositional environment. The Con Hook Hudson River shoreline was compared to the Iona Island Hudson River shoreline. The Con Hook marsh shoreline was compared to the Iona marsh shoreline. Shoreline conditions,

vegetation, and sediment types were directly compared between background and onsite locations. Additionally, a quantitative statistical approach (statistical hypothesis tests) was used to compare onsite and background sediment physical parameter data. Background and onsite sediment TOC, ORP, pH, and grain size percentage means, medians, and ranges were compared for each depositional environment.

Table 5-8 presents sediment physical parameters for each sample collected from the Con Hook Hudson River and Con Hook marsh shorelines. **Table 5-9** presents summary statistics of sediment physical parameters for each background shoreline, as compared to sediment physical parameters from the Iona Island Hudson River and Iona Marsh shorelines.

5.9.1 Con Hook Hudson River Shoreline

The Con Hook Hudson River shoreline was compared to the Iona Island Hudson River shoreline. The following subsections discuss comparisons between the Con Hook Hudson River shoreline and Iona Island Hudson River shoreline, as well the Con Hook Hudson River Shoreline Representativeness Conclusion.

5.9.1.1 Hudson River Shoreline and Sediment Observations

The Con Hook Hudson River Shoreline consisted of a rocky shoreline with large boulders along the upland and rocky beach like areas with cobble and large coarse sand. The water depth increased significantly off the shoreline. This is consistent with the Hudson River shoreline as based on observations during the site reconnaissance as presented in Section 5.1.1 of this RI report.

CHHRS-SU-06, CHHRS-SU-07 and CHHRS-SU-08 included rocky beach-like areas. Conditions within these DUs were similar to conditions observed along Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area). Finer-grained sediment (silt and clay) was observed and sampled at CHHRS-SU-01 through CHHRS-SU-05.

5.9.1.2 Hudson River Sediment pH and ORP Comparisons

Con Hook Hudson River shoreline sediment pH (6.6 to 6.8), field ORP (448 to 612 mV), and calculated standard hydrogen electrode ORP (653 to 817 mV) was similar to sediment physical parameters measured in Iona Island Hudson River shoreline sediment as presented in Sections 5.6.1.2 and 5.6.1.3 of this RI report (pH of 6.6 to 6.9, field ORP of 493 to 754 mV, and calculated standard hydrogen electrode ORP of 698 to 959 mV) (**Table 5-9**).

5.9.1.3 Hudson River Sediment Grain Size Comparisons

Overall, grain size along the Con Hook Hudson River shoreline was characterized by silt and clay with lesser amounts of sand and gravel (**Table 5-9**). The overall grain size was driven the lower grain size from 5 of 8 SUs, including CHHRS-SU-01 through CHHRS-SU-05 (**Table 5-8**). Grain size at these SUs was characterized as silt and clay and classified as ML (silt) using the

USCS (ASTM 2006). This differs from the coarser-grained sediment in the sand and gravel beach area along the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area).

Sediment collected from CHHRS-SU-06, CHHRS-SU-07, and CHHRS-SU-08 was characterized by medium to coarse sand and gravel (**Table 5-8**). Based on grain size analysis, sediment at these SUs was classified as SW (well graded sand) using the USCS (ASTM 2006). This is similar to sediment along the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (primarily medium sand characterized as SP [poorly graded sand] using the USCS), as presented in Section 5.6.1.4 of this RI Report.

5.9.1.4 Hudson River Sediment TOC Comparisons

TOC in Con Hook Hudson River shoreline sediment ranged from 7,200 to 46,000 mg/kg (**Table 5-9**). TOC concentrations were lower in coarser-grained sediment collected from CHHRS-SU-06, CHHRS-SU-07, and CHHRS-SU-08 (7,200 to 25,000 mg/kg) and higher in finer-grained sediment collected from CHHRS-SU-01 through CHHRS-SU-05 (32,000 to 46,000 mg/kg) (**Table 5-8**). TOC sediment from the Con Hook Hudson River shoreline was higher than that in Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (2,600 to 4,500 mg/kg). The TOC from CHHRS-SU-06 (7,200 mg/kg) was most similar to that of the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area).

5.9.1.5 Hudson River Shoreline Representativeness Conclusions

Shoreline observations and pH and ORP field screening results were consistent between the Con Hook Hudson River shoreline and Iona Island Hudson River shoreline. TOC and grain size results differed between onsite and background locations. Background sampling areas were variable, consisting of areas of rocky beach in CHHRS-SU-06, CHHRS-SU-07 and CHHRS-SU-08, and areas of finer-grained sediment in CHHRS-SU-01 through CHHRS-SU-05. TOC in background sediment was higher than TOC in onsite sediment.

Overall, sediment along the Con Hook Hudson River shoreline is finer-grained and has a higher TOC content than sediment collected from the Iona Island Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area). The shoreline of AOC #16 – Area D (Former Dump Area) consisted of a sand and gravel beach of limited extent. SUs along the Hudson River shoreline were more representative of the entire Iona Hudson River shoreline. Despite these differences, comparisons could still be made to determine if metals concentrations Hudson River shoreline sediment adjacent to AOC #16 – Area D (Former Dump Area) soil were consistent or less than background. The concentration of metals is expected to be higher in sediment with decreased grain size and increased TOC content, as these types of sediments tend to accumulate metals from natural and/or contaminant sources. Therefore, sediment along the Con Hook shoreline provides an accurate representation of background metals concentrations from upstream sources.

5.9.2 Con Hook Marsh Shoreline

The following subsections discuss comparisons between the Con Hook Hudson River shoreline and Iona Island Hudson River shoreline, as well the Con Hook Hudson River Shoreline Representativeness Conclusion.

5.9.2.1 Marsh Shoreline and Sediment Observations

The Con Hook marsh shoreline consisted primarily of a monotypic stand of common reed (*Phragmites australis*). This is similar to conditions observed along Iona Island Hudson River shoreline during the Phase I shoreline Reconnaissance, presented in Section 5.1.1 of this RI report.

5.9.2.2 Marsh Sediment pH and ORP Comparisons

The pH of Con Hook marsh shoreline sediment pH ranged from 6.5 to 7.0. This was slightly lower than the pH of Iona Island Marsh shoreline sediment (7.1 to 7.4) (**Table 5-9**). Con Hook Hudson River shoreline sediment field ORP ranged from 375 to 427 mV) and calculated standard hydrogen electrode ORP ranged from 580 to 632 mV. This was slightly greater than Iona Island Marsh shoreline sediment ORP values (field ORP of 296 to 342 mV and calculated standard hydrogen electrode ORP of 501 to 547 mV) (**Table 5-9**).

5.9.2.3 Marsh Sediment Grain Size Comparisons

Grain size analysis results for each ISM sediment sample collected from the Con Hook marsh shoreline are presented in **Table 5-8.** Similar to Iona Marsh sediment, grain size analysis of sediment collected from each SU along the Con Hook Marsh shoreline indicated primarily by silt and clay. Based on grain size analysis, sediment at these SUs was classified as SM (silt) using the USCS (ASTM 2006).

5.9.2.4 Marsh Sediment TOC Comparisons

Con Hook marsh sediment TOC ranged from 110,000 to 250,000 mg/kg. This was greater than Iona Island Marsh shoreline sediment TOC (60,000 to 88,000 mg/kg).

5.9.2.5 Marsh Sediment Representativeness Conclusions

Overall, Con Hook marsh shoreline background sampling locations were representative of the onsite Iona Marsh shoreline sampling locations. Observed background shoreline conditions and vegetation were similar to observed onsite conditions and sediment grain size results were similar between background and onsite. pH in background sediment was slightly but not significantly lower than pH in onsite sediment. ORP and TOC were higher in background sediment compared to onsite marsh sediment. However, ORP in background marsh sediment was lower than ORP in background Hudson River shoreline sediment. This is consistent with ORP in onsite marsh sediment, which was lower than ORP onsite Hudson River shoreline sediment.

Conversely, TOC in both the background and onsite marsh sediment was elevated when compared TOC in both background and onsite Hudson River shoreline sediment.

This page intentionally left blank

6. NATURE AND EXTENT OF CONTAMINATION

This section presents the contaminant analytical results in each media sampled as part of this RI, as well as the results background evaluations conducted to determine if concentrations of metals and PAHs in onsite media were consistent or greater than background. The purpose of this section is to characterize the nature (type and magnitude) and extent of contamination in onsite media such that informed decisions can be made as to the level of risk presented by the site and the appropriate type(s) of remedial response.

This section is organized as follows:

- Discussion of Phase I TAL metals, PAH, BTEX, PCBs and explosives residue and Phase II metals analytical results in onsite media
- Results of the comparison of TAL metals and PAH concentrations in onsite media to background concentrations
- Discussion of site contaminants, including locations and concentrations of individual analytes in each onsite media
- Summary of the nature and extent of contamination in each media.

6.1 ONSITE SOIL, SURFACE WATER, AND SEDIMENT ANALYTICAL RESULTS

Phase I onsite soil TAL metals, PAH, BTEX, PCBs and explosives residue analytical results and Phase II onsite surface water and sediment analytical results are discussed in the subsections below. Note that there were some cases where a constituent was not detected at the LOD or LOQ, but the LOD exceeded a project action limit (PAL) (i.e., EPA screening value) presented in the UFP-QAPP (EA 2020a) or UFP-QAPP Addendum (EA 2022). In soil, the LOD of non-detect results for nitroglycerine were greater than their respective residential soil RSLs, while Aroclor-1221, Aroclor-1242, 3-nitrotoluene, 1,3-dinitrobenzene, and Tetryl were greater than their respective ecological screening levels. In surface water, the LODs for antimony, arsenic, mercury, and thallium were greater than their respective EPA tapwater RSLs. These not detected analytes are further discussed in the HHRA presented in **Appendix G** and ERA presented in **Appendix H**.

6.1.1 Upland Surface Soil TAL metals, PAHs, BTEX, PCBs, And Explosives Residue Detections

Onsite surface soil samples (0–6 in. bgs) were collected from 27 onsite upland DUs (DU-1 through DU-7, DU-9 through DU-16, DU-20 through DU-23, DU-25, and EXDU-1 through EXDU-7) for analysis of TAL metals, PAHs, PCBs, and/or explosives residues. DU locations are presented in **Figure 3-1**. Analyte groups sampled at each of the onsite DUs were based on

previous investigation results and contaminants identified for each AOC (**Table 1-1** and Section 3.1.2.1 of this RI report). Analyte groups included the following as presented in **Table 3-1**:

- TAL metals at 15 upland DUs (DU-01 through DU-07 and DU-09 through DU-15) (note mercury was only sampled at 12 of the 15 upland DUs including DU-01 through DU-05, DU-09, and DU-11 through DU-16)

- PAHs at 13 upland DUs (DU-01 through DU-05, DU-09, DU-11 through DU-13, DU-16, and DU-20 through DU-22)
- PCBs at 2 upland DUs (DU-23 and DU-25)

- Explosives residues at 7 upland DUs (EXDU-1 through EXDU-7).

Phase I onsite ISM soil analytical results are presented in the following tables:

- **Table 6-1**: DU-1 through DU-16 upland soil metals and PAH analytical results

- **Table 6-2**: Former UST areas (DU-20 through DU-22) BTEX and PAH analytical results

- **Table 6-3**: Former transformer locations (DU-23 and DU-25) PCB analytical results

- **Table 6-4**: Former explosives buildings (EXDU-1 through EXDU-7) explosives residue analytical results.

Analytes detected in surface soil samples collected from one or more upland DUs are presented in the list below. Summaries of onsite analytical results for upland surface soil including DUs where each analyte was detected, concentration ranges for each analyte, and DUs with minimum and maximum concentrations are presented in **Table 6-5**.

- Up to 23 metals analytes (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, total chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc) at each of the 15 onsite upland DUs (DU-1 through DU-7 and DU-9 through DU-16)

- 18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-cd]pyrene, naphthalene, phenanthrene, and pyrene) at each of the 13 upland DUs sampled for PAHs

- 1 PCB analyte, Aroclor 1260, at both upland DUs sampled for PCBs (DU-23 and DU-25)

- 4 explosives residue analytes, including 1,3,5-trinitrobenzene, 1,3-dinitrobenzene, 2,4,6-trinitrotoluene, and 2,4-dinitrotoluene, at 1 of 7 upland DUs sampled for explosives residues (EXDU-1 only).

6.1.2 Upland Subsurface Soil TAL metals, PAHs, BTEX, PCBs, And Explosives Residue Detections

Soil encountered across most of the upland area during the Phase I investigation was shallow, with exposed/shallow bedrock and depth to refusal ranging from 6–12 in. bgs. Deeper soil in the upland area was encountered at DU-20 and DU-21 only, with refusal at 18 and 24 in. bgs, respectively. DU locations are presented in **Figure 3-1**. Onsite subsurface soil samples were collected from DU-20 (6–18 in. bgs) and DU-21 (6–24 in. bgs) for analysis of PAHs and BTEX. Subsurface soil was not sampled at additional upland DUs due to the shallow depth to refusal.

Analyte groups sampled at DU-20 and DU-21 were based on previous investigation results and contaminants identified for each AOC (**Table 1-1** and Section 3.1.2.1 of this RI report). Subsurface soil analytical results are presented in **Table 6-2.**

18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-cd]pyrene, naphthalene, phenanthrene, and pyrene) were detected in subsurface soil samples collected from both DU-20 and DU-21. BTEX analytes were not detected in subsurface soil samples collected from either DU. Summaries of PAH analytical results for upland subsurface soil including concentration ranges for each analyte detected and DUs with minimum and maximum concentrations are presented in **Table 6-5**.

6.1.3 AOC #16 – Area D (Former Dump Area) Soil Detections

Onsite surface soil samples (0–6 in. bgs) and subsurface soil samples (6–36 in. bgs) were collected from 3 DUs encompassing AOC #16 – Area D [Former Dump Area]) (DU-17 through DU-19) for analysis of TAL metals, PAHs, PCBs, and explosives residues. DU locations are presented in **Figure 3-1**. Analytes sampled at AOC #16 – Area D [Former Dump Area]), as presented in **Table 3-1**, were based on previous investigation results and contaminants identified for each AOC (**Table 1-1** and Section 3.1.2.1 of this RI report).

Phase I onsite ISM soil analytical for AOC #16 – Area D (Former Dump Area (DU-17 through DU-19) are presented in **Table 6-6**. Metals, PAHs, and PCBs were detected in surface and subsurface soil at each of the DUs encompassing AOC #16 – Area D [Former Dump Area]) (DU-17 through DU-19). Explosives residues were not detected in any of the surface or subsurface soil samples collected from DU-17 through DU-19. Analytes detected in surface and subsurface soil samples are presented in the list below. A summary of analytical results in surface and subsurface soil, including DUs where each analyte was detected, concentration ranges for each analyte detected, and DUs with minimum and maximum concentrations, is presented in **Table 6-7**.

- 23 metals analytes (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, total chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc) detected in both surface and subsurface soil samples collected from each of the 3 DUs

- 18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene) detected in both surface and subsurface soil samples collected from each of the 3 DUs

- 2 PCBs detected in surface soil samples collected from the 3 DUs (Aroclor-1248 at DU-17 and DU-18 and Aroclor-1260 at each of the 3 DUs)

- 2 PCBs detected in subsurface soil samples collected from the 3 DUs (Aroclor-1260 at DU-17 and DU-19 and Aroclor-1262 at DU-18 only).

6.1.4 Surface Water TAL Metals Detections

A total of 60 onsite discrete surface water samples were collected for analysis of TAL metals to evaluate the surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines, with 20 samples collected from each of the following areas (**Figure 3-5**):

- Source area at AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20)

- Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (IHRS-SW-01 through IHRS-SW-20)

- Iona marsh at the outlets of the riprap filled drainage swale (RRDS-SW-01 through RRDS-SW-10) and tidal wetland swale (TWS-SW-01 through TWS-SW-10).

Phase II surface water metals analytical results are presented in the following tables:

- **Table 6-8**: AOC #16 – Area D (Former Dump Area)

- **Table 6-9**: Iona Island Hudson River Shoreline

- **Table 6-10** for the Iona Marsh shoreline.

Metals analytes detected in one or more surface water samples collected from each area are presented in the list below. A summary of metals analytical results for onsite surface water

including locations where each metals analyte was detected, concentration ranges for each metals analyte, and samples with minimum and maximum concentrations are presented in **Table 6-11**.

- AOC #16 – Area D (Former Dump Area): 19 metals analytes (aluminum, antimony, arsenic, barium, beryllium, calcium, total chromium, cobalt, copper, lead, magnesium, manganese, nickel, potassium, selenium, sodium, thallium, and zinc)

- Iona Island Hudson River shoreline: 19 metals analytes (aluminum, antimony, arsenic, barium, calcium, total chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, and zinc)

- Iona Marsh shoreline: 17 metals analytes (aluminum, antimony, arsenic, barium, beryllium [tidal wetland swale only], calcium, total chromium [tidal wetland swale only], cobalt, copper, magnesium, manganese, nickel, potassium, sodium, thallium [tidal wetland swale only], vanadium [riprap filled drainage swale only], and zinc [tidal wetland swale only]).

6.1.5 Sediment TAL Metals Detections

Metals samples were collected from three onsite sediment DUs established at the ends of preferential surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines as follows (**Figure 3-6**):

- IHRS-DU-01 along the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area)

- RRDS-DU-01 along the Iona Marsh shoreline at the outlet of the riprap filled drainage swale

- TWS-DU-01 along the Iona Marsh shoreline at the outlet of the tidal wetland drainage swale.

Phase II ISM sediment metals analytical results are presented in **Table 6-12.** Metals analytes detected in sediment from each DU are presented in the list below. A summary of metals analytical results for onsite sediment including DUs where each metals analyte was detected, concentration ranges for each metals analyte, and samples with minimum and maximum concentrations are presented in **Table 6-13**.

- IHRS-DU-01: 17 metals analytes (aluminum, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, nickel, silver, thallium, vanadium, and zinc)

- RRDS-DU-01 and TWS-DU-01: 18 metals analytes (aluminum, antimony, arsenic, barium, beryllium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, thallium, vanadium, and zinc).

6.2 BACKGROUND COMPARISON

Background sampling was conducted to establish regional background concentrations for TAL metals and PAHs in soil and for TAL metals in surface water and sediment for comparison to measured site concentrations. A comparison was conducted to determine whether metals and PAH concentrations in onsite soil and metals concentrations in onsite surface water and sediment were consistent with or above background concentrations. Background samples were collected from the following locations:

- ISM surface soil samples from 8 background DUs (BADU-1 through BADU-8), established in Bear Mountain State Park); subsurface soil samples were not collected due to the shallow depth to refusal (less than 12 in. bgs) in each DU (**Figure 3-2**)

- Discrete surface water samples from 40 locations at Con Hook, including 20 locations along the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20) and 20 locations along the Con Hook marsh shoreline (CHMS-SW-01 through CHMS-SW-20) (**Figure 3-7**)

- ISM sediment samples from 2 sediment DUs established at Con Hook, each comprised of 8 SUs, including one DU along the Con Hook Hudson River shoreline (CHHRS-SU-01 through CHHRS-SU-08) and one DU along the Con Hook marsh shoreline (CHMS-SU-01 through CHMS-SU-08) (**Figure 3-7**).

Analytical results for background samples are presented in the following tables:

- **Table 6-14**: background soil metals and PAHs

- **Table 6-15**: background surface water metals

- **Table 6-16**: background surface water sediment.

A summary of analyte concentration ranges for each media is presented in **Table 6-17**.

6.2.1 Background Comparison Methods

Permutation test of means (Student t-Test with adjusted p-value) at the 95%UCLwas used to evaluate whether onsite soil metals and PAH concentrations and onsite sediment metals concentrations exceeded background concentration ranges. A quantitative statistical approach (statistical hypothesis tests) was used to evaluate whether onsite surface water metals concentrations exceeded background concentration ranges. The difference between mean onsite

and background concentrations of metals and PAHs in soil was evaluated with a permutation test. The null hypothesis that the onsite mean does not exceed the background mean was tested at the 95% significance level using p-values adjusted with the Benjamini-Hochberg procedure to control the false discovery error rate. These methods are detailed in the subsections below.

6.2.1.1 Permutation Test of Means (Soil and Sediment)

Permutation tests are a subset of nonparametric statistics. The two-sample permutation test of means is similar to a t-test in that it evaluates the difference between two group means, but in contrast to a t-test, the permutation test does not require that the data from each group follow a normal distribution or that the two groups have the same variance. For this reason, the permutation test is suitable for evaluating both small datasets and non-normal data distributions. Also, this permutation test does not require that the distribution of the two data groups have the same shape in order to be a central value test as does the commonly used Wilcoxon rank sum test.

The permutation test assumes only that the data from the two are "exchangeable" when the null hypothesis is true. For a two-sample permutation test of means, the test statistic is the observed difference in the two group means (i.e., site versus background). If the null hypothesis is true, the group assignment is arbitrary, as there is no difference in the means and the data in essence come from the same population. Therefore, the data are randomly rearranged regardless of group assignment to produce a different set of group means in each rearrangement. The difference in group means is computed and stored after each rearrangement, and this process is repeated for either all possible rearrangements (if possible) or several thousand permutations for larger data sets. The proportion of differences from the rearrangements that equal or exceed the one observed difference from the original data is the permutation p-value of the test (Helsel et al. 2020).

Metals and PAH concentrations in onsite surface and subsurface soil were compared to metals and PAH concentrations in background surface soil collected from Bear Mountain State Park (BADU-01 through BADU-08). Background comparisons for sediment were conducted for each depositional environment (Hudson River shoreline and marsh shoreline). Samples collected along the Hudson River shoreline at Iona Island (IHRS-DU-01) were compared to background samples collected along the Hudson River shoreline at Con Hook (CHHRS-SU-01 through CHHRS-SU-08). Samples collected along the Iona Marsh shoreline at the outlets of the riprap filled drainage swale (RRDS-DU-01) and tidal wetland swale (TWS-DU-01) were compared to background samples collected along the Con Hook Marsh shoreline (CHMS-SU-01 through CHMS-SU-08).

Concentrations for contaminants within each DU for soil and sediment were compared to background concentrations using a two-sample hypothesis test with the following null hypothesis. For each test, 10,000 permutation resamples were used to yield a stable p-value.

$$\text{Null hypothesis } (H_0)\text{: Site} \leq = \text{Background}$$
$$\text{Alternative hypothesis } (H_a)\text{: Site} > \text{Background.}$$

Permutation test data are presented in **Appendix F**. Results of permutation testing are discussed in Section 6.2.2 of this RI report.

6.2.1.2 Statistical Hypothesis Tests (Surface Water)

Statistical hypothesis tests using the two-sample hypothesis test described in Section 6.2.1.2 of this RI report was used to compare onsite and background metals concentrations in surface water. Mean concentrations from each onsite surface water area (AOC #16 – Area D [Former Dump Area], Iona Island Hudson River shoreline [IHRS], and Iona Marsh shoreline at the outlets of the riprap filled drainage swale [RRDS] and tidal wetland swale [TWS]) were compared to mean background concentrations from Con Hook (Con Hook Hudson River shoreline [CHHRS] and Con Hook Marsh shoreline [CHMS]) as follows:

- Mean concentrations for AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20) were compared to mean concentrations from both the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20) and Con Hook Marsh shoreline (CHMS-SW-01 through CHMS-SW-20)

- Mean concentrations for the Iona Island Hudson River shoreline (IHRS-SW-01 through IHRS-SW-20) were compared to mean concentrations for the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20)

- Mean concentrations for the Iona Island Hudson River shoreline (IHRS-SW-01 through IHRS-SW-20) were compared to mean concentrations for the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20).

Statistical hypothesis test data are presented in **Appendix F**. Results of statistical hypothesis test testing are discussed in Section 6.2.2.6 of this RI report.

6.2.2 Background Comparison Results

The results of the permutation tests for soil and sediment and the statistical hypothesis tests for surface water are presented the following tables:

- **Table 6-18**: onsite soil

- **Table 6-19**: onsite surface water

- **Table 6-20**: onsite sediment.

Each table presents the analytes detected in each soil and sediment DU and each surface water area at concentrations that exceeded background. A discussion of analytes exceeding background in each media is presented in the subsections below.

6.2.2.1 Upland Surface Soil TAL Metals Background Exceedances

Upland soil metals concentrations exceeded background at each of the 15 DUs sampled for metals (DU-1 through DU-7 and DU-9 through DU-16). DU locations are presented in **Figure 3-1**. Concentrations of 15 metals analytes exceeded background, including antimony, arsenic, barium, cadmium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, thallium, and zinc (**Table 6-18)**. The number and types of metals analytes exceeding background varied between DUs as presented in the list below.

- DU-1: 10 metals analytes (arsenic, barium, cadmium, calcium, cobalt, magnesium, manganese, potassium, sodium, zinc)
- DU-2: 12 metals analytes (arsenic, barium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-3: 12 metals analytes (arsenic, barium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-4: 13 metals analytes (antimony, arsenic, barium, cadmium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-5: 11 metals analytes (arsenic, barium, calcium, cobalt, iron, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-6: 12 metals analytes (arsenic, barium, cadmium, calcium, cobalt, copper, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-7: 13 metals analytes (arsenic, barium, cadmium, calcium, copper, iron, lead, magnesium, manganese, potassium, sodium, thallium, zinc)
- DU-9: 9 metals analytes (barium, calcium, cobalt, copper, magnesium, manganese, potassium, sodium, zinc)
- DU-10: 8 metals analytes (barium, calcium, cobalt, copper, magnesium, manganese, potassium, sodium)
- DU-11: 13 metals analytes (arsenic, barium, cadmium, calcium, cobalt, copper, lead, magnesium, manganese, potassium, sodium, thallium, zinc)
- DU-12: 12 metals analytes (arsenic, barium, cadmium, calcium, cobalt, copper, lead, magnesium, manganese, potassium, sodium, zinc)
- DU-13: 14 metals analytes (antimony, arsenic, barium, cadmium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, zinc)

- DU-14: 11 metals analytes (arsenic, barium, cadmium, calcium, cobalt, lead, magnesium, manganese, potassium, sodium, zinc)

- DU-15: 12 metals analytes (barium, cadmium, calcium, cobalt, copper, iron, lead, magnesium, manganese, potassium, sodium, zinc)

- DU-16: 11 metals analytes (barium, cadmium, calcium, cobalt, copper, iron, magnesium, manganese, potassium, sodium, zinc).

6.2.2.2 Upland Surface Soil PAH Background Exceedances

Upland soil PAHs concentrations exceeded background at 7 of the 12 DUs sampled for PAHs (DU-2, DU-4, DU-11, DU-12, DU-13, DU-16, and DU-22). DU locations are presented in **Figure 3-1**. Concentrations of 18 PAHs exceeded background, including 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene (**Table 6-18**). The number and types of PAH analytes exceeding background varied between DUs as presented in the list below.

- DU-2: 18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-c,d]pyrene, naphthalene, phenanthrene, pyrene)

- DU-4: 16 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, indeno[1,2,3-c,d]pyrene, naphthalene, phenanthrene, pyrene)

- DU-11: 13 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, indeno[1,2,3-c,d]pyrene, naphthalene)

- DU-12: 17 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-c,d]pyrene, naphthalene, phenanthrene, pyrene)

- DU-13: 18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-c,d]pyrene, naphthalene, phenanthrene, pyrene)

- DU-16: 11 metals analytes (barium, cadmium, calcium, cobalt, copper, iron, magnesium, manganese, potassium, sodium, zinc)

- DU-22: 18 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, fluorene, indeno[1,2,3-c,d]pyrene, naphthalene, phenanthrene, pyrene).

6.2.2.3 Upland Subsurface Soil PAH Background Exceedances

Upland subsurface soil PAH concentrations were consistent with or below background at both DUs sampled for PAHs (DU-20 and DU-21) (**Table 6-18**).

6.2.2.4 AOC #16 – Area D (Former Dump Area) Soil TAL Metals Background Exceedances

Metals concentrations in surface and subsurface soil exceeded background at each of the three DUs encompassing AOC #16 – Area D (Former Dump Area) (DU-17, DU-18, and DU-19) (**Table 6-18)**. DU locations are presented in **Figure 3-1**. Concentrations of 18 metals analytes exceeded background in surface soil, while concentrations of 23 metals analytes exceeded background in subsurface soil as presented in the list below.

- Surface soil: aluminum, antimony, arsenic, barium, cadmium, calcium, total chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, potassium, silver, sodium, and zinc

- Subsurface soil: aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, total chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc.

The number and types of metals analytes exceeding background in surface and subsurface soil varied between DUs as presented in the list below.

- DU-17 surface soil: 13 metals analytes (antimony, barium, cadmium, calcium, copper, lead, magnesium, manganese, mercury, potassium, silver, sodium, zinc)

- DU-17 subsurface soil: 15 metals analytes (antimony, arsenic, barium, beryllium, cadmium, calcium, copper, iron, lead, magnesium, mercury, selenium, sodium, thallium, zinc)

- DU-18 surface soil: 17 metals analytes (antimony, arsenic, barium, cadmium, calcium, chromium [total], cobalt, copper, iron, lead, magnesium, manganese, mercury, potassium, silver, sodium, zinc)

- DU-18 subsurface soil: 17 metals analytes (antimony, arsenic, barium, cadmium, calcium, chromium [total], copper, iron, lead, magnesium, manganese, mercury, nickel, silver, sodium, thallium, zinc)

- DU-19 surface soil: 13 metals analytes (aluminum, arsenic, barium, cadmium, calcium, cobalt, copper, iron, magnesium, manganese, potassium, sodium, zinc)

- DU-19 subsurface soil: 13 metals analytes (aluminum, arsenic, barium, cadmium, calcium, cobalt, copper, iron, magnesium, manganese, potassium, sodium, zinc).

6.2.2.5 AOC #16 – Area D (Former Dump Area) Soil PAH Background Exceedances

PAH concentrations in surface soil exceeded background at each of the three DUs encompassing AOC #16 – Area D (Former Dump Area) (DU-17, DU-18, and DU-19). In addition, PAH concentrations in subsurface soil exceeded background at background two of the three DUs (DU-17 and DU-18; PAH concentrations at DU-19 were below background) (**Table 6-18)**. DU locations are presented in **Figure 3-1**.

Concentrations of 14 PAH analytes exceeded background in surface soil, while concentrations of 8 PAH analytes exceeded background in subsurface soil as follows:

- Surface soil: 1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and naphthalene

- Subsurface soil: 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, anthracene, chrysene, fluorene, naphthalene, and phenanthrene.

The types of PAH analytes exceeding background varied between DUs in surface and subsurface soil. PAH analytes exceeding background in surface soil were as follows:

- DU-17 surface soil: 5 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, naphthalene)

- DU-17 subsurface soil: 4 PAH analytes (2-methylnaphthalene, acenaphthene, anthracene, naphthalene)

- DU-18 surface soil: 9 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, benzo[a]pyrene, benzo[b]fluoranthene, chrysene, dibenz[a,h]anthracene, naphthalene)

- DU-18 subsurface soil: 8 PAH analytes (1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, anthracene, chrysene, fluorene, naphthalene, phenanthrene)

- DU-19 surface soil: 13 PAH analytes (2-methylnaphthalene, acenaphthylene, anthracene, benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[g,h,i]perylene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, fluoranthene, indeno[1,2,3-c,d]pyrene, naphthalene)

- DU-19 subsurface soil: PAH concentrations below background.

6.2.2.6 Surface Water TAL Metals Background Exceedances

Surface water sampling areas and individual sample locations are presented in **Figure 3-5**. Concentrations of 9 metals analytes exceeded background, including arsenic, barium, total chromium, copper, magnesium, potassium, sodium, zinc (**Table 6-19**). The number and types of metals analytes exceeding background varied between each sampling area DUs as presented in the list below.

- AOC #16 – Area D (Former Dump Area) (DUMP-SW-01 through DUMP-SW-20): 2 metals analytes (copper and zinc) exceeded background concentrations from both the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20) and the Con Hook marsh shoreline (CHMS-SW-01 through CHMS-SW-20). While copper, magnesium, potassium, and sodium concentrations also exceeded background concentrations from the Con Hook Hudson River shoreline, concentrations were similar to or less than background concentrations from the Con Hook Marsh shoreline. As a result, the copper, magnesium, potassium, and sodium surface water concentrations are considered consistent with background.

- Iona Island Hudson River shoreline (IHRS-SW-01 through IHRS-SW-20): 6 metals analytes (arsenic, barium, copper, magnesium potassium, and sodium) exceeded background concentrations from the Con Hook Hudson River shoreline (CHHRS-SW-01 through CHHRS-SW-20).

- Iona Marsh shoreline at the outlet of the riprap filled drainage swale: (RRDS-SW-01 through RRDS-SW-20): 1 metals analyte (copper) exceeded background concentrations from the Con Hook marsh shoreline (CHMS-SW-01 through CHMS-SW-20).

- Iona Marsh shoreline at the outlet of the tidal wetland swale (TWS-SW-01 through TWS-SW-20: 2 metals analytes (total chromium and copper) exceeded background concentrations from the Con Hook marsh shoreline (CHMS-SW-01 through CHMS-SW-20).

6.2.2.7 Sediment TAL Metals Background Exceedances

Metals concentrations in sediment exceeded background each DU sampled (IHRS-DU-01, RRDS-DU-01, and TWS-DU-01) (**Table 6-20)**. Sediment background DU locations are presented in **Figure 3-6**. Concentrations of 14 metals analytes exceeded background, including

antimony, arsenic, barium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, nickel, silver, vanadium, and zinc (**Table 6-20**). Metals analytes exceeding background in each onsite sediment DU were as follows:

- IHRS-DU-01: 12 metals analytes (antimony, arsenic, barium, cadmium, total chromium, copper, iron, lead, nickel, silver, vanadium, and zinc) exceeded background concentrations from the Con Hook Hudson River shoreline (CHHRS-DU-01)

- RRDS-DU-01: 11 metals analytes (arsenic, barium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, nickel, and zinc) exceeded background concentrations from the Con Hook marsh shoreline (CHMS-DU-01)

- TWS-DU-01: 12 metals analytes (arsenic, barium, cadmium, total chromium, cobalt, copper, iron, lead, manganese, nickel, and zinc) exceeded background concentrations from the Con Hook marsh shoreline (CHMS-DU-01).

6.3 SITE CONTAMINANTS

Site contaminants include TAL metals and PAH analytes detected in onsite media at concentrations that exceed background, and PCBs and explosives residues in onsite soil detected during Phase I. These contaminants are assumed to be associated with former DoD activities. Site contaminants in each onsite media are presented in the following tables:

- **Table 6-21**: upland surface soil

- **Table 6-22**: AOC #16 – Area D (Former Dump Area) surface soil

- **Table 6-23**: AOC #16 – Area D (Former Dump Area) subsurface soil

- **Table 6-24**: surface water

- **Table 6-25**: sediment.

Site contaminants for each onsite soil and sediment DU and each surface water area are discussed in the subsections below. Note that types of contamination that may be eligible for DERP FUDS response include CERCLA hazardous substances or pollutants or contaminants, munitions constituent metals (lead, antimony, copper and zinc) and explosives residues.

Metals that are CERCLA hazardous substances under 40 CFR 302.4 include antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, sodium, thallium, and zinc (EPA 2024). Note that while sodium is considered a CERCLA hazardous metal (EPA 2024), sodium in environmental media at the Site is not assumed to be associated with historical DoD activities (i.e., not used or released during historical DoD use of the Site).

The full TAL metals list includes metals that are not listed as CERCLA hazardous substances in 40 CFR 302.4, including aluminum, barium, calcium, cobalt, iron, magnesium, manganese, potassium, and vanadium. These metals were included in the RI investigation to help evaluate geochemistry and support development of risk assessments. While these metals are presented in **Table 6-21** through **Table 6-25**, they are not discussed in the subsections below. Although aluminum, barium, cobalt, manganese, and vanadium are included on the EPA "List of Lists" as Emergency Planning and Community Right-to-Know Act (EPCRA) Section 313 Toxic Chemicals (aka Toxic Release Inventory Chemicals), these metals are not CERCLA hazardous substances therefore are not eligible for DERP FUDS response[5]. Calcium, magnesium, iron, and potassium, which are not included on the EPA "List of Lists", are essential nutrients for metabolic processes in organisms, which can regulate uptake and metabolism of these metals at naturally occurring concentrations.

6.3.1 Onsite Upland Surface Soil Contaminants

Upland surface soil contaminant groups include CERCLA hazardous metals, PAHs, PCBs and explosives residues as presented in **Figure 6-1** and discussed in the subsections below.

6.3.1.1 Upland Surface Soil CERCLA Hazardous Metals Contaminants

CERCLA hazardous metals contaminants present in upland surface soil include antimony, arsenic, cadmium, copper, lead, sodium, thallium, and zinc. Two or more CERCLA hazardous metals were identified as contaminants in surface soil at each of the 15 upland DUs sampled for metals (DU-1 through DU-7 and DU-9 through DU-16) (**Figure 6-1** and **Table 6-21)**. Locations and concentrations of each CERCLA hazardous metals in upland surface soil are presented in the list below.

- Antimony at 3 DUs, including DU-4 (1.5 to 2.1 mg/kg) and DU-13 (1.2 to 2.5 mg/kg)
- Arsenic at 11 DUs (DU-1 through DU-7 and DU-11 through DU-14), with concentrations ranging from 6.5 mg/kg at DU-10 to 43 mg/kg at DU-11
- Cadmium at 10 DUs (DU-1, DU-4, DU-6, DU-7, and DU-11 through DU-16), with concentrations ranging from 0.33 mg/kg at DU-12 to 1.1 mg/kg at DU-4

[5] The EPA "List of Lists" is a consolidated list of chemicals subject Emergency Planning and Community Right-to-Know Act (EPCRA); CERCLA); and Section 112(r) of the Clean Air Act. It was prepared to help facilities handling chemicals determine, for a specific chemical, whether they may be subject to certain reporting requirements. The "List of Lists" is used as a reference tool, not as a definitive source of compliance information.

- Copper at 11 DUs (DU-2, DU-3, DU-4, DU-6, DU-7, DU-9, DU-11, DU-12, DU-13, DU-15, and DU-16), with concentrations ranging from 5.6 mg/kg at DU-7 to 600 mg/kg at DU-13

- Lead at 11 DUs (DU-2 through DU-7 and DU-11 through DU-15), with concentrations ranging from 72 mg/kg at DU-6 to 2,000 mg/kg at DU-11

- Sodium at each of the 15 DUs exceeding background (34 to 63 mg/kg), with concentrations at onsite DUs ranging from 56 mg/kg at DU-11 to 440 mg/kg at DU-16

- Thallium at 2 DUs, including DU-7 (0.19 to 0.21 mg/kg) and DU-11 (0.19 to 0.22 mg/kg)

- Zinc at 14 DUs (DU-1 through DU-7, DU-9, and DU-11 through DU-16), with concentrations ranging from 56 mg/kg at DU-6 to 280 mg/kg at DU-4.

6.3.1.2 Upland Surface Soil PAH Contaminants

PAH contaminants present in upland surface soil include 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-c,d)pyrene, naphthalene, phenanthrene, and pyrene. Between 4 and 18 PAH analytes were identified as contaminants in surface soil at 7 of the 12 DUs sampled for PAHs (DU-2, DU-4, DU-11, DU-12, DU-13, DU-16, and DU-22). (**Figure 6-1** and **Table 6-21)**. Locations and concentrations of each PAH contaminant in upland surface soil are presented in the list below.

- 1-methylnaphthalene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from 0.021 mg/kg at DU-2 to an estimated 0.45 mg/kg at DU-13

- 2-methylnaphthalene at each of the 7 DUs, with concentrations ranging from an estimated 0.0082 mg/kg at DU-16 to an estimated 0.45 mg/kg at DU-13

- Acenaphthene at 5 of the 7 DUs (DU-2, DU-12, DU-13, DU-16, and DU-22), with concentrations ranging from an estimated 0.036 mg/kg at DU-16 to an estimated 4.7 mg/kg at DU-13

- Acenaphthylene at 5 of the 7 DUs (DU-2, DU-4, DU-11, DU-13, and DU-22), with concentrations ranging from 0.09 mg/kg at DU-2 to an estimated 1.3 mg/kg at DU-13

- Anthracene at each of the 7 DUs, with concentrations ranging from 0.063 mg/kg at DU-16 to an estimated 8 mg/kg at DU-13

- Benzo(a)anthracene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.89 mg/kg at DU-4 to an estimated 17 mg/kg at DU-13

- Benzo(a)pyrene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.75 mg/kg at DU-11 to an estimated 13 mg/kg at DU-13

- Benzo(b)fluoranthene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 1.1 mg/kg at DU-17 to an estimated 13 mg/kg at DU-13

- Benzo(g,h,i)perylene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from 0.64 mg/kg at DU-22 to an estimated 7.9 mg/kg at DU-13

- Benzo(k)fluoranthene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.36 mg/kg at DU-11 to an estimated 7.4 mg/kg at DU-13

- Chrysene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.75 mg/kg at DU-11 to an estimated 16 mg/kg at DU-13

- Dibenz(a,h)anthracene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.16 mg/kg at DU-11 to an estimated 2.4 mg/kg at DU-13

- Fluoranthene at 5 of the 7 DUs (DU-2, DU-4, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 1.3 mg/kg at DU-11 to an estimated 38 mg/kg at DU-13

- Fluorene at 4 of the 7 DUs (DU-2, DU-12, DU-13, and DU-22), with concentrations ranging from 0.069 mg/kg at DU-22 to an estimated 3.9 mg/kg at DU-13

- Indeno(1,2,3-c,d)pyrene at 6 of the 7 DUs (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-22), with concentrations ranging from 0.73 mg/kg at DU-22 to an estimated 9.2 mg/kg at DU-13

- Naphthalene at each of the 7 DUs, with concentrations ranging from 0.012 mg/kg at DU-16 to an estimated 1.1 mg/kg at DU-13

- Phenanthrene at 5 of the 7 DUs (DU-2, DU-4, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 0.46 mg/kg at DU-4 to an estimated 27 mg/kg at DU-13
- Pyrene at 5 of the 7 DUs (DU-2, DU-4, DU-12, DU-13, and DU-22), with concentrations ranging from an estimated 1.3 mg/kg at DU-4 to an estimated 30 mg/kg at DU-13.

Note that DU-2 and DU-11 were investigated owing to former coal storage activities. Surface soil PAH detections within these DUs associated with former coal storage areas may be owing to coal particles. Coal particles were not observed in the soil from DU-2 and DU-11 during completion of RI field activities. However, onsite soil was significantly reworked and removed during demolition of former structures between November 1965 and December 1973 and excavation and regrading following demolition. Contaminants including particles of coal remaining from coal storage areas present in surface soil were likely spread over much of the operational area. PAH detections owing to particles of coal are not addressed under CERCLA as coal is considered a product rather than a hazardous waste. No remedial actions are warranted owing to PAH detections from coal particles. However, PAHs released from coal particles and absorbed on to (e.g., subsurface) soils would be actionable under CERCLA.

6.3.1.3 Upland Soil PCB Contaminants

PCB contaminants in upland surface soil include PCB-1260 and total PCBs at DU-23 and DU-25 (**Figure 6-1** and **Table 6-21**). Trace concentrations of PCB-1260 and total PCBs ranged from 0.019 to 0.034 mg/kg at DU-23 and 0.011 to 0.016 mg/kg at DU-25.

6.3.1.4 Upland Soil Explosives Residue Contaminants

Explosive residue contaminants in upland soil include 1,3,5-trinitrobenzene, 1,3-dinitrobenzene, 2,4,6-trinitrotoluene, and 2,4-dinitrotoluene at EXDU-1 only (**Figure 6-1 and Table 6-21**). Trace concentrations in surface soil at EXDU-1 are presented in the list below.

- 1,3,5-trinitrobenzene: estimated 0.029 mg/kg
- 1,3-dinitrobenzene: estimated 0.038 to 0.051 mg/kg
- 2,4,6-trinitrotoluene: estimated 0.21 to 0.37 mg/kg
- 2,4-dinitrotoluene: estimated 0.063 to 0.22 mg/kg.

6.3.2 AOC #16 – Area D (Former Dump Area) Soil Contaminants

Contaminant groups in surface and subsurface soil at AOC #16 – Area D (Former Dump Area) include the following:

- Surface soil: CERCLA hazardous metals, PAHs, and PCBs at each DU (DU-17, DU-18, and DU-19) (**Figure 6-1**)

- Subsurface soil: CERCLA hazardous metals at each DU, PAHs at 2 of 3 DUs (DU-17 and DU-18), and PCBs at 2 of 3 DUs (DU-18 and DU-19) (**Figure 6-2**).

The range of contaminant concentrations in surface soil at each DU encompassing AOC #16 – Area D (Former Dump Area) is presented in **Table 6-22** for surface soil **and Table 6-23** for subsurface soil.

6.3.2.1 AOC #16 – Area D (Former Dump Area) CERCLA Hazardous Metals Contaminants

CERCLA hazardous metals contaminants present in surface and subsurface soil at AOC #16 – Area D (Former Dump Area) include the following:

- Surface soil: antimony, arsenic, cadmium, total chromium, copper, lead, mercury, silver, sodium, and zinc

- Subsurface soil: antimony, arsenic, beryllium, cadmium, total chromium, copper, lead, mercury, nickel, silver, sodium, thallium, and zinc.

Between 6 and 10 CERCLA hazardous metals analytes were identified as contaminants in surface soil at each of the 3 DUs encompassing AOC #16 – Area D (Former Dump Area) (DU-17 through DU-19) (**Figure 6-1** and **Table 6-22**). Between 5 and 13 CERCLA hazardous metals analytes were identified as contaminants in subsurface soil at each of the 3 DUs encompassing AOC #16 – Area D (Former Dump Area) (DU-17 through DU-19) (**Figure 6-2** and **Table 6-23**). Locations and concentrations of each CERCLA hazardous metals contaminant in surface and subsurface soil are presented in the list below.

- Antimony in surface and subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 6.2 to 9.9 mg/kg while concentrations in subsurface soil ranged from 4.4 to 13 mg/kg

- Arsenic in surface soil from DU-18 and DU-19 and in subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 6.8 to 15 mg/kg while concentrations in subsurface soil ranged from 16 to 25 mg/kg

- Beryllium in subsurface soil from DU-17, with concentrations ranging from 1.2 to 1.5 mg/kg

- Cadmium in surface soil at each DU and in subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.25 to 20 mg/kg while concentrations in subsurface soil ranged from 3.2 to 24 mg/kg

- Total chromium in surface and subsurface soil from DU-18; concentrations in surface soil ranged from 14 to 240 mg/kg while concentrations in subsurface soil ranged from 29 to 33 mg/kg

- Copper in surface and subsurface soil at each DU; concentrations in surface soil ranged from 83 to 1,700 mg/kg while concentrations in subsurface soil ranged from 130 to 5,600 mg/kg

- Lead in surface and subsurface soil from DU-17 and DU-18); concentrations in surface soil ranged from 1,200 to 2,900 mg/kg while concentrations in subsurface soil ranged from 820 to 2,900 mg/kg

- Mercury in surface and subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.61 to 4.3 mg/kg while concentrations in subsurface soil ranged from 0.71 to 0.21 mg/kg

- Nickel in subsurface soil from DU-18, with concentrations ranging from 52 to 79 mg/kg

- Selenium in subsurface soil from DU-17, with concentrations ranging from 1.1 to 1.5 mg/kg

- Silver in surface soil from DU-17 and DU-18 and in subsurface soil from DU-18; concentrations in surface soil ranged from 0.56 to 0.92 mg/kg while concentrations in subsurface soil ranged from 0.83 to 2.1 mg/kg

- Sodium surface and subsurface soil at each DU; concentrations in surface soil ranged from 370 to 810 mg/kg, while concentrations in subsurface soil ranged from 420 to 3,400 mg/kg

- Thallium in subsurface soil from DU-17 and DU-18, with concentrations ranging from 0.27 to 0.8 mg/kg

- Zinc in surface and subsurface soil at each DU; concentrations in surface soil ranged from 83 to 8,200 mg/kg while concentrations in subsurface soil ranged from 60 to 5,600 mg/kg.

6.3.2.2 AOC #16 – Area D (Former Dump Area) PAH Contaminants

PAH contaminants present in surface and subsurface soil at AOC #16 – Area D (Former Dump Area) include the following:

- Surface soil: 1-methylnaphthalene, 2-methylnaphthalene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene,

benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and naphthalene

- Subsurface soil: 1-methylnaphthalene, 2-methylnaphthalene, acenaphthene, anthracene, chrysene, fluorene, naphthalene, and phenanthrene.

Between 5 and 13 PAH analytes were identified as contaminants at each of the 3 DUs encompassing AOC #16 – Area D (Former Dump Area) (DU-17 through DU-19) (**Figure 6-1** and **Table 6-22**). The number of PAH analytes identified as contaminants in subsurface soil ranged from 4 analytes at DU-17 to 8 analytes at DU-18 (**Figure 6-2** and **Table 6-23**). No PAH analytes were identified as contaminants in subsurface soil at DU-19.

Locations and concentrations of each PAH contaminant in surface and subsurface soil are presented in the list below.

- 1-methylnaphthalene in surface and subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.026 to 0.041 mg/kg while concentrations in subsurface soil ranged from 0.08 to 0.11 mg/kg

- 2-methylnaphthalene in surface soil at each DU and in subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.018 to 0.072 mg/kg while concentrations in subsurface soil ranged from 0.095 to 0.16 mg/kg

- Acenaphthene in subsurface soil from DU-18, with concentrations ranging from 0.18 to 0.23 mg/kg

- Acenaphthylene in surface soil at each DU, with concentrations ranging from 0.059 to 0.27 mg/kg

- Anthracene in surface soil at each DU and in subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.13 to 0.43 mg/kg while concentrations in subsurface soil ranged from 0.081 to 0.23 mg/kg

- Benzo(a)anthracene in surface soil from DU-19, with concentrations ranging from 1.1 to 2.5 mg/kg

- Benzo(a)pyrene in surface soil from DU-18 and DU-19, with concentrations ranging from 0.44 to 1.9 mg/kg

- Benzo(b)fluoranthene in surface soil from DU-18 and DU-19, with concentrations ranging from 0.86 to 3.4 mg/kg

- Benzo(g,h,i)perylene in surface soil from DU-19, with concentrations ranging from 0.55 to 1.1 mg/kg

- Benzo(k)fluoranthene in surface soil from DU-19, with concentrations ranging from 0.59 to 1.2 mg/kg

- Chrysene in surface soil from DU-18 and DU-19 and in subsurface soil from DU-18; concentrations in surface soil ranged from 0.86 to 2.3 mg/kg while concentrations in subsurface soil ranged from 0.65 to 1.7 mg/kg

- Dibenz(a,h)anthracene in surface soil from DU-18 and DU-19, with concentrations ranging from 0.11 to 0.41 mg/kg

- Fluoranthene in surface soil from DU-19, with concentrations ranging from 1.6 to 4 mg/kg

- Fluorene in subsurface soil from DU-18, with concentrations ranging from 0.14 to 0.16 mg/kg

- Indeno(1,2,3-c,d)pyrene in surface soil from DU-19, with concentrations ranging from 0.77 to 1.5 mg/kg

- Naphthalene in surface soil at each DU and in subsurface soil from DU-17 and DU-18; concentrations in surface soil ranged from 0.046 to 0.24 mg/kg while concentrations in subsurface soil ranged from 0.2 to 0.71 mg/kg

- Phenanthrene in subsurface soil from DU-18, with concentrations ranging from 0.66 to 1.4 mg/kg.

6.3.2.3 AOC #16 – Area D (Former Dump Area) PCB Contaminants

PCB contaminants in surface and subsurface soil at AOC #16 – Area D (Former Dump Area) include the following (**Figure 6-1** and **Figure 6-2**):

- Surface soil: Aroclor-1248 and Aroclor-1260

- Subsurface soil: Aroclor-1260 and Aroclor-1262.

Locations and concentrations of each PCB contaminant in surface and subsurface soil are presented in the list below (**Table 6-22** and **Table 6-23**).

- Aroclor-1248 in surface soil from DU-17 and DU-18, with concentrations ranging from 0.84 to an estimated 0.14 mg/kg

- Aroclor-1260 in surface soil at each DU and in subsurface soil from DU-19; estimated concentrations in surface soil ranged from 0.0022 to 0.25 mg/kg while estimated concentrations in subsurface soil ranged from 0.049 to 0.054 mg/kg

- Aroclor-1262 in subsurface soil from DU-18, with estimated concentrations ranging from 0.057 to 0.15 mg/kg.

6.3.3 Surface Water Contaminants

CERCLA hazardous metals contaminants in surface water include arsenic, total chromium, copper, sodium, zinc (EPA 2024). The number of CERCLA hazardous metals analytes identified as contaminants in each surface water area investigated during Phase II ranged from one analyte in surface water from Iona Marsh at the outlet of the riprap filled drainage swale to three analytes in surface water from the Hudson River shoreline adjacent to AOC #16 – Area D (**Table 6-24**). Locations and concentrations of each CERCLA hazardous metals in surface water are presented in the list below.

- Arsenic in surface water from the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area), with concentrations in each of the 20 samples collected (estimated [trace] concentrations ranging from 0.4 to 0.64 µg/L) exceeding the background concentration range from the Con Hook Hudson River shoreline (0.33-0.46 µg/L); however, note that all concentrations were within the range of background from the Con Hook marsh shoreline (0.38 to 2.7 µg/L)

- Total chromium in surface water from Iona Marsh at the outlet of the tidal wetland swale, with the concentration at TWS-SW-7 (estimated 0.690 µg/L) exceeding the background concentration range from the Con Hook marsh shoreline (0.5-0.64 µg/L)

- Copper in surface water at each area

  — AOC #16 – Area D (Former Dump Area): while concentrations in 19 of the 20 samples collected (excluding DUMP-SW-06) (ranging from an estimated [trace] 1.60 to 7.10 µg/L) exceeded the background concentration range from the Con Hook marsh shoreline (0.61 to 1.3 µg/L), concentrations in only 4 samples (DUMP-SW-05, DUMP-SW-10, DUMP-SW-15, and DUMP-SW-20) (ranging from 3.60 to 7.10 µg/L) exceeded the background concentration range from both the Con Hook Hudson River shoreline (0.95 to 3.4 µg/L)

  — Hudson River shoreline: concentrations in only 14 of 20 samples collected (IHRS-SW-01, IHRS -SW-03 through IHRS-SW-05, IHRS-SW-10 through IHRS-SW-16, and IHRS-SW-18 through IHRS-SW-20 (ranging from 3.4 to 11 µg/L) exceeded the background concentration range from the Con Hook Hudson River shoreline (0.95 to 3.4 µg/L)

  — Iona Marsh shoreline at the outlet of the riprap filled drainage swale: estimated (trace) concentrations in only 2 of 10 samples collected (RRDS-SW-06, and RRDS-SW-09) (1.4 µg/L each) exceeded the background concentration range from the Con Hook marsh shoreline (0.61 to 1.3 µg/L)

— Iona Marsh shoreline at the outlet of the tidal wetland swale: estimated (trace) concentrations in only 3 of 10 samples collected TWS-SW-07, TWS-SW-09, and TWS-SW-10) (ranging from 1.4 to 1.5 µg/L) exceeded the background concentration range from the Con Hook marsh shoreline (0.61 to 1.3 µg/L)

- Sodium in surface water from the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area), with concentrations in only 10 of 20 samples collected (IHRS-SW-01 and IHRS-SW-02 through IHRS-SW-20) (ranging from 19,000 to 34,000 µg/L) exceeded the background concentration range from the Con Hook Hudson River shoreline (15,000 to 18,000 µg/L); however, note that all concentrations were within or below the range of background concentrations from the Con Hook marsh shoreline (17,000 to 110,000 µg/L)

- Zinc in surface water from AOC #16 – Area D (Former Dump Area), with concentrations in only 4 of 20 samples collected (DUMP-SW-2, DUMP-SW-3, DUMP-SW-10, and DUMP-SW-20 (ranging from an estimated 11 to 44 µg/L) exceeding the background concentration range from the Con Hook marsh shoreline (2 to 8 µg/L); however, note that all concentrations were within the range of background concentrations from the Con Hook Hudson River shoreline (3 to 90 µg/L).

6.3.4 Sediment Contaminants

CERCLA hazardous metals contaminants present in sediment include antimony, arsenic, cadmium, total chromium, copper, lead, nickel, silver, and zinc (EPA 2024). The number of CERCLA hazardous metals analytes identified as contaminants in each sediment DU ranged from seven analytes in each DU established in Iona Marsh (RRDS-DU-01 and TWS-DU-01) to nine analytes in the DU established along the Hudson River shoreline adjacent to AOC #16 – Area D (IHRS-DU-01) (**Table 6-25**). Locations and concentrations of each CERCLA hazardous metals contaminant in sediment are presented in the list below.

- Antimony at IHRS-DU-01, with concentrations ranging from 89 to 110 mg/kg

- Arsenic at each DU, with concentrations ranging from 32 to 35 mg/kg in sediment collected from IHRS-DU-01; 9.4 to 9.7 in sediment collected from RRDS-DU-01, and 8 to 9.3 mg/kg in sediment collected from TWS-DU-01

- Cadmium at each DU, with concentrations ranging from 8.9 to 9.6 mg/kg in sediment collected from IHRS-DU-01; 0.91 to 0.96 in sediment collected from RRDS-DU-01, and 0.84 to 2.2 mg/kg in sediment collected from TWS-DU-01

- Total chromium at each DU, with concentrations ranging from 130 to 150 mg/kg in sediment collected from IHRS-DU-01; 40 to 43 in sediment collected from RRDS-DU-01, and 41 to 43 mg/kg in sediment collected from TWS-DU-01

- Copper at each DU, with concentrations ranging from 4,600 to 7,600 mg/kg in sediment collected from IHRS-DU-01; 51 to 58 in sediment collected from RRDS-DU-01, and 55 to 72 mg/kg in sediment collected from TWS-DU-01

- Lead at each DU, with concentrations ranging from 7,700 to 14,000 mg/kg in sediment collected from IHRS-DU-01; 56 to 67 in sediment collected from RRDS-DU-01, and 65 to 97 mg/kg in sediment collected from TWS-DU-01

- Nickel at each DU, with concentrations ranging from 69 to 110 mg/kg in sediment collected from IHRS-DU-01; 34 mg/kg in sediment collected from RRDS-DU-01, and 31 to 35 mg/kg in sediment collected from TWS-DU-01

- Silver at IHRS-DU-01, with concentrations ranging from 1 to 2 mg/kg

- Zinc at each DU, with concentrations ranging from 3,600 to 3,800 mg/kg in sediment collected from IHRS-DU-01; 190 to 200 mg/kg in sediment collected from RRDS-DU-01, and 230 to 990 mg/kg in sediment collected from TWS-DU-01

6.4 CONTAMINANT EXTENT IN ONSITE MEDIA

The extent of contaminants identified in each onsite media (upland surface soil, AOC #16 – Area D [Former Dump Area] surface and subsurface soil, surface water, and sediment) is discussed in the subsections below.

6.4.1 Contaminant Extent in Upland Soil

The upland terrestrial environment of Iona Island where upland soil is present was investigated through sampling of 27 DUs (DU-1 through DU-7, DU-9 through DU-16, DU-20 through DU-23, DU-25, and EXDU-1 through EXDU-7) encompassing approximately 25 acres. DU locations are presented in **Figure 3-1**. Surface soil at upland DUs was sampled for analysis of TAL metals, PAHs, PCBs, and/or explosives residue during previous investigation. Based on these previous studies contaminants were identified for each AOC (**Table 1-1** and Section 3.1.2.1 of this RI report). Site contaminants identified in upland surface soil included CERCLA hazardous metals, PAHs, PCBs, and explosives residues as presented in Section 6.3.1 of this RI report. The extent of contaminants identified in upland soil surface is further discussed in the subsections below.

The majority of soil cover across Iona Island is shallow (<12 inches depth). Exposed and shallow bedrock and hardscape was encountered across the majority of the site. Due to shallow soil cover and shallow depth to refusal, subsurface soils were only collected from two upland DUs (DU-20 and DU-21). Upland subsurface soil was sampled for BTEX and PAHs. No contaminants were identified in upland subsurface soil sampled during this RI.

6.4.1.1 Extent of CERCLA Hazardous Metals Extent in Upland Soil

Phase I results identified widespread, elevated concentrations of metals in surface soil (0–6 in. bgs) throughout the upland area of Iona Island, with 2 or more CERCLA hazardous metals in surface soil at each of the 15 upland DUs sampled for metals during this RI (**Figure 6-1** and **Table 6-21**). Each of the 15 upland DUs encompassed approximately 1 acre (200 x 200 ft) in area, for a total of 15 acres of metals-impacted soil. The depth to bedrock within these 15 upland DUs ranged from approximately 2 in. bgs at DU-13 to 12 in. bgs at DU-4, DU-11, DU-16, and DU-16. Subsurface soil was not sampled at these DUs due to the shallow depth to bedrock.

The highest concentrations of CERCLA hazardous metals in Phase I upland surface soil were detected at DU-4 (copper and zinc), DU-7 (lead), and DU-11 (arsenic). DU-4 and DU-7 were established to evaluate potential contamination in soil at previous SI sampling locations (II-EA-SD-02-01 at DU-4 and II-EA-SS-02-08 at DU-7), which had elevated concentrations of metals (Alion 2008) (which had elevated concentrations of antimony, copper, lead, mercury, and/or zinc) (**Figure 3-1**). DU-11 was established to evaluate potential contamination in soil at and in the vicinity of AOC #18 – Area F (Former Coal Storage Area).

6.4.1.2 Extent of PAHs in Upland Soil

Phase I results identified PAH impacts in upland surface soil at 7 upland DUs, including five DUs sized at approximately 1-acre each (200 ft x 200 ft) (DU-2, DU-4, DU-11, DU-12, DU-13, and DU-16), and one DU sized at 60 x 60 ft (DU-22) (**Figure 6-1** and **Table 6-21**). The highest concentrations of PAHs in upland surface soil were reported at DU-13, established to evaluate AOC #1 – Former Building 103 (Paint and Oil Storage. DU locations are presented in **Figure 3-1**.

Subsurface soil was not sampled at DU-2, DU-4, DU-11, DU-12, DU-13, and DU-16 due to the shallow depth to refusal. The depth to refusal within these DUs ranged from approximately 2 in. bgs at DU-12 to 12 in. bgs at DU-4 and DU-11. Upland subsurface soil was only collected from DU-20 and DU-21 during this RI. PAH concentrations in both surface and subsurface soil at these DUs were below background. In addition, PAH concentrations at these DUs decreased overall with depth (**Table 6-3**).

6.4.1.3 Extent of PCBs in Upland Soil

Phase I results identified PCB impacts (trace concentrations) in surface soil at DU-23 and DU-25 (**Table 6-21** and **Figure 6-1**). DU-23 was a 60 x 60-ft DUs established to evaluate the presence/absence of PCBs at former Transformer T1 located northwest of Building 406. DU-25 was a 60 x 60-ft DUs established to evaluate the presence/absence of PCBs at former Transformer T3 northeast of Building 220. Subsurface soil was not sampled at DU-23 and DU-25 due to the shallow depth to bedrock (approximately 6 in. bgs at DU-23 and 8 in. bgs at DU-25).

6.4.1.4 Extent of Explosives Residues in Upland Soil

Explosive residue detections in surface soil at former explosive storage and filling operations building locations were limited to EXDU-1 **(Table 6-21** and **Figure 3-1)**. This DU encompassed approximately one acre (200 ft x 200 ft) and was established to evaluate the presence or absence of residual explosives contamination in surface soil from Building 609 – Mine Loading Plant. Subsurface soil samples were collected from EXDU-1. Most of the DU consisted of exposed bedrock, with thin soil cover in the eastern portion of the DU only. The western portion of the DU consisted of a bedrock cliff.

6.4.2 Contaminant Extent in AOC #16 – Area D (Former Dump Area) Soil

AOC #16 – Area D (Former Dump Area) encompasses approximately 0.85 acres and is confined to the low-lying marsh area between Round Island to the southeast and Iona Island to the northwest that is inundated with water twice daily during high tide and during storm events (**Figure 6-3**). The northeastern boundary of AOC #16 – Area D (Former Dump Area) is the Hudson River shoreline. A small sand and gravel beach (sediment) is located along the Hudson River shoreline at the northeastern edge of AOC #16 – Area D (Former Dump Area). The area southwest of AOC #16 – Area D (Former Dump Area) consists of marshland and fill material emplaced by PIPC following transfer of the FUDS from the Navy in 1965.

Concrete slabs, pipes, burned metal debris, and ash were noted in test pits excavated in AOC #16 – Area D (Former Dump Area) during the MMRP intrusive investigation (EA 2021). Burn pit material and debris (including ash and foundry sand) observed in the test pits potentially originates from a former incinerator (AOC #2: Former Building 121 – Incinerator) that was located near the Hudson River shoreline on the western edge of AOC #16 – Area D (Former Dump Area).

AOC #16 – Area D (Former Dump Area) was investigated through sampling of three DUs (DU-17, 18, and 19) encompassing the entire areal extent of AOC #16 – Area D (Former Dump Area). DU-17, DU-18, and DU-19 were each established at approximately 1 acre (200 x 200 ft). DU-17 encompassed the northwestern portion of AOC #16 – Area D (Former Dump Area) adjacent to Iona Island and the Hudson River shoreline. This DU also covered AOC #2: Former Building 121 – Incinerator. DU-18 encompassed the northeastern portion of AOC #16 – Area D (Former Dump Area) adjacent to Round Island and the Hudson River shoreline. DU-19 encompassed the southern portion of AOC #16 – Area D (Former Dump Area). Surface and subsurface soil samples were collected from DU-17, DU-18, and DU-19 during this RI, with a total of 3 acres sampled for analysis of TAL metals, mercury, PAHs, PCBs, and explosives residues. Site contaminants identified in surface and subsurface soil at DU-17, DU-18, and DU-19 included CERCLA hazardous metals, PAHs, and PCBs as presented in Section 6.3.2 of this RI report.

Refusal/bedrock was not encountered in AOC #16 – Area D (Former Dump Area) during this RI or during previous investigations (as discussed in Section 1.5 of this RI report). Borings advanced during this RI in DU-17, DU-18, and DU-19 within AOC #16 – Area D (Former Dump Area) were terminated at 3 ft bgs in accordance with the UFP-QAPP (EA 2020a), and borings

advanced during the 1998 Data Collection Activities were terminated at 2 ft bgs (Greeley-Polhemus 1997). Test pits excavated in AOC #16 – Area D (Former Dump Area) during the MMRP intrusive investigation could not go beyond 3 to 4 ft bgs inches due to test pits filling with water (EA 2021). Intrusive data from the MMRP RI indicated that the depth of disposal in the Dump Area is greater than 3 ft bgs in certain areas.

Based on bathymetry data, a shallow bedrock shelf extends out from AOC #16 – Area D (Former Dump Area) into the Hudson River (USACE New York District 2018 and NOAA NCEI 2022) (**Figure 1-6**). The shelf extends 250 to 350 ft eastward into the Hudson River channel, with depths ranging from 0 ft along the shoreline to approximately 10 ft below the river surface at the eastern edge of the shelf. Based on the Hudson River bathymetry data (USACE New York District 2018 and NOAA NCEI 2022), AOC #16 – Area D (Former Dump Area), topography (EA 2020b), and field observations during the MMRP RI (EA 2021), the bedrock elevation at AOC #16 – Area D (Former Dump Area)is likely to be the same as the elevation of the near shore bedrock shelf (**Figure 1-6**). This elevation results in an estimated bedrock depth of 5 ft bgs, which would also be the maximum depth of AOC #16 − Area D (Former Dump Area) fill.
The extent of contaminants (CERCLA hazardous metals, PAHs, and PCBs) identified in AOC #16 – Area D (Former Dump Area) surface and subsurface soil is further discussed in the subsections below.

6.4.2.1 Extent of CERCLA Hazardous Metals in AOC #16 – Area D (Former Dump Area) Soil

Phase I results indicated that CERCLA hazardous metals are present throughout AOC #16 – Area D (Former Dump Area), with elevated concentrations of metals in surface and subsurface soil at each DU encompassing AOC #16 – Area D (Former Dump Area). Surface and subsurface soil in DU-17 and DU-18 are significantly impacted by lead (concentrations up to 2,900 mg/kg), mercury (concentrations up to 4.3 mg/kg), and copper (concentrations up to 5,600 mg/kg) as presented in **Table 6-2** and summarized in **Table 6-22** and **Table 6-23**. Except for arsenic in surface soil, sodium in surface and subsurface soil, and vanadium in subsurface soil, the concentration of CERCLA hazardous metals at DU-19 decrease significantly, with concentrations of several CERCLA hazardous metals below background (antimony, total chromium, lead, mercury, and silver in surface soil; and antimony, arsenic, beryllium, cadmium, total chromium, lead, mercury, nickel, silver, and thallium in subsurface soil).

6.4.2.2 Extent of PAHs in AOC #16 – Area D (Former Dump Area) Soil

Phase I results indicated PAH impacts in surface soil at each DU encompassing AOC #16 – Area D (Former Dump Area) as presented in **Table 6-22.** The majority of PAH analytes and the highest concentrations detected in surface soil from DU-18 and DU-19. Phase I results also indicated PAH impacts in subsurface soil at DU-17 and DU-18 as presented in **Table 6-23.** The highest concentrations in subsurface soil were primarily detected at DU-18 (**Table 6-23**). PAH concentrations in subsurface soil in DU-19 decreased to below background.

6.4.2.3 Extent of PCBs in AOC #16 – Area D (Former Dump Area) Soil

Phase I results indicated PCB impacts in surface soil at each DU encompassing AOC #16 – Area D (Former Dump Area) as presented in **Table 6-2** and summarized in **Table 6-22**. Total PCB concentrations in surface soil ranged from an estimated (trace) 0.0071 mg/kg at DU-19 to estimated 0.4 mg/kg at DU-18 (**Table 6-22**). Phase I results indicated PCB impacts in subsurface soil at DU-18 and DU-19 only. Total PCB concentrations in subsurface soil ranged from an estimated 0.057 mg/kg at DU-18 to an estimated (trace) 0.54 mg/kg at DU-19 (**Table 6-23**). The highest concentrations in surface soil were detected at DU-18, while the highest concentrations in subsurface soil were detected at DU-19.

6.4.3 Contaminant Extent in Surface Water and Sediment

Surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines were noted during the Phase I site reconnaissance. These pathways included tidal/stormwater flow to the Hudson River shoreline and two drainages leading to Iona Marsh (riprap filled drainage swale and tidal wetland swale). Following evaluation of Phase I data, further evaluation of these surface water pathways was recommended during Phase II (EA 2022).– Therefore, surface water samples during Phase II were collected within AOC #16 – Area D (Former Dump Area) and surface water and sediment samples were collected at the endpoints of surface water migration pathways identified during Phase I (Hudson River shoreline adjacent to AOC #16 – Area D [Former Dump Area] and Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale). Surface water and sediment samples were analyzed for TAL metals. The extent of CERCLA hazardous metals contaminants identified in surface water and sediment is further discussed in the subsections below.

No surface water migration pathways were noted leading from the upland area to the Hudson River and Iona Marsh shorelines. Therefore, additional investigation of surface water and sediment along the shorelines of the upland area was not conducted during this RI.

6.4.3.1 Extent of CERCLA Hazardous Metals in Surface Water

Phase II analytical results indicated CERCLA hazardous metals (arsenic, total chromium, copper, zinc, and/or sodium) in each surface water area sampled (**Table 6-24**). Sampling locations in each surface area with elevated concentrations of CERCLA hazardous metals were as follows:

- AOC #16 – Area D (Former Dump Area): copper at 4 of 20 sampling locations (DUMP-SW-05, DUMP-SW-10, DUMP-SW-15, and DUMP-SW-20); and zinc at 4 of 20 sampling locations (DUMP-SW-2, DUMP-SW-3, DUMP-SW-10, and DUMP-SW-20)

- Hudson River shoreline: arsenic throughout the entirety of the shoreline (each of the 20 sampling locations); copper at 14 of 20 sampling locations (IHRS-SW-01, IHRS-SW-03

through IHRS-SW-05, IHRS-SW-10 through IHRS-SW-16, and IHRS-SW-18 through IHRS-SW-20); and sodium at 19 of 20 sampling locations (IHRS-SW-01 and IHRS-SW-02 through IHRS-SW-20)

- Iona Marsh at the outlet of the riprap filled drainage swale: copper at 2 of 10 sampling locations (RRDS-SW-06 and RRDS-SW-09)

- Iona Marsh at the outlet of the tidal wetland swale: total chromium at 1 of 10 sampling locations (TWS-SW-7) and copper at 3 of 10 sampling locations (TWS-SW-07, TWS-SW-09, and TWS-SW-10).

6.4.3.2 Extent of CERCLA Hazardous Metals in Onsite Sediment

Sediment samples during Phase II were collected from one DU established along the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) (IHRS-DU-01) and two DUs established in Iona Marsh at the outlets of the riprap filled drainage swale (RRDS-DU-01) and tidal wetland swale (TWS-DU-01). Each DU was established at approximately 0.5-acre in size. These DUs are further discussed in the subsections below.

Phase II analytical results indicated that the Iona Island Hudson River shoreline is significantly impacted by CERCLA hazardous metals, particularly antimony, arsenic, cadmium, total chromium, copper, lead, nickel, silver, and zinc (**Table 6-25**). The Iona Marsh shoreline was less impacted, with significantly lower concentrations of CERCLA hazardous metals (arsenic, cadmium, total chromium, copper, lead, nickel, and zinc, with concentrations one to three orders of magnitude lower those detected in than Hudson River shoreline sediment).

6.4.3.2.1 Hudson River Shoreline (IHRS-DU-01)

IHRS-DU-01 was located on the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area). The sediment DU included the approximately 0.1-acre sand and gravel beach area adjacent to DU-17 and DU-18 within the eastern portion of AOC #16 – Area D (Former Dump Area). The beach area is exposed at low tide and inundated with water twice daily during high tide and during storm events.

The northwestern edge of the beach area along AOC #16 – Area D (Former Dump Area) terminates at the river wall that extends northwestward along the Iona Island shoreline. Based on observations from the Phase I shoreline reconnaissance, most of the areas along the river wall consists of exposed bedrock and gravel except for some small pockets of sediment deposition.

The southeastern edge of the beach terminates along Round Island approximately 240 ft beyond downstream from AOC #16 – Area D (Former Dump Area). Historical installation layout maps from 1934 and 1947 (USAGC 2018) indicate that the shoreline east of AOC #16 – Area D (Former Dump Area) contains fill material associated with a 10-in. diameter discharge pipe. No discharge pipe was observed in this area during the shoreline reconnaissance or HTRW RI field activities.

The shallow bedrock shelf along the shoreline of AOC #16 – Area D (Former Dump Area) and the river wall to the northwest of AOC #16 – Area D (Former Dump Area) encompasses an area of approximately 9 acres. At the shoreline of AOC #16 – Area D (Former Dump Area) where Phase II sediment sampling was conducted, the shelf extends 250 to 350 ft into the Hudson River before the channel slopes steeply downward to a depth of approximately -95 ft below the river surface. The shelf thins to less than 100 ft along the river wall to the northwest of AOC #16 – Area D (Former Dump Area). Additionally, the shelf thins southwest of AOC #16 – Area D (Former Dump Area) and terminates along the shoreline of Round Island. While sediment may be present along the shelf beyond the limit of IHRS-DU-01, it is anticipated that elevated concentrations of metals in sediment associated with AOC #16 – Area D (Former Dump Area) would be limited to the nearshore area. Metals concentrations would decrease further offshore due to dispersion within the high energy river environment.

6.4.3.2.2 Iona Marsh Shoreline (RRDS-DU-01 and TWS-DU-01)

RRDS-DU-01 was located on the Iona Marsh shoreline at the outlet of the riprap filled drainage swale leading from the southwestern end of AOC #16 – Area D (Former Dump Area) (DU-19) south/southeast to Iona Marsh. TWS-DU-01 was located on the Iona Marsh shoreline at the outlet of the tidal wetland swale leading from the southwestern end of AOC #16 – Area D (Former Dump Area) west/southwest to Iona Marsh. The shoreline between RRDS-DU-01 and TWS-DU-01 was filled by PIPC following transfer of the FUDS from the Navy in 1965. Additionally, metal debris (e.g., rebar, old fencing, and other metal pieces) were observed in the riprap filled drainage swale.

6.5 SUMMARY

The findings of this HTRW RI have identified the following contaminants in onsite media:

- CERCLA hazardous metals, PAHs, PCBs, and explosives residues in onsite upland surface soil (**Figure 6-1 and Table 6-21**)

- CERCLA hazardous metals, PAHs, and PCBs in surface and subsurface soil within AOC #16 – Area D (Former Dump Area) (**Figure 6-1, Figure 6-2, Table 6-22, and Table 6-23**)

- CERCLA hazardous metals in surface water and sediment at the endpoints of surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines (**Table 6-24** and **Table 6-25**).

Phase I surface soil results indicated widespread, elevated concentrations of CERCLA hazardous metals and PAHs in surface soil (0–6 in. bgs) throughout the upland area of Iona Island, and elevated concentrations of PCBs and explosives residues in select Phase I DUs. CERCLA hazardous metals, PAHs, PCBs, and explosives residues analytes in each DU are presented in **Figure 6-21** and **Table 6-21**. Each of the 15 upland DUs sampled for metals (DU-01 through

DU-07 and DU-09 through DU-15) encompassing approximately 15 total acres contain elevated concentrations of CERCLA hazardous metals above background concentrations.

PAH impacted soil at 7 upland DUs (DU-2, DU-4, DU-11, DU-12, DU-13, DU-16, and DU-22) encompassing approximately 6 total acres. The highest concentrations of CERCLA hazardous metals in Phase I upland surface soil were detected at DU-4 (copper and zinc), DU-7 (lead), and DU-11 (arsenic). The highest concentrations PAHs were detected at DU-13. In addition to metals and PAHs, trace concentrations of PCB analytes were detected in upland surface soil were detected at DU-23 and DU-25 and explosives residues were detected in upland surface soil at EXDU-1.

Phase I soil results from AOC #16 – Area D (Former Dump Area) elevated concentrations of metals, PAHs, and PCBs in surface and subsurface soil at each of the 3 DUs encompassing the area (DU-17, DU-19, and DU-19). Surface and subsurface soil at DU-17 and DU-18 were significantly impacted by metals, particularly lead, mercury, and copper. The highest PAH concentrations were detected in soil from DU-18 and DU-19, while PCB impacts were noted in surface soil from DU-17 and DU-18 and in subsurface soil from DU-18 and DU-19.

Phase II metals results indicated elevated concentrations of CERCLA hazardous metals in both surface water and sediment at the endpoints of contaminant migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines. While surface water impacts were limited to select metals (arsenic, total chromium, copper, sodium, and/or zine in each area investigated), sediment along the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area) is significantly impacted with elevated concentrations of antimony, arsenic, cadmium, total chromium, copper, lead, nickel, silver, and zinc. While elevated concentrations of CERCLA hazardous metals including arsenic, cadmium, total chromium, copper, lead, nickel, and zinc were detected in Iona Marsh sediment at the outlets of the riprap filled drainage swale and tidal wetland swale, concentrations of each analyte were significantly lower (by at least an order of magnitude) than concentrations along the Hudson River shoreline.

7. CONTAMINANT FATE AND TRANSPORT

This section discusses the persistence and migration characteristics of site contaminants identified in Section 6 of this RI report. Contaminant fate refers to the expected final state that a contaminant will achieve following release to the environment. Contaminant transport refers to migration mechanisms and rate of contaminant movement from the source area. The fate of contaminants is affected by physical and chemical properties of the contaminants that govern partitioning of contaminants into environmental media, as well as transport processes and properties of the media through which the contaminants migrate.

Evaluation of environmental fate and transport mechanisms is necessary to determine the potential for continued presence of contaminants and offsite migration. The evaluation process assists in the determination of exposure pathways and potential exposure risks to current and future human populations and the environment. In addition, understanding of environmental fate and transport mechanisms is necessary to identify potential technologies that may be appropriate for remediation of the site.

7.1 SITE CONTAMINANTS SUMMARY

The following contaminant groups were identified in onsite media as discussed in Section 6.3 and summarized in Section 6.5 of this RI report:

- Upland surface soil: CERCLA hazardous metals widespread throughout the upland area; organic compounds (PAHs, PCBs, and explosives residues) in select DUs (**Table 6-21**)

- AOC #16 – Area D (Former Dump Area): CERCLA hazardous metals and organic compounds (PAHs, and PCBs) in surface and subsurface soil (**Figure 6-1, Figure 6-2, Table 6-22, and Table 6-23**)

- Surface water: CERCLA hazardous metals at AOC #16 – Area D (Former Dump Area) during tidal inundation and at the endpoints of surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines (**Table 6-24** and **Table 6-25**)

- Sediment: CERCLA hazardous metals at the endpoints of surface water migration pathways leading from AOC #16 – Area D (Former Dump Area) to the Hudson River and Iona Marsh shorelines (**Table 6-24** and **Table 6-25**).

7.2 SITE CONTAMINANT PHYSIOCHEMICAL CHARACTERISTICS

The chemical characteristics pertinent to the fate and transport of site contaminants are discussed in the following sections for the purpose of examining the mobility of contaminants within and between different media. The extent to which a contaminant moves or is transported through the environment is referred to as its mobility. In general, a contaminant that is water soluble will

move readily with water and is considered highly mobile. Conversely, a contaminant with movement that is strongly inhibited in the environment due to chemical and physical interactions with solid media is considered to have low mobility. The extent and rate at which a contaminant is transported through various media is based on the chemical and physical interactions of that contaminant with the media. During transport there are attenuation processes that can affect the rate of movement and the concentration of site contaminants in environmental media. Processes that can affect the site contaminants discussed include volatilization, adsorption, biodegradation, dissolution, photolysis, and precipitation.

A brief description of these processes is presented in the list below.

- Volatilization: The process by which a chemical is transferred from soil or water into a vapor phase or the atmosphere.

- Adsorption: The adherence of a chemical to the surface of a substance or another chemical. This interaction does not involve penetration of the chemical into, or changes in the structure of, the other substance. The process of adsorption typically results in retardation of contaminant movement.

- Biodegradation: The breaking down (degradation) of contaminants by microorganisms.

- Dissolution: The reaction which occurs when a contaminant comes into contact with and reacts with water. As a result, a hydroxyl group typically replaces a leaving group (such as a chloride) in the chemical structure.

- Photolysis: The breaking down (degradation) of contaminants by sunlight.

- Precipitation: The formation of a solid substance from a solution.

Properties specific to chemical contaminants or contaminant classes are discussed in the following subsections.

7.2.1 CERCLA Hazardous Metals

CERCLA hazardous metals listed in 40 CFR 302.4 include antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc (EPA 2024). The fate and transport for these metals is governed largely by the physical and chemical formation of metallic compounds, binding to the soil matrix, and speciation. Assessing the mobility of metals in environmental media is complicated because of the many organic and inorganic complexes and salts they form. The compounds and bonds formed by metals are determined by reduction and oxidation (redox) reactions, by the dominant pH in soil and sediment, and by the presence of organic carbon. These factors affect different metals in different ways.

CERCLA hazardous metals undergo a variety of processes in soil and water, which include dissolution, reduction, oxidation, and adsorption. These reactions are highly dependent on factors such as pH, salinity, ionic strength, particle-surface reactions, and the presence of anions and natural organic acids. Acidity increases the bioavailability of many cationic compounds, such as copper, lead, and zinc, which may become soluble at pHs below 5.

The CERCLA hazardous metals contaminants identified in onsite media are expected to be relatively insoluble when in metallic form or as inorganic complexes and salts but may become soluble in the presence of organic acids and reducing conditions. Adsorption of metals through cation exchange, specific adsorption, co-precipitation, or organic complexation by soil and sediment is the primary determinant of the mobility of metals in natural systems. Metals vary in the extent to which they are adsorbed by these mechanisms, and different adsorbents range in selectivity for metals.

Mobility of dissolved chemicals in surface water systems, relative to adsorption to solids, can be quantified by distribution coefficients (K_d). This is the primary relevant chemical characteristic for metals. The distribution coefficient represents the partitioning between liquids and solids (transfer by adsorption) assuming that the relationship is linear and reversible (a valid assumption for surface water/groundwater studies). Compounds with K_d values that are orders of magnitude greater than 1 liter per kilogram (L/kg) can be considered essentially immobile (Freeze and Cherry 1979). Distribution coefficients for CERCLA hazardous metals identified as contaminants in onsite media are presented in **Table 7-1** (EPA Office of Research and Development 2015).

7.2.2 Organic Constituents

The primary chemical characteristics for organic compounds include the following:

- Molecular weight: a measure of the weight/size of an organic contaminant molecule; is a factor in the Henry's Law Constant, biodegradation, and sorption.

- Organic-carbon partition coefficient (K_{oc}): measure of chemical partitioning between organic carbon and water. The higher the value, the more likely a chemical is to bind to soil or sediment rather than to remain dissolved in water

- N-octanol/water partition coefficient (K_{ow}): indicator of the environmental fate and bioavailability of a compound. Compounds with high values tend to accumulate in the fatty tissues of organisms.

- Aqueous solubility: the maximum concentration of chemical in the aqueous phase when the solution is in equilibrium. An indicator of a contaminant's ability to migrate in the environment.

- Melting and boiling points: temperatures at which a compound melts and boils.

- Vapor pressure: determines how quickly a compound will evaporate from surface soil or water into the air. Compounds with higher vapor pressure evaporate more quickly.

- Henry's Law Constant: the ratio of the concentration of a chemical in air to the concentration of a chemical in water. It reflects the volatility of a substance; substances with low values tend to persist in water and may be adsorbed onto soil or sediment.

Chemical characteristics for organic groups identified as site contaminants (PAHs, PCBs, and explosives residues) are discussed in the subsections below. Chemical characteristics for individual analytes identified as contaminants are presented in **Table 7-2**.

7.2.2.1 PAHs

The primary factors determining persistence, mobility, and fate of PAHs are degradation, volatilization, and binding to soil. PAHs may degrade over time into longer-lasting products by reacting with sunlight and other chemicals in the air, generally over a period of days to weeks. Breakdown in soil and water generally takes weeks to months and is caused primarily by the actions of microorganisms (ATSDR 1995). Volatilization is another factor that may affect PAHs, particularly low molecular weight (LMW) PAHs. Concentrations of these contaminants may decrease in soil over time due to transfer to and dispersion in the air. Therefore, volatilization is an important factor in eliminating these contaminants from soil. Perhaps the most important factor affecting fate of PAHs in soil is their affinity for binding to fine grained soils and organic matter. The soil organic carbon-water partition coefficients for PAHs vary depending on grain size, with the highest values in silt (fine particles) followed by sand and clay.

Sorption of PAHs to soil may limit biodegradation. Other factors that affect biodegradation include organic content, structure and particle size of the soil, presence of metals that are toxic to microorganisms, characteristics of the microbial population, and physical properties of the specific PAHs.

PAHs have low water solubility. In aquatic systems, PAHs are found primarily sorbed to particles that have settled to the bottom or are suspended in the water column.

7.2.2.2 PCBs

PCBs degrade over long periods of time due to weathering and do not readily break down in soil Therefore, they persist in soil with half-lives of months to years (ATSDR 2000). PCBs have low water solubility and adsorb strongly to sediment and soil, which decreases the mobility of these compounds, preventing them from dissolving in water. However, the hydrophobicity of these compounds increases the potential for uptake into the tissues of biota and the potential for bioaccumulation. Hydrophobic compounds may bioaccumulate and can biomagnify in fats and lipids within fish, invertebrates, or wildlife (EPA 2000). PCBs bioaccumulate in food chains and are stored in fatty tissues due to their stability and lipophilicity. Bioaccumulated PCBs are of particular relevance to human health because of their persistence in the body.

7.2.2.3 Explosives Residues

Adsorption rates for explosives residues identified in soil vary depending on the type of soil and sediment and the ionic strength of the surface and groundwater. Generally, explosives residues adsorb less than PCBs and metals. Explosives residues have a relatively high solubility and tend to be more stable in water and less likely to breakdown. The lower adsorption coefficients suggest explosives residues have a slight tendency to sorb to sediments, suspended solids, and biota, but are moderately mobile to highly mobile in soil.

7.3 BIOLOGICAL INTERACTIONS

The interactions between a contaminant and biota present at the site may also affect contaminant fate and transport within the environment. These interactions are described in the following subsections.

7.3.1 Bioconcentration

Bioconcentration is the accumulation of compounds by biota to greater concentrations than present in the aqueous phase. This is quantified using the bioconcentration factor which is the ratio of the compound concentration in the biota and in the water. Bioconcentration factors are typically expressed in units of L/kg. Higher values of partition coefficient indicate a preference of the compound for the non-aqueous phase (low solubility in water).

CERCLA hazardous metals analytes identified as contaminants in onsite soil and sediment and PAHs, PCBs, and explosives residues analytes identified as contaminants in onsite soil have high partition coefficients (**Table 7-1** and **Table 7-2**). This indicates that site contaminants are more persistent in onsite soil and biota.

7.3.2 Bioaccumulation

Bioaccumulation is the accumulation of compounds by biota from both aqueous phase and dietary phase exposure. The bioaccumulation factor, when related to aqueous phase concentrations, is larger than the actual bioconcentration factor.

A discussion of bioaccumulation for each contaminant group identified in the site is discussed in the subsections below.

7.3.2.1 Metals

CERCLA hazardous metals (particularly arsenic, copper, cadmium, lead, nickel, mercury, and zinc) have been known to accumulate in fish, birds, mammals, and/or plants (Garai 2021, Sanchari 2023, Wren 1986, Angulo-Bejarano et al. 2021). No biota samples were taken during this RI to confirm whether the site was serving as a source of compounds accumulating in biota.

7.3.2.2 PAHs

PAHs can accumulate in plants, aquatic organisms, and animals from intake of contaminated water, soil, and food; however, biomagnification of the compounds does not appear to be significant (ATSDR 1995). No biota samples were taken during this RI to confirm whether the site was serving as a source of compounds accumulating in biota.

7.3.2.3 PCBs

PCBs are particularly subject to bioaccumulation by biota because they are fat soluble and resistant to degradation. When PCBs are released into the environment and available for uptake through food, soil, and sediment ingested by biota, PCBs are stored in the fatty tissue. Even at low exposure levels, the concentration in biota can increase due to continued uptake of PCBs combined with slow degradation in tissue. Over time, this can accumulate to a high level. Additionally, concentrations of PCBs in biota higher on the food chain can be magnified through ingestion of organisms low in the food chain, which is known as biomagnification. No biota samples were taken during this RI to confirm whether the site was serving as a source of compounds accumulating in biota.

7.3.2.4 Explosives Residues

Explosives residues have limited persistence in surface soil and low K_{ow} values for explosives residues suggest limited potential for bioaccumulation.

7.4 TRANSPORT AND MECHANISMS OF MIGRATION

The primary release mechanism for contaminants identified during this HTRW RI includes spills, direct releases, and dumping, as presented in Section 2.3 of this RI report. Secondary release mechanisms include soil removal/reworking, infiltration/leaching, and runoff/erosion. In addition, contaminants may have been transported along the surface via overland runoff and erosion and ultimately deposited in shoreline sediments; these release mechanisms may be historically significant but are unlikely to contribute to current exposure pathways due to the vegetated nature of the soil. The most significant tertiary release mechanism for the Site is uptake of contaminants from abiotic media (e.g., soil) into prey tissue that is consumed by wildlife

Analytical results from the onsite soil and sediment sampling conducted under this HTRW RI indicate that contaminants from within AOC #16 – Area D (Former Dump Area) have been transported to the shoreline and deposited in shoreline sediment. The following sections present contaminant migration pathways to the shoreline.

7.4.1 Contaminant Migration and Transport from Upland Area Soil

Surface water migration pathways were not identified leading from the upland area to the shoreline. The upland area is extensively vegetated, which limits potential for contaminant migration via soil erosion and stormwater runoff.

7.4.2 Contaminant Migration and Transport from AOC #16—Area D (Former Dump Area) to the Hudson River Shoreline

Fill material and impacted soil at AOC #16 – Area D (Former Dump Area) is confined to the low-lying marsh area between Round and Iona Island. The northeastern boundary of AOC #16 – Area D (Former Dump Area) is the Hudson River shoreline. The surface elevation of AOC #16 – Area D (Former Dump Area) (0–2 ft amsl) is the same as the Hudson River shoreline adjacent to AOC #16 – Area D (Former Dump Area).

AOC #16 – Area D (Former Dump Area) is tidally influenced and inundated with water twice daily during high tide and during storm events. Water was encountered at AOC #16 – Area D (Former Dump Area) during low tide at a depth of 3–4 ft bgs. This water rises during high tide and storm events and inundates AOC #16 – Area D (Former Dump Area) and provides a potential contaminant migration pathway to the Hudson River shoreline.

The types of contaminants detected in site soil at AOC #16 – Area D (Former Dump Area) would be bound to soil particles and unlikely to desorb (leach) from soil to water. In addition, the *Phragmites australis* root system would limit advective transport (bulk movement) of soil and contaminants. Phase II surface water analytical results did not indicate that contaminants within soil at AOC #16 – Area D (Former Dump Area) were being mobilized during tidal inundation and transported to the Hudson River shoreline. However, sediment along the Hudson River shoreline is impacted by metals including antimony, arsenic, cadmium, total chromium, copper, lead, nickel, silver, and zinc. Except for silver, elevated concentrations of these same metals were detected in Phase I soil samples from within AOC #16 – Area D (Former Dump Area).

The surface water migration pathway from AOC #16 – Area D (Former Dump Area) to the Hudson River shoreline may have been more historically significant before growth and development of the *Phragmites australis* stands. Additionally, metals contaminants at AOC #16 – Area D (Former Dump Area) may be mobilized during storm events when there is increased potential for soil erosion and advective transport of soil particles to the shoreline. Stormwater sampling was not conducted during this RI.

7.4.3 Contaminant Migration and Transport from AOC #16—Area D (Former Dump Area) to Iona Marsh

Potential pathways leading from AOC #16 – Area D (Former Dump Area) to Iona Marsh were observed during the shoreline reconnaissance, including a riprap filled drainage swale and tidal wetland swale. The headwaters of these swales are located at the western edge of AOC #16 – Area D (Former Dump Area). Although water was not observed in these drainages during the

shoreline reconnaissance, these drainages may be inundated with water during storm events and may provide an intermittent discharge pathway for flood water within AOC #16 – Area D (Former Dump Area) to Iona Marsh.

Elevated concentrations of CERCLA hazardous metals were detected in marsh sediment, including arsenic, copper, lead, nickel, and zinc at the outlet of the riprap filled drainage swale and arsenic, cadmium, copper, lead, nickel, and zinc at the outlet of the tidal wetland swale. Phase I analytical results from DU-19, which covers the western portion of AOC #16 – Area D (Former Dump Area), indicated elevated concentrations of arsenic, cadmium, copper, and zinc.

Phase II surface water analytical results from the outlets of the riprap filled drainage swale and tidal wetland swale did not indicate that contaminants in soil from AOC #16 – Area D (Former Dump Area) were being transported along these pathways to Iona Marsh. The types of contaminants detected in site soil at DU-19 would be bound to soil particles and unlikely to desorb (leach) from soil to water. In addition, the *Phragmites australis* root system within AOC #16 – Area D (Former Dump Area) and the vegetated nature of the tidal wetland swale would limit advective transport (bulk movement) of soil and contaminants.

The shoreline between RRDS-DU-01 and TWS-DU-01 was filled by PIPC following transfer of the FUDS from the Navy in 1965. This fill material was not sampled during Phase II, and the source and nature of the fill material is unknown. While arsenic, cadmium, copper, and zinc detected in Iona Marsh sediment is consistent with metals detected in DU-19 soil, there is also potential that metals within fill material soil may have contributed to elevated concentrations in marsh sediment. In addition, metal debris (e.g., rebar, old fencing, and other metal pieces) were observed in the riprap filled drainage swale and could contribute to metals concentrations in sediment detected at the outlet of the riprap filled drainage swale.

7.5 CONTAMINANT BIOAVAILABILITY

High levels of metals and PAHs in soil and sediment are not necessarily indicative of the adverse effects to human health and/or ecological receptors. The toxicity of a contaminant is related to bioavailability. Many contaminants may form complexes or compounds that bind them to soil and make them chemically inaccessible to ecological receptors. Alternatively, these elements and compounds may be present in forms that are easily dissolved and absorbed, or in forms that tend to bind to biological tissues. It is these forms of easily absorbed chemicals that are most toxic.

Once released into the liquid phase, a contaminant can move freely to a living organism. Contaminants that are bioaccumulated in plants or animals become available to the higher organisms that feed on them. Some toxic forms of metals (e.g., mercury) accumulate in animal tissue, while others (e.g., lead) accumulate in plants.

The fate and behavior of metals in soil and sediment are determined by retention/release processes, which regulate the concentration of metals in the soil solution and thus their bioavailability. The primary soil factors controlling the potential bioavailability of metals are soil pH; the availability and characteristics of sorption sites on soil surfaces; and the content of iron,

aluminum, soil organic matter, and clay mineral content. Natural processes such as adsorption, ion exchange, complexation, and precipitation can cause metals to become immobilized; and therefore, not bioavailable.

Onsite soil and sediment physical parameter data were used to qualitatively evaluate bioavailability of contaminants detected in onsite soil and sediment. The following subsections present parameters that were used to qualitatively evaluate bioavailability of contaminants detected in onsite soil and sediment.

7.5.1 Bioavailability Parameters

Grain size, TOC, ORP, and pH data were used as screening tools to make estimates of solubility and contaminant availability. CEC in soil were used in conjunction with grain size and TOC content to qualitatively evaluate the potential bioavailability of metals in soil. The impacts of physical parameters on contaminant bioavailability are discussed in the subsections below.

7.5.1.1 pH

pH influences the stability of existing metal phases, weathering, and incorporation of metals into mineral phases, as well as the degree and strength of adsorption of metals to soil and sediment. In general, metal mineral dissolution and solubility increase as soil pH decreases (i.e., in acidic soil), and metal solubilities increase as redox potential decreases.

In general, soil and sediment moisture pH values lower than 5 to 6 will result in greater metal solubility and bioavailability. Acidity increases the bioavailability of many cationic metals, such as barium, chromium, copper, lead, vanadium, and zinc, which may become more soluble at pH below 5. Increasing the pH increases the sorption of metals to soil and sediment particles, making the metal less bioavailable. Metal concentrations and bioavailability generally increase by an order of magnitude with each pH unit drop from neutrality. Above these pH levels most metals will precipitate as hydroxides and metal solubility and bioavailability decreases dramatically. However, oxyanion species of metals like arsenic and antimony have negative charge and become more soluble at higher than neutral pH.

7.5.1.2 ORP

In general, bioavailability of metals goes down with decreasing with redox potential (Eh) or ORP. At circumneutral pH, an Eh or ORP less than 0 volts results in reduced bioavailability especially in the presence of sulfur and sulfur compounds which precipitate metal sulfides. Some metals like iron and manganese are liberated at low Eh but these metals are not acutely toxic at low levels. Arsenic, however, can be liberated by the dissolution of iron and manganese oxides which tend to sorb the oxyanion form or arsenic and antimony.

7.5.1.3 Grain Size

Grain size provides an indication of the grain or particle surface area and can be used to estimate soil permeability and to better understand chemical release from the solid. Particle size provides screening information on the rate and magnitude of contaminant sorption/desorption, which can control bioavailability. Smaller particles have larger surface area to mass ratios and tend to demonstrate higher levels of solubility for metals, thereby decreasing their bioavailability in soil.

Soil particle size also can affect the solubility of chemicals such as metals from soil, and thus their bioavailability. In soil and sediment, very small clay particles (up to 0.004 mm) exhibit a strong influence from electrical charges on their surface, resulting in cohesive forces. Particle sizes between 0.004 mm and approximately 0.0625 mm are known as silt and are in a transition range. The silt particles are too large to feel much influence from the electromotive forces and too small to mobilize inertia against flowing water. When particle size exceeds 0.0625 mm, electromotive forces are insignificant. These particles are non-cohesive and are classified as sand, gravel, cobble.

Soil and sediment can generally be classified into two groups: coarse, with a grain size > 62 microns (μm), or fine, with a grain size < 62 μm. The coarse fraction is composed primarily of stable, inorganic silicate materials that are non-cohesive and generally not associated with chemical contamination. The fine fraction consists of particles with a relatively large surface area to volume ratio. Typically, surface electric charges cause the fine particles to be more chemically and biologically active, thereby increasing the likelihood of sorption and desorption of contaminants.

7.5.1.4 Total Organic Carbon

TOC is a measure of the organic carbon contained within soil. Metal cations sorb to soil organic matter, and strong adsorption to organic matter reduces the solubility of metals in soil. Increased organic content (TOC) is an indicator of potentially reduced bioavailability. Organic carbon content can be used to obtain a reasonably accurate estimate of the sorption distribution coefficient for hydrophobic organic compounds in soil or sediment samples that have ≥ 0.5 percent carbon (wt/wt).

7.5.1.5 Cation Exchange Capacity

CEC is the total capacity of a soil to hold exchangeable cations (i.e., essential nutrients) and provides a buffer against soil acidification. Soils with a higher clay fraction and organic matter tend to have a higher CEC than sandy soils. Toxicity to plants and earthworms from metals (particularly lead, cobalt, nickel, copper, and zinc) has been shown to increase with decreasing CEC of the soil (Organisation for Economic Co-operation and Development 2016, Oorts et al. 2021).

The CEC of a soil is expressed in centimol positive charge per kilogram of soil ($cmol_c/kg$) or meq/100g of soil. Note that expressions are numerically identical (10 $cmol_c/kg$ = 10 meq/100 g).

In general, if the CEC value is low, few cations are able to bind to the soil particles; if the CEC value is high, a larger number of cations can bind to the soil. Sandy soils low in organic matter have a very low CEC (i.e., less than 3 meq/100g) while heavier clay soils or soils high in organic matter generally have a much higher CEC (i.e., greater than 20 meq/100g) (Cornell University 2007). Soils with clays containing high CEC of 50 milliequivalents per 100 g or more are more bioavailable than rocky or poorly weathered soils. Organic rich soils often have CEC of 100 milliequivalents per 100 g and organic matter can increase bioavailability in general depending on soil pH.

The following table, prepared by the U.S. Navy (2000) presents a general overview of how different physical parameters in soil impact bioavailability potential of metals.

	Bioavailability		
Site History	**Low**	**Medium**	**High**
Metal Forms:			
Sulfides	X		
Elemental (metallic)	X		
Sulfates		X	
Carbonates			X
Oxides			X (except Ni)
Particle Size (of metal-bearing grains):			
Small			X
Large	X		
Weathering/Aging Time:			
Sulfides	X →		
Elemental	X →		
Carbonates		←	X
Oxides		←	X
Soil Chemistry			
pH:			
Acidic		X	
Basic			X (Cd, Hg, Pb, Ni)
Alkaline soils			X (Cd, Hg, Pb, Ni)
High TOC			X (Hg, Pb)
High Fe and Mn		X (As)	
Sulfide-producing soil		X (Cd, Hg, Pb, Ni)	

7.5.2 Bioavailability Assessment of Onsite Soil

Soil physical parameters are discussed in Section 5.2 of this RI report and presented in **Table 5-2** and **Table 5-3**. Soil in the upland area primarily consists of silt and sand. Clay content ranged from 1.7 to 9.64 percent. Overall, onsite upland soil is high in organic matter, with TOC values ranging from 13,000 to 46,000 mg/kg. pH results (ranging from 5.4 to 7.5) indicate that metals in soil are less soluble and more likely to sorb to onsite soil particles. In addition, soil ORP results (field ORP greater than 400 mV and calculated standard hydrogen electrode corrected ORP ranging greater than 512 mV) indicate reduced bioavailability. Overall, the CEC across the upland area (23 to 39 meq/100g) indicates a high organic matter content and a high number of cations for binding to metals. The high organic matter content will restrict mobilization of metals

and, therefore, the soil will tend to accumulate metals. Since the metals will be sorbed tightly to soil particles they will be less bioavailable.

Soil in AOC #16 – Area D (Former Dump Area) primarily consists of silt and sand. Clay content ranged from clay 0.43 to 3.14 percent. Overall, the soil is high in organic matter, with TOC values ranging from 25,000 300,000 mg/kg. pH results (ranging from 7.0 to 8.1) indicate that metals in soil are less soluble and more likely to sorb to onsite soil particles. In addition, soil ORP results (field ORP greater than 275 mV and calculated standard hydrogen electrode corrected ORP ranging greater than 480 mV) indicate reduced bioavailability. Overall, the CEC across AOC #16 – Area D (Former Dump Area) (30 to 91 meq/100g) indicates a high organic matter content and a high number of cations for binding to metals. The high organic matter content will restrict mobilization of metals and, therefore, the soil will tend to accumulate metals. Since the metals will be sorbed tightly to soil particles they will be less bioavailable.

7.5.3 Sediment Bioavailability Assessment of Iona Island Hudson River Sediment

In sediment, sulfides, grain size, and TOC content play a significant role in the bioavailability, and ultimately, toxicity of metals. Sediment consisting of fine-grained particles and high organic matter (i.e., TOC) are more likely to bind historical contaminants making them less bioavailable. Coarser-grained particles (e.g., sand and gravel) with low TOC are less likely to bind historical contaminants making them more bioavailable.

Grain size and TOC analytical results indicate that sediment along the Iona Island Hudson River Shoreline differs from sediment along the Iona Marsh shoreline at the outlets of the riprap filled drainage swale and tidal wetland swale. Grain size results indicated that sediment along the Hudson River shoreline consists primarily of medium to coarse sand, with clay content of 1.78 to 8.2 percent. TOC in Hudson River shoreline sediment ranged from 2,600 to 4,500 mg/kg. Grain size results for marsh sediment indicated primarily silt and clay, with clay content of 25.33 to 37.17 percent. TOC in Iona Marsh sediment ranged from 60,000 to 88,000 mg/kg. Observations during the reconnaissance confirmed the differences in sediments on either side of the island. The marsh shoreline areas consisted of soft, mucky marsh sediments; whereas the Hudson River side of the island had higher sand content and had much less organic matter. The Hudson River side of the island was subject to higher energy thus leaving behind coarser/inert particles and depositing finer materials downstream. Based on the coarser grain size and low TOC content of Hudson River shoreline sediment samples, these sediments are less likely to bind historical contaminants making them more bioavailable. Grain size and TOC sediment results for Iona Marsh indicated that Iona Marsh sediment is conducive for binding historical contaminants making them less bioavailable.

7.5.4 Sediment AVS/SEM Evaluation

Sediment with similar concentrations of metals may have different toxic effects, depending on the amount of organic carbon and/or sulfide available to bind and render the metals non-bioavailable. The AVS/SEM approach developed by EPA (2005) was used to conduct a screening level evaluation of toxicity to sediment-dwelling organisms. AVS/SEM is an

approximation parameter used to account for differences in sulfide and refine predictions of heavy metal toxicity in sediment for the following divalent metals: copper, cadmium, nickel, lead, and zinc.

In the laboratory, sulfide is volatilized from sediments by the addition of acid and SEM are the metals extracted during the AVS procedure. One mole of SEM will react with one mole of AVS in sediments. The reaction forms an insoluble metal sulfide that is not available for uptake by benthic organisms. Therefore, the amount of AVS present in sediments serves a critical role in setting limits to metal availability and toxicity. The AVS/SEM method gives a better indication of sediment toxicity to benthic organisms than measurements of "total" metals by measuring only the "bioavailable" fraction of metals present. The difference between the sum of the molar concentrations of SEM and the molar concentration of AVS, normalized to the fraction of organic carbon (f_{oc}) predicts which sediments are toxic. The equation is $(\sum SEM\text{-}AVS)/f_{oc}$ and the toxicity thresholds are as follows:

- If $(\Sigma SEM\text{-}AVS)/f_{oc} < 130\ \mu mol/g_{oc}$, metals are unlikely to be bioavailable/toxic and there is no ecological risk.

- If $130\ \mu mol/g_{oc} < (\Sigma SEM\text{-}AVS)/foc < 3000\ \mu mol/g_{oc}$, metals may be bioavailable/toxic and additional evaluation (i.e., toxicity testing) is recommended; ecological risk is unknown.

- If $(\Sigma SEM\text{-}AVS)/foc > 3000\ \mu mol/g_{oc}$, metals are likely bioavailable/toxic; however additional evaluations (i.e., toxicity testing) should be conducted to confirm that ecological risks exist.

AVS/SEM results for the Iona Island Hudson River shoreline were over 25,000 $\mu mol/g_{oc}$, which indicates that the metals are likely to be bioavailable and cause toxicity. The low TOC concentrations along the Hudson River Shoreline (2,600 to 4,500 mg/kg) indicate that there is much less TOC along the Hudson River sediments for metals to bind to reduce their bioavailability potential.

AVS/SEM results from Iona Marsh sediment at the outlets of the riprap filled drainage swale and tidal wetland swale were less than 130 $\mu mol/g_{oc}$. This indicates that the metals in sediment along Iona Marsh are unlikely to be bioavailable; therefore, they are unlikely to cause toxicity to sediment-dwelling organisms.

8. HUMAN HEALTH AND ECOLOGICAL RISK ASSESSMENTS

This section presents a summary of the HHRA and ERA prepared to evaluate potential risk to human and ecological receptors exposed to onsite soil, surface water, and sediment at the Iona Island Naval Ammunition Depot Formerly FUDS. The complete HHRA is presented in **Appendix G**. The ERA (including the SLERA and RSLERA) is presented in **Appendix H**.

8.1 CALCULATION OF THE 95% UPPER CONFIDENCE LIMIT

The 95UCL was used to represent the exposure point concentration (EPC) in the risk assessments and was directly compared with appropriate risk screening criteria in the risk assessments. An EPC is defined as the concentration of a COPC or COPEC in site media to which a receptor may be exposed. The 95UCL is defined as a value that, when calculated repeatedly for randomly drawn subsets of site data, equals or exceeds the true mean 95 percent of the time. The 95UCL provides a conservative estimate of the average (or mean) concentration and a reasonable confidence that the true site average will not be underestimated and that chemicals will not be missed as COPCs to human health or COPECs to ecological receptors.

The 95UCL was calculated for the following analytical data sets. Analytical results that were rejected during data validation (dibenz[a,h]anthracene at BADU-4 as presented in Section 4.2 of this RI report) were excluded when calculating the 95UCL.

- Metals, PAH, BTEX, PCB, and/or explosives analytical results for each onsite soil DU based upon the results of the ISM soil triplicate samples collected during Phase I and Phase II

- Metals analytical results for each onsite surface water area investigated (AOC #16 – Area D [Former Dump Area], Iona Hudson River shoreline, and Iona Marsh shoreline) based on the results of 20 discrete samples collected from each area

- Metals analytical results for each onsite sediment DU based upon the results of the ISM sediment triplicate samples collected during Phase II

- Background soil metals and PAH analytical results based upon the 8 ISM samples collected in Bear Mountain State Park

- Background surface water metals analytical results for the Con Hook Hudson River shoreline and Con Hook marsh shoreline based upon the 20 discrete samples collected in each depositional environment

- Background sediment metals analytical results for the Con Hook Hudson River shoreline and Con Hook marsh shoreline based upon the 8 ISM samples collected in each depositional environment.

8.1.1 Phase I Soil 95UCL Calculations

95UCLs for Phase I soil DUs were calculated using the ITRC calculator[8] (ITRC 2012) as discussed in Worksheets #11 and #14 of the UFP-QAPP (EA 2020a). Two candidate UCL equations that can accommodate ISM data sets were evaluated using Phase I soil analytical data, including the Student's-t and Chebyshev. The Student's-t UCL is expected to provide valid 95UCL values when the distribution of means is approximately normal. The Chebyshev is generally considered to be a more conservative estimate of the UCL because it generally achieves or exceeds the desired coverage rates, even for non-normal distribution (ITRC 2012). For Phase I analytical data, in almost all cases, the Chebyshev 95UCL for Phase I analytical data was higher than the Student's-t. The actual difference between the 95UCLs for both methods was relatively small, generally less than 2 mg/kg for analytical results. The Chebyshev 95UCL was selected to represent the EPC 95UCL because it represents a more conservative estimate of the 95UCL.

8.1.2 Phase II Surface Water 95UCL Calculations

95UCLs for Phase II discrete surface water analytical results were calculated for each surface water area investigated (AOC #16 – Area D [Former Dump Area], Iona Hudson River shoreline, Iona Marsh shoreline, Con Hook Hudson River shoreline, and Con Hook Marsh shoreline) using EPA's ProUCL 5.2 (June 2022) software. Calculations were completed using analytical results from the 20 surface water samples collected within each area.

8.1.3 Phase II Sediment 95UCL Calculations

95UCLs Phase II metals results for each sediment DUs were calculated using the updated ITRC Calculator (ITRC 2020). The 2020 ITRC Calculator recommended either the Student's-t or Chebyshev 95UCLs based upon coefficient of variation (CV) of increments. The CV of increments was estimated based on summary statistics of replicates. The calculator recommended the Student's-t 95UCL for data sets where the CV of increments was low (defined as CV < 1.5). The calculator recommended the Chebyshev 95UCL for data sets where the CV was medium (defined as 1.5 < CV < 3) or high (defined as CV > 3) (ITRC 2020). The 95UCL for Phase II metals results was selected as either the Students-t or Chebyshev 95UCL based upon the recommendation from the ITRC calculator.

8.1.4 95UCL Results

The 95UCLs for each Phase I soil DU, Phase II surface water area, and Phase II sediment DU are included in the analytical results tables presented in Section 6 of this RI report as follows:

- **Table 6-1** through **Table 6-4**: onsite upland soil

[8] The ITRC calculator was updated in 2020. The 2012 version is no longer available.

- **Table 6-6**: AOC #16 – Area D (Former Dump Area) soil
- **Table 6-8** through **Table 6-10**: onsite surface water
- **Table 6-12**: onsite sediment
- **Table 6-14**: background soil
- **Table 6-15**: background surface water
- **Table 6-16**: background sediment.

The 95UCLs for ISM samples are often greater than the maximum detected concentration in the individual triplicate samples. Per the ITRC ISM guidance, with ISM data, the calculated 95UCL value should always be used as the EPC even if it is higher than any of the individual ISM results. This situation is not uncommon, particularly when the number of replicates is small. This was the case for each onsite Phase I soil and Phase II sediment DU sampled during this RI. With three replicates in each DU, the UCL for a DU always exceeded the highest individual ISM result in that DU.

8.2 SCREENING CRITERIA COMPARISON

As part of the HHRA and ERA, analytical data generated during the HTRW RI were evaluated to determine whether concentrations of detected contaminants were greater than applicable screening criteria. Screening criteria are risk-based concentrations derived from standardized equations, combining exposure information assumptions and EPA toxicity data. Screening criteria are not cleanup standards and are not applied as such. Screening criteria exceedances do not automatically designate an area as contaminated or indicate a response action is necessary. Rather, screening criteria exceedances suggest that further evaluation of the potential risks posed by site-related contaminants may be necessary.

8.2.1 Human Health Screening Criteria

The following human health screening criteria were used for Phase I and II analytical data (**Table 8-1**):

- EPA residential soil RSLs (updated November 2023) (EPA 2023a). A restrictive clause is in place for the island that it shall only be used for recreational/park purposes only; therefore, residential development is unlikely to occur at the site (USACE 1995). However, EPA residential Soil RSLs are included to assess for potential child receptors at the site, including site visitation for nature walks and potential camping. Soil and sediment results were compared to the residential soil RSLs.

- EPA Safe Drinking Water Act maximum contaminant levels (MCLs) and tapwater RSLs (updated November 2023) were used as screening criteria for surface water results (EPA 2023a).

- Background concentrations for soil, sediment, and surface water were also used as screening criteria.

8.2.2 Ecological Screening Criteria

The following ecological screening criteria were used for Phase I and Phase II analytical data:

- EPA Region 4 ecological screening values for soil, as presented in the EPA Region 4 ERA Supplemental Guidance, Scientific Support Section Superfund Division EPA Region 4, March 2018 (EPA 2018) (**Table 8-2**). The selection hierarchy in the guidance sourced values from EPA EcoSSL documents first for the select metals and PAHs for which they are available.

- Currently available National Recommended Water Quality Criteria (NRWQC) for aquatic life, chronic freshwater (updated October 2023) (EPA 2023b). For analytes without currently available NRWQC, additional values were selected from EPA compilations. Due to a lack of compiled EPA surface water screening values for Region 2 (the State of New York's EPA region), screening values from EPA Regions 3 and 4 were compared and are presented in **Table 8-3**. These values include compilations from outdated NRWQC, the Great Lakes Initiative Clearinghouse resources Tier II criteria (EPA 2024), revised in 2013, and Suter and Tsao 1996. The hierarchy for selection of screening values was: NRWQC (current values), Great Lakes Initiative (2013), and Suter and Tsao (1996). Bold values in **Table 8-3** indicate the selected screening values for each analyte.

- EPA Region 4 (March 2018) ecological screening values for sediment (EPA 2018). Due to a lack of EPA sediment screening values for Region 2 (the State of New York's EPA region), EPA's most recent (i.e., 2018) compilation of sediment screening values for Region 4 were used, since values are the same (or lower) than those presented by Region 3. Freshwater sediment screening values (ecological sediment screening values [ESV]) were compared to sediment data for the SLERA. EPA's less conservative Region 4 Refinement Screening Values (RSVs) were incorporated into the RSLERA. Values are presented in **Table 8-4**. These values include the following sources of peer-reviewed, scientific literature:

  — Long et al. 1991. The Potential for Biological Effects of Sediment-Sorbed Contaminants Tested in the National Status and Trends Program. NOAA Technical Memorandum NOS OMA 52. Effects range low (ER-L) for chronic and effects range medium (ER-M) for acute.

- MacDonald et al. 2003. Development and Evaluation of Numerical Sediment Quality Assessment Guidelines for Florida Inland Waters. Florida Department of Environmental Protection, Tallahassee, FL. Development and Evaluation of Numerical Sediment Quality Assessment Guidelines for Florida Inland Waters. Threshold effect concentration for the ESV and probable effect concentration for the RSV.

- Los Alamos National Laboratory ECORISK Database. September 2017.

The full TAL metals list for soil, surface water, and sediment samples was reported to help evaluate geochemistry and support development of the risk assessments. Note that types of contamination that may be eligible for DERP FUDS response include CERCLA hazardous substances or pollutants or contaminants. Metals that are CERCLA hazardous substances listed in 40 CFR 302.4 include antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc (EPA 2024). While there are no EPA screening criteria for nutrient metals in soil and sediment, and while nutrient metals (calcium, magnesium, and potassium) are not CERCLA hazardous substances and are ineligible for DERP FUDS response, nutrient metals were included in the soil, surface water, and sediment metals analyte lists to help evaluate soil and sediment geochemistry and ultimately bioavailability.

EPA surface water screening criteria for metals are hardness dependent. The lower confidence limit (LCL) of the mean hardness values was used as the hardness adjuster for water quality criteria. The use of the LCL addresses variation and uncertainty in hardness data. One value was used for Iona Island (LCL of the 60 onsite hardness samples) and one value was used for Con Hook (LCL of the 40 background hardness samples).

8.3 HUMAN HEALTH RISK ASSESSMENT

The HHRA is a qualitative or quantitative process that characterizes site conditions and determines applicable risk to human health, based on potential exposure scenarios to contaminants at the Iona Island Naval Ammunition Depot FUDS. The HHRA was conducted in accordance with CERCLA, as amended by Title 42 of the U.S. Code Sections 9601 through 9675 and followed the procedures and methodologies set forth by the EPA and USACE.

The objectives of the HHRA included the following:

- Outline the regulatory basis and guidance for conducting the HHRA
- Outline the methods for determining COPCs in site media
- Present the exposure setting that details land use, nearby human populations, and potential site activities
- Develop a CSM that characterizes relevant complete contaminant exposure pathways and receptors of concern
- Calculate potential carcinogenic and non-carcinogenic risk to receptors of concern (e.g., any human contact at the site under current or future scenarios)
- Identify areas that pose no unacceptable risks to human health and require no further action
- Determine contaminants of concern in site media that contribute significantly to potential risk concerns, which will be used to evaluate risk management decisions.

8.3.1 Identification of Contaminants of Potential Concern

Risk-based screening and background evaluations were conducted to identify COPCs in each media at the site. Risk-based screening was conducted by comparing detected analyte concentrations within each DU to risk-based screening concentrations. Any analyte in any medium for which the measured concentration exceeded the risk-based screening concentration was retained as an initial COPC. EPA's most recent (November 2023) RSLs were used for risk-based screening purposes in the HHRA (**Table 8-1**). For soil and sediment ISM results, the 95UCL for each DU was compared to EPA residential soil RSLs. While a restrictive clause is in place for the island that it shall be used for recreational purposes only, and while residential development is unlikely to occur at the site (USACE 1995), EPA residential soil RSLs were included to evaluate potential child receptors at the site. For surface water results, the maximum detected concentration was compared to the screening criteria (EPA Tapwater RSLs and EPA MCLs).

Background comparisons for onsite soil metals and PAH results and onsite surface water and sediment metals results were conducted using permutation test of means (Student t-Test with adjusted p-value), as presented in Section 6.2.1.1 of this RI report. The results of permutation testing are presented in **Appendix F** of this HTRW RI Report. Background comparisons for onsite surface water results were conducted using a quantitative statistical approach (statistical hypothesis tests), as presented in Section 6.2.1.2 of this RI report. Only analytes that exceeded both the risk-based screening criteria and background concentrations were selected as COPCs for quantitative evaluation in the HHRA.

8.3.1.1 Upland Soil

COPCs were identified as those analytes exceeding both EPA RSLs and background concentrations. COPCs in soil samples included five CERCLA hazardous metals (antimony, arsenic, copper, lead, and thallium) and five PAHs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenz[a,h]anthracene, and indeno[1,2,3-c,d]pyrene) as presented in **Table 8-5** and summarized in the list below.

- Antimony at DU-13
- Arsenic at DU-01, DU-02, DU-03, DU-4, DU-5, DU-6, DU-7 DU-11, DU-12, DU-13, and DU-14
- Copper at DU-13
- Lead at DU-7
- Thallium at DU-7 and DU-11
- Benzo(a)anthracene at DU-02, DU-4, DU-11, DU-12, DU-13, and DU-22
- Benzo(a)pyrene at DU-02, DU-4, DU-11, DU-12, DU-13, and DU-22
- Benzo(b)fluoranthene at DU-02, DU-4, DU-11, DU-12, DU-13, and DU-22
- Dibenz(a,h)anthracene at DU-02, DU-4, DU-11, DU-12, DU-13, and DU-22
- Indeno(1,2,3-c,d)pyrene at DU-02, DU-4, DU-11, DU-12, DU-13, and DU-22.

While cobalt, iron, and manganese were also identified in the HHRA as COPCs, these metals are not CERCLA hazardous substances and are not eligible for DERP FUDS response; therefore, these metals are not presented on **Table 8-5**. COPCs were not identified for upland surface soil at DU-20, DU-21, DU-23, DU-25, or EXDU-1 through EXDU-7. Additionally, COPCs were not identified for subsurface soil at DU-20 or DU-21.

8.3.1.2 AOC #16 – Area D (Former Dump Area) Soil

COPCs identified in surface soil at AOC #16 – Area D (Former Dump Area) included eight CERCLA hazardous metals (antimony, arsenic, cadmium, copper, lead, mercury, thallium, and zinc), five PAHs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, dibenz[a,h]anthracene, and indeno[1,2,3-c,d]pyrene), and one PCB (Aroclor 1260). COPCs identified in subsurface soil included seven CERCLA hazardous metals (antimony, arsenic, copper, lead, mercury, thallium, and zinc) and three PAHs (benzo[a]pyrene, benzo[b]fluoranthene, and dibenz[a,h]anthracene). While aluminum, cobalt, iron, manganese,

and vanadium were also identified in the HHRA as COPCs, these metals are not CERCLA hazardous substances and are not eligible for DERP FUDS response.

COPCs in AOC #16 – Area D (Former Dump Area) soil are presented in **Table 8-5** and summarized in the list below.

- Antimony: DU-17 (surface and subsurface soil) and DU-18 (surface and subsurface soil)
- Arsenic: DU-17 (surface and subsurface soil), DU-18 (surface and subsurface soil), and DU-19 (surface soil only)
- Cadmium: DU-17 (surface soil only)
- Copper: DU-17 (surface soil only) and DU-18 (surface and subsurface soil)
- Lead: DU-17 (surface and subsurface soil) and DU-18 (surface and subsurface soil)
- Mercury: DU-18 (surface and subsurface soil)
- Thallium: DU-17 (surface and subsurface soil) and DU-18 (surface and subsurface soil)
- Zinc: DU-17 (surface and subsurface soil) and DU-18 (surface and subsurface soil)
- Benzo(a)anthracene: DU-19 (surface soil only)
- Benzo(a)pyrene: DU-18 (surface soil only) and DU-19 (surface soil only)
- Benzo(b)fluoranthene: DU-18 (surface soil only) and DU-19 (surface soil only)
- Dibenz(a,h)anthracene: DU-18 (surface soil only) and DU-19 (surface soil only)
- Indeno(1,2,3-c,d)pyrene: DU-18 (surface soil only)
- Aroclor 1260: DU-18 (surface soil only).

8.3.1.3 Surface Water

No COPCs were identified for surface water (**Table 8-6**).

8.3.1.4 Sediment

COPCs identified in sediment included metals six CERCLA hazardous metals (antimony, arsenic, cadmium, copper, lead, and thallium) as presented in **Table 8-7** and summarized in the

list below. While cobalt, iron, and manganese were also identified in the HHRA as COPCs, these metals are not CERCLA hazardous substances and are not eligible for DERP FUDS response.

- Antimony: IHRS-DU-01
- Arsenic: IHRS-DU-01, RRDS-DU-01, TWS-DU-01
- Cadmium: IHRS-DU-01, TWS-DU-01
- Copper: IHRS-DU-01
- Lead: IHRS-DU-01
- Thallium: IHRS-DU-01.

8.3.2 Human Health Exposure Assessment

Following identification of COPCs, the human health exposure assessment was conducted to identify persons or receptors that are or may be exposed to the site, the pathways through which they are potentially exposed, and the magnitude of these potential exposures. The exposure assessment included several steps:

- Evaluating the exposure setting, which includes a description of the land use and the potentially exposed human populations
- Developing the CSM, identifying the source of contamination, the contamination transport and release mechanisms, the exposure media, the exposure routes, and the potentially exposed populations
- Calculating EPCs for each COPC for each of the complete exposure pathways identified in the CSM
- Identifying the exposure models and parameters with which to calculate the exposure intakes
- Calculating exposure intakes.

Soil was identified as the primary medium of concern. Evaluation of Phase I soil analytical results revealed potential concern for the migration of chemicals from AOC#16 – Area D (Former Dump Area) to surface water and sediment. Migration pathways include tidal flow to the Hudson River shoreline and defined surface water channels leading to Iona Marsh (riprap-filled drainage swale and tidal wetland swale). No COPCs were determined for surface water. Therefore, only sediment was considered a potential medium of concern.

Current receptors identified for evaluation in the HHRA included park personnel, researchers, adult recreators, adolescent recreators, child recreators, adolescent trespassers, and Boy Scouts/campers as presented in Section 2.5 of this RI report. Potential future site users identified for evaluation included each of the current users as well as construction workers.

Human health exposure pathways presented in Section 2.5 of this RI report were evaluated and updated during development of the HHRA to identify complete, potentially complete, or incomplete exposure pathways to receptors as based upon site history, current and anticipated site use, and identification of COPCs in onsite media. The updated Human Health CSM is presented in **Figure 8-1**.

The following surface soil exposure pathways are considered potentially complete for all current and potential future receptors (park personnel, researchers, construction workers, recreational users, trespassers, and Boy Scouts/campers):

- Incidental ingestion of surface soil
- Dermal contact with surface soil
- Inhalation of windblown particulates from surface soil.

Additionally, the following sediment exposure pathways are considered complete for current and future recreational users, park personnel, and trespassers:

- Incidental ingestion of sediment
- Dermal contact with sediment.

The subsurface soil exposure pathway (incidental ingestion with, direct contact with, and inhalation of windblown particulates from subsurface soil) was considered potentially complete for future construction workers.

The HHRA quantitatively evaluated each DU at the site that revealed potential COPCs in onsite soil and sediment. The 95UCLs calculated from the triplicate results within each soil and sediment DU were used to represent the EPC for each COPC within each soil and sediment DU. Calculation of 95UCLs is discussed in Section 8.1 of this RI report.

In addition, two separate soil exposure areas were evaluated to represent expected receptor exposure to the upland portions of the entire island. All receptors are likely to visit various areas of the upland portion of the island while onsite. No specific upland areas were identified as presenting an attractive area for any of the receptors to spend a majority of their time. The first exposure area, identified as the Island Exposure Area, encompassed all soil DUs except DU-17 through DU-19 within AOC #16 – Area D (Former Dump Area). The second exposure area, identified as the Dump Area Exposure Area, includes the three soil DUs covering AOC #16 –

Area D (Former Dump Area) (DU-17 through DU-19). EPCs for each exposure area were represented by the combined 95UCL for each COPC from each DU within the exposure area. This 95UCL for each exposure area was calculated using the ITRC (2020) area weighted calculator. The sediment DUs, IHRS, RRDS, and TWS, were not evaluated within an exposure area. The physical condition and location of these DUs differ from the exposure areas.

8.3.3 Human Health Risk Characterization

The characterization of human health risk was conducted by combining information from the exposure assessment with that from the toxicity assessment. Chemical intakes for each receptor and each exposure pathway were combined with toxicity information to derive cumulative excess lifetime cancer risks (ELCRs) and cumulative non-cancer HIs for each DU and each exposure area. Potential human health risk concerns were identified if the non-cancer HIs >1.0 or cancer risks were above the acceptable risk range of 10^{-4} to 10^{-6}.

For lead in soil and sediment, lead risks were modeled using *Recommendations of the Technical Review Workgroup for Lead, An Interim Approach to Assessing Risks Associated with Adult Exposures to Lead in Soil* (EPA 2003, 2009, 2017d). Potential concerns for construction workers (soil only) park personnel (soil and sediment), recreational adults and adolescents (soil and sediment) were evaluated with the EPA Adult Lead Model (ALM). The ALM evaluates the percentage of a target population that will have blood-lead levels above a reference concentration of 5 micrograms lead per deciliter (µg/dL). To achieve a specific level of protectiveness, EPA has established a limit to exposure to soil lead levels such that a typical (or hypothetical) child would have an estimated risk of no more than 5 percent exceeding the reference blood-lead level.

8.3.4 Human Health Risk Assessment Results

Potential receptors evaluated in the HHRA included park personnel, researcher, construction workers, recreational users (adult, adolescent, and child), adolescent trespasser, and camper/Boy Scout. Each receptor was evaluated for exposure to each individual DUs. The evaluation of DU analytical results was performed on a DU-basis to inform potential decisions that relate to the DU. Carcinogenic risks for all receptors exposures to the individual DUs were either below or within the EPA's acceptable risk range of $1x10^{-6}$ to $1x10^{-4}$. The non-cancer HI thresholds for all receptors exposure to the individual DUs were below the acceptable threshold of 1.0, except the construction worker exposure to DU-13 and DU-18. However, a breakdown by target organ did not reveal any target organs above the acceptable threshold of 1.0 for the construction workers exposure to DU-13 and DU-18. Therefore, the HHRA did not reveal potential concerns for carcinogenic risks or non-cancer hazards for any receptor's exposure to each DU.
Additionally, the HHRA noted that all potential site receptors may not remain within one DU because none of the DUs present an attractive area for any of the receptors to spend a majority of time while onsite. It is likely that all receptors may visit various areas of Iona island during their visit. Therefore, the HHRA evaluated all potential receptors for exposure to two exposure areas: Iona Island Exposure Area and the Former Dump Area Exposure Area. The Iona Island Exposure Area is an upland area that includes all DUs, except DU-17 through DU-19 within AOC #16 – Area D (Former Dump Area). The second exposure area, identified as the Former

Dump Area Exposure Area, includes only DUs 17 through 19. DU-17 through DU-19 within AOC #16 – Area D (Former Dump Area) were considered different from the remainder of the Iona Island DUs because the area is a marshy that is covered with vegetation and subject to tidal influence from the Hudson River. These constraints make access difficult. The marsh area between Iona Island and Round Island where AOC #16 – Area D (Former Dump Area) located is also identified as a future nature preserve/wetland area. No construction or other activities are expected in this area and actual contact with this area is likely minimal due to vegetation and tidal influences. It is noted that the sediment DUs (i.e., IHRS, RRDS, and TWS), were not evaluated within an exposure area and were only evaluated as individual DUs. For both the Iona Island and Former Dump Area Exposure Areas, the HHRA indicated all carcinogenic risks were either below or within the EPA's acceptable risk range of $1x10^{-6}$ to $1x10^{-4}$. The non-cancer HI thresholds were below the acceptable threshold of 1.0 for all receptors evaluated, except the construction worker exposure to the Former Dump Area Exposure Area. A breakdown by target organ did not reveal any target organs above the acceptable threshold of 1.0 for the construction workers exposure to the Former Dump Area Exposure Area. Therefore, the HHRA did not reveal potential concerns for carcinogenic risks or non-cancer hazards for any receptor's exposure to each exposure area.

Lead was evaluated separately from the carcinogenic risks and non-cancer hazards discussed above. Lead was evaluated through the use of the EPA's adult lead model (ALM). To achieve a specific level of protectiveness, EPA has established that a typical (or hypothetical) child would have an estimated risk of no more than 5 percent exceeding the reference blood-lead level of 5 µg/dL. The results of the ALM revealed soil within DU-7, DU-17 and DU-18, the Former Dump Area Exposure Area, and sediment within the IHRS DU revealed greater than 5 percent of the population would exceed the reference blood-lead level of 5 µg/dL. DU-7 only revealed potential concerns for a construction worker exposure. DUs 17 and 18 revealed potential concerns for the construction worker and park personnel, and the IHRS DU revealed potential concerns for all receptors evaluated for lead exposures (construction worker, park personnel and recreational users).

It is noted that the Former Dump Area Exposure Area, which includes DU-17 and DU-18, is a marshy area that is covered with vegetation and subject to tidal influence that makes access difficult. The Dump Area is also identified as a future nature preserve/wetland area. No construction or other activities are expected in this area and actual contact with this area is minimal and unlikely to result in human health concerns. Additionally, construction worker exposure represents exposures that are usually controlled using standard health and safety protocols and personal protective equipment. Potential lead risk concerns identified for the construction worker do not warrant further evaluation or risk management decisions.
Park personnel potential exposure to one specific DU for an entire year is not an expected scenario. The park personnel are more likely to be exposed to environmental media over the entire island for activities such as grass mowing, site inspections, and general maintenance. For this reason, the exposure to the entire island is better represented by an average (or mean) concentration across the DUs, which includes all DUs sampled (i.e., DU-1 through DU-7, DU-9 through DU-19, IHRS, RRDS, and TWS). It is noted that determining a mean concentration using just the DU lead concentrations likely results in a overestimate of the mean lead

concentration across the entire Iona Island. The DUs only represent approximately 25 acres out of the 124 acres of the Iona Island Naval Ammunition Depot FUDS. The determination of the lead DU mean concentration is similar to method used to determine EPCs for the combined exposure areas (i.e., the Former Dump Exposure Area and the Iona Island Exposure Area). The use of only the DU lead results provides a protective evaluation of potential contact. The mean soil lead concentration across all DUs is 667 mg/kg, which reveals less than 5% of the population exceeds the target blood-lead level (**Table 8-9**). The results of the ALM modeling for the mean lead concentration across the DUs show no potential concerns for the park personnel exposure to lead based upon expected exposure across the entire island. Therefore, the park personnel exposure to Iona Island does not warrant further evaluation or risk management decisions.

The recreational user exposure to lead within the IHRS DU did reveal significant exceedance of the acceptable blood-lead threshold. Unlike the park personnel expected exposure, the recreational user may spend a significant amount of time at the IHRS DU. This DU is located along the Hudson River and is a flat area where boaters may visit, and the recreational user exposure is an exposure that is difficult to control on the island. While sediments in this area are generally sandy with larger grain size that is difficult to adhere to the skin surface, there is a potential for contact, sample results from the IHRS DU reveal potential transport of contaminants from AOC #16 – Area D (Former Dump Area) along the surface via overland runoff and erosion and into shoreline sediments. As a result, there are sufficient potential concerns for a recreational user exposure to the IHRS DU to warrant additional evaluation and/or risk management decisions.

8.3.5 Human Health Risk Assessment Uncertainties

Uncertainties in the risk characterization can stem from the inherent uncertainties in the data evaluation, the exposure assessment process (including any modeling of EPCs in secondary media from primary media), and the toxicity assessment process. For each step of the risk assessment process, conservative assumptions were made that are intended to be protective of human health and to ensure that risks are not underestimated. The overestimation of potential risks from exposure to the site would not change the overall conclusions of the HHRA, except for lead. For all chemicals, except lead, the HHRA revealed no potential risk concerns for any receptors' exposure to the site.

Potential receptor exposure to environmental media within the Iona Island does not adhere to "typical" default exposure scenarios that are modeled for a recreational area. The site is remote, and use of the site is intermittent. While the site is used by PIPC and there is evidence of local residents visiting the site, the actual exposure and contact with the site media is difficult to quantify. Additionally, a majority of the exposure parameters determined for each receptor were based upon professional judgement and EPA guidance. The exposure parameter that presents the most uncertainty is the exposure frequency (EF), or number of days a receptor visits/contacts the site. Conservative EFs were determined for each receptor to provide a protective evaluation. However, the EFs are likely overestimated, especially when evaluating a long-term exposure to the site.

8.4 ECOLOGICAL RISK ASSESSMENT

The ERA is provided in **Appendix H**. It evaluated the potential for adverse effects to ecological receptors exposed to site-related COPECs. The overall objective of the ERA was to quantitatively and qualitatively evaluate exposure and risks to ecological receptors, and to provide risk managers with information necessary to achieve management goals and evaluate remedial decisions, if necessary.

The ERA followed the procedures and methodologies set forth by the U.S. Environmental Protection Agency (EPA) and USACE as documented in Section 1.1. of the ERA (**Appendix H**).

Both a SLERA and RSLERA were completed as part of the ERA, which identified exposure pathways and COPECs by eliminating those contaminants and exposure pathways that pose negligible risks to receptor groups.

The SLERA was conducted using Phase I and Phase II analytical data to evaluate if contaminant concentrations presented a potential risk to terrestrial and aquatic ecological receptors. The SLERA process was conservative and was based on no observed adverse effect levels (NOAELs). These represent the most conservative endpoint, in that no adverse effects were observed for the test organisms from which the NOAELS were derived at a given concentration or dose. The SLERA concluded with a list of COPECs for each media evaluated (soil, sediment, surface water).

Based on the results of the SLERA, the RSLERA refined the potential exposure and risks using more site-specific information and less conservative assumptions. Exposure modeling conducted as part of the RSLERA used appropriate literature-based, receptor-specific exposure parameters that are more realistic of exposures that are possible at the site. The RSLERA also considered spatial distribution of the data, statistical evaluations (e.g., outlier analysis), bioavailability, background, and other potential explanatory factors (e.g., pH, grain size, total organic carbon) to be incorporated into the evaluation.

8.4.1 Ecological Conceptual Site Model

The first step in the ERA consisted of developing the ecological CSM. Media of concern and ecological receptors were evaluated to identify potential exposure routes linking the two and to determine which pathways are complete and significant. Terrestrial and aquatic ecological receptor groups identified for the site and potential exposure routes for each receptor group are presented in Section 2.6 of this RI report.

The preliminary ecological CSM from the UFP-QAPP (EA 2020a) was evaluated and updated following the Phase I Investigation to refine complete, potentially complete, or incomplete exposure pathways to receptors based on site history, ecological setting, results from the Phase I Shoreline Reconnaissance, and observations during Phase I field activities. The combined terrestrial and aquatic CSM is presented in **Figure 8-2.**

8.4.2 Ecological Receptors

Terrestrial receptor groups included plants, invertebrates, mammals (herbivorous, insectivorous, and predatory), birds (insectivorous and predatory), and herptiles. Aquatic receptor groups included plants, benthic invertebrates, zooplankton, fish (demersal and pelagic), mammals (herbivorous and piscivorous), and birds (herbivorous, insectivorous, and piscivorous). For each of the protected species identified in Section 1.6.11 Threatened and Endangered Species, a suitable surrogate receptor was identified for the evaluation of risk to the protected species. See Section 6.4.2 of the ERA (**Appendix H**) for the uncertainties associated with the evaluation of risk via surrogate receptors. Representative receptor species were selected based on feeding guilds and availability of wildlife exposure models. The following list identifies receptor species as well as any protected species that were evaluated via the surrogate receptors:

- Terrestrial plant community
    - Small whorled pogonia (*Isotria medeoloides*)
- Terrestrial invertebrate community, as represented by earthworms (*Lumbricus terrestris*)
- Populations of herbivorous mammals, as represented by meadow vole (*Microtus pennsylvanicus*)
- Populations of insectivorous mammals, as represented by short-tailed shrew (*Blarina brevicauda*)
    - Indiana bat (*Myotis sodalis*) and northern long-eared bat (*Myotis septentrionalis*)
- Populations of insectivorous birds, as represented by American robin (*Turdus migratorius*)
    - Cerulean warbler (*Setophaga cerulea*) and the golden-winged warbler (*Vermivora chrysoptera*)
- Populations of predatory (carnivorous) mammals, as represented by red fox (*Vulpes vulpes*)
- Populations of predatory (carnivorous) birds, as represented by red-tailed hawk (*Buteo jamaicensis*)
    - Northern harrier (*Circus cyaneus*)
- Populations of herptiles (i.e., amphibians and reptiles)
    - Bog turtle *(Clemmys muhlenbergii*)

- Aquatic plant community
- Benthic invertebrate community
- Aquatic life (zooplankton, demersal fish, and large pelagic fish)
    - Shortnose sturgeon (*Acipenser brevirostrum*) and Atlantic sturgeon (*Acipenser oxyrhynchus*)
- Populations of herbivorous mammals, as represented by muskrat (*Ondatra zibethicus*)
- Populations of herbivorous birds, as represented by mallard duck (*Anas platyrhynchos*)
- Populations of insectivorous birds, as represented by lesser scaup (*Aythya affinis*)
    - Pied-billed grebe (*Podilymbus podiceps*)
- Populations of piscivorous mammals, as represented by river otter (*Lontra canadensis*)
- Populations of piscivorous birds, as represented by great blue heron (*Ardea herodias*)
    - Least bittern (*Ixobrychus exilis*)
    - Bald eagle (*Haliaeetus leucocephalus*)
    - Osprey (*Pandion haliaetus*).

Herptiles (reptiles and amphibians) could inhabit terrestrial areas and aquatic (marsh) areas at the site as detailed above in Sections 2.6.2 and 2.6.4. However, due to the lack of toxicological information, exposure factors, and ecological screening values for these species, only a qualitative evaluation of potential risks is possible. Risks to reptiles and amphibians are assumed to be similar to other receptors such as birds based on studies comparing toxic thresholds between the two groups (Salice et al. 2009).

8.4.3 Screening-Level Ecological Risk Assessment

The SLERA consisted of a preliminary screen of contaminant concentrations against generic, conservative ecological screening values. The SLERA concluded with a list of COPECs to be further evaluated in the RSLERA.

Overall, the following COPECs were retained for further evaluation in soil since the most conservative ecological soil screening level was exceeded in at least one DU **(Appendix H, Table 4-4)**: antimony, arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium (subsurface only) thallium, zinc, HMW and LMW PAHs, total PCBs, and 1,3-dinitrobenzene

(surface only). With the exception of DU-20, DU-21, and DU-25, each DU had at least one COPEC in soil.

The following COPECs were retained for further evaluation in sediment **(Appendix H, Table 4-5)**: antimony, arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc. Identification as a COPEC indicates potential for ecological risk, and the COPECs were carried through the RSLERA process for receptor-specific evaluations.

No COPECs were identified in surface water **(Appendix H, Table 4-6)**.

8.4.4 Assessment and Measurement Endpoints

Assessment and measurement endpoints were identified for each representative receptor species evaluated at the site. Assessment endpoints included protection of ecological communities and protection and maintenance (i.e., survival, growth, and reproduction) of populations of receptors from exposure to COPECs in environmental media. Measurement endpoints are measurable ecological characteristics that are related to the assessment endpoints (EPA 1998). Measurement endpoints are used to assess the potential for effects on the assessment endpoints through their comparison to screening-level concentrations or toxicity values. Measurement endpoints selected for use in the ERA included chemistry data for environmental media sampled during Phase I and Phase II, modeled doses of COPECs, and quantitative measurements of physical parameters in site media.

8.4.5 Refined Screening-Level Ecological Risk Assessment

The RSLERA further evaluated the COPECs selected during the SLERA and refined the conservative assumptions to be more site-specific, based on quantifiable effects to apical endpoints rather than no observed adverse effects levels (NOAELs).

Though the SLERA was evaluated on a DU basis, for the terrestrial component of the RSLERA the DUs have been grouped into the Former Dump Area (DU-17 through DU-19) and the Iona Island (all other DUs) exposure areas. These two areas were grouped on the basis of the Former Dump Area representing a potential source area for the site. The three one-acre DUs grouped as the Former Dump Area incorporate and extend beyond the boundary of the approximately 0.85-acre AOC #16 – Area D designated previously as the Former Dump Area.

Due to the shallow depth of refusal, subsurface soil from Iona Island was only collected from DU-20 and DU-21 and those samples did not exceed screening levels. Therefore, the 95UCL EPCs calculated for the Iona Island exposure area include surface soil results only from all DUs analyzed (except DU-17 through DU-19).

Surface and subsurface soil samples in the Former Dump Area (DU-17 through DU-19) were collected from 0 to 6 inches and 6 to 36 inches, respectively. Ecological receptors are generally assumed to be exposed to surface soil only as that is the biologically active zone. Ecological receptors are generally assumed to be exposed to surface soil only as that is the biologically

active zone and the depth of this zone varies based on site conditions. EPA has quantified soil biological activity in forests and grasslands as a function of depth and recommends that soil samples for assessment of ecological risk include the top 25 to 30 centimeters (approximately 10 to 12 inches) (EPA 2015). The surface soil interval collected was relatively shallow (6 inches) and ecological receptors may be exposed to soil deeper than the surface soil interval in the Former Dump Area (EPA 2015). Since the subsurface sample results had exceedances of the screening levels and relatively high concentrations of COCs, as a conservative measure, the 95UCL EPCs calculated for the Former Dump Area were based on surface soil and subsurface soil from DU-17 through DU-19.

The aquatic component of the RSLERA evaluated risk on a DU basis (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale).

Assumptions refined for the list of COPEC/receptor combinations determined in the SLERA included the following:

1. Refinement of screening levels. See **Appendix H, Section 5.2.3 Toxicity Reference Values and Refinement Screening Valsues**. For lower-trophic level receptors (i.e., aquatic plants benthic invertebrates, and demersal fish), less conservative sediment screening benchmarks/toxicity reference values were used, notably EPA's Region 4 RSVs for sediment. EPCs were compared to RSVs.

2. Refinement of exposure assumptions to reflect realistic, site-specific exposure and effects for the representative receptors presented in Section 2.6 of this RI report. Each of these representative species consumes different food items, ingests different quantities of incidental soil due to their feeding habits, have different ingestion rates, and require varying habitat ranges. Area use factors (AUFs) were calculated based on the habitat range of a given receptor and account for the amount of time receptors are likely to be in the site area and exposed to COPECs. Contaminant doses to these receptors were calculated based on their species-specific characteristics such that all representative receptors were assessed.

3. Refinement of accumulation/uptake factors to estimate tissue concentrations for food web models. Literature-based uptake factors and exposure parameters were used in the food web models to estimate a daily dose of COPEC to each receptor.

4. Site- and receptor-specific benchmarks. See **Appendix H, Section 5.2.3 Toxicity Reference Values and Refinement Screening Values**. LOAEL exceedances were the primary focus in the RSLERA. The geometric mean of the LOAELs provided by EPA in the EcoSSL documents for survival, growth, and reproduction were used to develop LOAELs for each COPEC. In the absence of LOAEL data for a specific receptor/COPEC, it was assumed that the LOAEL was 10 times the value of the NOAEL. LOAELs were used as toxicity reference values (TRVs).

The ecological exposure evaluation was conducted to evaluate potential risks to ecological communities and receptor group populations. The exposure evaluation for ecological communities was conducted as follows:

- Terrestrial Plants and Soil Invertebrates: Surface and subsurface soil datasets were combined and EPCs for the grouped DUs (Former Dump Area and Iona Is.) were compared to TRVs for terrestrial plants and soil invertebrates

- Aquatic plants, benthic invertebrates, and demersal fish: EPCs for the aquatic DUs (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale) were compared to RSVs for sediment

- Populations of birds and mammals: EPCs for the terrestrial and aquatic exposure areas were used in food web modeling to derive dose-based exposure estimates for wildlife (i.e., populations of birds and mammals), which were then compared to TRVs to evaluate if adverse effects were possible from exposure to COPECs in food and soil/sediment.

The HQ approach was used to estimate risk by comparing TRVs to EPCs by dividing the EPC by the TRV. HQs greater than 1 indicate potential for adverse effects.

8.4.6 Uncertainty Assessment

There are inherent uncertainties with any risk assessment that have the potential to over- or under-estimate risks including uncertainties in the analytical data, input parameters used in the food web models, and TRVs. A brief summary of potential sources of uncertainty associated with the RSLERA are included below, refer to Section 6 of the ERA (**Appendix H**) for more information:

- Environmental sampling:
  - Study design could miss areas where constituents are present or miss other constituents that were not analyzed in a specific sample.

- Analytical data:
  - The 95UCL was used as an upper estimate of mean exposures and this value was typically higher than the replicate sample results.
  - There are some cases where a constituent is not detected at the LOD or LOQ, but the LOD or LOQ exceeds a screening value.
  - There were minor data quality issues including matrix interference, trace contamination in blank samples, and/or exceeding holding times.

- Estimated exposure and toxicity data:
  - Generally, food web models represent a worst-case scenario of possible risks to the receptor groups.
  - The exposure parameters used in the food web models are not site-specific and literature-based values are not available for all species.
- Toxicity Reference Values
  - The assessment of risks was primarily based on the comparison of estimated doses to TRVs from the literature.
  - TRVs are typically generated using the most bioavailable/toxic form of the metal, which may not be present on-site.
  - There is a paucity of toxicological data in the literature for soil invertebrates and plants, and TRVs are generally developed to be conservative.
    The evaluation of risk to aquatic plants and demersal fish relied on RSVs, which are based on statistical evaluations of toxicological data for a few benthic invertebrate species.
- Assessment of risks:
  - Few methods are available to extrapolate the potential for adverse effects from the individual level to the population level.
  - With the exception of the osprey, the presence of protected species on-site is not known.
  - Surrogate receptor species were used to estimate risk to protected species but every species is unique, and special status species often have unique features of their life histories that have made them vulnerable to population declines which would not be reflected in the exposure parameters of the selected surrogate species.
  - Lack of receptor-specific chemical benchmarks, uptake data, and bioconcentration rates for reptiles and amphibians pose challenge to the assessment and characterization of risks to herptiles.
  - There are limitations associated with the use of HQs to determine the potential for risk to ecological receptors.

The uncertainties were considered as part of the Ecological Risk Characterization and conclusions.

8.4.7 RSLERA Results and Risk Characterization

The quantitative results of the RSLERA and additional characterization that interprets the potential risk for each receptor group is provided in the sections below. Consistent with ERA guidance (EPA 1997), results of the RSLERA are designed to estimate an upper-bound potential for adverse effects to the selected representative receptor species. Therefore, exceedance of a TRV indicates the potential for adverse effects; however, it does not indicate that an adverse effect is occurring from the COPEC (Tannenbaum et al. 2003). It does, however, indicate that additional evaluation may be necessary. The magnitude of the HQ indicates the potential for risk, with higher HQs indicating a higher potential for adverse effects. Risks are evaluated with the context of uncertainties and site-specific information to result in overall characterization. Results of the RSLERA for each of the receptors are summarized below, see **Appendix H** for tables of all results.

8.4.7.1 Terrestrial Plants

When the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area) were compared to EcoSSLs (i.e., TRVs) for plants, the following COPECs had HQs greater than 1:

Insert 8-1. Risk Characterization for Terrestrial Plants.

Receptor	Exposure Area	COPEC	HQ	Bioavailability Adjusted HQ	Risk Characterization Conclusions
Terrestrial Plants	Iona Island	Lead	3	1	No risk due to adjusted HQ≤1
		Thallium	3	-	No risk due to qualitative bioavailability assessment
		HMW PAHs	2	-	No risk due to qualitative bioavailability assessment
	Former Dump Area	Chromium	82	-	Potential for risk
		Copper	22	9	Potential for risk
		Lead	15	6	Potential for risk
		Mercury	6	-	Potential for risk
		Selenium	2	-	No risk due to low magnitude of exceedance
		Thallium	6	-	No risk due to low effect level HQ<1
		Zinc	21	9	Potential for risk

- Not calculated; bioavailability adjustment method was not developed for these analytes (EPA 2020).

In the Iona Island exposure area, though there are concentrations of metals in exceedance of plant TRVs (i.e., arsenic, chromium, copper, lead, mercury, selenium, thallium, and zinc) in individual DUs, the HQs for the combined 95UCL EPC are all 3 or less. Using the EPA's soil bioavailability classification procedure, Iona Island and the Former Dump Area soil can be classified as 'Medium-Low' metal bioavailability, based on pH levels > 6.5 in all soils and

percent clay < 26 percent (EPA 2020). The corresponding percent bioavailability is 41 percent, which decreases the lead HQ to 1 for the Iona Island area. The soil bioavailability classification was not developed for thallium and HMW PAHs, which also showed exceedances at Iona Island; however, the high CEC values and organic carbon content are likely to reduce bioavailability of these compounds (Huang et al. 2018; Wick et al. 2020). Thus site-wide concentrations of COPECs are not expected to pose risk to terrestrial plants.

In the Former Dump Area, the HQ for the combined 95UCL EPC for selenium is 2. Due to the low magnitude of exceedance of the EcoSSL, site-wide concentrations of selenium in the Former Dump Area soil are not expected to pose risk to terrestrial plants. The HQs for the remaining COPECs range from 6 to 82, indicating risk may be more likely. To evaluate the potential magnitude of risk, a weight of evidence evaluation was conducted that incorporates multiple lines of evidence into the determination of risk.

Adjusting for an assumed 41 percent bioavailability of copper, lead, and zinc (EPA 2020), HQs remain above 1 for terrestrial plants in the Former Dump Area; thus, there is potential risk to terrestrial plants from these compounds at the Former Dump Area. Though the soil bioavailability method was not developed based on literature for mercury, chromium, or thallium, pH and percent clay are major factors driving bioavailability of these compounds (Hussain et al. 2022; Huang et al. 2018; Wick et al. 2020; Reijonen and Hartikainen 2016; Sewart et al. 2003). Consequently, assuming a similar percent bioavailability for these compounds (i.e., 41 percent), HQs would still be above 1 for all compounds, indicating risk from chromium, mercury, and thallium to terrestrial plants at the Former Dump Area.

Importantly, significant uncertainty exists regarding the TRV used for thallium of 0.05 mg/kg. The TRV is lower than the mean background concentration of thallium measured in this assessment of 0.13 mg/kg (Table 4-4 of **Appendix H**). When using the corresponding low effect level for thallium of 0.5 mg/kg (Los Alamos National Laboratory 2018), the HQ falls below 1. Consequently, risk to populations of terrestrial plants from thallium at the Former Dump Area is unlikely; however, risk from chromium, copper, lead, mercury, and zinc is potentially present.

As discussed in Section 2.1.6.1 of the ERA (**Appendix H)**, the small whorled pogonia, which is federally listed as threatened and state listed as endangered, is not known to occur on the site but is believed to occur in Rockland County, New York, and could be present at upland forested portions of the site. The small whorled pogonia is a terrestrial plant that is sensitive to competition with other species. Therefore, this species would not use the frequently flooded Former Dump Area as habitat due to its moisture regime and predominance of *Phragmites australis* coverage. The risks to terrestrial plants from chromium, copper, lead, mercury, and zinc in the Former Dump Area are not expected to impact small whorled pogonia plants.

8.4.7.2 Soil Invertebrates

When the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area) were compared to EcoSSLs (i.e., TRVs) for soil invertebrates, the following COPECs had HQs greater than 1:

Insert 8-2. Risk Characterization for Soil Invertebrates.

Receptor	Exposure Area	COPEC	HQ	Bioavailability Adjusted HQ	Risk Characterization Conclusions
Soil Invertebrates	Iona Island	Arsenic	2	-	No risk due to qualitative bioavailability assessment
		HMW PAHs	2	-	No risk due to qualitative bioavailability assessment
	Former Dump Area	Arsenic	2	-	No risk due to qualitative bioavailability assessment
		Chromium	205	-	Potential for risk
		Copper	19	8	Potential for risk
		Mercury	34	-	Potential for risk
		Zinc	28	12	Potential for risk

- Not calculated; bioavailability adjustment method was not developed for these analytes (EPA 2020).

In the Iona Island exposure area, though there are concentrations of metals in exceedance of soil invertebrate TRVs (i.e., arsenic, chromium, copper, lead, mercury, and zinc) in individual DUs, the HQs for the combined 95UCL EPC are all 2 or less. The high CEC values and organic carbon content of the soil are likely to reduce bioavailability of these compounds (EPA 2020); thus, site-wide concentrations of COPECs in the Iona Island exposure area surface soil are not expected to pose risk to soil invertebrates.

In the Former Dump Area, the HQ for the combined 95UCL EPCs for arsenic is 2. Due to the low magnitude of exceedance of the EcoSSL and likely reduced bioavailability due to the soil physical parameters, the site-wide concentrations of arsenic in the Former Dump Area soil are not expected to pose risk to soil invertebrates. The HQs for the remaining COPECs range from 19 to 205, indicating risk may be more likely. Assuming a 41 percent bioavailability, HQs for all compounds (excluding arsenic) remain above 1, indicating that risk from chromium, copper, mercury, and zinc to soil invertebrates is potentially present at the Former Dump Area. As highlighted previously, the Former Dump Area is inundated with water twice daily during high tide and during storm events. In addition, the Former Dump Area includes areas with thick stands of *Phragmites* that may prevent habitation by soil invertebrates. Though, core samples taken from a phragmites dominated tidal marsh in New Jersey, USA indicates macroinvertebrate presence and community richness with Oligochaeta, Nematoda and Polychaeta being most abundant (Angradi et al. 2001).

Based on the high HQ exceedances (HQs of 205, 19, 34, and 28 for chromium, copper, mercury, and zinc, respectively) and a lack of site-specific information on the invertebrate community, potential risk to this receptor group could not be ruled out.

8.4.7.3 Terrestrial Herbivorous Mammals

Potential risks to herbivorous mammals were evaluated using a food web model for meadow voles. Ingestion doses were calculated for each exposure area based on the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area), which were used to predict the concentration in plant tissue that would be consumed by voles. The dose from soil

and dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk. None of the constituents in any DU had NOAEL or LOAEL-based HQs greater than 1; therefore, there is no potential risk to herbivorous mammals in either exposure area.

8.4.7.4 Terrestrial Insectivorous Birds

Potential risks to insectivorous birds were evaluated using a food web model for the American robin. Robins were assumed to be migratory, spending only a portion of their time (8 months) at the site. Ingestion doses were calculated for each exposure area based on the combined 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area), which were also used to predict a concentration in plant and invertebrate tissue that would be consumed by robins. The dose from soil and dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk. The insert below presents the HQs ($HQ_{NOAEL,}$ HQ_{LOAEL}, and Bioavailability Adjusted HQ_{LOAEL}) as well as risk characterization conclusions for all COPECs that exceeded the NOAEL-based TRVs.

Insert 8-3. Risk Characterization for Terrestrial Insectivorous Birds.

Receptor	Exposure Area	COPEC	HQ_{NOAEL}	HQ_{LOAEL}	Bioavailability Adjusted HQ_{LOAEL}	Risk Characterization Conclusions
Insectivorous birds (American robin)	Iona Island	Lead	6	3	1	No risk due to adjusted HQ≤1
		HMW PAH	3	<1	-	No risk, HQ_{LOAEL}<1
	Former Dump Area	Cadmium	3	<1	<1	No risk, HQ_{LOAEL}<1
		Copper	21	7	3	Potential for risk
		Lead	29	15	7	Potential for risk
		Zinc	2	<1	<1	No risk, HQ_{LOAEL}<1

- Not calculated, bioavailability adjustment method was not developed for these analytes (EPA 2020).

When the doses are compared to the NOAEL-based TRVs, lead and HMW PAHs HQs exceed 1 in the Iona Island exposure area and cadmium, copper, lead, and zinc HQs exceed 1 in the Former Dump Area. When the doses are compared to the LOAEL-based TRVs, all HQs fall to 1 or below 1 with the exception of lead in the Iona Island exposure area and copper and lead in the Former Dump Area. It is important to consider that the LOAEL TRV for HMW PAHs is highly uncertain. EPA (2007f) did not derive a TRV for HMW PAHs due to a lack of data; thus, an uncertainty factor was applied to the available NOAEL to estimate a LOAEL. Consequently, the HQ based on this value is uncertain.

Adjusting the soil EPC by 41 percent, the HQ based on the comparison of the LOAEL-based TRV for lead to the dose to insectivorous birds at Iona Island falls to 1. Consequently, site-wide concentrations of lead in the Iona Island exposure area surface soil are not expected to pose risk to terrestrial insectivorous birds.
Adjusting the soil EPC in the Former Dump Area by 41 percent, resultant HQs are 3 and 7 based on comparison to the LOAEL-based TRVs for copper and lead, respectively. Consequently,

measured soil physical parameters and the resultant lower bioavailability would not entirely mitigate potential risks from copper and lead to insectivorous birds at the Former Dump Area.

Several uncertainties exist with regards to the models and assumptions used to assess risks to terrestrial insectivorous birds. In the absence of site-specific tissue, the oligochaete tissue concentrations are modeled based on an uptake factor and equation for copper and lead, respectively. The uptake factor and equations developed by Sample et al. (1998a) and suggested for use in EcoSSL guidance (EPA 2007a) are generalized, as they represent multiple oligochaete species, seasons, and soil types and characteristics, which have all been shown to affect uptake (Sample et al. 1998a). Therefore, the uncertainty with the oligochaete tissue estimate for any specific location may be high (Sample et al. 1998a), and thus the exposure estimates to the wildlife receptors that eat oligochaetes are also uncertain.

Further uncertainty exists relating to the suitability of the Former Dump Area habitat for soil invertebrate foraging by insectivorous birds. As highlighted previously, thick stands of *Phragmites* cover a limited area of the Former Dump Area, which may provide a barrier to soil invertebrate foraging by insectivorous birds. Phragmites colonization is likely to have a negative overall impact on bird communities; however, some species are known to have preference for Phragmites dominated habitat.

The Former Dump Area is inundated with water twice daily during high tide and during storm events, which may limit the presence of soil invertebrate prey items within the area. A previous study of *Phragmites* dominated marsh in New Jersey found presence of macroinvertebrates including Oligochaeta, Nematoda, and Polychaeta, suggesting that suitable prey items are likely present (Angradi et al. 2001). Macroinvertebrate densities were high in *Phragmites* reeds on Iona Island, based on surveys conducted in 1999 and 2000 (Yozzo and Osgood 2013). Though some of the species identified in the aforementioned studies were aquatic or semiaquatic, bioaccumulation of copper and lead in benthic macroinvertebrates would be higher in these species compared to terrestrial soil invertebrates based on bioaccumulation factors. In addition, bird species known to use *Phragmites* dominated habitat, such as the marsh wren, consume both terrestrial and aquatic invertebrates (Beaubien et al. 2020). Without further site-specific information, it is impossible to know which condition is predominant at the Former Dump Area.

The America robin was selected as the surrogate receptor for the cerulean warbler and the golden-winged warbler, which are both considered species of special concern by the state of New York. Both protected species are smaller than the robin and use of the robin as a surrogate receptor may underestimate risk to these species based on differences in ingestion rate relative to body weight. The diet of both cerulean and golden-winged warblers primarily consists of insects (NYDEC 2023); thus, the American robin model was adjusted to consume almost entirely insects to more closely represent the two state species of concern. The cerulean warbler prefers deciduous forest habitats (Cornell Lab of Ornithology 2023a), and the golden-winged warbler prefers mosaic forest near wetlands (Cornell Lab of Ornithology 2023b). Both habitat types exist on-site; thus, both species may be present at the site. Thick stands of *Phragmites australis* are not their preferred habitat, meaning it is unlikely either species will spend all their time inhabiting the Former Dump Area. Consequently, risks to these threatened species may be overestimated

based on the lack of habitat suitability, though the use of the Former Dump Area for foraging by species of concern cannot be ruled out based on this assessment.

There is potential for population-level impacts to terrestrial insectivorous birds given LOAEL-based HQs exceed 1 for lead and copper (HQs of 7 and 3, respectively, see **Insert 8-3**) even when bioavailability is incorporated into the exposure model. The LOAEL-based HQs for lead and copper are based on comparisons to TRVs that are derived from chronic exposures with effects on reproductive endpoints. Given this impact is directly linked to population sustainability (fecundity and recruitment), it is prudent to highlight the potential for population-level impacts to insectivorous avian species for lead and copper at the Former Dump Area. However, population-level effects on this receptor group cannot be determined or ruled out without further site-specific ecological data. Information on populations present within the Former Dump Area (abundance and density as well as other parameters) would be needed to reduce this uncertainty and to provide insight into population impacts from these metals. Equally important, species of concern may be present in the area, for which effects at the individual effect level are significant. Consequently, potential risks to species of concern from copper and lead exposure in the Former Dump Area cannot be ruled out. Therefore, it is concluded there is potential risk to insectivorous birds and consequently two bird species of special concern due to copper and lead at the Former Dump Area.

8.4.7.5 Terrestrial Insectivorous Mammals

Potential risks to insectivorous mammals were evaluated using a food web model for short-tailed shrew. Ingestion doses were calculated for each exposure area based on the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area), which were also used to predict a concentration in plant, small mammal, and invertebrate tissue that would be consumed by shrews. The dose from soil and dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk. The insert below presents the HQs (HQ_{NOAEL}, HQ_{LOAEL}, and Bioavailability Adjusted HQ_{LOAEL}) as well as risk characterization conclusions for all COPECs that exceeded the NOAEL-based TRVs.

Insert 8-4. Risk Characterization for Terrestrial Insectivorous Mammals.

Receptor	Exposure Area	COPEC	HQ_{NOAEL}	HQ_{LOAEL}	Bioavailability Based HQ_{LOAEL}	Risk Characterization Conclusions
Insectivorous mammals (shrew)	Iona Island	Lead	2	<1	<1	No risk, HQ_{LOAEL}<1
		HMW PAHs	10	<1	-	No risk, HQ_{LOAEL}<1
	Former Dump Area	Antimony	9	<1	-	No risk, HQ_{LOAEL}<1
		Cadmium	6	<1	<1	No risk, HQ_{LOAEL}<1
		Copper	12	7	3	Potential for risk
		Lead	7	4	2	Potential for risk
		Thallium	3	<1	-	No risk, HQ_{LOAEL}<1
		Zinc	2	<1	<1	No risk, HQ_{LOAEL}<1
		HMW PAHs	3	<1	-	No risk, HQ_{LOAEL}<1

- Not calculated, bioavailability adjustment method was not developed for these analytes (EPA 2020).

When the doses were compared to the NOAEL-based TRVs, lead and HMW PAHs HQs exceeded 1 in the Iona Island exposure area and antimony, cadmium, copper, lead, thallium, zinc, and HMW PAHs HQs exceeded 1 in the Former Dump Area. When the doses are compared to the LOAEL-based TRVs, all HQs fell below 1 except for copper and lead in the Former Dump Area. Accounting for bioavailability based on soil parameters as discussed previously (i.e., assuming 41 percent bioavailability), HQs still exceeded 1 for both copper and lead when compared to NOAEL and LOAEL-based TRVs, indicating that the lower bioavailability could not mitigate the potential for risk to terrestrial insectivorous mammals.

The shrew was a surrogate receptor for the Indiana bat (*Myotis sodalis*) and northern long-eared bat (*Myotis septentrionalis*), which are both federal and state-listed endangered species. There is uncertainty associated with the use of the short-tailed shrew as a surrogate for these species based on differences in size and life history (see Section 2.1.6.1 of the ERA; **Appendix H**). Additional uncertainty exists regarding the models used to estimate soil invertebrate tissue concentrations as discussed in the preceding section. The short-tailed shrew is assumed to spend all its time at the site based on the published home range (EPA 1993), which is a conservative assumption given that the area is inundated with water twice daily during high tide and during storm events. Previous studies suggest that short-tailed shrews favor forested habitats over tidally inundated marshes (Ekernas and Mertes 2006). As such, risks based on exposure within the Former Dump Area to this receptor group may be overestimated. In addition, the endangered bat species for which the shrew was a surrogate receptor are unlikely to forage entirely in the Former Dump Area; thus, risks may be further overestimated. Despite this, the potential for population-level effects on this receptor group cannot be determined or ruled out without further site-specific ecological data; though effects may be possible based on exceedance of TRVs associated with effects on reproduction. Given the shrew was a receptor for both federal and state-listed endangered species, risks at the individual level are important. Therefore, it is concluded there is potential risk to insectivorous mammals and consequently protected bat species from copper and lead at the Former Dump Area.

8.4.7.6 Carnivorous Mammals

The potential risks to carnivorous mammals were evaluated using a food web model for red fox. Ingestion doses were calculated for each exposure area based on the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area), which were also used to predict a concentration in small mammal tissue that would be consumed by fox. The dose from soil and dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk. None of the HQs exceeded the threshold of 1 so risk to carnivorous mammals is not expected.

8.4.7.7 Carnivorous Birds

Potential risks to carnivorous birds were evaluated using a food web model for red-tailed hawk. Ingestion doses were calculated for each exposure area based on the 95UCL EPCs for surface soil (Iona Island) and surface and subsurface soil (Former Dump Area), which were also used to predict a concentration in small mammal tissue that would be consumed by hawks. The dose

from soil and dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk.

When the doses were compared to the NOAEL-based TRVs, HQs were less than 1 except for the HQ for lead which was 3. The HQ for lead dropped to 1 when the dose was compared to the LOAEL-based TRV. Consideration of soil physical parameters and the associated reduced bioavailability of constituents reduced risk further. Based on the lack of exceedance of the LOAEL-based TRVs, risk to carnivorous birds is not expected. The red-tailed hawk was a surrogate species for the northern harrier (*Circus cyaneus*), a state-listed threatened species. Risk to this protected bird species is not expected.

8.4.7.8 Herptiles (Terrestrial and Aquatic)

In Section 2.1.6.1 of the ERA (**Appendix H)**, herptiles (i.e., reptiles and amphibians) were evaluated based on a qualitative evaluation using other receptors as surrogate species. For reptiles, potential risks are expected to be most similar to that of birds (Salice et al. 2009), but risks to any receptor could indicate potential risks to herptiles. This assumption is made due to the lack of toxicological and exposure information for herptiles. The RSLERA results and risk characterization for terrestrial species are presented above in Section 8.4.6.1.1 of this RI report and the risk characterization for aquatic species are presented below in Section 8.4.6.1.2 of this RI report.

There is potential risk to herptiles in the Former Dump Area due to copper and lead in the soil because of the potential risk to terrestrial insectivorous birds as well as terrestrial plants and soil invertebrates (copper only). There are also potential risks to herptiles due to chromium, mercury, and zinc due to risks to plants and/or soil invertebrates.

Since there were no COPECs identified in surface water or potential risks to other aquatic life, there are no anticipated risks to herptiles due to concentrations of COPECs in surface water. There is potential risk to aquatic insectivorous birds, aquatic plants, benthic invertebrates, demersal fish, and, therefore, herptiles due to lead in the sediment at the Iona Island Hudson River Shoreline. There are also risks to herptiles due to antimony, cadmium, nickel, and zinc in the sediment at Iona Island Hudson River Shoreline due to risks to aquatic plants, benthic invertebrates, and demersal fish.

Given that box and painted turtles have been recorded in the study area, it is possible that bog turtles, a federally threatened and state endangered species, could be present on site. However, of the areas with potential risks to herptiles, adequate habitat is likely not present. The Former Dump Area is densely vegetated with primarily *Phragmites australis*, an invasive species known to eliminate the microhabitats important to the bog turtle (NYDEC 2023c). Iona Island Hudson River Shoreline also does not feature the preferred habitat of the bog turtles (open wet meadows and boggy areas). Therefore, bog turtles are not likely to be found in these areas of potential risk, and risk is not expected to bog turtles.

Overall, using other receptors as surrogates for herptiles, potential risk was identified for this group at the Former Dump Area from chromium, copper, lead, mercury, and zinc. At the Iona Island Hudson River Shoreline, potential risk from antimony, cadmium, lead, nickel, and zinc was identified for herptiles based on exceedances for other receptors including birds and soil invertebrates.

8.4.7.9 Aquatic Plant Community

As discussed above in 2.1.6.2 and 4.2.2 of **Appendix H**, there are no sediment screening values protective of aquatic plants. Therefore, aquatic plants rooted in sediments were evaluated by comparing EPCs for sediment to refined sediment screening benchmarks. The HQs for six metals at Iona Island Hudson River Shoreline (antimony, cadmium, copper, lead, nickel, and zinc) exceeded 1. Only zinc exceeded its RSV in the Riprap Drainage Swale with an HQ of 3. Zinc in this area may be attributed to the metal debris (e.g., rebar, old fencing, and other metal pieces) observed in the Riprap Drainage Swale. AVS/SEM results from the Riprap Drainage Swale indicate that metals in sediment are unlikely to be bioavailable; therefore, zinc is not expected to pose risk in the Riprap Drainage Swale exposure area. No concentrations of metals exceeded RSVs in the Tidal Wetland Swale. In addition, none of the concentrations of metals in any surface water samples exceeded surface water quality criteria in any area. Therefore, aquatic plants are not at risk in the Riprap Drainage Swale or the Tidal Wetland Swale.
As discussed in the Benthic Invertebrate Community results in Section 8.4.7.10, metals in sediments are bioavailable at the Iona Island Hudson River Shoreline based on AVS/SEM results and low TOC content. Despite the low concentrations in surface water, due to the exceedance of the RSVs and bioavailability of metals, risk to aquatic plants from antimony, cadmium, copper, lead, nickel, and zinc in sediment is possible at the 0.5 acre Iona Island Hudson River Shoreline exposure area.

8.4.7.10 Benthic Invertebrate Community

When the sediment EPCs for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale) were compared to the RSVs, the following COPECs had HQs greater than 1:

Insert 8-5. Risk Characterization for Benthic Invertebrates.

Receptor	Exposure Area	COPEC	HQ	Risk Characterization Conclusions
Benthic Invertebrates	Iona Island Hudson River Shoreline	Antimony	5	Potential for risk
		Cadmium	2	Potential for risk
		Copper	68	Potential for risk
		Lead	147	Potential for risk
		Nickel	3	Potential for risk
		Zinc	9	Potential for risk
	Riprap Drainage Swale	Zinc	3	No risk due to AVS/SEM results

None of the COPECs in the Tidal Wetland Swale had HQs greater than 1. Only one COPEC, zinc, has an HQ greater than 1 in the Riprap Drainage Swale. Zinc in this area may be attributed

to the metal debris (e.g., rebar, old fencing, and other metal pieces) observed in the drainage swale. AVS/SEM results from the Riprap Drainage Swale are less than 130 µmol/g_{oc}, which indicates that the metals in sediment are unlikely to be bioavailable; therefore, zinc is not expected to pose risk to benthic invertebrates in the Riprap Drainage Swale exposure area.

At Iona Island Hudson River Shoreline, AVS/SEM results combined with low TOC content and sandy sediments indicate that the area provides suitable conditions for metals in sediment to be bioavailable. During the Shoreline Reconnaissance, benthic organisms were observed beneath large boulders and riprap along the shoreline, but none were observed within the river shoreline sediments during sampling. The area is primarily gravel, riprap, and course-grained sand with the exception of pockets of deposited sediment (EA 2020); thus, limited habitat may be present for benthic invertebrates. A benthic community assessment on the Hudson River Shoreline sediments would need to be completed in order to confirm the lack of benthos and lack of suitable habitat. The lack of observed benthic organisms in the sediment could also be an indicator that concentrations of COPECs in the sediment are contributing to benthic organism toxicity.

This exposure area is spatially limited to one-half acre, immediately adjacent to the Former Dump Area. Just beyond this shallow shelf, river bathymetry indicates a steep slope leading to a deep river channel. Concentrations of metals in surface water are low, indicating dilution from the Hudson River current or that metals are not desorbing from sediment particles and are not dissolving into surface water at concentrations that would cause adverse effects

Due to the exceedance of the RSVs and bioavailability of metals, risk to benthic invertebrates from antimony, cadmium, copper, lead, nickel, and zinc in sediment is possible.

8.4.7.11 Zooplankton Community

Zooplankton were evaluated by comparing surface water concentrations to freshwater surface water quality criteria. There were no exceedances of any water quality criteria; therefore, risks to the zooplankton community are not expected.

8.4.7.12 Demersal Fish Community

Demersal fish (i.e., benthic-feeding fish) are exposed to surface water and sediment (Section 2.6.3). Demersal fish were evaluated by comparing EPCs for sediment to RSVs and by comparing surface water concentrations to water quality criteria. There were no exceedances of any water quality criteria. The HQs for six metals in sediment at Iona Island Hudson River Shoreline (antimony, cadmium, copper, lead, nickel, and zinc) exceeded 1. As highlighted above, the AVS/SEMs results coupled with sandy sediments and low organic carbon at Iona Island Hudson River Shoreline suggest that metals may be bioavailable.

Evaluating risk to demersal fish from the drainage swales may be a conservative evaluation as the areas may be dry for at least part of the year. However, aerial images show drainage swales connecting to water (Figure 3-3). With the available information, use of the drainage swales by

these receptors cannot be dismissed. Only zinc exceeded its RSV in the Riprap Drainage Swale with an HQ of 3. Zinc in this area may be attributed to the metal debris (e.g., rebar, old fencing, and other metal pieces) observed in the drainage swale. AVS/SEM results from the Riprap Drainage Swale indicate that metals in sediment are unlikely to be bioavailable; therefore, zinc is not expected to pose risk in the Riprap Drainage Swale exposure area. No concentrations of metals exceeded RSVs in the Tidal Wetland Swale. Therefore, demersal fish are not at risk in the Riprap Drainage Swale or the Tidal Wetland Swale.

Demersal fish will not use the Former Dump Area as habitat. Thus, the Former Dump Area is not evaluated as an exposure area for this receptor. As previously mentioned, the small shelf area at the 0.5 acre Iona Island Hudson River Shoreline exposure area adjacent to the Former Dump Area is lined with boulders and riprap. Beyond the rocky shoreline, sandy sediments that lack organic matter are prevalent. As a result, there may be a lack of sufficient habitat for infaunal benthic invertebrate communities and aquatic plants. Without this base of the food web for foraging and sufficient habitat for spawning, small benthic-feeding fish (i.e., demersal fish) are also unlikely to inhabit this area, minimizing the potential for exposure and risk in these receptor groups.

Concentrations of metals in surface water are low, indicating dilution from the Hudson River current or that metals are not desorbing from sediment particles and are not dissolving into surface water at concentrations that would cause adverse effects. As discussed above, metals in sediments are bioavailable based on AVS/SEM results and low TOC content. Due to the exceedance of the RSVs and bioavailability of metals, risk to demersal fish from antimony, cadmium, copper, lead, nickel, and zinc in sediment is possible.

The endangered Atlantic sturgeon and shortnose sturgeon are demersal fish. Atlantic sturgeon migrates up the Hudson River from the Atlantic beginning in April for reproduction and migrate back to the ocean in the late summer through fall (NOAA 2023a, New York Heritage Program 2023a). Shortnose sturgeon spawn in the Hudson River using large rocky substrate (New York Heritage Program 2023b), which is found at the littoral zone of the Iona Island Hudson River Shoreline. Juvenile shortnose sturgeon may remain at the saltfront during maturation. Within the Hudson River the saltfront is dynamic and is identified by specific conductance at 500 µS cm^{-1}. The United States Geological Survey defines the saltfront and provides daily and historical measurements of the river as supported by the Hudson River Saltfront Data and Project (https://ny.water.usgs.gov/projects/dialerplots/saltfront.html). Juvenile Atlantic sturgeon have been harvested near and south of Iona (Peterson et al. 2000; Sweka 2007) indicating they could be present at the Iona Island Hudson River Shoreline. Adult sturgeon are likely to be transient in nature and thus risks to that lifestage may be limited; however, juvenile sturgeon could be at risk due to lead in the sediment at Iona Island Hudson River Shoreline.

8.4.7.13 Pelagic Fish Community

Pelagic fish inhabit the water column. They were evaluated by comparing surface water concentrations to water quality criteria. There were no exceedances of any water quality criteria; therefore, risks to the pelagic fish community are not expected.

8.4.7.14 Aquatic Herbivorous Birds

Potential risks to herbivorous birds were evaluated using a food web model for mallard duck. Ingestion doses were calculated for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale) based on the EPC in sediment, which was also used to predict a concentration in plant tissue that would be consumed by ducks. The dose from sediment and the dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate HQs. Mallard duck has a large habitat/foraging range (1,075 acres) and, therefore, the AUF was adjusted to account for the expected proportion of time the species would spend in 0.5-acre DUs. HQs greater than 1 indicate potential risk. None of the constituents in any DU had NOAEL or LOAEL-based HQs greater than 1; therefore, risks to aquatic herbivorous birds are not expected.

8.4.7.15 Aquatic Herbivorous Mammals

Potential risks to herbivorous mammals were evaluated using a food web model for muskrat. Ingestion doses were calculated for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale) based on the EPC in sediment, which was also used to predict a concentration in plant tissue that would be consumed by muskrat. The muskrat was also evaluated in the Former Dump Area (DUs 17,18, and 19) because this area is inundated with water twice daily during high tide and during storm events and contains an abundance of *Phragmites australis*, which could be consumed by muskrat (Kiviat 2013). Ingestion doses were calculated for the Former Dump Area based on the soil EPC, which was also used to predict concentrations in plant tissue.

The dose from sediment/soil and the dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. HQs greater than 1 indicate potential risk. None of the constituents in the Riprap Drainage Swale, Tidal Wetland Swale, or the Former Dump Area had NOAEL or LOAEL-based HQs greater than 1; therefore, there is no potential risk to herbivorous mammals. The HQs (HQ_{NOAEL} and HQ_{LOAEL}) as well as risk characterization conclusions for all COPECs in exceedance of the NOAEL-based TRV at Iona Island Hudson River Shoreline for aquatic herbivorous mammals are presented in the following insert.

Insert 8-6. Risk Characterization for Aquatic Herbivorous Mammals.

Receptor	Exposure Area	COPEC	HQ_{NOAEL}	HQ_{LOAEL}	Risk Characterization Conclusions
Aquatic herbivorous mammals (muskrat)	Iona Island Hudson River Shoreline	Antimony	5	<1	No risk, HQ_{LOAEL}<1
		Copper	2	1	No risk, HQ_{LOAEL}≤1
		Lead	4	2	No risk due to low HQ and habitat considerations

When the doses from Iona Island Hudson River Shoreline are compared to the NOAEL-based TRVs, antimony, copper, and lead, exceed 1. When the doses are compared to the LOAEL-based TRVs, the HQ for antimony falls below 1, and to a value of 1 for copper. Therefore, risk to aquatic herbivorous mammals is not expected due to antimony and copper in sediment.

The shoreline area consists of sandy sediment and lacks aquatic vegetation due to the high-energy environment, which is subject to scouring. It is unlikely that muskrat would spend 100 percent of its time in this area (as the food web models assume due to a relatively small range of 0.33 acre) when there are areas such as the Former Dump Area with vegetation nearby. Habitat suitability studies have shown that muskrat burrows and foraging are positively related to aquatic vegetation coverage, with muskrat occupancy also negatively related to percent sand in soil (Cotner and Schooley 2011; Nadeau et al. 1995). Taking this into account with the relatively low HQs based on comparison to the LOAEL-based TRV (HQ of 2), risk to aquatic herbivorous mammals from lead is not expected.

8.4.7.16 Aquatic Insectivorous Birds

Potential risks to insectivorous birds were evaluated using a food web model for lesser scaup. Ingestion doses were calculated for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale) based on the EPC in sediment, which was also used to predict a concentration in invertebrate tissue that would be consumed by scaup. The dose from sediment and the dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. Lesser scaup has a large habitat/foraging range (219 acres) and, therefore, the AUF was adjusted to account for the expected proportion of time the species would spend in 0.5-acre DUs (Section 8.4.5).

HQs greater than 1 indicate potential risk. When the doses were compared to the NOAEL-based TRVs, HQs were less than 1 except for the HQ for lead at Iona Island Hudson River Shoreline only which was 6. The HQ for lead dropped to 3 when the dose was compared to the LOAEL-based TRV. Based on the exceedance of the LOAEL-based TRV, there is potential for risk to insectivorous birds due to lead at the Iona Island Hudson River Shoreline. As highlighted above, AVS/SEM results, low TOC content, and sandy sediments indicate that the area provides conditions for metals in sediment to be bioavailable. Thus, it is concluded that potential risks to aquatic insectivorous birds may be present. The HQs (HQ_{NOAEL} and HQ_{LOAEL}) as well as risk characterization conclusions for lead at Iona Island Hudson River Shoreline for aquatic insectivorous birds are presented in the following insert.

Insert 8-7. Risk Characterization for Aquatic Insectivorous Birds.

Receptor	Exposure Area	COPEC	HQ_{NOAEL}	HQ_{LOAEL}	Risk Characterization Conclusions
Aquatic insectivorous birds (lesser scaup)	Iona Island Hudson River Shoreline	Lead	6	3	Potential for risk

The lesser scaup was selected as a surrogate receptor for the pied-billed grebe, a protected species that prefers wetland habitats with both open water and aquatic vegetation cover available. The Iona Island Hudson River Shoreline does not provide suitable habitat for the species. Therefore, the pied-billed grebe is not likely to use the exposure area for nesting and foraging and is unlikely to be at risk due to lead in sediment.

As highlighted previously (Section 8.4.7.4), effects at the population-level cannot be determined based on the magnitude of HQ exceedances, though effects at this level are considered possible based on the exceedances of TRVs derived from studies of reproductive effects. Additional data collection and modeling approaches would be necessary to fully elucidate the potential for population-level effects on aquatic insectivorous birds at the Iona Island Hudson River Shoreline.

8.4.7.17 Piscivorous Mammals

Potential risks to piscivorous mammals were evaluated using a food web model for river otter. Ingestion doses were calculated for the site based on the EPC in sediment for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale). Concentrations in fish tissue were calculated using surface water concentrations and BCFs. The dose from sediment and the dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. River otter have a large habitat/foraging range (859 acres) and, therefore, the AUF was adjusted to account for the expected proportion of time the species would spend in 0.5-acre DUs. HQs greater than 1 indicate potential risk. None of the HQs exceeded the threshold of 1; therefore, risk to piscivorous mammals is not expected.

8.4.7.18 Piscivorous Birds

Potential risks to piscivorous birds were evaluated using a food web model for great blue heron. Ingestion doses were calculated for the site based on the EPC in sediment for each aquatic DU (Iona Island Hudson River Shoreline, Riprap Drainage Swale, and Tidal Wetland Swale). Concentrations in fish tissue were calculated using surface water concentrations and BCFs. The dose from sediment and the dose from biota were summed to calculate a total dose, which was then compared to NOAEL and LOAEL-based TRVs to calculate an HQ. Great blue heron habitat/foraging range is expected to be approximately 11 acres and, therefore, the AUF was adjusted to account for the expected proportion of time the species would spend in 0.5-acre DUs. HQs greater than 1 indicate potential risk. None of the HQs exceeded the threshold of 1; therefore, risk to piscivorous birds is not expected.

The great blue heron was selected as a surrogate receptor for the following piscivorous protected species: least bittern, bald eagle, and osprey. The suitability of the great blue heron as a surrogate receptor for each of the protected species is discussed in Section 2.1.6.2 of the ERA (Appendix H). The home ranges of the protected species are greater than the 11-acre home range of the great blue heron. The least bittern home range is approximately 24 acres (Cornell Lab 2024), and the bald eagle and osprey are expected to have minimum home ranges that are approximately

300 acres (EPA 1993). Since no risks to piscivorous birds are expected, no risks to the protected species are expected.

8.5 RISK ASSESSMENT SUMMARIES

The subsections below present summaries of the human health and ecological risk assessments evaluations and conclusions.

8.5.1 Human Health Risk Assessment Summary

The HHRA identified COPCs in each soil and sediment DU based-on detected concentrations that exceeded the EPA Residential Soil RSLs and exceedances of background concentrations. In soil, COPCs included mainly metals and PAHs. The PCB Aroclor 1260 was also identified as a COPC in soil within DU-18, which is located within AOC #16 – Area D (Former Dump Area). In sediment, select metals were identified as COPCs in each of the three sediment DUs. No COPCs were identified in surface water. Therefore, surface water was not evaluated further in the HHRA and no risk concerns for human receptors exposed to site surface water.

Potential receptors evaluated in the HHRA included park personnel, researcher, construction workers, recreational users (adult, adolescent, and child), adolescent trespasser, and camper/Boy Scout. Each receptor was evaluated for exposure to each individual DUs. The evaluation of DU analytical results was performed on a DU-basis to inform potential decisions that relate to the DU. Carcinogenic risks for all receptors exposures to the individual DUs were either below or within the EPA's acceptable risk range of $1x10^{-6}$ to $1x10^{-4}$. The non-cancer HI thresholds for all receptors exposure to the individual DUs were below the acceptable threshold of 1.0, except the construction worker exposure to DU-13 and DU-18. However, a breakdown by target organ did not reveal any target organs above the acceptable threshold of 1.0 for the construction workers exposure to DU-13 and DU-18. Therefore, the HHRA did not reveal potential concerns for carcinogenic risks or non-cancer hazards for any receptor's exposure to each DU.

Additionally, the HHRA noted that all potential site receptors may not remain within one DU because none of the DUs present an attractive area for any of the receptors to spend a majority of time while onsite. It is likely that all receptors may visit various areas of Iona Island during their visit. Therefore, the HHRA evaluated all potential receptors for exposure to two exposure areas: Iona Island Exposure Area and the Former Dump Area Exposure Area. For both the Iona Island and Former Dump Area Exposure Areas, the HHRA indicated all carcinogenic risks were either below or within the EPA's acceptable risk range of $1x10^{-6}$ to $1x10^{-4}$. The non-cancer HI thresholds were below the acceptable threshold of 1.0 for all receptors evaluated, except the construction worker exposure to the Former Dump Area Exposure Area. A breakdown by target organ did not reveal any target organs above the acceptable threshold of 1.0 for the construction workers exposure to the Former Dump Area Exposure Area. Therefore, the HHRA did not reveal potential concerns for carcinogenic risks or non-cancer hazards for any receptor's exposure to each exposure area.

Lead was identified as a COPC in onsite soil based upon a comparison to the EPA residential soil RSL (400 mg/kg). Blood lead modeling for soil and sediment analytical results revealed greater than 5 percent of the population exceeded the reference blood-lead level of 5 µg/dL for the following receptors:

- Construction workers exposed to surface soil at DU-7 in the upland area, and surface and subsurface soil at DU-17 and DU-18 covering the eastern portion of AOC #16 – Area D (Former Dump Area), and sediment from IHRS-DU-01 (Iona Island Hudson River shoreline adjacent to AOC #16 – Area D [Former Dump Area])

- Park personnel exposed to surface and subsurface soil at DU-17 and DU-18 and sediment within IHRS-DU-01

- Recreational users exposed to sediment within IHRS-DU-01.

The HHRA determined that potential risk concerns associated with lead for the park personnel and construction workers are likely overestimated. It is noted that the Former Dump Area Exposure Area, which includes DU-17 and DU-18, is a marshy area that is covered with vegetation and subject to tidal influence that makes access difficult. The Former Dump Area is also identified as a future nature preserve/wetland area. No construction or other activities are expected in this area and actual contact with this area is minimal and unlikely to result in human health concerns. Additionally, construction worker exposure represents exposures that are usually controlled using standard health and safety protocols and personal protective equipment. Potential lead risk concerns identified for the construction worker within DU-7, DU-17, DU-18, and the Former Dump Exposure Area do not warrant further evaluation or risk management decisions.

Additionally, the park personnel potential exposure to one specific DU for an entire year is not an expected scenario. The park personnel are more likely to be exposed to environmental media over the entire island for activities such as grass mowing, site inspections, and general maintenance. For this reason, the exposure to the entire island is better represented by an average (or mean) concentration of the DUs across the site, which includes all DUs sampled (i.e., DU-1 through DU-7, DU-9 through DU-19, IHRS, RRDS, and TWS). It is noted that this mean concentration does not include the areas of the site not sampled and likely overestimates the true mean lead concentration. The mean soil lead concentration across all DUs is 667 mg/kg, revealing less than 5% of the population exceeds the reference blood-lead level of 5 µg/dL. The results of the ALM modeling for the mean lead concentration across all the DUs reveal no potential concerns for the park personnel exposure to lead based upon expected exposure. Therefore, the park personnel exposure to Iona Island does not warrant further evaluation or risk management decisions.

The recreational user exposure to lead in sediment from IHRS DU did reveal significant exceedance of the acceptable blood-lead threshold. Unlike the worker expected exposure, the recreational user may spend a significant amount of time in this area. While sediments in this

area are generally sandy with larger grain size that is difficult to adhere to the skin surface, there is a potential for contact, sample results from the IHRS DU reveal potential transport of contaminants from AOC #16 (Former Dump Area) along the surface via overland runoff and erosion and into shoreline sediments. As a result, there are sufficient potential concerns for a recreational user exposure to the IHRS DU to warrant additional evaluation and/or risk management decisions in a Feasibility Study. Sample results from the RRDS and TWS DUs on the tidal marsh side of Iona Island do not reveal impacts from AOC #16 or potential risk concerns for receptors, which reveals the tidal marsh area is disconnected from the Former Dump Area.

8.5.2 Ecological Risk Assessment Summary

The ERA evaluated both terrestrial and aquatic receptors. After the completion of the SLERA, only those receptors potentially at risk were evaluated using a site-specific RSLERA.

The terrestrial exposure areas were: 1) Iona Island Exposure Area; and 2) Former Dump Exposure Area. Representative terrestrial receptor categories included plants, soil invertebrates, herbivorous mammals (representative species meadow vole), insectivorous birds (representative species American robin), insectivorous mammals (representative species short-tailed shrew), carnivorous birds (representative species red tailed hawk), carnivorous mammals (representative species red fox), and herptiles.

The aquatic exposure areas were: 1) Iona Island Hudson Shoreline; 2) riprap drainage swale; and 3) tidal wetland swale. Representative aquatic receptor categories included plants, benthic invertebrates, zooplankton, demersal fish, pelagic fish, herbivorous birds (representative species mallard duck), herbivorous mammals (representative species muskrat), insectivorous birds (representative species lesser scaup), piscivorous mammals (representative species river otter) piscivorous birds (representative species great blue heron), and herptiles.

No receptors were found to be at risk in the terrestrial Iona Island exposure area, which does not include the Former Dump Area. These risk findings apply also to two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and two state listed species of insectivorous birds (i.e. cerulean warbler and golden-winged warbler). No risks to aquatic receptors were found in the riprap drainage swale or the tidal wetland swale exposure areas.

In the Former Dump Area soil exposure area, plants, soil invertebrates, insectivorous mammals, insectivorous birds, and herptiles are potentially at risk from metals (chromium, copper, lead, mercury, and/or zinc), with risk being driven by avian exposure to lead. This risk potentially extends to two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and two species of insectivorous birds which are New York State listed species of special concern (i.e. cerulean warbler and golden-winged warbler). In the Iona Island Hudson Shoreline sediment exposure area, plants, benthic invertebrates, demersal fish, herptiles and insectivorous birds are potentially at risk from metals (antimony, cadmium, copper, lead, nickel and zinc), with risk being driven by exposure to lead. This risk from sediment potentially extends to two species of endangered demersal fish (juvenile sturgeon) (i.e. Atlantic sturgeon, short-nosed sturgeon).

Insert 8-8. Summary of Potential Risk Characterization for All Ecological Receptors.

Habitat Type	Exposure Area	Media	COPEC	Receptors
Terrestrial	Iona Island	No receptors are at risk due to COPECs in soil.		
	Former Dump Area	Soil (surface and subsurface)	Chromium	• Terrestrial plants • Soil invertebrates • Herptiles
			Copper	• Terrestrial plants • Soil invertebrates • Terrestrial Insectivorous Birds (including 2 NY species of special concern) • Terrestrial Insectivorous Mammals (including 2 federal and state-listed endangered bat species) • Herptiles
			Lead	• Terrestrial plants • Terrestrial Insectivorous Birds (including 2 NY species of special concern) • Terrestrial Insectivorous Mammals (including 2 federal and state-listed endangered bat species) • Herptiles
			Mercury	• Terrestrial plants • Soil invertebrates • Herptiles
			Zinc	• Terrestrial plants • Soil invertebrates • Herptiles
Aquatic	Iona Island Hudson Shoreline	Sediment	Antimony, Cadmium, Copper, Lead, Nickel, and Zinc	• Aquatic plants • Benthic invertebrates • Demersal fish (including 2 species of endangered sturgeon) • Herptiles
			Lead	• Aquatic insectivorous birds
	Riprap Drainage Swale	No receptors are at risk due to COPECs in surface water or sediment.		
	Tidal Wetland Swale	No receptors are at risk due to COPECs in surface water or sediment.		

Risk from soil in the Former Dump Area is mitigated for common species by the small spatial extent of the area (< 2 acres), dense phragmites stands and twice daily inundation during tidal cycles; population level effects are unlikely from soils in this area. Similarly, population level risk is unlikely for common species due to the small extent of sediment in shoreline areas immediately adjacent to the Former Dump Area. The attenuation of risk these factors is not as clear for the two listed bats species, two listed bird species and two endangered fish species (listed because of preferred riverine habitat by the Former Dump Area for a juvenile life stage), as value is put on a single individual in these instances.

The purpose of the RSLERA was to incorporate easily obtained site specific information to refine the ecological risk evaluation. With the introduction of these sub-tiers of evaluation, the SLERA was refined to provide fewer generic conclusions of ecological risk; however, even with

these refinements, hazard calculations show potentially significantly greater risks in this isolated area due to the presence of federal/state-listed or endangered species in the Former Dump Area. These species include two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and state listed/Special Concern avian species (cerulean warbler and golden-winged warbler), as well as two endangered species of fish (shortnose sturgeon and Atlantic sturgeon) potentially exposed to sediments at the waterline in front of the Former Dump Area along the shoreline of Iona Island on the Hudson River.

The risk conclusions of the SLERA/RSLERA after these sub-tiers of evaluation show that potential risks are confined to a small area of the site with a sharply defined lateral extent of contamination due to island topography and the Hudson River, as well as a sharply defined vertical extent of contamination due to bedrock at approximately three (3) ft bgs based on test pitting and shoreline bathymetric data. Size notwithstanding, based upon current nature and extent information, the Former Dump Area represents on-going source area due to the presence of ash from the former on-site incinerator, as encountered during test pitting.

9. CONCLUSION AND RECOMMENDATIONS

The HTRW RI was conducted to characterize the nature and extent of hazardous substances in environmental media attributable to past DoD activities and to evaluate potential risk to human health and ecological receptors. Samples to characterize nature and extent were collected as ISM DUs across the island. This section presents conclusions of the HHRA and ERA and recommendations.

9.1 HUMAN HEALTH RISK ASSESSMENT CONCLUSIONS

DUs were evaluated as individual exposure areas and combined into two separate exposure areas for the HHRA: 1) Iona Island Exposure Area; and 2) the Former Dump Exposure Area. The HHRA current receptors included park personnel, researcher, adult recreator, adolescent recreator, child recreator, adolescent trespasser, and camper. Potential future site users included each of the current users as well as a construction worker. Based upon potential receptors and their current or reasonably anticipated future exposures at the site, only the child/adult/adolescent recreational users exposed to lead in sediment located along the Hudson River shoreline (IHRS-DU-01) presented potentially significant risk that would require additional risk management decisions for the Iona FUDS.

9.2 ECOLOGICAL RISK ASSESSMENT CONCLUSIONS

The ERA evaluated both terrestrial and aquatic receptors. After the completion of the SLERA, only those receptors potentially at risk were evaluated using a site-specific RSLERA.

The terrestrial exposure areas were: 1) Iona Island Exposure Area; and 2) Former Dump Exposure Area. Representative terrestrial receptor categories included plants, soil invertebrates, herbivorous mammals (representative species meadow vole), insectivorous birds (representative species American robin), insectivorous mammals (representative species short-tailed shrew), carnivorous birds (representative species red tailed hawk), carnivorous mammals (representative species red fox), and herptiles.

The aquatic exposure areas were: 1) Iona Island Hudson Shoreline; 2) riprap drainage swale; and 3) tidal wetland swale. Representative aquatic receptor categories included plants, benthic invertebrates, zooplankton, demersal fish, pelagic fish, herbivorous birds (representative species mallard duck), herbivorous mammals (representative species muskrat), insectivorous birds (representative species lesser scaup), piscivorous mammals (representative species river otter) piscivorous birds (representative species great blue heron), and herptiles.

No receptors were found to be at risk in the terrestrial Iona Island exposure area, which does not include the Former Dump Area. These risk findings apply also to two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and two state listed species of insectivorous birds (i.e. cerulean warbler and golden-winged warbler). No risks to aquatic receptors were found in the riprap drainage swale or the tidal wetland swale exposure areas.

In the Former Dump Area soil exposure area, plants, soil invertebrates, insectivorous mammals, insectivorous birds, and herptiles are potentially at risk from metals (chromium, copper, lead, mercury, and/or zinc), with risk being driven by avian exposure to lead. This risk potentially extends to two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and two species of insectivorous birds which are New York State listed species of special concern (i.e. cerulean warbler and golden-winged warbler). In the Iona Island Hudson Shoreline sediment exposure area, plants, benthic invertebrates, demersal fish, herptiles and insectivorous birds are potentially at risk from metals (antimony, cadmium, copper, lead, nickel and zinc), with risk being driven by exposure to lead. This risk from sediment potentially extends to two species of endangered demersal fish (juvenile sturgeon) (i.e. Atlantic sturgeon, short-nosed sturgeon).

Risk from soil in the Former Dump Area is mitigated for common species by the small spatial extent of the area (< 2 acres), dense phragmites stands and twice daily inundation during tidal cycles; population level effects are unlikely from soils in this area. Similarly, population level risk is unlikely for common species due to the small extent of sediment in shoreline areas immediately adjacent to the Former Dump Area. The attenuation of risk these factors is not as clear for the two listed bats species, two listed bird species and two endangered fish species (listed because of preferred riverine habitat by the Former Dump Area for a juvenile life stage), as value is put on a single individual in these instances.

9.3 HTRW RI RECOMMENDATIONS

Both the human health and ecological risk assessments indicate potentially significant risk for the Former Dump Area and the Iona Island Hudson River shoreline sediments in its immediate vicinity. These conclusions are the result of a baseline HHRA and an RSLERA.

The purpose of the RSLERA was to incorporate easily obtained site specific information to refine the ecological risk evaluation. With the introduction of these sub-tiers of evaluation, the SLERA was refined to provide fewer generic conclusions of ecological risk; however, even with these refinements, hazard calculations show potentially significantly greater risks in this isolated area due to the presence of federal/state-listed or endangered species in the Former Dump Area. These species include two federal/state-listed species of bats (i.e. Indiana bat, northern long-eared bat) and state listed/Special Concern avian species (cerulean warbler and golden-winged warbler), as well as two endangered species of fish (shortnose sturgeon and Atlantic sturgeon) potentially exposed to sediments at the waterline in front of the Former Dump Area along the shoreline of Iona Island on the Hudson River.

The risk conclusions of the SLERA/RSLERA after these sub-tiers of evaluation show that potential risks are confined to a small area of the site with a sharply defined lateral extent of contamination due to island topography and the Hudson River, as well as a sharply defined vertical extent of contamination due to bedrock at approximately three (3) ft bgs based on test pitting and shoreline bathymetric data. Size notwithstanding, based upon current nature and extent information, the Former Dump Area represents on-going source area due to the presence of ash from the former on-site incinerator, as encountered during test pitting.

In accordance with USACE's Environmental Quality Risk Assessment Handbooks, Volumes 1 (human health) (USACE 1999), and 2 (environmental evaluation) (USACE 2010), baseline risk assessments must be completed for the FUDS (USACE 2022). The HHRA and the SLERA/RSLERA meet the definition of baseline risk assessments (USEPA, 2001); therefore, the RI is complete.

It is recommended that this project proceed directly to an FS, rather than spend time and resources determining a less conservative site-specific cleanup number or by conducting a BERA. The conclusion of this RI is that the portion of this FUDS, known as the Former Dump Area, indicates potentially significant risk to listed species since value is placed at the individual level. Based upon its small size, and sharply defined boundaries for the contamination, this FUDS should proceed to a FS to evaluate the appropriate remedy to address these risks (USEPA 2001). The FS will consider State applicable or relevant and appropriate requirements associated with both the environment and human health. A letter will be sent to NYSDEC/ New York State Department of Health requesting the state's proposed list of applicable or relevant and appropriate requirements.

○	○	○	○	○	○

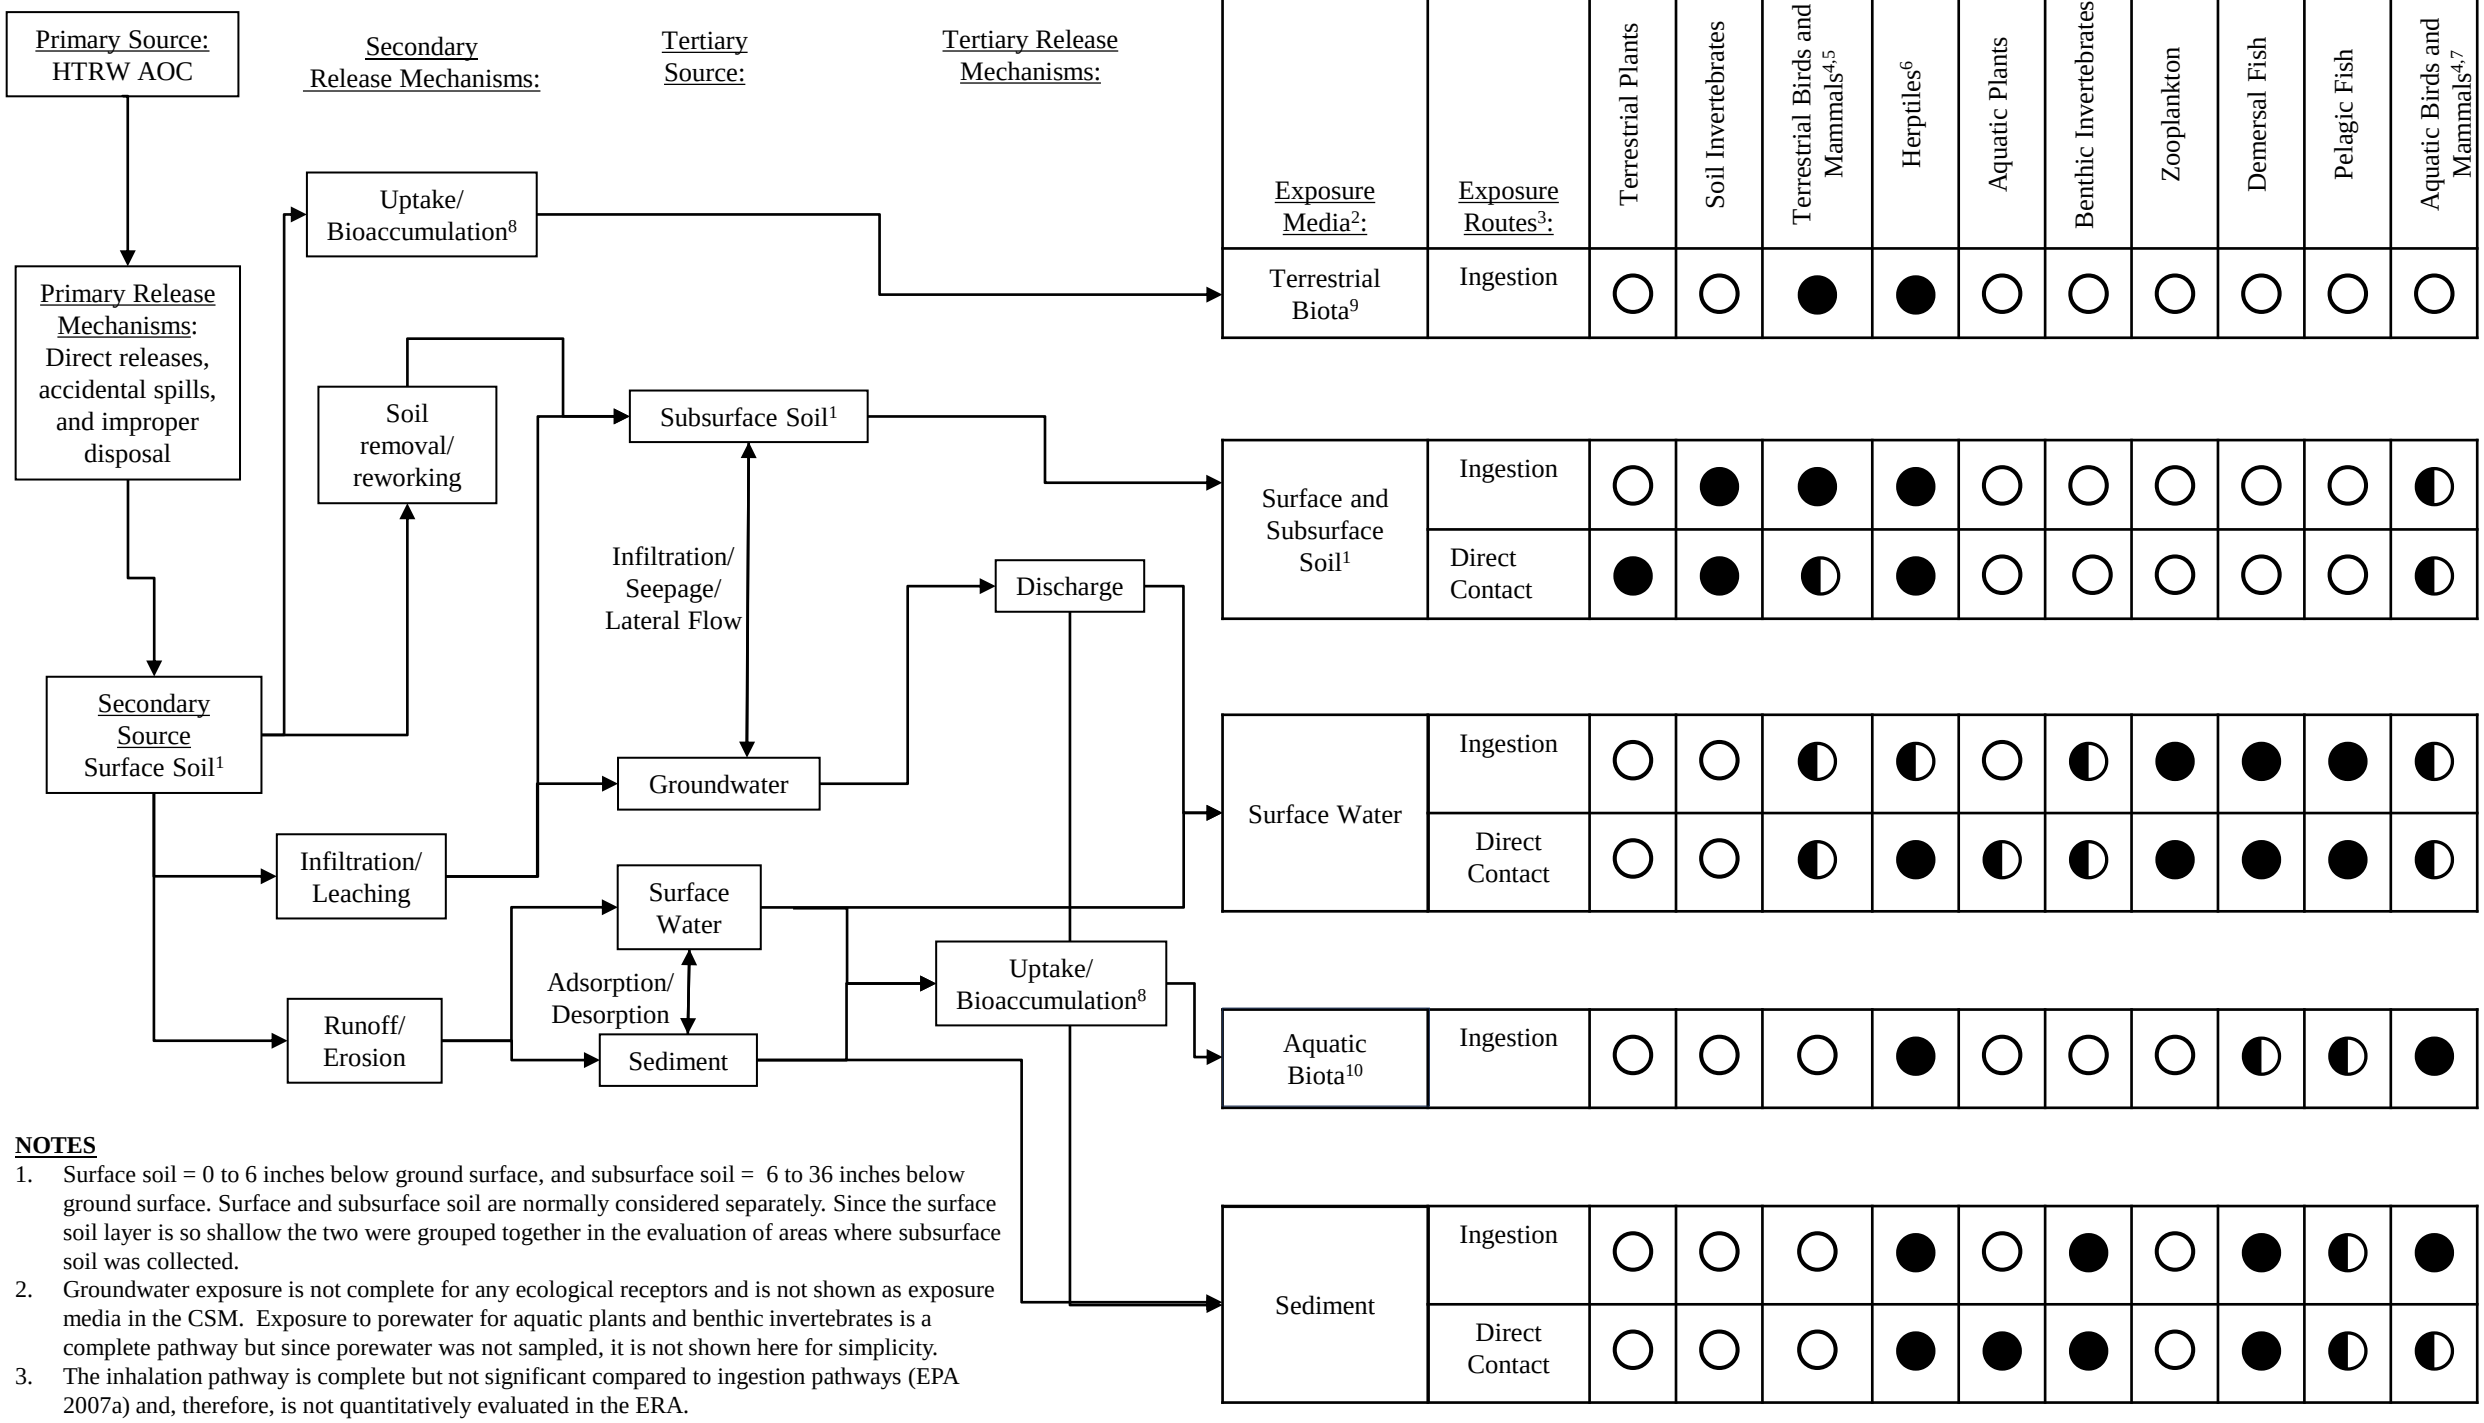
LEGEND

● Complete Pathway; confirmed receptor and media interaction (i.e., a source, migration route, and receptor have been identified).

◑ Potentially Complete Pathway; receptor and media interaction; however, the exposure may be limited, either due to the type of receptor or the nature of the source, and has not been confirmed.

○ Incomplete Pathway; no receptor and media interaction. No evaluation is conducted.

NOTES
Surface soil = defined as the interval from 0 to 6 inches bgs.
Subsurface soil = defined as the interval from 6 to 36 inches bgs.
VOC = Volatile Organic Compound



NOTES

1. Surface soil = 0 to 6 inches below ground surface, and subsurface soil = 6 to 36 inches below ground surface. Surface and subsurface soil are normally considered separately. Since the surface soil layer is so shallow the two were grouped together in the evaluation of areas where subsurface soil was collected.
2. Groundwater exposure is not complete for any ecological receptors and is not shown as exposure media in the CSM. Exposure to porewater for aquatic plants and benthic invertebrates is a complete pathway but since porewater was not sampled, it is not shown here for simplicity.
3. The inhalation pathway is complete but not significant compared to ingestion pathways (EPA 2007a) and, therefore, is not quantitatively evaluated in the ERA.
4. Direct contact pathways for mammals and birds is limited by fur and feathers and is considered in incidental soil ingestion during grooming.
5. Mammals such as voles, shrews, and foxes may be exposed to subsurface soil during burrowing activities.
6. Herptiles are evaluated qualitatively using other receptors as surrogate species due to the lack of ecotoxicity values for these receptors. Risks to any receptor could indicate potential risks to herptiles.
7. Aquatic birds and mammals may be exposed to soil when burrowing or foraging on the bank, but exposure to these receptors expected to be less than that captured by exposure to terrestrial birds and mammals. Primary abiotic media of concern to aquatic wildlife is sediment.
8. Only bioaccumulation directly into biota that will be consumed by a receptor is shown here for simplicity, though there can be several trophic levels.
9. Terrestrial biota identified as terrestrial plants, soil invertebrates, and small wildlife.
10. Aquatic biota identified as aquatic plants, benthic invertebrates, and demersal fish.

● Complete Pathway; confirmed receptor and media interaction (i.e., a source, migration route, and receptor have been identified). Exposure is evaluated quantitatively.

◑ Complete Pathway, but not Significant; There is confirmed receptor and media interaction. However, pathway is not significant and exposure is not evaluated quantitatively.

◯ There is no receptor and media interaction. No evaluation is conducted.

Area of Concenr (AOC) Number	Building/Structure	Historical Activities	Potential AOC-Specific Contaminants Based on Historical Activities	Historical Sampling Results[1.2]	Potential Release to Environment	COPC Specific Analyte List	Decision Unit
1	Former Building 103	Storage of paint and oil; likely solvent use.	Solvents from paints (VOCs and SVOCs); Petroleum Oil Lubricants (POL); and metals.	October 1996 – elevated metals (arsenic, lead) and PAHs in shallow subsurface soil sample IX103-B1 December 2007 – no samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years). SVOCs from paints would	TAL metals, PAHs	DU-13
2	Former Building 121	Former incinerator; historical records do not indicate whether municipal solid waste or hazardous waste was burned in the incinerator.	Residual organics and metals; PAHs from incomplete combustion.	October 1996 – elevated metals (arsenic, barium, cadmium, lead) and PAHs in shallow subsurface soil sample IX121-B1 December 2007 – elevated metals (lead) detected in sediment sample II-EA-SD-02-02 collected near this AOC	Volatilization of ash particles into air and soil deposition; potential land disposal; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater.	TAL metals, PAHs	DU-17
3	Former Building 123	Former garage; historical records do not indicate if this building was used for equipment or materials storage.	Solvents (VOCs and SVOCs), POL, and metals.	No historical samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. Note: VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years).	TAL metals, PAHs	DU-5
4	Former Buildings 124, 125, 126, 127, and 128	Sewage Disposal Plant.	Chlorides, organic compounds (VOCs and SVOCs), metals, microorganisms.	October 1996 – elevated metals (arsenic, lead) in shallow subsurface soil sample IX124/8-B1. Low concentrations of PAHs (below screening criteria). December 2007 – elevated metals (antimony, copper, lead, mercury, zinc) in surface soil sample II-EA-SS-02-16	Chemical spills; leaks from sewer lines/ tanks to surface water or groundwater; land disposal of sludge. Note: VOCs (including from POLs) are unlikely to be present in soil due to characteristics of VOCs (high solubility and mobility) and due to the time since deactivation (70 years). Due to the time since deactivation (70 years), microorganisms from DoD use are likely not present.	TAL metals, PAHs	DU-16
5	Former Building 207	Former garage used by the Marines; historical records do not indicate if this building was used for equipment or materials	Solvents (VOCs and SVOCs), POL, and metals.	No historical samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related	TAL metals, PAHs	DU-8
6	Former Building 213	Storage of paint; likely solvent use.	Solvents from paints (VOCs and SVOCs) and metals	No historical samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years). SVOCs from paints would have polymerized.	TAL metals, PAHs	DU-12

9	Former Building 220	Former garage; historical records do not indicate if this building was used for equipment or materials storage.	Solvents (VOCs and SVOCs), POL, and metals.	No historical samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years).	TAL metals, PAHs	DU-9
10	Former Building 406	Tin, electrical and annealing shop	Solvents (VOCs and SVOCs), POL, and metals.	No historical samples collected	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years).	TAL metals, PAHs	DU-1
11	Former Building 407	Paint shop and pipe shop; likely solvent use	Solvents (VOCs and SVOCs), POL, and metals	October 1996 – elevated metals (arsenic, lead) and PAHs in shallow subsurface soil sample IX407-B1 December 2007 – elevated metals in surface soil sample (II-EA-SS-02-05) collected near this AOC	Volatilization of VOCs to air; spills to surface soil; overland flow to surface water/ sediment; leaching to subsurface soil and groundwater. **Note:** VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years).	TAL metals, PAHs	DU-3
12	Former Building 410	Power house; coal ash (including fly ash, bottom ash, and/or sludge).	PAHs and metals (such as arsenic, cadmium, and mercury)	October 1996 – highest detected PAHs at site, in shallow subsurface soil sample IX410-B1; metals were not tested December 2007 – no samples collected	Volatilization of ash particles into air and soil deposition; potential land disposal; leaching to subsurface soil and groundwater; overland flow to surface water / sediment.	TAL metals, PAHs	DU-3
13	Former fuel oil AST	One former 2,500-gallon fuel oil AST located near Former Building 233.	VOCs/BTEX, PAHs	October 1996 - no site-related VOCs in shallow subsurface soil.	Leaching to subsurface soil and groundwater; overland flow to surface water / sediment. Note: VOCs are unlikely to be present in soil due to characteristics of VOCs (high solubility and mobility) and due to the time since deactivation (70 years); however, as BTEX is a primary component of fuel oil, BTEX is retained for further evaluation.	BTEX, PAHs	DU-20

Table 1-1 HTRW Project Areas of Concern

Area of Concenr (AOC) Number	Building/Structure	Historical Activities	Potential AOC-Specific Contaminants Based on Historical Activities	Historical Sampling Results[1,2]	Potential Release to Environment	COPC Specific Analyte List	Decision Unit
14	Former fuel oil AST	One former fuel oil AST (size unknown) located near Dock 131.	VOCs/BTEX, PAHs	No historical samples collected	Leaching to subsurface soil and groundwater; overland flow to surface water / sediment. Note: VOCs are unlikely to be present in soil due to characteristics of VOCs (high solubility and mobility) and due to the time since deactivation (70 years); however, as BTEX is a primary component of fuel oil, BTEX is retained for further evaluation.	BTEX, PAHs	DU-21
15	Former fuel oil AST	Two former fuel oil ASTs (size unknown) located near Former Building 410.	VOCs/BTEX, PAHs	October 1996 - no site-related VOCs in shallow subsurface soil.	Leaching to subsurface soil and groundwater; overland flow to surface water / sediment. Note: VOCs are unlikely to be present in soil due to characteristics of VOCs (high solubility and mobility) and due to the time since deactivation (70 years); however, as BTEX is a primary component of fuel oil, BTEX is retained for further evaluation.	BTEX, PAHs	DU-22
16	Dump Area	Historical records suggest that construction debris was used as fill between Iona and Round Island; the content of the dump is unknown but may have contained waste or munitions debris.	Unknown contents – could include solvents, paints, POL (VOCs and SVOCs); PCBs, explosives, and metals	October 1996 – elevated metals (arsenic, barium, cadmium, chromium, lead, silver); PAHs; explosives compounds (2,4 dinitrotoluene, 2,6-dinitrotoluene) in shallow subsurface soil samples IXDMP-B1, -B2; one PCB compound (Aroclor 1260) detected in sample IXDMP-B1 December 2007 – no samples collected	Leaching to subsurface soil and groundwater; overland flow to surface water / sediment. Note: VOCs (including from POLs) are unlikely to be present in soil due to characteristics of solvent related VOCs (high solubility and mobility) and due to the time since deactivation (70 years).	TAL Metals, PAHs, PCBs, Explosives	DU-17, DU-18, DU-19
17	Former Coal Trestle and Storage Area – located near Former Building 410	Coal storage for the power house.	Metals (such as arsenic, cadmium, and mercury), SVOCs	No historical samples collected	Soil deposition; leaching to subsurface soil and groundwater; soil deposition; potential land disposal.	TAL metals, PAHs	DU--1, DU-2
18	Former Coal Storage Area – located near Former Building 215	Coal stored on a concrete foundation for use at the Depot.	Metals (such as arsenic, cadmium, and mercury), SVOCs	No historical samples collected	Soil deposition; leaching to subsurface soil and groundwater; soil deposition; potential land disposal.	TAL metals, PAHs	DU-11
19	Former transformers	Electrical transformers for Depot.	PCBs	No historical samples collected	Leaching to subsurface soil and groundwater; overland flow to surface water / sediment.	PCBs	DU-23, DU-24, DU-25

NOTES:

1. Low (estimated) detections of 1,1-dichloroethene, acetone, and methylene chloride were detected in all of the samples analyzed for VOCs in October 1996. The samples were qualified as “B” because the compounds were detected in one or more of the QA/QC blank samples and/or “J” because the detected concentration was less than the quantitation limit.

2. The December 2007 MMRP SI samples were not selected based on proximity to the HTRW AOCs (sampled previously by Greeley), they were selected for broad coverage of the 1903 Explosion Area.

NOTES:
AOC = Area of concern
AST = Above ground storage tank
BTEX = Benzene, toluene, ethylbenzene, and xylenes
COPC = Contaminant of potential concern
PAH = Polycyclic aromatic hydrocarbon
PCB = Polychlorinated biphenyl
POL = Petroleum oil and lubricants
SVOC = Semi-volatile organic compound
TAL = Target Analyte List
VOC = Volatile organic compound

Table 1-2 Former Buildings on Iona Island Naval Ammunition Depot Associated with Ammunition and Explosives

Building No.[a], [b], [c], [f], (1)	Building Name[a], [b], [c], [f]	Decision Unit	Year Built[a], [c]	Built Purpose or Use[c], [e]	Foundation[a], [b], [e]	Notes [b], [c], [d]	Extent of Explosives Residues Presence (EM 385-1-97)			Other Basis/Notes
							Table I.5-1 Item No. Note 2	Solid, Liquid, Gas	Significant or Limited	
202	Shell House #5 & Explosive "D" Plant	EXDU-7	1912	(Shop)[e]	Stone/Concrete	• Walls-brick; Floor – wood; Roof – Tin laid on wood, with wood rafters[b] • Ammunition is almost always present[b] • Explosive "D" Loading Plant[g] • Two buildings labeled Vacuum System Housing (no building number) are located on the right and left sides of Building 202, map dated 1947[e]	22, 54, 63, 67-74, 97	Solid (dusts)	Significant	• D Plant • Bulk ammonium picrate? • No production at Iona Depot • Possible loading of explosives into large projectiles? • Document on Storage references the erection of Special buildings for "sifting" explosive "D" circa 1945[g]. This process could possibly require an explosives dust vacuum collection system. • Listed on 1958 Real Estate Annex Building 226 was a one-story concrete lean-to attached to Building 202[k]
306	Filling House #2 Cartridge Filling House and Reforming Plant[e]	EXDU-6	1939	Maintenance (Shop)[e] Maintenance (Cartridge Filling Shop)[k]	Concrete	• Attached to Bldg. 313, Cartridge Case Storage[c] • This building was attached to Building 313 and had a Vertical Electric Conveyor System to assist in moving material[k]	54, 97	Solid	Significant	• At intervals, a small amount of ammunition may be kept in them for a short period but not generally[b] • Possible loading of explosives? • Map dated 1947 shows this building was used to fill cartridge cases[e]
307	Filling House #5 Projectile Filling House[e]	EXDU-5	1940	Maintenance (Shop)[e] Maintenance (Projectile Filling House)[k]	Concrete		54, 63, 67-74, 97	Solid	Significant	• At intervals, a small amount of ammunition may be kept in them for a short period but not generally[b] • Possible loading of explosives? • Map dated 1947 shows this building was used to fill projectiles[e]
404	Filling House #1 Bag Charge Filling House[e]	EXDU-4	1939	Maintenance (Ammunition and Explosives) (Shop)[e]	Concrete	• Attached to Bldg. 404, Powder Storage Building[c] • This building is attached to Building 421[k]	54, 97	Solid	Significant	• At intervals, a small amount of ammunition may be kept in them for a short period but not generally[b] • Possible loading of explosives?
503	Filling House #6 Charge Assembly House[e]	EXDU-3	1942	Maintenance (Ammunition and Explosives) (Shop)[e]	Concrete	• Powder awaiting sale[b] • Ammunition is almost always present[b]	54, 63, 67-74, 82 97	Solid	Significant	• Possible assembly of cartridges, shrapnel rounds • Possible loading of explosives? • Enclosure B, para 2[i] Use of fusible links on opening between rooms normally indicates that maintenance on ammunition is being performed.

Table 1-2 Former Buildings on Iona Island Naval Ammunition Depot Associated with Ammunition and Explosives

Building No.[a], [b], [c], [f], (1)	Building Name[a], (b), (c), (f)	Decision Unit	Year Built[a], (c)	Built Purpose or Use[c], (e)	Foundation[a], (b), (e)	Notes (b), (c), (d)	Extent of Explosives Residues Presence (EM 385-1-97)			Other Basis/Notes
							Table I.5-1 Item No. Note 2	Solid, Liquid, Gas	Significant or Limited	
										This could be anything from repackaging to rebuilding.
506	Filling House #3 (Bombproof) Bombproof[e]	EXDU-2	1906	Maintenance (Storage)[f] Maintenance (Ammunition and Explosives)[k]	Brick		54, 59, 63, 67-74, 97	Solid	Significant	• At intervals, a small amount of ammunition may be kept in them for a short period but not generally[b] • Possible loading of explosives? • Maintenance on ammunition involved a number of operations such as those listed in the 1928 Annual report[j] • Shown on map dated 1947 as only a Bombproof[e]
609	Mine Loading Plant Inert Storehouse[f] Miscellaneous Storehouse[e]	EXDU-1	1918	Ammunition Storage (Storage)[e]	Concrete	• Ammunition is almost always present[b] • 8”, 10”, 14” and 16” dummy charges, steel plugs, 3” and 5” covers, drill projectiles, fleshless pellets[f] • Mine filling operation with melted TNT[h]	5, 48, 54, 56, 97	Solid, Liquids and Gas	Significant	• Shown as Mine Loading Plant on map dated 1928-12-31[e] • Plant was discontinued by late 1942 and kettles used to melt TNT were removed[h] • Shown on a map dated 1947 as a Miscellaneous Storehouse[e] • See 1918 Annual Report/Navy Department on detail info on Mine Loading Plant[l]

(j) 1928-08-23 Annual Report, examples of ammunition maintenance activities
(k) 1958-05-01 Real Estate and Building Annex
(l) 1918 Annual Report/Navy Department, Mine Loading Plant

Note 2 Explanations of type of ammunition or explosives operation/facility phase of explosive released from Table I.5-1/EM 385-1-97 is provided below:

5 – Cast loading
22 –Explosives or explosives dust vacuum collection
54 – Pack/unpack bay in a maintenance or production building
56- 63 – Pressing, low speed, automated or manual (normally used in the press loading of larger items, such as projectiles and warheads
67 – Projectile base plate assembly or removal
68 – Projectile crimping
69 – Projectile fin assembly or removal
70 – Projectile main charge pressing
71 – Projectile ogive assembly or removal
72 – Projectile pull-apart (from cartridge case)
73 – Projectile rotating band or obturator assembly or removal
74 – Projectile seating
94 – Storage (e.g., earth covered magazines, aboveground magazines, covered storage pads, service magazines)
97 – Temporary storage bay in a maintenance or production building

Table 1-2 Former Buildings on Iona Island Naval Ammunition Depot Associated with Ammunition and Explosives

Building No.[(a), (b), (c), (f,) (1)]	Building Name[(a), (b), (c), (f)]	Decision Unit	Year Built[(a), (c)]	Built Purpose or Use[(c), (e)]	Foundation[(a), (b), (e)]	Notes [(b), (c), (d)]	Extent of Explosives Residues Presence (EM 385-1-97)			Other Basis/Notes
							Table I.5-1 Item No. [Note 2]	Solid, Liquid, Gas	Significant or Limited	

Note 1 - Building requires more information about specific operations that would indicate a source of potential significant explosives residue and would need to be revised to include operations such as cast loading (Item #5 of Table I.5-1/EM 385-1-97).

General Notes: Section 5 (*Building and Installed Equipment Containing Explosive Residues That Present Explosion Hazards*) in Engineering Manual 385-1-97 *Explosives Safety and Health Requirements Manual* and Department of Army Pamphlet 385-64 *Ammunition and Explosives Safety Standards* is specific to real property which includes buildings and installed equipment. The guidance provides safety requirements for former operating buildings and any installed equipment when there is a potential of residual explosives that present an explosive hazard.

Significant explosives residues – Caused by operations that can result in extensive migration of significant amounts of explosives in the building and its installed equipment. Can be released in solid, liquid, or vapor form. Can migrate into cracks, voids, behind wall and roof panels, drains, roof rafters, porous surfaces, etc. Solids - operations capable of generating explosive dusts result in significant migration and residual presence. Liquids - In process liquid explosives can leave residues in pipes and vessels. Spills and wash-down of equipment can carry explosives into cracks in the floor and into drains and sumps. Gases - When solid explosives are heated, can volatilize into the air, and migrate about the building. After condensation, the explosive is again a solid.

1. United States Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) Table, EPA, May 2019. Value shown is equal to HI=0.1. Carcinogenic values equal to 1x10-6.
2. EPA Ecological Soil Screening Levels (ECO-SSLs), February 2005 - April 2008. (a) = Avian; (i) = Soil Invertebrates; (m) = Mammalian; (p) = Plants

NOTES:
CAS = Chemical Abstracts Service
mg/kg = Milligram(s) per kilogram
B = Compound detected in one or more quality assurance / quality control blank sample(s)
J =Estimated concentration
U =The analyte was not detected. Reporting limits for the non-detects were not defined.
Bold values exceed NYSDEC background concentrations and EPA Ecological Soil Screening Levels.
Red concentrations meet or exceed EPA Residential Soil RSLs.
Concentrations highlighted in yellow are at or exceed EPA Industrial Soil RSLs.
Shaded values indicate detection limits are higher than screening values.

1. Location refers to the nearest former building.
2. United States Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) Table, EPA, May 2019. Value shown is equal to HI=0.1. Carcinogenic values equal to 1x10-6.
3. EPA Ecological Soil Screening Levels (ECO-SSLs), February 2005 - April 2008. Lowest values presented: (a) = Avian; (i) = Soil Invertebrates; (m) = Mammalian; (p) = Plants

NOTES:
BG=background sample
CAS = Chemical Abstracts Service
J=Analyte is present. Reported value may not be accurate or precise.
U=Not detected (i.e. less than method detection limits for metals and less than reporting limits for explosives). The associated number indicates the approximate sample concentration necessary to be detected.
UJ=Not detected, quantitation limit may be inaccurate or imprecise.
Bold values exceed EPA Ecological Soil Screening Levels.
Red concentrations exceed EPA Residential Soil RSLs.
Shaded values indicate detection limits are higher than any screening values.

1. Location refers to the nearest former building.
2. United States Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) Table for Soil, USEPA, May 2019. Value shown is equal to HI=0.1. Carcinogenic values equal to 1x10-6.
3. EPA Region 4 Sediment Screening Values for Hazardous Waste Sites, Marine/Estuarine Sediment Screening Value (March 2018)

NOTES:
CAS = Chemical Abstracts Service
J = Analyte is present between the method detection limit and the reporting limit.
U=Not detected (i.e. less than method detection limits for metals and less than reporting limits for explosives). The associated number indicates the approximate sample concentration necessary to be detected.
UJ = Not detected, quantitation limit may be inaccurate or imprecise.
Bold values exceed EPA Ecological Sediment Screening Values.
Red concentrations exceed EPA Residential Soil RSLs.
Concentrations highlighted in yellow meet or exceed USEPA Industrial Soil RSLs.
Shaded values indicate detection limits are higher than screening values.

Table 1-6 Protected Animal Species at Iona Island

Group	Species	Common Name	Status	Jurisdiction
Fish	*Acipenser brevirostrum*	shortnose sturgeon	Endangered	Federal/State
Fish	*Acipenser oxyrhynchus*	Atlantic sturgeon	Endangered	Federal/State
Birds	*Haliaeetus leucocephalus*	Bald eagle	Threatened[1]	State
Birds	*Ixobrychus exilis*	Least bittern	Threatened	State
Birds	*Setophaga cerulea*	Cerulean warbler	Special Concern	State
Birds	*Vermivora chrysoptera*	Golden-winged warbler	Special Concern	State
Birds	*Pandion haliaetus*	Osprey	Special Concern	State
Birds	*Circus cyaneus*	Northern harrier	Threatened	State
Birds	*Podilymbus podiceps*	Pied-billed grebe	Threatened	State
Plants	*Isotria medeoloides*	Small whorled pogonia	Threatened/Endangered	Federal/State
Mammals	*Myotis sodalis*	Indiana bat	Endangered	Federal/State
Mammals	*Myotis septentrionalis*	Northern long-eared bat	Endangered[2]	Federal/State
Reptiles	*Clemmys muhlenbergii*	Bog turtle	Threatened/Endangered	Federal/State

NOAA 2023a

1. Bald eagles are also federally protected under the Bald and Golden Eagle Protection Act.
2. On November 29, 2022, the USFWS published a ruling reclassifying Northern Long-eared Bat from Threatened to Endangered under the federal Endangered Species Act. This rule is effective January 30, 2023. The change to Endangered in New York will take place at the same time as the Federal listing.

Table 3-1 HTRW RI Phase I Sample Collection

Sample Location	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	Analytical Laboratory	Laboratory Report
Phase I Investigation Area: Surface and Subsurface Soil, Groundwater								
DU-1	Surface soil triplicate incremental sample	IINY-DU-1A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/18/2020	1500	MS/MSD	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134722-1
		IINY-DU-1B-SSIS-20200318		3/18/2020	1500	Not applicable		280-J134722-1
		IINY-DU-1C-SSIS-20200318		3/18/2020	1500	Not applicable		280-J134722-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 6 hand auger borings at DU-1. Soil depth to refusal ranged from 6 to 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-2	Surface soil triplicate incremental sample	IINY-DU-2A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/19/2020	815	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-2B-SSIS-20200319		3/19/2020	815	Not applicable		280-J134777-1
		IINY-DU-2C-SSIS-20200319		3/19/2020	815	Not applicable		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-2. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-3	Surface soil triplicate incremental sample	IINY-DU-3A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/18/2020	1545	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134722-1
		IINY-DU-3B-SSIS-20200318		3/18/2020	1545	Not applicable		280-J134722-1
		IINY-DU-3C-SSIS-20200318		3/18/2020	1545	Not applicable		280-J134722-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-3. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-4	Surface soil triplicate incremental sample	IINY-DU-4A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/18/2020	1430	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134722-1
		IINY-DU-4B-SSIS-20200318		3/18/2020	1430	Not applicable		280-J134722-1
		IINY-DU-4C-SSIS-20200318		3/18/2020	1430	Not applicable		280-J134722-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 6 hand auger borings at DU-4. Significant anomalies in 1-acre DU. Soil depth to refusal at one boring was 12 inches bgs, soil depth to refusal at remaining borings ranged from 4 to 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-5	Surface soil triplicate incremental sample	IINY-DU-5A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/19/2020	900	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-5B-SSIS-20200319		3/19/2020	900	Not applicable		280-J134777-1
		IINY-DU-5C-SSIS-20200319		3/19/2020	900	Not applicable		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-5. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-6	Surface soil triplicate incremental sample	IINY-DU-6A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, pH by field screening	3/19/2020	1500	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-6B-SSIS-20200319		3/19/2020	1500	Not applicable		280-J134777-1
		IINY-DU-6C-SSIS-20200319		3/19/2020	1500	Not applicable		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-6. Exposed bedrock / bedrock wall in DU-6. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-7	Surface soil triplicate incremental sample	IINY-DU-7A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, pH by field screening	3/19/2020	1345	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-7B-SSIS-20200319		3/19/2020	1345	Not applicable		280-J134777-1
		IINY-DU-7C-SSIS-20200319		3/19/2020	1345	Not applicable		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-7. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-8	Surface soil triplicate incremental sample	Not Collected	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	DU-8 Deletion – DU-8 was placed at former Building 207 that was a small garage located between existing Buildings 222, 201, and 212. Building 207 is also known as HTRW AOC #5. DU-8 is a 200x200 ft decision unit that was established around former Building 207 to determine whether former operations at this building served as a source of contaminants to the environment at concentrations that may result in potential risks to human and ecological receptors. Following mark-out DU-8 in the field and site reconnaissance conducted on 18 March 2020, numerous rusted and deteriorating 55-gallon drums, deteriorating pallets, piles of roofing shingles, chain link fencing, and other debris were observed in DU-8. Several empty 55-gallon drums were lying on their sides, while other drums were upright and filled with fluid. The material contained within the drums is not known. Residue indicative of roofing tar was observed on the outside of several drums, and staining was noted on the ground surface.					
	Subsurface soil triplicate incremental sample							

Table 3-1 HTRW RI Phase I Sample Collection

Sample Location	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	Analytical Laboratory	Laboratory Report
DU-9	Surface soil triplicate incremental sample	IINY-DU-9A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/19/2020	1040	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-9B-SSIS-20200319		3/19/2020	1040	Not applicable		280-J134777-1
		IINY-DU-9C-SSIS-20200319		3/19/2020	1040	MS/MSD		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-9. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-10	Surface soil triplicate incremental sample	IINY-DU-10A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, pH by field screening	3/19/2020	1120	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134777-1
		IINY-DU-10B-SSIS-20200319		3/19/2020	1120	Not applicable		280-J134777-1
		IINY-DU-10C-SSIS-20200319		3/19/2020	1120	Not applicable		280-J134777-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-10. Exposed bedrock and bedrock wall within DU. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-11	Surface soil triplicate incremental sample	IINY-DU-11A-SSIS-20200330	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/30/2020	1115	MS/MSD	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135113-1
		IINY-DU-11B-SSIS-20200330		3/30/2020	1115	Not applicable		280-J135113-1
		IINY-DU-11C-SSIS-20200330		3/30/2020	1115	Not applicable		280-J135113-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-11. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-12	Surface soil triplicate incremental sample	IINY-DU-12A-SSIS-20200330	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/30/2020	1215	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135113-1
		IINY-DU-12B-SSIS-20200330		3/30/2020	1215	Not applicable		280-J135113-1
		IINY-DU-12C-SSIS-20200330		3/30/2020	1215	Not applicable		280-J135113-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-12. Soil depth to refusal less than 2 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-13	Surface soil triplicate incremental sample	IINY-DU-13A-SSIS-20200330	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH by field screening	3/30/2020	1340	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135113-1
		IINY-DU-13B-SSIS-20200330		3/30/2020	1340	Not applicable		280-J135113-1
		IINY-DU-13C-SSIS-20200330		3/30/2020	1340	Not applicable		280-J135113-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-13. Soil depth to refusal less than 2 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-14	Surface soil triplicate incremental sample	IINY-DU-14A-SSIS-20200320	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, pH by field screening	3/20/2020	830	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134848-1
		IINY-DU-14B-SSIS-20200320		3/20/2020	830	Not applicable		280-J134848-1
		IINY-DU-14C-SSIS-20200320		3/20/2020	830	Not applicable		280-J134848-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-9. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
DU-15	Surface soil triplicate incremental sample	IINY-DU-15A-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, pH by field screening	4/1/2020	820	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1

DU-22	Surface soil triplicate incremental sample	IINY-DU-22A-SSIS-20200316	PAHs by EPA Method 8270 SIM (surface and subsurface soil), BTEX by EPA Method 8260B (subsurface soil only), and pH by field screening	3/16/2020	1530	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134674-1
		IINY-DU-22B-SSIS-20200316		3/16/2020	1530	Not applicable		280-J134674-1
		IINY-DU-22C-SSIS-20200316		3/16/2020	1530	Not applicable		280-J134674-1
	Subsurface soil triplicate incremental sample	Not Collected	Advanced 6 hand auger borings at DU-22. Soil depth to refusal ranged from 6 to 8 inches bgs (<1 ft). Did not collect subsurface soil.					

Table 3-1 HTRW RI Phase I Sample Collection

Sample Location	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	Analytical Laboratory	Laboratory Report
DU-23	Surface soil triplicate incremental sample	IINY-DU-23A-SSIS-20200320	Aroclor PCBs by EPA Method 8082A, and pH by field screening	3/20/2020	915	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134848-1
		IINY-DU-23B-SSIS-20200320		3/20/2020	915	Not applicable		280-J134848-1
		IINY-DU-23C-SSIS-20200320		3/20/2020	915	Not applicable		280-J134848-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-23. Soil depth to refusal less than 6 inches bgs (<1 ft). Majority of DU is exposed bedrock. Very shallow soil. Did not collect subsurface soil.				
DU-24	Surface soil triplicate incremental sample	Not Collected	Aroclor PCBs by EPA Method 8082A, and pH by field screening	DU-24 Deletion – Historical documents indicate that a former transformers on a pole was located along the former eastern sentry path from Iona Island onto Round Island. A 60x60 ft decision unit, DU-24, was established on Round Island to evaluate the presence/absence of PCBs associated with the former transformer. DU-24 was one of three transformer decision units that is known as HTRW AOC #19 on Iona Island (Note: the other two transformer decision units were collect). DU-24 is bounded by the Hudson River to east/northeast and the former dump area between Iona and Round Islands to the northwest. A downed former electric pole was noted during a reconnaissance on 20 March 2020. The majority of DU-24 is exposed bedrock with little to thin soil cover. Sediment and soil was noted along the northeastern edge of DU-24 off the bedrock outcrop of Round Island, however this sediment/soil is along the shoreline of the tidally influenced Hudson River. Per a call with USACE on 24 March 2020, DU-24 will not be sampled. There is little/no soil available for sampling in the area of the former transformer. Any PCBs that may have been released from former transformers would have been transported via runoff and overland flow across the bedrock outcrop of Round Island to the Hudson River. However, as the Hudson River itself is a PCB source, collecting PCBs from soil/sediment along the Hudson River will not provide information that could be used to evaluate a potential release related to former transformers.					
	Subsurface soil triplicate incremental sample							
DU-25	Surface soil triplicate incremental sample	IINY-DU-25A-SSIS-20200320	Aroclor PCBs by EPA Method 8082A, and pH by field screening	3/20/2020	1030	MS/MSD	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134848-1
		IINY-DU-25B-SSIS-20200320		3/20/2020	1030	Not applicable		280-J134848-1
		IINY-DU-25C-SSIS-20200320		3/20/2020	1030	Not applicable		280-J134848-1
	Subsurface soil triplicate incremental sample	Not Collected		Advanced 5 hand auger borings at DU-25. Exposed bedrock and bedrock wall within DU. Soil depth to refusal less than 8 inches bgs (<1 ft). Did not collect subsurface soil.				
Former Buildings Identified as Having Significant Potential for Explosive Hazard (EXDU; pending direction of contracting offer): Surface and Subsurface Soil								
EXDU-1	Surface soil triplicate incremental sample	IINY-DU-1A-SSIS-20200317	Explosives residues by EPA Method 8330B, and pH by field screening	3/17/2020	1535	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J134675-1

Table 3-1 HTRW RI Phase I Sample Collection

Sample Location	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	Analytical Laboratory	Laboratory Report
Phase I Background: Surface and Subsurface Soil								
BDU-1	Surface Soil Incremental Sample	IINY-BADU-1-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	1145	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Did not collect subsurface soil.				
BDU-2	Surface Soil Incremental Sample	IINY-BADU-2-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	1215	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-3	Surface Soil Incremental Sample	IINY-BADU-3-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	1245	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-4	Surface Soil Incremental Sample	IINY-BADU-4-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	1320	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-5	Surface Soil Incremental Sample	IINY-BADU-5-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	955	MS/MSD	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-6	Surface Soil Incremental Sample	IINY-BADU-6-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	920	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-7	Surface Soil Incremental Sample	IINY-BADU-7-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	900	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.				
BDU-8	Surface Soil Incremental Sample	IINY-BADU-8-SSIS-20200401	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM	4/1/2020	925	Not applicable	Eurofins TestAmerica St. Louis, MO for ISM processing; Eurofins TestAmerica, Denver, CO for analysis	280-J135166-1
	Subsurface Soil Incremental Sample	Not Collected		<12" to refusal. Portions of DU is rock outcrop. Soil typically only 3" to 8" in depth. Did not collect subsurface soil.

NOTES:
% = Percent
µmoles/g = micromoles per gram
f_{OC} = Fraction of organic carbon
CAS= Chemical Abstracts Service
EPA = United States Environmental Protection Agency
ID = Identification
in. = Inches
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
UJ = Analyte not detected, and associated numerical value (LOD) is approximate
Red font indicates SEM:AVS ratio > 1
Highlighted cells indicate $(\sum SEM-AVS)/f_{OC}$ > 3000 µmoles/g and metals are bioavailable/toxic.

DU-8 (AOC #5: Former Building 207 – Marine Garage Building) was not sampled because it would not be possible to separate metals and PAH contaminants originating from former Building 207, from contaminants originating from drums and other debris observed in DU-8.

NOTES:

mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

Validation Reason Codes:

A Serial dilution
C LCS Recovery
D MS RPD
H2 Prep Hold Time
I Surrogate recovery outside project limits
L Lab Blank
M MS Recovery
M2 Post Spike
P1 Column RPD
TR Trace Level Detect
V2 CCV

Detected results are bolded.

NOTES:

mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

Detected results are bolded.

Validation Reason Codes:

A	Serial dilution
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits
L	Lab Blank
M	MS Recovery
M2	Post Spike
P1	Column RPD
TR	Trace Level Detect
V2	CCV

River. While sediment and soil was noted along the northeastern edge of DU-24 off the bedrock outcrop of Round Island, this sediment/soil was along the shoreline of the tidally influenced Hudson River. The Hudson River itself is a PCB source. Therefore, collecting PCBs from soil/sediment along the Hudson River would not

NOTES:

mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected Numerical value is LOD or LOQ, as indicated
- Bias low
+ Bias high
Detected results are bolded.

Validation Reason Codes:

A	Serial dilution
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits
L	Lab Blank
M	MS Recovery
M2	Post Spike
P1	Column RPD
TR	Trace Level Detect
V2	CCV

Table 6-5 Upland Soil Detections Summary

Analyte	CAS #	Upland Surface Soil				Upland Subsurface Soil			
		Onsite DU With Detection	Concentration Range (mg/kg)	DU with Minimum Concentration	DU with Maximum Concentration	Onsite DU With Detection	Concentration Range (mg/kg)	DU with Minimum Concentration	DU with Maximum Concentration
TAL Metals									
Mercury	7439-97-6	12 of 12 DUs sampled (DU-01 through DU-05, DU-09, DU-11 through DU-16)	0.073 to 0.36	DU-09	DU-13	Not sampled due to shallow depth to refusal in upland soil (less than 12 in. bgs)			
Silver	7440-22-4	11 of 15 DUs sampled (DU-03, DU-04, DU-06, DU-07, DU-10 through DU-16)	0.055 to 0.11	DU-16	DU-07				
Aluminum	7429-90-5	Each of 15 DUs sampled (DU-01 through DU-07, DU-09 through DU-16)	9,300 to 15,000	DU-10	DU-16				
Antimony	7440-36-0		0.35 to 2.5	DU-10	DU-07, DU-13				
Arsenic	7440-38-2		6.5 to 43	DU-10, DU-15	DU-11				
Barium	7440-39-3		55 to 110	DU-06	DU-07				
Beryllium	7440-41-7		0.43 to 0.69	DU-04	DU-12				
Cadmium	7440-43-9		0.17 to 1.1	DU-10	DU-04				
Calcium	7440-70-2		2,900 to 2,8000	DU-04	DU-11				
Chromium, Total	7440-47-3		11 to 19	DU-06	DU-04				
Cobalt	7440-48-4		5.6 to 8.6	DU-07	DU-13				
Copper	7440-50-8		21 to 600	DU-01	DU-13				
Iron	7439-89-6		15,000 to 2,000	DU-01	DU-16				
Lead	7439-92-1		31 to 2000	DU-10	DU-07				
Magnesium	7439-95-4		3,800 to 19,000	DU-01	DU-11				
Manganese	7439-96-5		410 to 1,100	DU-15	DU-13				
Nickel	7440-02-0		13 to 19	DU-07	DU-04				
Potassium	2023695		910 to 1700	DU-11	DU-16				
Selenium	7782-49-2		0.24 to 0.68	DU-12	DU-13				
Sodium	7440-23-5		56 to 440	DU-11	DU-16				
Thallium	7440-28-0		0.1 to 0.22	DU-05	DU-11				
Vanadium	7440-62-2		17 to 31	DU-06	DU-13				
Zinc	7440-66-6		55 to 280	DU-10	DU-04				
PAHs									
1-Methylnaphthalene	90-12-0	Each of 12 DUs sampled (DU-01 through DU-05, DU-09, DU-11 through DU-13, DU-16, and DU-20 through DU-22)	0.0036 at to 0.45	DU-01	DU-13	Each of 2 DUs sampled (DU-20, DU-21)	0.0049 to 0.0063	DU-20	DU-21

NOTES:
mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

Validation Reason Codes:
A Serial dilution
C LCS Recovery
D MS RPD
H2 Prep Hold Time
I Surrogate recovery outside project limits
L Lab Blank
M MS Recovery
M2 Post Spike
P1 Column RPD
TR Trace Level Detect
V2 CCV

Detected results are bolded.

NOTES:
mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the qu
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

NOTES:
mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the qua
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
PCB = Polychlorinated biphenyl
RSL = regional screening level
U = Analyte not detected Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

Validation Reason Codes:

A	Serial dilution
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits
L	Lab Blank
M	MS Recovery
M2	Post Spike
P1	Column RPD
TR	Trace Level Detect
V2	CCV

1. 95UCLs calculated using ProUCL. The recommended 95UCL is presented. For those analytes that were not detected in any of the 20 surface water samples collected, ProUCL recommends that UCLs should also be non-detect. For those analytes detected in only 1 of 20 samples (total chromium, selenium, thallium), the maximum detected concentration is presented.

NOTES:

CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
KM = Kaplan-Meier
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD or LOQ, as indicated

Validation Reason Codes:

A Serial dilution
L Lab Blank
TR Trace Level Detect

Detected results are bolded.

1. 95UCLs calculated using ProUCL. Recommended UCLMs are presented. For those analytes that were not detected in any of the 20 surface water samples collected, ProUCL recommends that UCLs should also be non-detect. For those analytes detected in only 1 of 20 samples (total chromium, iron), the maximum detected concentration is presented.

NOTES:

CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
KM = Kaplan-Meier
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD

Validation Reason Codes:

A Serial dilution
L Lab Blank
TR Trace Level Detect

Detected results are bolded.

1. 95UCLs calculated using ProUCL. Suggested UCLMs are presented. For those analytes that were not detected in any of the 20 surface water samples collected, ProUCL recommends that UCLs should also be non-detect.
For those analytes detected in only 1 of 10 samples (antimony and vanadium in RRDS samples and thallium and zinc in TWS samples), the maximum detected concentration is presented.

NOTES:
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
KM = Kaplan-Meier
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
ND = not detected
NS = No standard
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD

Validation Reason Codes:
A Serial dilution
L Lab Blank
TR Trace Level Detect

Detected results are bolded.

NOTES:

95% UCL = 95% upper confidence limit for arithmetic mean
mg/kg = milligrams per kilogram
mV = millivolts
CAS = Chemical Abstracts Service
CV = Coefficient of variation
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
RSL = regional screening level
- Bias low
+ Bias high

Validation Reason Codes:

A	Serial dilution
D	MS RPD
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Detected results are bolded.

NOTES:
mg/kg = milligrams per kilogram
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
NS = No standard
PCB = Polychlorinated biphenyl
R = The data are unusable. The sample results are rejected due to serious deficiencies in meeting the QC criteria
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD or LOQ, as indicated
UJ = Analyte not detected, and associated numerical value (LOD or LOQ) is approximate
- Bias low
+ Bias high

Validation Reason Codes:

A	Serial dilution
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits
L	Lab Blank
M	MS Recovery
M2	Post Spike
P1	Column RPD
TR	Trace Level Detect
V2	CCV

1. 95UCLs calculated using ProUCL. Suggested UCLMs are presented. For those analytes that were not detected in any of the 20 surface water samples collected, ProUCL recommends that UCLs should also be non-detect. For those analytes detected in only 1 of 20 samples (cobalt, lead), the maximum detected concentration is presented.

NOTES:
CAS = Chemical Abstracts Service
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
KM = Kaplan-Meier
LOD = Limit of detection
LOQ = Limit of quantitation
N/A = not applicable
NC = not calculated
ND = not detected
NS = No standard
RSL = regional screening level
U = Analyte not detected. Numerical value is LOD

Validation Reason Codes:
A Serial dilution
L Lab Blank
TR Trace Level Detect

Detected results are bolded.

NOTES:

95% UCL = 95% upper confidence limit for arithmetic mean
mg/kg = milligrams per kilogram
mV = millivolts
CAS = Chemical Abstracts Service
CV = Coefficient of variation
EPA = United States Environmental Protection Agency
J = Estimated: The analyte was positively identified; the quantitation is an estimation
RSL = regional screening level
- Bias low
+ Bias high

Detected results are bolded.

Validation Reason Codes:

A	Serial dilution
D	MS RPD
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Ecological screening values for freshwater, chronic exposure. Hierarchy for selected values is as follows:

1. National Recommended Water Quality Criteria (NRWQC), updated October 2023 (EPA 2023b).

2. Canadian Council of Ministries of the Environment (CCME 2003). CCME values were not selected as these are Canadian numbers.

3. Values from the publication by Suter and Tsao 1996. Toxicological benchmarks for screening potential contaminants of concern for effects on aquatic biota: 1996 Revision. ES/ER/TM-96/R2. This source was used when no other values were available.

4. Great Lakes Initiative (GLI), Clearinghouse Resources Tier II criteria revised 2013 (EPA 2013).

Notes:

µg/L = Microgram(s) per liter

EPA = U.S. Environmental Protection Agency

**Lead and cadmium values are based on water hardness, as follows, using a 95%LCL of 71 mg/L calcium carbonate ($CaCO_3$) for hardness:

Cadmium: 1.101672-[(ln hardness) x 0.041838)]

Lead: 1.46203-[(ln hardness) x 1.45712)]

2 3/16/2020 Iona Island Naval Ammunition Depot
Formerly used Defense Site (FUDs)

1100 Amanda Kohn on site. JD Marlow gives health & safety briefing. AK signs in, signs accident prevention plan form / tailgate briefing form.
1115 AK & JD drive to each Hazardous, Toxic, & Radioactive Waste (HTRW) incremental sampling (ISM) grid location to scope conditions. Exposed bedrock and roads, shallow soil. Plan for day: attempt ISM of surface soil (0-6 inches below ground surface [bgs]), collect samples for polycyclic aromatic hydrocarbons (PAHs), evaluate potential for collection of subsurface soil (0.5-3 ft bgs). Working w/ Tim Reese
1330 DU-20. Move grid against building 222 60x60 grid, 5x6 lanes for ISM to collect 30 increments of soil
1530 Finish surface soil at DU-20. Collected 3 ISM samples, ~950 g each:
IINY-DU-20A-SSIS-20200316 @1530
IINY-DU-20B-SSIS-20200316 @1530
IINY-DU-20C-SSIS-20200316 @1530
pH readings: Surface Soil at DU-20:
20A = 6.1
20B = 6.5
20C = 6.6

Iona Island Naval Ammunition Depot FUDS 3/16/2020

Subsurface soil at DU-20 ~18" deep. Will collect subsurface soil at 6"-18" bgs

TR, Josh (UXO Tech), Derek collecting surface soil

1625 At DU-22. 60x60 ft grid. 5x6 lanes for ISM to collect 30 increments of soil. Sampling 0-6" for PAHs

Evaluate subsurface soil potential w/ hand auger: advanced 6 borings w/in DU-22. Depths ranged from ~6 to ~8" bgs

1645 Finish collecting surface soil at DU-22

Collected 3 ISM samples

IINY-DU-22A-SSIS-2020316 @ 1645

IINY-DU-22B-SSIS-2020316 @ 1645

IINY-DU-22C-SSIS-2020316 @ 1645

pH readings: surface soil at DU-22:

A= 6.7

B= 6.8

C= 6.8

Chain of custody = ~~061620-A~~ AK 3/16/20 031620-A

Will not collect subsurface soil at DU-22:

6 hand auger borings advanced. Soil is less than 12" deep. Will notify USACE representative for path forward for subsurface soil

Rite in the Rain

3/17/2020 Iona Island Naval Ammunition Depot FUDS

0700 AK on site. Sign in, attend tailgate safety briefing.
Plan for day: check DU-21 condition for brush clearing. Surface soil at exDU-1 through Ex-DU 7. Explosives sampling only.
Working w/ Josh (UXO tech), Derek

0855 DU-20 subsurface soil
Silty soil with some sand (fine to coarse) and gravel (fine to coarse). Brown. Poorly sorted. Dry. Recovery to 18" (0.5 to 1.5 ft)

VOC sample collection: one sample = 6 x 60mL VOA w/ methanol preservative. 5 x 5 grams per VOA vial. Additional volume in ziploc bag for % moisture

0930 Collect subsurface from DU-20

Decision Unit #	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	COC ID	Soil pH
Phase I Investigation Area: Surface and Subsurface Soil, Groundwater								
DU-1	Surface Soil Incremental Sample collected in triplicate	IINY-DU-1A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	3/18/2020	1500	MS/MSD	031820-B	5.6
		IINY-DU-1B-SSIS-20200318		3/18/2020	1500		031820-B	6.5
		IINY-DU-1C-SSIS-20200318		3/18/2020	1500		031820-B	6.8
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-1A-SBIS1-YYYYMMDD	Advanced 6 hand auger borings at DU-1. Soil depth to refusal ranged from 6 to 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-1B-SBIS1-YYYYMMDD						
		IINY-DU-1C-SBIS1-YYYYMMDD						
DU-2	Surface Soil Incremental Sample collected in triplicate	IINY-DU-2A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	3/19/2020	815		031920-A	5.6
		IINY-DU-2B-SSIS-20200319		3/19/2020	815		031920-A	6.6
		IINY-DU-2C-SSIS-20200319		3/19/2020	815		031920-A	6.8
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-2A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-2. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-2B-SBIS1-YYYYMMDD						
		IINY-DU-2C-SBIS1-YYYYMMDD						
DU-3	Surface Soil Incremental Sample collected in triplicate	IINY-DU-3A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	3/18/2020	1545		031820-B	7.0
		IINY-DU-3B-SSIS-20200318		3/18/2020	1545		031820-B	7.0
		IINY-DU-3C-SSIS-20200318		3/18/2020	1545		031820-B	7.1
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-3A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-3. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-3B-SBIS1-YYYYMMDD						
		IINY-DU-3C-SBIS1-YYYYMMDD						
DU-4	Surface Soil Incremental Sample collected in triplicate	IINY-DU-4A-SSIS-20200318	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	3/18/2020	1430		031820-B	6.9
		IINY-DU-4B-SSIS-20200318		3/18/2020	1430		031820-B	7.0
		IINY-DU-4C-SSIS-20200318		3/18/2020	1430		031820-B	7.1
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-4A-SBIS1-YYYYMMDD	Advanced 6 hand auger borings at DU-4. Significant anomalies in 1-acre DU. Soil depth to refusal at one boring was 12 inches bgs, soil depth to refusal at remaining borings ranged from 4 to 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-4B-SBIS1-YYYYMMDD						
		IINY-DU-4C-SBIS1-YYYYMMDD						
DU-5	Surface Soil Incremental Sample collected in triplicate	IINY-DU-5A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	3/19/2020	900		031920-A	7.1
		IINY-DU-5B-SSIS-20200319		3/19/2020	900		031920-A	7.1
		IINY-DU-5C-SSIS-20200319		3/19/2020	900		031920-A	7.1
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-5A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-5. Hard to locate areas to advance borings due to exposed bedrock and shallow bedrock/refusal. Soil depth to refusal less than 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-5B-SBIS1-YYYYMMDD						
		IINY-DU-5C-SBIS1-YYYYMMDD						
DU-6	Surface Soil Incremental Sample collected in triplicate	IINY-DU-6A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, pH (screened in the field with pH meter)	3/19/2020	1500		031920-B	7.5
		IINY-DU-6B-SSIS-20200319		3/19/2020	1500		031920-B	7.5
		IINY-DU-6C-SSIS-20200319		3/19/2020	1500		031920-B	7.5
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-6A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-6. Exposed bedrock / bedrock wall in DU-6. Soil depth to refusal less than 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-6B-SBIS1-YYYYMMDD						
		IINY-DU-6C-SBIS1-YYYYMMDD						
DU-7	Surface Soil Incremental Sample collected in triplicate	IINY-DU-7A-SSIS-20200319	TAL Metals by EPA Methods 6010C/6020A, pH (screened in the field with pH meter)	3/19/2020	1345		031920-B	7.4
		IINY-DU-7B-SSIS-20200319		3/19/2020	1345		031920-B	7.4
		IINY-DU-7C-SSIS-20200319		3/19/2020	1345		031920-B	7.5
	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-7A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-7. Soil depth to refusal less than 8 inches bgs (<1 ft). Will not collect subsurface soil.					
		IINY-DU-7B-SBIS1-YYYYMMDD						
		IINY-DU-7C-SBIS1-YYYYMMDD						
DU-8	Surface Soil Incremental Sample collected in triplicate	IINY-DU-8A-SSIS-YYYYMMDD	TAL Metals by EPA Methods 6010C/6020A, Mercury by EPA Method 7471B, PAHs by EPA Method 8270 SIM, pH (screened in the field with pH meter)	DU-8 Deletion – DU-8 was placed at former Building 207 that was a small garage located between existing Buildings 222, 201, and 212. Building 207 is also known as HTRW AOC #5. DU-8 is a 200x200 ft decision unit that was established around former Building 207 to determine whether former operations at this building served as a source of contaminants to the environment at concentrations that may result in potential risks to human and ecological receptors. Following mark-out DU-8 in the field and site reconnaissance conducted on 18 March 2020, numerous rusted and deteriorating 55-gallon drums, deteriorating pallets, piles of roofing shingles, chain link fencing, and other debris were observed in DU-8. Several empty 55-gallon drums were lying on their sides, while other drums were upright and filled with fluid. The material contained within the drums is not known. Residue indicative of roofing tar was observed on the outside of several drums, and staining was noted on the ground surface. Per discussion with USACE on 24 March 2020, DU-8 will not be sampled because it would not be possible to separate metals and PAH contaminants originating from former Building 207, from contaminants originating from drums and other debris observed in DU-8.

	Subsurface Soil Incremental Sample collected in triplicate	IINY-DU-23A-SBIS1-YYYYMMDD	Advanced >5 hand auger borings at DU-23. Soil depth to refusal less than 6 inches bgs (<1 ft). Majority of DU is exposed bedrock. Very shallow soil. Will not collect subsurface soil.					
		IINY-DU-23B-SBIS1-YYYYMMDD						
		IINY-DU-23C-SBIS1-YYYYMMDD						
DU-24	Surface Soil Incremental Sample collected in triplicate	IINY-DU-24A-SSIS-YYYYMMDD	Aroclor PCBs by EPA Method 8082A, and pH (screened in the field with pH meter)	DU-24 Deletion – Historical documents indicate that a former transformers on a pole was located along the former eastern sentry path from Iona Island onto Round Island. A 60x60 ft decision unit, DU-24, was established on Round Island to evaluate the presence/absence of PCBs associated with the former transformer. DU-24 was one of three transformer decision units that is known as HTRW AOC #19 on Iona Island (Note: the other two transformer decision units were collect). DU-24 is bounded by the Hudson River to east/northeast and the former dump area between Iona and Round Islands to the northwest. A downed former electric pole was noted during a reconnaissance on 20 March 2020. The majority of DU-24 is exposed bedrock with little to thin soil cover. Sediment and soil was noted along the northeastern edge of DU-24 off the bedrock outcrop of Round Island, however this sediment/soil is along the shoreline of the tidally influenced Hudson River. Per a call with USACE on 24 March 2020, DU-24 will not be sampled. There is little/no soil available for sampling in the area of the former transformer. Any PCBs that may have been released from former transformers would have been transported via runoff and overland flow across the bedrock outcrop of Round Island to the Hudson River. However, as the Hudson River itself

Decision Unit #	Sample Type	Sample Identification Code	Analyses	Sample Date	Sample Time	QA/QC Sample	COC ID	Soil pH
Phase I Investigation Area: Surface and Subsurface Soil, Groundwater								
		IINY-DU-24C-SBIS1-YYYYMMDD		Released from former transformers would have been transported via runoff and overland flow across the bedrock outcrop of Roundi Island to the Hudson River. However, as the Hudson River itself is a PCB source, collecting PCBs from soil/sediment along the Hudson River will not provide information that could be used to evaluate a potential release related to former transformers.				
DU-25	Surface Soil Incremental Sample collected in triplicate	IINY-DU-25A-SSIS-20200320	Aroclor PCBs by EPA Method 8082A, and pH (screened in the field with pH meter)	3/20/2020	1030	MS/MSD	032020-A	6.2

Dr sampling 1450 - @1750
Details w/ D. Hendricks

leave Con hook @ 1800
arrive Cat dock @ 1900
unload at dock 1900 - 1930

DAILY FIELD REPORT

Day: Thursday Date: 21 April 2022

Temperature: (F) (am) 45°F (pm) 60°F

Wind Direction: E-NE (am) 5-10 mph (pm) 15-25 mph

Weather: Clear (am)
Cloudy w/ (pm)
Slight precipitation

Project Name:
Iona Island Phase II

Contract No.

Arrive at site: 0730 (am)

Leave site: 1930 (pm)

HEALTH & SAFETY:

Are there any changes to the Health & Safety Plan? Yes ( ) No (✓)
(If yes, list the deviation under items for concern)

Are monitoring results at acceptable levels?

Soil	Yes ( )	n/a (✓)	* No ( )
Waters	Yes ( )	n/a (✓)	* No ( )
Air	Yes ( )	n/a (✓)	* No ( )

- *If No, provide comments*

OTHER ITEMS:

Site Sketch Attached: Yes ( ) No (✓)
Photos Taken: Yes (✓) No ( )

DESCRIPTION OF DAILY WORK PERFORMED:

- EA personnel (T. King, J. Morris, K. Miller, & D. Hendricks) arrived at Newburgh, NY boat ramp @ ~ 0730.
- Field team departed for Con Hook Island @ 0800 traveling south on the Hudson River. J. Morris provided boat safety in-brief and T. King provided H+S in-brief prior to departure.
- EA team arrived @ Con Hook @ ~ 0830; T. King, K. Miller, & D. Hendricks exited boat for surface water and sediment sampling event.
- D. Hendricks & K. Miller collected surface water samples CHHRS-SW-01 through CHHRS-SW-20 from 0900-1500. T. King collected sediment samples from CHHRS-SU-01 through CHHRS-SU-08, and ~~CHHRS~~ CHMS-SU-01 through CHMS-SU-05 from 0900-1500.
- EA field team collected surface water samples CHMS-SW-01 through CHMS-SW-20 from 1500 to 1730.
- EA departed ~~Iona~~ Con Hook Island @ 1730 and arrived at the boat ramp @ 1830.
- This concludes the Iona Phase II sampling effort.

pH CALIBRATION CHECK
Time: __1602_____

pH STANDARD	END OF DAY CALIBRATION READING	PASS/FAIL? (if not within 0.2 pH unit of standard, fail)
4.0	4.0	Pass
7.0	7.1	Pass
10.0	10.1	Pass

CONDUCTIVITY CALIBRATION CHECK Time: __1605_____

CONDUCTIVITY STANDARD	END OF DAY CALIBRATION READING	PASS/FAIL? (if not within 10% of standard, fail)
1.413	1.491	Pass

TURBIDITY CALIBRATION CHECK Time: __1609_____

STANDARD	END OF DAY CALIBRATION READING	PASS/FAIL? (if not within 10 % of standard, fail)
0 NTU	0 NTU	Pass
126 NTU	125 NTU	Pass

ORP CALIBRATION CHECK
Time: __1613_____

STANDARD	END OF DAY CALIBRATION READING	PASS/FAIL? (if not within 20 mV of standard, fail)
240 millivolts	245 mV	Pass

DISSOLVED OXYGEN CALIBRATION CHECK Time: __1617_____

STANDARD	END OF DAY CALIBRATION READING	PASS/FAIL? (if <95% of standard, fail)
100% AIR SATURATION	99%	Pass

Phase II Sample Tracking Table

This page intentionally left blank

Sample Location	Field Description	Field USCS Code	USCS Group Name	Field ORP (mV)	StandardHydrogen Electrode ORP (mV)
Phase II Investigation Area: Surface Soil					
DU-04	Brown, dry silt with organics and fine to coarse grained sand	ML	Silty sand / sandy silt	284	489
			Silty sand	275	480
			Silty sand	269	474
DU-07	Brown, dry silt with organics and very fine-grained sand, some clay	ML	Silty sand	402	607
			Silty sand	310	515
			Silty sand	307	512
DU-09	Brown, slightly moist silt with organics and very fine to coarse grained sand	ML	Sandy silt	242	447
			Silty sand / sandy silt	245	450
			Silty sand / sandy silt	240	445
DU-11	Brown, moist, very fine-grained sand	SP/SM	Sandy silt	239	444
			Silty sand	252	457
			NA	225	430
DU-13	Dark brown, moist, well sorted silt with very fine grained sand	ML	Silty sand	307	512
			Silty sand	298	503
			Silty sand	322	527
DU-17	Dark brown, moist, well sorted silt and organic matter with very fine grained sand	OL	Silty sand	294	499
			Silty sand	297	502
			Silty sand with gravel	288	493
DU-18	Dark brown, moderately sorted silt with very fine grained sand	ML	Silty sand	300	505
			Silty sand / Poorly graded sand with silt	290	495
			Poorly graded sand with silt	299	504
DU-19	Dark brown, moist, moderately sorted silt and organic matter with very fine grained sand	OL	Silty sand	275	480
			Silty sand	292	497
			Silty sand	297	502

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134674-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 108 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering Science and Technology, Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-22A-SSIS-20200316 (N)/ 280-134674-4	Nitrobenzene-d5	0.000	44 - 125	10 - 125	percent	J/X	I	Diluted Out
IINY-DU-22A-SSIS-20200316 (N)/ 280-134674-4	2-Fluorobiphenyl	0.000	46 - 115	10 - 115	percent	J/X	I	Diluted Out
IINY-DU-22A-SSIS-20200316 (N)/ 280-134674-4	Terphenyl-d14	202.0	58 - 133	10 - 133	percent	J/None	I	Diluted Out
IINY-DU-22B-SSIS-20200316 (FD)/ 280-134674-5	Terphenyl-d14	0.000	58 - 133	10 - 133	percent	J/X	I	Diluted Out

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Qualified Results

No results associated with this sample delivery group required qualification.

Table of All Trace Results

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition
I	Surrogate recovery outside project limits.
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		2-Fluorobiphenyl and Nitrobenzene-d5 failed the surrogate recovery criteria low for IINY-DU-22A-SSIS-20200316 (280-134674-4).Terphenyl-d14 failed the surrogate recovery criteria high. Terphenyl-d14 failed the surrogate recovery criteria low forIINY-DU-22B-SSIS-20200316 (280-134674-5). The required dilutions diluted the surrogates out, therefore data were not qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD is incorrectly associated in the ADR report; should be associated with sample IINY-DU-20B-SSIS-20200316. Qualifiers were reviewed manually. Multiple PAHs were below QC limits. However, the concentration in the sample exceeded four times the spiking amount, therefore no qualifiers were applied.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range for PAHs is 1.42-42.6.
Were QAPP specified laboratory PQLs achieved?	•			

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134675-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- Lab Replicate RPD
- Laboratory Triplicate RSD
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Reference Material
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 29 results (8.73%) out of the 332 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-20A-SBIS1-20200317 (SD)/ 280-134675-1MSD	Pyrene	126.8	55 - 117	10 - 117	percent	J/None	M	
IINY-DU-20A-SBIS1-20200317 (SD)/ 280-134675-1MSD	Fluoranthene	130.4	55 - 119	10 - 119	percent	J/None	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for BNASIMD

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-20A-SBIS1-20200317	N	Fluoranthene	0.00900	0.140 J1	0.140 J	+	mg/kg	M
IINY-DU-20A-SBIS1-20200317	N	Pyrene	0.00900	0.140 J1	0.140 J	+	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
C	LCS Recovery
M	MS Recovery
P1	Column RPD
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MSD was above QC limits for Pyrene and Fluoranthene.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	There are ISM- Field Triplicates were collected. The % RSD ranged from 0-37.7.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8330B (Nitroaromatics and Nitramines by HPLC)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a blank prepared and analyzed with each batch?	•			
Were target analytes in the blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS or LCS/LCSD pair analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?		•		Grinding LCS (LCSSRM) recovered outside of reporting limits for TNT and tetryl on the primary column. As per the method, the entire client sample is ground initially, therefore, it is not possible to re-grind samples. Associated data have been J or UJ qualified.
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a project specific MS or MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		3,5-Dinitroaniline recovered below QC limits and 2-Amino-4,6-dinitrotoluene recovered above QC limits in the MS and MSD performed on sample IINY-EXDU-4A-SSIS-20200317. 3,5-Dinitroaniline data for the triplicate ISM samples from this location were J or UJ qualified. Because 2-Amino-4,6-dinitrotoluene was not detected in the project samples and the MS/MSD recovery was above QC limits, data for this analyte were not qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Was a project-specific duplicate analyzed, and the RPD within QAPP acceptance limits?	•			A lab duplicate was analyzed and all results were non-detect, therefore the RPD was not calculated.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD ranged from 17-80.
Were QAPP specified laboratory reporting limits achieved?	•			
Were surrogate recoveries within project acceptance limits?	•			
Were column comparison differences with project acceptance limits?		•		The %RPD between the primary and confirmation column exceeded 40% for the following: 2,4-Dinitrotoluene in IINY-EXDU-1B-SSIS-20200317 (280-134675-14) and 1,3,5-Trinitrobenzene in IINY-EXDU-1C-SSIS-20200317 (280-134675-15). The data have been J qualified.
Was the intial calibration within criteria?	•			
Was a second source check standard analyzed and within all applicable criteria?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134677-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Ambient Blank
- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 48 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
SW8260B	2 of the 6 methanol preserved aliquots received for sample IINY-DU-20A-SBIS1-20200317 (280-134677-2) did not contain any Methanol (Methanol had leaked out or absorbed); therefore they were removed from the calculation of the initial weight and final volume, and only the 4 aliquots that contained methanol were included in the composite analysis.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Trace Results

No results associated with this sample delivery group are considered trace.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.

B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: SW8260B (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			2 of the 6 methanol preserved aliquots received for sample IINY-DU-20A-SBIS1-20200317 (280-134677-2) did not contain any Methanol (Methanol had leaked out or absorbed); therefore they were removed from the calculation of the initial weight and final volume, and only the 4 aliquots that contained methanol were included in the composite analysis.
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			Insufficient sample volume was available to perform the MS/MSD on the field and trip blank samples (aqueous matrix). A LCS/LCSD was used instead.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD was not calculated since all results were ND.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134722-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- Lab Replicate RPD
- Laboratory Triplicate RSD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Reference Material
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 191 results (32.37%) out of the 590 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Quality Control Outliers for test method BNASIMD, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-3B-SSIS-20200318 (FD)/ 280-134722-20	Terphenyl-d14	56.00	58 - 133	10 - 133	percent	J/UJ	I	Diluted Out

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-489694/1-A (LB)/ MB 280-489694/1-A	Aluminum	2.410	< 1.6	< 50	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-1A-SSIS-20200318 (MS)/ 280-134722-13MS	Iron	140.0	81 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-1A-SSIS-20200318 (MS)/ 280-134722-13MS	Aluminum	480.0	74 - 119	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-1A-SSIS-20200318 (SD)/ 280-134722-13MSD	Iron	120.0	81 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-1A-SSIS-20200318 (SD)/ 280-134722-13MSD	Aluminum	400.0	74 - 119	30 - 125	percent	J/None	M	Spike amount Insignificant

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-489837/1-A (LB)/ MB 280-489837/1-A	Silver	0.009550	< 0.0078	< 0.1	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-1A-SSIS-20200318	N	Silver	0.0930	0.0660 J	0.0930 U		mg/kg	L
IINY-DU-1B-SSIS-20200318	FD	Silver	0.0990	0.0650 J	0.0990 U		mg/kg	L
IINY-DU-1C-SSIS-20200318	FT	Silver	0.0990	0.0600 J	0.0990 U		mg/kg	L
IINY-DU-3B-SSIS-20200318	FD	Silver	0.0940	0.0750 J	0.0940 U		mg/kg	L
IINY-DU-3C-SSIS-20200318	FT	Silver	0.0990	0.0970 J	0.0990 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8330B, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-EXDU-7A-SSIS-20200318 (MS)/ 280-134722-10MS	3,5-Dinitroaniline	85.91	86 - 118	20 - 118	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8330B, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-EXDU-7A-SSIS-20200318 (SD)/ 280-134722-10MSD	4-Nitrotoluene	21.90	< 20	< 20	rpd	J/None	D	
IINY-EXDU-7A-SSIS-20200318 (SD)/ 280-134722-10MSD	3-Nitrotoluene	22.42	< 20	< 20	rpd	J/None	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?		•		The following samples were prepared outside of preparation holding time due to ISM preparation: IINY-DU-1A-SSIS-20200318(280-134722-13), IINY-DU-1B-SSIS-20200318 (280 134722-14), IINY-DU-1C-SSIS-20200318 (280-134722-15), IINY-DU-4A-SSIS-20200318 (280-134722-16), IINY-DU-4B-SSIS-20200318 (280-134722-17), IINY-DU-4C-SSIS-20200318 (280-134722-18), IINY-DU-3A-SSIS-20200318 (280-134722-19), IINY-DU-3B-SSIS-20200318 (280 134722-20) and IINY-DU-3C-SSIS-20200318 (280-134722-21). This is for preparation batch 280-491250. Associated data were J or UJ qualified.
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		Surrogates diluted out of samples IINY-DU-3B-SSIS-20200318, IINY-DU-4A-SSIS-20200318 and IINY-DU-4B-SSIS-20200318, which were analyzed at 10-100x dilution. The data were not qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?		•		Insufficient sample volume was aliquoted to perform a MS/MSD. An LCSD was added to the batch.
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD ranged from 0-53.
Were QAPP specified laboratory PQLs achieved?	•			Yes, but dilutions had to be performed which raised the limits.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Aluminum was detected less than 1/2 of the LOQ. Project sample results were more than the LOQ and 10x the blank concentration, and no data were qualified.
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Aluminum and Iron failed recovery criteria high in the MS and MSD. However the concentration in the unspiked sample exceeded four times the spiking amount, therefore data were not qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Were the post spike recoveries within project acceptance limits?		•		Recoveries were high for Aluminum and Iron, however the concentration in the unspiked sample exceeded 4x the spiking amount.
Were the serial dilution RPD values within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM, Field Triplicates were collected. The % RSD for TAL Metals ranged from 0-44.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•

Review Questions

Method: SW8330B (Nitroaromatics and Nitramines by HPLC)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a blank prepared and analyzed with each batch?	•			
Were target analytes in the blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS or LCS/LCSD pair analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?		•		Grinding LCS (LCSSRM) recovered outside of reporting limits for TNT and Tetryl on the primary column. As per the method, the entire client sample is ground initially, therefore, it is not possible to re-grind samples. Associated data were J or UJ qualified.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a project specific MS or MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			The recovery for 3,5-Dinitroaniline was 85.91 percent. The recovery limits are 86-118 percent. The qualifier was removed.
Was the MS/MSD RPD within project acceptance limits?		•		3-Nitrotoluene and 4-Nitrotoluene had an RPD of 22. These compounds were not detected in parent sample IINY-EXDU-7A-SSIS-20200318, therefore no data were qualified.
Was a project-specific duplicate analyzed, and the RPD within QAPP acceptance limits?	•			A lab duplicate was analyzed and all results were non-detect, therefore RPDs were not calculated.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD was not calculated since all sample results were ND.
Were QAPP specified laboratory reporting limits achieved?	•			
Were surrogate recoveries within project acceptance limits?	•			
Were column comparison differences with project acceptance limits?	•			
Was the intial calibration within criteria?	•			
Was a second source check standard analyzed and within all applicable criteria?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134777-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 58 results (10.23%) out of the 567 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

This SDG was revised in order to report the 1x Analysis of Cadmium instead of the 50x dilution for IINY-DU-10C-SSIS-20200319 (280-134777-12), IINY-DU-6A-SSIS-20200319 (280-134777-16), IINY-DU-6B-SSIS-20200319 (280-134777-17) and IINY-DU-6C-SSIS-20200319 (280-134777-18). The laboratory indicated that it was acceptable to report the 1x analysis for these samples.

Reviewed by Tara Lamond, Data Manager, EA Engineering, Science, and Technology, Inc., PBC

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Samantha Saalfield

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology, Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method BNASIMD, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-490509/1-A (LB)/ MB 280-490509/1-A	Chrysene	0.002020	< 0.002	< 0.01	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-9C-SSIS-20200319 (MS)/ 280-134777-9MS	Fluoranthene	142.6	55 - 119	10 - 119	percent	J/None	M	Spike amount Insignificant

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-9C-SSIS-20200319 (MS)/ 280-134777-9MS	Barium	125.3	86 - 116	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (MS)/ 280-134777-9MS	Lead	134.3	84 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (MS)/ 280-134777-9MS	Manganese	460.0	85 - 116	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (SD)/ 280-134777-9MSD	Barium	153.3	86 - 116	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (SD)/ 280-134777-9MSD	Lead	179.3	84 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (SD)/ 280-134777-9MSD	Manganese	311.1	85 - 116	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-DU-9C-SSIS-20200319 (SD)/ 280-134777-9MSD	Vanadium	117.4	82 - 116	30 - 125	percent	J/None	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW6020A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		Several surrogates recovered low due to the required dilutions in samples IINY-DU-2A-SSIS-20200319, IINY-DU-2B-SSIS-20200319 (280-134777-2), and IINY-DU-2C-SSIS-20200319 (280-134777-3). Fluoranthene-d10 and Terphenyl-d14 failed the surrogate recovery criteria low for IINY-DU-9C-SSIS-20200319 (280-134777-9). Evidence of matrix interference due to high target analytes ispresent; therefore, reextraction and/or re-analysis was not performed. Data for sample IINY-DU-9C-SSIS-20200319 were J qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Chrysene was detected in method blank at less than 1/2 the LOQ. Associated results were more than the LOQ and 10x the blank detection, and no data were qualified.
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	An LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)				
Review Questions	Yes	No	NA	Comment
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD is incorrectly associated in the ADR report; should be associated with sample IINY-DU-9C-SSIS-20200319. Qualifiers were manually reviewed. Benzo(a)anthracene, Benzo (b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Fluoranthene, Indeno(1,2,3-c,d)pyrene, Phenanthrene and Pyrene recovered above QC limits. However Benzo (b)fluoranthene, Fluoranthene, and Pyrene had concentrations in the unspiked sampling exceeding four times the spiking amount. Detected results for benzo(a)anthracene, benzo (g,h,i)perylene, chrysene, indeno(1,2,3-c,d)pyrene, and phenanthrene in the triplicate samples from location IINY-DU-09 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD ranged from 4-51.7.
Were QAPP specified laboratory PQLs achieved?	•			Sample dilutions raised LOQs.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•

Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD is incorrectly associated in the ADR report; should be associated with sample IINY-DU-9C-SSIS-20200319. Aluminum, Calcium, Iron, Magnesium, Potassium, and Sodium recovered outside QC limits. However, aluminum and iron were present in the parent sample at concentrations more than 4x the spike. Calcium, magnesium, potassium, and sodium results for the triplicate samples from location IINY-DU-09 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Were the post spike recoveries within project acceptance limits?		•		Aluminum, Calcium, Iron and Magnesium wereoutside recovery limits for samples IINY-DU-5ASSIS-20200319 and IINY-DU-9C-SSIS-20200319. Aluminum, Calcium, Iron, Magnesium, and Sodium were outside recovery limits for sample IINY-DU-10-SSIS-20200319.In all cases except calcium in sample IINY-DU-5A-SSIS-20200319 and sodium in sample IINYDU-10A-SSIS-20200319, the analytes were present in the parent sample at concentrations more than 4x the spike. Calcium and sodium results, respectively, for these two samples were J qualified.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Were the serial dilution RPD values within project acceptance limits?		•		Calcium, Iron, and Magnesium had a %D outside QC limits in sample IINY-DU-9C-SSIS-20200319. Magnesium had a %D outside QC limits in sample IINY-DU-10A-SSIS-20200319. Results are J qualified for these metals in the respective samples.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD for TAL Metals ranged from 0-73.
Were QAPP specified laboratory PQLs achieved?	•			Required dilutions raised limits. The reporting limits have been adjusted accordingly. Additionally, the internal standard was outside criteria at 1X for 1xIINY-DU-10A-SSIS-20200319 (280 134777-10), (280-134777-A-10-G PDS ^5) and (280-134777-A-10-G SD ^25).
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-134849-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 14 results (10.85%) out of the 129 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

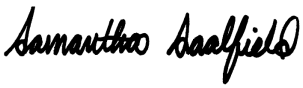
As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



May 27, 2020

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology, Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

IINY-DU-14C-SSIS-20200320	FT	Sodium	470	73.0 J J1	73.0 J	-	mg/kg	M/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-491057/1-A (LB)/ MB 280-491057/1-A	Lead	0.02580	< 0.018	< 0.4	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Table of All Qualified Results

Test Method: SW6010C	Extraction Method: SW3050B							
FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-14A-SSIS-20200320	N	Calcium	93.0	9500	9500 J	+	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
L	Lab Blank
M	MS Recovery
P1	Column RPD
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD is incorrectly associated in the ADR report; should be associated with sample IINY-DU-14C-SSIS-20200320. Qualifiers were manually reviewed. Aluminum, calcium, iron, and magnesium recoveries were above QC limits in the MS and MSD. Sodium recovered slightly below QC limits in the MS and MSD. For aluminum and iron, the concentrations in the unspiked sample exceeded 4x the spiking amount. Calcium, magnesium, and sodium results for the triplicate samples from location IINY-DU-14 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Were the post spike recoveries within project acceptance limits?		•		Aluminum, calcium, iron, and magnesium recoveries were outside QC limits in sample IINY-DU-14C-SSIS-20200320. For all four analytes, the concentrations in the unspiked sample exceeded 4x the spiking amount.
Were the serial dilution RPD values within project acceptance limits?		•		The %D was outside QC limits for Calcium and Iron Results for sample IINY-DU-14C-SSIS-20200320 were J qualified.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range for TAL Metals is 0-16.1.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the system properly tuned based on method criteria?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Lead was detected at a concentration less than 1/2 the LOQ. Project sample results were more than the LOQ and 10x the blank result, and no data were qualified.
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			A MS/MSD was performed for antimony and silver only.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range for TAL Metals is 0-16.1.
Were the post spike recoveries within project acceptance limits?	•			
Were the serial dilution RPD values within project acceptance limits?	•			RPDs were not calculated because results were below LOQ.
Were QAPP specified laboratory PQLs achieved?	•			Limits were raised due to required dilutions.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by TestAmerica Laboratories, Inc., Arvada, CO and were reported under sample delivery group (SDG) 280-135113-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 172 results (46.61%) out of the 369 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

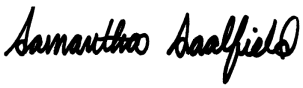
Reviewed by Tara Lamond, Data Manager, EA Engineering, Science, and Technology Inc., PBC

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



May 27, 2020

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method BNASIMD, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-13C-SSIS-20200330 (FT)/ 280-135113-9	Fluorene	15.91	< 14	< 28	days	J/UJ	H2	Prep Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-490958/1-A (LB)/ MB 280-490958/1-A	Iron	18.50	< 8.3	< 80	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-11A-SSIS-20200330 (MS)/ 280-135113-1MS	Magnesium	136.0	78 - 115	30 - 125	percent	J/None	M	Spike amount Insignificant

Quality Control Outliers for test method SW7471B, Total, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-11A-SSIS-20200330 (SD)/ 280-135113-1MSD	Mercury	20.17	< 20	< 20	rpd	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Reason Code Definitions

Code	Definition
A	Serial dilution
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?		•		Due to ISM prep the samples were received at the Denver lab outside hold time. Associated data were J or UJ qualified.
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		Several surrogates were outside QC limits due to the required dilutions. The surrogates diluted out of samples run at 40-200x dilution, and data were not qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	Field blanks were not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Benzo(a)anthracene, Benzo(a)pyrene, Benzo (b)fluoranthene, Benzo(g,h,i)perylene, Benzo (k)fluoranthene, Chrysene, Fluoranthene, Indeno(1,2,3-c,d)pyrene, Phenanthrene, Pyrene have recoveries outside QC limits. Because of high concentrations in the parent sample and required dilutions data were not qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD ranges are 6.93-56.9.
Were QAPP specified laboratory PQLs achieved?	•			Dilutions resulted in elevated LOQs.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

Review Questions

Method: SW7471B (Mercury in Soil (Manual Cold-Vapor Technique))				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			Due to analyst error, CCV/CCB brackets were not run every ten samples. CCV/CCB was run at the beginning and end of run, according to source method.
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MSD recovered below QC limits. The mercury results for the triplicate samples collected from location IINY-DU-11 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			The ADR report shows an RPD of 20.17% and that data were qualified. However professional judgement was used to remove the RPD reason code for sample IINY-DU-11A-SSIS-20200330 since the QC limit for RPDs is 20%.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD ranges from 12-32.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by TestAmerica Laboratories, Inc., Arvada, CO and were reported under sample delivery group (SDG) 280-135117-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- Lab Replicate RPD
- Laboratory Triplicate RSD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Reference Material
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 445 results (32.62%) out of the 1364 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
BNASIMD	No additional comments; see Checklist for detail.
SW6010C	The laboratory was unable to keep the 10g samples from foaming out of the cup with the addition of acid or peroxide. Replacement 10g aliquots were therefore divided into two 5 gram aliquots, digested, filtered into one container and brought to its normal 500ml final volume.
SW6020A	No additional comments; see Checklist for detail.
SW7471B	No additional comments; see Checklist for detail.
SW8082A	EPA Method 8082/8082A requires a minimum of 3 peaks to be used for PCB quantitation. Due to the presence of matrix interferences, one of five peaks were unidentified because it was causing a false E flag and may result in biased recoveries. Only 4 peaks were used for quantitation of Aroclor 1260 for IINY-DU-18C-SSIS-20200331 (280-135117-18). This is for preparation batch 280-492221 and analytical batch 280-493242.
SW8330B	No additional comments; see Checklist for detail.

Reviewed by Tara Lamond, Data Manager, EA Engineering, Science, and Technology, Inc., PBC

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

May 27, 2020

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology, Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for BNASIMD

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-19A-SSIS-20200331	N	Fluorene	0.00920	0.0770 J1	0.0770 J	-	mg/kg	M
IINY-DU-19B-SSIS-20200331	FD	Fluorene	0.00960	0.0280	0.0280 J	-	mg/kg	M
IINY-DU-19C-SSIS-20200331	FT	Fluorene	0.0100	0.0390	0.0390 J	-	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-19A-SSIS-20200331 (SD)/ 280-135117-1MSD	Acenaphthylene	0.09400	< 0.0097	< 0.0097	mg/kg	J/None	D

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-16A-SSIS-20200331 (N)/ 280-135117-13		14.28	< 14	< 28	days	J/UJ	H2	Prep Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	2-Methylnaphthalene-d10	31.00	41 - 100	10 - 100	percent	J/UJ	I	
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	2-Fluorobiphenyl	34.00	46 - 115	10 - 115	percent	J/UJ	I	
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	2-Methylnaphthalene-d10	37.00	41 - 100	10 - 100	percent	J/UJ	I	Diluted Out
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	2-Fluorobiphenyl	38.00	46 - 115	10 - 115	percent	J/UJ	I	Diluted Out
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	Terphenyl-d14	45.00	58 - 133	10 - 133	percent	J/UJ	I	Diluted Out
IINY-DU-18C-SSIS-20200331 (FT)/ 280-135117-18	Fluoranthene-d10	48.00	55 - 101	10 - 101	percent	J/UJ	I	Diluted Out

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010C, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-490960/1-A (LB)/ MB 280-490960/1-A	Iron	126.0	< 83	< 800	mg/kg	U/None	L	
MB 280-490960/1-A (LB)/ MB 280-490960/1-A	Aluminum	26.90	< 16	< 500	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Quality Control Outliers for test method SW6020A, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7471B, Total, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-19A-SSIS-20200331 (MS)/ 280-135117-1MS	Mercury	58.26	80 - 124	30 - 125	percent	J/UJ	M

Quality Control Outliers for test method SW8082A, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-17A-SBIS1-20200331 (N)/ 280-135117-7	Decachlorobiphenyl	54.00	59 - 130	10 - 130	percent	J/UJ	I

Quality Control Outliers for test method SW8330B, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method SW8330B, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-19C-SSIS-20200331 (FT)/ 280-135117-3		14.28	< 14	< 28	days	J/UJ	H2	Prep Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8330B, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
C	LCS Recovery
D	MS RPD
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
M2	Post Spike
P1	Column RPD
TR	Trace Level Detect
V2	CCV

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			ADR report indicates prep hold time was exceeded. Samples were prepared within the 14 day hold time requirement. The qualifiers were removed.
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		Multiple analytes recovered outside criteria. The affected samples required dilutions, and surrogate non-conformance occurred in both diluted and non-diluted analyses. Associated results were J or UJ qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			LCSD provided for one batch, for which insufficient volume was available to perform an MS/MSD.
Was a MS/MSD pair prepared with each batch?		•		As noted above, insufficient volume was available to perform an MS/MSD for analysis batch 491753.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
Were MS/MSD recoveries within project acceptance limits?		•		Several analytes recovered below the QC limits for the MS and MSD on the diluted sample IINY-DU-19A-SSIS-20200331. Acenaphthylene and Fluorene recovered below QC limits for the undiluted run of the same sample. All analytes except fluorene were present in the parent sample at a concentration more than 4x the spike, therefore data for these analytes were not qualified. Fluorene results for the triplicate samples from location IINY-DU-19 were J qualified.
Was the MS/MSD RPD within project acceptance limits?		•		2-Methylnaphthalene, acenaphthylene, and naphthalene exceeded the RPD limit. Results for these analytes in the triplicate samples from location IINY-DU-19 were J qualified.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD ranged from 1-71.
Were QAPP specified laboratory PQLs achieved?	•			Required dilutions raised limits.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Aluminum and Iron were detected above the MDL but less than 1/2 the LOQ. Sample results were more than 10x the blank detection, therefore no data were qualified.
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Aluminum, Calcium, Iron, and Magnesium recovered outside QC limits in the MS and MSD. Aluminum, Calcium, and Iron concentrations in the parent sample were more than 4x the spike concentration, therefore data for these analytes were not qualified. Magnesium data for the triplicate samples from location IINY-DU-19 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Were the post spike recoveries within project acceptance limits?		•		Aluminum, Calcium, Iron, and Magnesium recovered outside QC limits in sample IINY-DU-19A-SSIS-20200331. All four were present in the parent sample at concentrations more than 4x the spike concentrations, therefore data were not qualified.
Were the serial dilution RPD values within project acceptance limits?		•		The %D for Calcium and Iron in sample IINY-DU-19A-SSIS-20200331, and Magnesium in sample INY-DU-19B-SBIS1-20200331 were outside QC limits. Results for the respective analytes in these two samples were J qualified.

Review Questions	Yes	No	NA	Comment
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range for TAL Metals is 0-131.
Were QAPP specified laboratory PQLs achieved?	•			Required dilutions raised limits.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the system properly tuned based on method criteria?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?		•		Recoveries of several metals in LLICVs were outside QC limits.
Were CCVs run at the required frequency and within acceptance criteria?		•		Recoveries of several metals in LLCCVs were outside QC limits.
Were ICB/CCBs run at the required frequency and within acceptance criteria?		•		The CCB for analytical batch 280-493402 contained Lead greater than one-half the reporting limit. Associated samples were not re-analyzed because the sample results were greater than 10x the amount found in the CCB.
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Lead was detected above the DL but less than 1/2 the LOQ in analysis batch 493375. In analysis batch 493402 lead was detected above the DL but less than the LOQ. Sample results were more than the LOQ and 10x the blank detection, therefore data were not qualified.
Were target analytes in the field blank less than MDL?			•	These are ISM-Field Triplicates were collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?		•		Insufficient sample volume was available to perform a MS/MSD/DUP associated with preparation batch 280-492997 and 280-493020. An LCS /LCSD was added.
Were MS/MSD recoveries within project acceptance limits?		•		Several metals recovered outside QC limits. Of these Copper, Zinc, Barium, Manganese, Lead, and Vanadium had concentrations in the parent sample more than 4x the spike concentration, and associated results were not qualified. Results for Arsenic, Beryllium, Chromium, Thallium, Antimony, and Nickel in the triplicate sample from location IINY-DU-19 were J qualified.

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Was the MS/MSD RPD within project acceptance limits?		•		Several RPDs were outside QC limits. Results for Arsenic, Beryllium, Selenium, Nickel, Zinc, Barium, Manganese, and Thallium in the triplicate sample from location IINY-DU-19 were J qualified.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range for TAL Metals is 0-131.
Were the post spike recoveries within project acceptance limits?		•		Barium and Manganese were outside QC limits for IINY-DU-19A-SSIS-20200331. Results are J qualified.
Were the serial dilution RPD values within project acceptance limits?		•		The %D for Vanadium for sample IINY-DU-18C-SSIS-20200331 was outside QC limits.
Were QAPP specified laboratory PQLs achieved?	•			Required dilutions raised limits.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW7471B (Mercury in Soil (Manual Cold-Vapor Technique))				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?		•		A deviation from the Standard Operating Procedure occurred. Due to analyst error, CCV/CCB brackets were not run every ten samples. CCV/CCB was run at the beginning and end of run, according to source method.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Mercury recovered outside QC limits. The results for the triplicate sample from location IINY-DU-19 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were collected. The % RSD range is 1-68.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8082A (Polychlorinated Biphenyls (PCB))

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			The initial calibration curve analyzed in batch 280-492961 was outside acceptance criteria for surrogate DCB Decachlorobiphenyl on the front column. The DCB surrogate is reported from the back column only.(ICV 280-492961/10)
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?		•		
Were CCVs run at the required frequency and within acceptance criteria?		•		CCVs are over the %D criteria for PCB-1260 in batch 492961 and 493095; for PCB-1268 in batch 493242; and for PCB-1262 in batch 493362. Associated results were J qualified.
Were surrogate recoveries within project acceptance limits?		•		Surrogate recoveries were outside QC limits in samples IINY-DU-17A-SBIS1-20200331, IINY-DU-17B-SBIS1-20200331, IINY-DU-17C-SBIS1-20200331, IINY-DU-18C-SSIS-20200331, and IINY-DU-19C-SSIS-20200331. Evidence of matrix interference was present, e.g. viscous samples with significant amounts of sediment in the final extract vial. Associated results were J or UJ qualified.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Aroclor-1260 recovered below QC limits. The results for this analyte in the triplicate samples from location IINY-DU-19A were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Were column comparison differences with project acceptance limits?		•		Aroclor-1260 had RPDs outside QC limits for IINY-DU-19A-SSIS-20200331, IINY-DU-19B-SSIS-20200331, IINY-DU-19C-SSIS-20200331, IINY-DU-19B-SBIS1-20200331, and IINY-DU-17C-SBIS1-20200331. Results were J qualified.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM- Field Triplicates were not collected. The % RSD ranges from 4.2-65.2.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			

Review Questions

Method: SW8082A (Polychlorinated Biphenyls (PCB))				
Review Questions	Yes	No	NA	Comment
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8330B (Nitroaromatics and Nitramines by HPLC)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			The ADR report indicates the prep hold time was not met. The samples were prepared within 14 days of collection. The qualifiers were removed.
Were all requested target analytes reported?	•			
Was a blank prepared and analyzed with each batch?	•			
Were target analytes in the blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS or LCS/LCSD pair analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?		•		Grinding LCS (LCSSRM) associated with preparation batch 280-491769 and analytical batch 280-491980 recovered outside of reporting limits for 1,3-Dinitrobenzene, TNT, 2,4-Dinitrotoluene, 2,6-Dinitrotoluene, 3-Nitrotoluene, 4-Nitrotoluene, Nitrobenzene, and Tetryl. As per the method, the entire client sample is ground initially, therefore, it is not possible to re-grind samples. Associated results were J or UJ qualified.
Was the LCS/LCSD RPD within project acceptance limits?			•	An LCSD was not provided.
Was a project specific MS or MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		3,5-Dinitroaniline recovered slightly below the QC criteria in the MS. Results for this analyte in the triplicate sample from location IINY-DU-19 were J or UJ qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
Was a project-specific duplicate analyzed, and the RPD within QAPP acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD was not calculated since all results were ND.
Were QAPP specified laboratory reporting limits achieved?	•			
Were surrogate recoveries within project acceptance limits?		•		Surrogates in several samples recovered outside QC limits. There was evidence of matrix interference. Associated samples were J or UJ qualified.
Were column comparison differences with project acceptance limits?		•		The RPD was outside QC limits for the Grinding LCS (sample LCSSRM 280-491769/5-A) for Nitroglycerin. No project sample data were qualified due to this exceedance.
Was the intial calibration within criteria?	•			
Was a second source check standard analyzed and within all applicable criteria?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by TestAmerica Laboratories, Inc., Arvada, CO and were reported under sample delivery group (SDG) 280-135166-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 148 results (37.28%) out of the 397 results (sample and field QC samples) reported are qualified based on review and 1 results (0.25%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Reviewed by Tara Lamond, Data Manager, EA Engineering, Science, and Technology, Inc., PBC.

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

May 27, 2020

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology, Inc., PBC.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method BNASIMD, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-BADU-5-SSIS-20200401 (SD)/ 280-135166-8MSD	Benzo (g,h,i)perylene	5.000	49 - 127	10 - 127	percent	J/X	M	Spike amount Insignificant

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for BNASIMD

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-BADU-5-SSIS-20200401	N	Acenaphthene	0.0380	0.0490 H J1 D	0.0490 J	-	mg/kg	H2/M/I
IINY-BADU-5-SSIS-20200401	N	Anthracene	0.0380	0.120 H J1 D	0.120 J	-	mg/kg	H2/M/I
IINY-BADU-5-SSIS-20200401	N	Fluorene	0.0380	0.0650 H J1 D	0.0650 J	-	mg/kg	H2/M/I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-BADU-1-SSIS-20200401 (N)/ 280-135166-4		25.94	< 14	< 28	days	J/UJ	H2	Prep Exceeds UWL
IINY-BADU-1-SSIS-20200401 (N)/ 280-135166-4	Fluorene	25.94	< 14	< 28	days	J/UJ	H2	Prep Exceeds UWL

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Quality Control Outliers for test method BNASIMD, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-BADU-7-SSIS-20200401 (N)/ 280-135166-10	Terphenyl-d14	47.00	58 - 133	10 - 133	percent	J/UJ	I	
IINY-BADU-8-SSIS-20200401 (N)/ 280-135166-11	Fluoranthene-d10	47.00	55 - 101	10 - 101	percent	J/UJ	I	
IINY-BADU-8-SSIS-20200401 (N)/ 280-135166-11	Terphenyl-d14	52.00	58 - 133	10 - 133	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-BADU-5-SSIS-20200401 (MS)/ 280-135166-8MS	Iron	220.0	81 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-BADU-5-SSIS-20200401 (MS)/ 280-135166-8MS	Aluminum	620.0	74 - 119	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-BADU-5-SSIS-20200401 (MS)/ 280-135166-8MS	Sodium	81.46	83 - 118	30 - 125	percent	J/UJ	M	
IINY-BADU-5-SSIS-20200401 (SD)/ 280-135166-8MSD	Iron	200.0	81 - 118	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-BADU-5-SSIS-20200401 (SD)/ 280-135166-8MSD	Aluminum	600.0	74 - 119	30 - 125	percent	J/None	M	Spike amount Insignificant
IINY-BADU-5-SSIS-20200401 (SD)/ 280-135166-8MSD	Sodium	80.87	83 - 118	30 - 125	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW6010C

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-BADU-5-SSIS-20200401	N	Sodium	500	63.0 J J1	63.0 J	-	mg/kg	M/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-490964/1-A (LB)/ MB 280-490964/1-A	Lead	0.02640	< 0.018	< 0.39	mg/kg	U/None	L	
MB 280-490964/1-A (LB)/ MB 280-490964/1-A	Manganese	0.1170	< 0.093	< 0.96	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD).
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?		•		Samples missed holding time due to ISM prep. Data were J or UJ qualified.
Were all requested target analytes reported?	•			
Was the GC/MS system properly tuned based on method criteria?	•			
Was instrument tuning completed every 12 hours during sample analysis?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were Internal Standard retention times and area criteria within method requirements?	•			
Were internal standards spiked for every sample, standard, and QC sample?	•			
Were surrogate recoveries within project acceptance limits?		•		All samples had surrogates outside acceptance criteria. In some case surrogates were diluted out by 10-40x dilutions. Data for samples run with less than 5x dilution were in most cases J or UJ qualified. One non-detect result (Dibenz (a,h)anthracene in IINY-BADU-4-SSIS-20200401) was X qualified due to 0% surrogate recovery.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Several analytes recovered outside QC limits. Benzo[a]anthracene, Benzo[a]pyrene, Benzo [b]fluoranthene, Benzo[g,h,i]perylene, Benzo [k]fluoranthene, Chrysene, Fluoranthene, Indeno [1,2,3-cd]pyrene, Phenanthrene, and Pyrene had concentrations in the parent sample more than 4x the spike concentration. Results for acenaphthene, anthracene, and fluorene in sample IINY-BADU-5-SSIS-20200401 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			

Review Questions

Method: BNASIMD (GC/MS-SIM Analysis by SW8270D)

Review Questions	Yes	No	NA	Comment
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Required dilutions raised limits.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was the Calibration within acceptance criteria?	•			
Were the required minimum levels of calibration standards used in the initial calibration?	•			
Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	A LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Iron, Aluminum, and Sodium recovered outside QC limits. Aluminum and Iron were present in the parent sample at concentrations more than 4x the spike concentration, therefore data were not qualified for these metals. The sodium result was J qualified for sample IINY-BADU-5-SSIS-20200401.
Was the MS/MSD RPD within project acceptance limits?	•			
Were the post spike recoveries within project acceptance limits?		•		Aluminum, Iron, and Magnesium were outside QC limits. Aluminum and Iron were present in the parent sample at concentrations greater than 4x the spike concentration. The magnesium result for sample IINY-BADU-5-SSIS-20200401 was J qualified.
Were the serial dilution RPD values within project acceptance limits?		•		The %D for Magnesium was outside QC limits. The magnesium result for sample IINY-BADU-5-SSIS-20200401 was J qualified.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD range for TAL Metals is 0-46.
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•

Was either analysis of an ICV performed after each ICAL or a second source standard prior to sample analysis?	•			
Were all reported analytes for the ICV within the required criteria?	•			
Were CCVs run at the required frequency and within acceptance criteria?		•		LLCCVs for Barium, Cadmium, Antimony, Zinc, were outside QC limits.
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Did the ICSA have any non-target interferents above the MDL?		•		
Were the ICSA/ICSAB recoveries within QAPP acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		MB 280-490964/1-A associated with analysis batch 494739 had detections of Lead and Manganese that were above the method detection limit but below 1/2the LOQ. Associated results were greater than the LOQ and 10x the blank detection, so data were not qualified.
Were target analytes in the field blank less than MDL?			•	A field blank was not collected.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	An LCSD was not provided.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Barium, Chromium, Vanadium, and Manganese recovered outside QC limits. Barium and Manganese had concentrations in the original sample greater than 4x the spike concentration. Chromium and vanadium results for sample IINY-BADU-5-SSIS-20200401 were J qualified.
Was the MS/MSD RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	These are ISM-Field Triplicates were collected. The % RSD range for TAL Metals is 0-46.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN2805. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 7 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

All quality control criteria were met except for the RPD between duplicate analysis for sample IINY-SD02-20200407. The TOC result was "J" qualified for this sample.

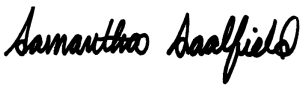
Reviewed by Tara Lamond, Data Manager, EA Engineering, Science, and Technology, Inc., PBC

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.



May 27, 2020

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology, Inc., PBC

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Table of All Trace Results

Test Method: WBLACK Extraction Method: NONE

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-SD06-20200407	N	Total Organic Carbon	1000	960 J	960 J		mg/kg	TR

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Lancaster Laboratories Environmental, LLC, Lancaster, PA and were reported under sample delivery group (SDG) 280-161283-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 21 results (35.00%) out of the 60 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

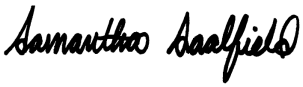
Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Senior Chemist, EA Engineering, Science, and Technology

July 22, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method AVS, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-IHRS-SED-01-041922 (N)		8.210	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-IHRS-SED-02-041922 (N)		8.200	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-IHRS-SED-03-041922 (N)		8.210	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-RRDS-FD1-041922 (FD)		8.330	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-RRDS-SED-01-041922 (N)		13.10	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-RRDS-SED-02-041922 (N)		13.10	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-RRDS-SED-03-041922 (N)		13.09	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-TWS-SED-01-041922 (N)		13.07	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-TWS-SED-02-041922 (N)		13.07	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL
IINY-TWS-SED-03-041922 (N)		13.07	< 7	< 14	days	J/UJ	H1	Test Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Test Hold Time for AVS

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-IHRS-SED-01-041922 280-161283-8	N	Acid Volatile Sulfide	0.670	0.430 U	0.430 UJ		umoles/g	H1

IINY-TWS-SED-03-041922 280-161283-7	N	Acid Volatile Sulfide	1.50	0.930 U	0.930 UJ		umoles/g	H1

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010D, Field Duplicate RPD

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-RRDS-FD1-041922 (N)	Nickel	71.19	< 50	< 50	rpd	J/None	D3	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Field Duplicate RPD for SW6010D

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-RRDS-FD1-041922 280-161283-4	FD	Nickel	0.0170	0.380 J1	0.380 J	-	umoles/ g	D3/M2
IINY-RRDS-SED-03-041922 280-161283-3	N	Nickel	0.0170	0.800	0.800 J		umoles/ g	D3

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010D, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-TWS-SED-01-MS-041922 (MS)	Cadmium	72.00	82 - 113	10 - 113	percent	J/UJ	M	
IINY-TWS-SED-01-MS-041922 (MS)	Copper	74.00	81 - 117	10 - 117	percent	J/UJ	M	
IINY-TWS-SED-01-MS-041922 (MS)	Lead	50.00	81 - 112	10 - 112	percent	J/UJ	M	Spike amount Insignificant

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
D3	Field Duplicate RPD
H1	Test Hold Time
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: AVS (EPA Draft Method for the Determination of Acid Volatile Sulfide and Simultaneously Extractable Metals in Sediment)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?		•		AVS extractions were performed outside the 7-day hold time. Results were flagged with the J/UJ qualifier.
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		An LCS was prepared and analyzed with each batch. Since an MS/MSD pair and a laboratory replicate sample were included with the analysis batch, a LCSD was not prepared..
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	An LCSD was not prepared, since an MS/MSD pair and laboratory duplicate were prepared with prep/analysis batches.
Was a MS/MSD pair prepared with each batch?		•		One MS/MSD was prepared, in accordance with the QAPP requirement of 1 MS/MSD per 20 samples.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	ISM samples were not included in this SDG.
Were surrogate recoveries within project acceptance limits?			•	Surrogates are not necessary for the AVS method.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			AVS was not detected in the field duplicate pair of IINY-RRDS-SED-03-041922 and duplicate IINY-RDS-FD1-041922.
Were reported sample concentrations within calibration range?	•			

Review Questions

Method: AVS (EPA Draft Method for the Determination of Acid Volatile Sulfide and Simultaneously Extractable Metals in Sediment)				
Review Questions	Yes	No	NA	Comment
Were Instrument Performace Checks (Degradation Checks) performed and within acceptace criteria?			•	Instrument performance checks are not required b the AVS method.
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?		•		ICV is not required for the AVS method.
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were internal standard retention times and area criteria within method requirements?			•	Internal standards not required for the AVS method.
Were internal standards spiked for every sample, standard, and QC sample?			•	Internal standards not required for the AVS method.
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Was a Cleanup Procedure required (Cleanup Recovery Checks) verified and within acceptance limits?	•			
Was a Second Column/Detector used and the column difference within acceptance limits?			•	A second column/detector was not required for the AVS method.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	The sulfide method is not included in the QSM. Note that although the laboratory is DoD accredited for analysis of sulfide, it is not accredited for the AVS extraction.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6010D (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment

Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required .
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		An LCS was prepared and analyzed with each batch. Since an MS/MSD pair and a laboratory replicate sample were included with the analysis batch, a LCSD was not prepared.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Since an MS/MSD pair and a laboratory replicate sample were included with the analysis batch, a LCSD was not required.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The %recoveries for the metals in the MS/MSD prepared with project sample IINY-TWS-SED-01-041922 were below QC limits. The parent sample results have been flagged with a J qualifier with negative bias, except for lead because the concentration in the sample was more than 4 times the spike.
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?		•		The post digestion spike %recoveries for zinc in the spike prepared with sample IINY-RRDS-SED-01-041922 and for nickel and zinc in the spike prepared with duplicate IINY-RRDS-FD1-041922 were below QC limits. The associated results in the parent samples have been flagged with J qualifiers with negative bias.

Review Questions

Method: SW6010D (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?		•		The serial dilution performed on sample IINY-RRDS-SED-01-041922 had % differences exceeding the criterion of 10% and results for the parent sample were flagged with J qualifiers. Another serial dilution was performed on duplicate IINY-RRDS-FD1-041922, with % differences below 10%.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	No ISM samples were included with this SDG.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?		•		The parent/field duplicate RPD for the analysis of nickel for parent sample IINY-RRDS-SED-03-041922 and associated field duplicate IINY-RDS-FD1-041922 was above QC limits. The associated sample results have been flagged with the J qualifier.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	Although the laboratory is accredited for the Method 6010D analysis, it is not accredited for the AVS extraction. No deviations were noted.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Katahdin Analytical Services, Scarborough, ME and were reported under sample delivery group (SDG) IONA-1. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 1 results (4.35%) out of the 23 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

This DVR for SDG "IONA-1" addresses the Total Organic Carbon results for the samples included in SDG 280-161296-1.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method WBLACK, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-19C-SSIS-041922 (MS)	Total Organic Carbon	157.0	75 - 125	75 - 125	percent	J/None	M	
IINY-DU-19C-SSIS-041922 (SD)	Total Organic Carbon	157.0	75 - 125	75 - 125	percent	J/None	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for WBLACK

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-19C-SSIS-041922 SP2007-34	FT	Total Organic Carbon	1000	25000	25000 J	+	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Table of All Qualified Results

Test Method: WBLACK		**Extraction Method: NONE**						
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-19C-SSIS-041922 SP2007-34	FT	Total Organic Carbon	1000	25000	25000 J	+	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions	
Code	Definition
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions	
Flag	Definition
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

Bias	
-	The result may be biased low
+	The result may be biased high
Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result	

Review Questions

Method: WBLACK (Walkley-Black Method, Organic Carbon (TOC))				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			No volume was received for IINY-DU-11C-SSIS-041822.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			No quantitation limit goals were specified for TOC in the QAPP. However, MDL/LOD/LOQ were consistent with those presented in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		An LCS was prepared and analyzed. Since an MS/MSD pair was included with the analysis batch, a LCSD was not required.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Since an MS/MSD pair wasincluded with the analysis batch, a LCSD was not required.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD %Rs for project sample IINY-DU-19C-SSIS-041922 were above QC limits. The associated project sample result has been flagged with a J qualifier with positive bias.
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?		•		Each field sample included a related duplicate/triplicate sample set, except for IINY-DU-11 which only had a duplicate.
Were reported sample concentrations within calibration range?			•	
Was the Calibration within project acceptance criteria?			•	

Review Questions

Method: WBLACK (Walkley-Black Method, Organic Carbon (TOC))				
Review Questions	Yes	No	NA	Comment
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?			•	
Were CCVs run at the required frequency and within project acceptance criteria?			•	
Were ICB/CCBs run at the required frequency and within acceptance criteria?			•	
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	
Were internal standard recoveries within project acceptance limits?			•	
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			The Case Narrative notes that results were calculated using 100% total solids, and that the 9 -11 gram sample aliquots provided had to be subsampled prior to analysis due to high carbon content.
Were DoD QSM corrective actions followed if deviations were noted?			•	TOC by Walkley Black is not included in the DoD QSM.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161297-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 11 results (6.43%) out of the 171 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

July 28, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573845/1-A (LB)	Iron	17.70	< 8.3	< 80	mg/kg	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

IINY-IHRS-DU-01A-SEDIS-041922 (MS)	Vanadium	68.00	82 - 116	10 - 125	percent	J/UJ	M	
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Vanadium	76.00	82 - 116	10 - 125	percent	J/UJ	M	
IINY-IHRS-DU-01A-SEDIS-041922 (MS)	Zinc	-2250	82 - 119	10 - 125	percent	J/X	M	Spike amount Insignificant
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Zinc	-2850	82 - 119	10 - 125	percent	J/X	M	Spike amount Insignificant

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW6020A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Arsenic	0.890	35.0 J1	35.0 J	-	mg/kg	M
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Selenium	0.740	0.590 U J1	0.590 UJ		mg/kg	M/D
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Silver	0.200	1.00 J1	1.00 J	-	mg/kg	M
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Vanadium	0.740	37.0 J1	37.0 J	-	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Barium	54.22	< 20	< 20	rpd	J/UJ	D	
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Chromium	40.91	< 20	< 20	rpd	J/UJ	D	
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Copper	24.21	< 20	< 20	rpd	J/UJ	D	
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Lead	40.78	< 20	< 20	rpd	J/UJ	D	
IINY-IHRS-DU-01A-SEDIS-041922 (SD)	Selenium	35.59	< 20	< 20	rpd	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS RPD for SW6020A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Barium	30.0	370 D J1 Q	370 J		mg/kg	D

IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Silver	0.200	1.00 J1	1.00 J	-	mg/kg	M
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Vanadium	0.740	37.0 J1	37.0 J	-	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method SW6010C							
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Aluminum	46.0	6900 J1	6900	6900 J	A
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Iron	740	180000 D J1	180000	180000 J	A

Modified Qualifiers for test method SW6020A							
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Antimony	0.390	110 J1	110	110 J	A
IINY-IHRS-DU-01A-SEDIS-041922 280-161297-1	N	Lead	30.0	7700 J1 D	7700 J	7700 J	D/M2

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
D	MS RPD
L	Lab Blank
M	MS Recovery
M2	Post Spike
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?		•		Suffix -041922 was not included at end of sample names on the COC and was added by the laboratory as requested.
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Iron was detected in a method blank. The associated sample results were greater than 5x the method blank detection; therefore no qualification was necessary.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batch 573845 included a LCS and a MS/MSD pair, but did not include a LCSD.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batch 573845 included a LCS and a MS/MSD pair, but did not include a LCSD. An LCSD is not required per the QAPP.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		A MS/MSD was performed on sample IINY-IHRS-DU-01A-SEDIS-041922. Recoveries were outside acceptance limits, but the parent sample results were greater than 4x the spike concentration
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?		•		A PS was performed on sample IINY-IHRS-DU-01A-SEDIS-041922. Recoveries were outside acceptance limits. Results were qualified based on serial dilution also outside QC limits (see next item).
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?		•		A serial dilution was performed on sample IINY-IHRS-DU-01A-SEDIS-041922, and the % difference for aluminum and iron were above QC limits, at 29% and 15%. Associated results were flagged with a J qualifier.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			Each field sample included a related duplicate/triplicate sample set.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?		•		Suffix -041922 was not included at end of sample names on the COC and was added by the laboratory as requested.
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•

Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Lead was detected in a method blank. The associated sample results were greater than 10x the method blank detection; therefore, no qualification was necessary.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 573580 and 573842 each included a LCS and a MS/MSD pair, but did not include a LCSD.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 573580 and 573842 each included a LCS and a MS/MSD pair, but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		The %Rs were within QC limits, or the sample result was greater than 4x the spike concentration, with the following exceptions. The %Rs for the MS/MSD prepared with project sample IINY-IHRS-DU-01A-SEDIS-041922 were below QC limits for arsenic, selenium, silver, and vanadium. The associated sample results have been flagged with the J or UJ qualifier.
Was the MS/MSD RPD within project acceptance limits?		•		The RPDs for the MS/MSD prepared with project sample IINY-IHRS-DU-01A-SEDIS-041922 were above QC limits for barium, chromium, copper, lead, and selenium. The associated sample results have been flagged with the J or UJ qualifier.

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Were Post Spike (PS) recoveries within project acceptance limits?		•		The the PS performed on sample IINY-IHRS-DU-01A-SEDIS-041922 had an %R outside QC limits for lead. The lead result was flagged with the J qualifier.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?		•		A serial dilution was performed on sample IINY-IHRS-DU-01A-SEDIS-041922. Antimony had a % difference (11%) exceeding acceptance criteria. The antimony result was flagged with the J qualifier.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			Each field sample included a related duplicate/triplicate sample set.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrations greater than 1/2 LOQ. The vendor acknowledges that barium is a trace impurity in the standard. No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that low-level CCVs (CCVLs, separate from the LLCCVs) had %Rs above QC limits for barium, beryllium, and manganese. The associated results were greater than 10 times the CCVL concentrations. No data were qualified based on CCVLs.
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Katahdin Analytical Services, Scarborough, ME and were reported under sample delivery group (SDG) SP2022. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 9 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

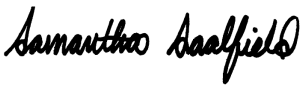
This DVR for SDG "SP2022" addresses the Total Organic Carbon results for the samples included in SDG 280-161297-1.

Analytical Method	Data Reviewer Comment
WBLACK	No additional comments; see Checklist for detail.

July 16, 2022

Reviewed by Christopher Ma, Chemist, EA Engineering Science and Technology, Inc

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering Science and Technology, Inc

July 28, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition
TR	Trace Level Detect

There are no Flag Code definitions to display.

Bias

-	The result may be biased low

+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			No quantitation limit goals were specified for TOC in the QAPP. However, MDL/LOD/LOQ were consistent with those presented in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		An LCS was prepared and analyzed. Since an MS/MSD pair was included with the analysis batch, a LCSD was not required.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Since an MS/MSD pair was included with the analysis batch, a LCSD was not required.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	PS not applicable to Walkley Black.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			Each field sample included a related duplicate/triplicate sample set.
Were reported sample concentrations within calibration range?			•	
Was the Calibration within project acceptance criteria?			•	
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?			•	
Were CCVs run at the required frequency and within project acceptance criteria?			•	

Review Questions

Method: WBLACK (Walkley-Black Method, Organic Carbon (TOC))				
Review Questions	Yes	No	NA	Comment
Were ICB/CCBs run at the required frequency and within acceptance criteria?			•	
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	
Were internal standard recoveries within project acceptance limits?			•	
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			The Case Narrative notes that results were calculated using 100% total solids, and that the 9 -11 gram sample aliquots provided had to be subsampled prior to analysis due to high carbon content.
Were DoD QSM corrective actions followed if deviations were noted?			•	TOC by Walkley Black is not included in the DoD QSM.
Were any data recommended for exclusion in the data validation process?		•		

Data Validation Report for 280-161368-1_52_2a_FUDSChem

Facility:	C02NY0744-02, Iona Island Naval Ammunition Depot, SI
Event:	Iona Island Naval Ammunition Depot, HTRW Sampling Phase II
SDG:	280-161368-1_52_2a_FUDSChem
Guidance Document:	UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020
Prime Contractor:	EA Engineering Science & Technology, Inc., Hunt Valley, MD

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161368-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 25 results (5.18%) out of the 483 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
SW6010C	No additional comments; see Checklist for detail.
SW6020A	No additional comments; see Checklist for detail.

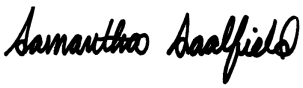
July 26, 2022

Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

July 28, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573022/1-A (LB)	Calcium	78.70	< 24	< 200	ug/l	U/None*	L	
MB 280-573022/1-A (LB)	Iron	29.90	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573022/1-A (LB)	Magnesium	11.60	< 4.2	< 200	ug/l	U/None*	L	
MB 280-573022/1-A (LB)	Sodium	735.0	< 97	< 1000	ug/l	U/None*	L	
MB 280-573581/1-A (LB)	Calcium	24.20	< 24	< 200	ug/l	U/None*	L	
MB 280-573581/1-A (LB)	Iron	11.60	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573581/1-A (LB)	Magnesium	16.40	< 4.2	< 200	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

IINY-IHRS-SW-15-041922 280-161368-16	N	Iron	100	29.0 J	34.0 U		ug/l	L

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-IHRS-SW-16-041922 280-161368-17	N	Iron	100	33.0 J	34.0 U		ug/l	L
IINY-IHRS-SW-17-041922 280-161368-18	N	Iron	100	38.0 J	100 U		ug/l	L
IINY-IHRS-SW-18-041922 280-161368-19	N	Iron	100	35.0 J	100 U		ug/l	L
IINY-IHRS-SW-19-041922 280-161368-20	N	Iron	100	28.0 J	34.0 U		ug/l	L
IINY-IHRS-SW-FD1-041922 280-161368-5	FD	Iron	100	38.0 J	100 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, Field Duplicate RPD

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-IHRS-SW-FD1-041922 (N)	Copper	2.100	< 2	< 2	ug/l	J/UJ	D3	5XRL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Field Duplicate RPD for SW6020A, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-IHRS-SW-04-041922 280-161368-4	N	Copper	2.00	4.40	4.40 J		ug/l	D3
IINY-IHRS-SW-FD1-041922 280-161368-5	FD	Copper	2.00	2.30	2.30 J		ug/l	D3

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573274/1-A (LB)	Beryllium	0.2500	< 0.08	< 1	ug/l	U/None*	L	
MB 280-573274/1-A (LB)	Cobalt	0.1050	< 0.092	< 1	ug/l	U/None*	L	
MB 280-573274/1-A (LB)	Lead	0.3040	< 0.18	< 3	ug/l	U/None*	L	
MB 280-573274/1-A (LB)	Manganese	0.6610	< 0.31	< 3.5	ug/l	U/None*	L	
MB 280-573312/1-A (LB)	Beryllium	0.1410	< 0.08	< 1	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6020A, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions	
Code	Definition
D3	Field Duplicate RPD
L	Lab Blank
TR	Trace Level Detect

Flag Code and Definitions	
Flag	Definition
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U	Undetected: The analyte was analyzed for, but not detected.

Bias	
-	The result may be biased low
+	The result may be biased high
Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result	

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blank samples were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Calcium, iron, magnesium, and sodium were detected in method blanks. Associated sample results for iron were less than the LOQ and were qualified U. Associated sample results for calcium, magnesium, and sodium were greater than the LOQ and more than 5x the blank detections and were not qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	Post Spike was not required as MS/MSD recoveries were within acceptance limits.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?			•	Dilution test was not required as MS/MSD recoveries were within acceptance limits.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-IHRS-SW-04-041922 is associated with field duplicate sample IINY-IHRS-SW-FD1-041922. Parent/field duplicate RPDs were in control.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that a low-level CCV (CCVL, separate from the LLCCV) had %R above QC limits for sodium. No data were qualified based on CCVLs. The associated results were greater than 10 times the CCVL concentrations. No data were qualified based on CCVLs.
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM corrective actions/deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Beryllium, cobalt, lead, and manganese were detected in method blank samples. The associated sample results which were less than the LOQ were qualified U.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?	•			
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?		•		One field duplicate was included with 20 project samples. Parent sample IINY-IHRS-SW-04-041922 is associated with field duplicate sample IINY-IHRS-SW-FD1-041922. Parent/field duplicate RPDs were in control with the exception of copper (63%). The copper results were flagged J.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Corpus Christi, TX and were reported under sample delivery group (SDG) 280-161296-2_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Field Duplicate RPD
- Field Triplicate RSD
- Lab Blank
- Lab Replicate RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 23 results (100.00%) out of the 23 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
SW9081	The re-run of the CEC samples were questionable due to the ISM sample prep (drying of samples changing results). Therefore all sample results were J qualifed as estimated concentrations.

November 10, 2022

Reviewed by Tara Lamond, Data Manager, EA Engineering Science and Technology, Inc

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

December 14, 2022

Reviewed by Samantha Saalfield, Senior Scientist, EA Engineering Science and Technology, Inc

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW9081, Lab Replicate RPD

The objective of duplicate sample (LR) analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. Duplicate analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Laboratory duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-DU-04A-SSIS-041822 (LR)	Cation-Exchange Capacity	35.71	< 20	< 20	rpd	J/None	D1	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Replicate RPD for SW9081

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DU-04A-SSIS-041822 280-161296-1	N	Cation-Exchange Capacity	0.0500	33.0	33.0 J		meq/100 g	D1/P
IINY-DU-04B-SSIS-041822 280-161296-2	FD	Cation-Exchange Capacity	0.0500	33.0	33.0 J		meq/100 g	D1/P
IINY-DU-04C-SSIS-041822 280-161296-3	FT	Cation-Exchange Capacity	0.0500	34.0	34.0 J		meq/100 g	D1/P

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
D1	Lab Replicate RPD
P	Sample preservation/collection requirement not met.

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW9081 (Cation-Exchange Capacity of Soils (Sodium Acetate))				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on the COCs match the sample labels?	•			No volume was received for IINY-DU-11C-SSIS-041822.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) documented?	•			
Were sample results reported with percent moisture correction if required?			•	
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?			•	LCS/LCSDs were not required for this method.
Were LCS/LCSD recoveries within project acceptance limits?			•	LCS/LCSDs were not required for this method.
Was the LCS/LCSD RPD within project acceptance limits?			•	LCS/LCSDs were not required for this method.
Was a MS/MSD pair prepared with each batch?			•	MS/MSDs were not required for this method.
Were MS/MSD recoveries within project acceptance limits?			•	MS/MSDs were not required for this method.
Was the MS/MSD RPD within project acceptance limits?			•	MS/MSDs were not required for this method.
Were Post Spike (PS) recoveries within project acceptance limits?			•	A PS was not required for this method.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		Laboratory duplicates were analyzed per the QAPP. The laboratory duplicate that was performed on sample IINY-DU-04A-SSIS-041822 had a RPD of 35.71% which was above QC limits. Samples IINY-DU-04A-SSIS-041822, IINY-DU-04B-SSIS-041822, and IINY-DU-04C-SSIS-041822 were J qualified.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			

Review Questions

Method: SW9081 (Cation-Exchange Capacity of Soils (Sodium Acetate))

Review Questions	Yes	No	NA	Comment
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were internal standard recoveries within project acceptance limits?			•	Internal standards are not required by the method.
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	CEC is not included in the QSM.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161371-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 25 results (5.18%) out of the 483 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Analytical Method	Data Reviewer Comment
SW6010C	No additional comments; see Checklist for detail.

Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.

Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

August 24, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573581/1-A (LB)	Calcium	24.20	< 24	< 200	ug/l	U/None*	L	
MB 280-573581/1-A (LB)	Iron	11.60	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573581/1-A (LB)	Magnesium	16.40	< 4.2	< 200	ug/l	U/None*	L	
MB 280-573688/1-A (LB)	Calcium	24.30	< 24	< 200	ug/l	U/None*	L	
MB 280-573688/1-A (LB)	Iron	26.50	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573688/1-A (LB)	Magnesium	4.590	< 4.2	< 200	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
L	Lab Blank
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Calcium, iron, and magnesium were detected in method blanks. Associated sample results for iron less than the LOQ were qualified U. Associated sample results for calcium and magnesium were greater than the LOQ and more than 5x the blank detections and were not qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		While a LCS/LCSD pair was included with prep batch 573581, prep batch 573688 included an MS/MSD pair and an LCS but not an LCSD. LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?		•		Prep batch 573688/analysis batch 574025 included an MS/MSD pair while prep batch 573581/analysis batch 573869 did not include an MS/MSD pair. One MS/MSD pair was collected for the 20 field samples per the QAPP.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	Post Spike was not required as MS/MSD recoveries were within acceptance limits.

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?		•		A serial dilution was prepared with project sample IINY-DUMP-SW-18-041922. The serial dilution %D for calcium was above QC limits. The calcium sample result has been flagged with a J qualifier.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-DUMP-SW-18-041922 is associated with field duplicate sample IINY-DUMP-SW-FD1-041922. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Analysis batches 573788 and 573934 both included a LCS, but did not include an LCSD. Both batches did have a MS/MSD pair. LCSDs are not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Analysis batches 573788 and 573934 both included a LCS, but did not have an LCSD. Both batches did have a MS/MSD pair.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?	•			
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-DUMP-SW-18-041922 is associated with field duplicate sample IINY-DUMP-SW-FD1-041922. Copper, nickel, and zinc had RPDs>30%, but one or both results were below the LOQ; therefore, no data were qualified.

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			Silver results less than the LOD for three samples were U qualified at the LOD based on detections in CCBs greater than the detection limit but less than 1/2 LOQ.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrations greater than 1/2 LOQ. The vendor acknowledges that barium is a trace impurity in the standard. No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that a low-level CCV (CCVL, separate from the LLCCV) had %R above QC limits for barium. The associated results were non-detect or greater than 10 times the CCVL concentrations. No data were qualified based on CCVLs.
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161371-2_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

Field Duplicate RPD

Prep Hold Time

Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 1 results (4.76%) out of the 21 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

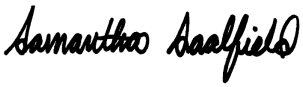
Narrative Comments

Analytical Method	Data Reviewer Comment
A2340B	No additional comments; see Checklist for detail.

July 26, 2022

Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

August 24, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Table of All Qualified Results

Test Method: A2340B		**Extraction Method: NONE**						
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-DUMP-SW-18-041922 280-161371-18	N	Hardness (as CaCO3)	3.00	75.0	75.0 J		mg/l	A

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method A2340B

FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-DUMP-SW-18-041922 280-161371-18	N	Hardness (as CaCO3)	3.00	75.0	75.0	75.0 J	A

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: A2340B (Hardness by Calculation)

Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)			•	A PQL was not established for hardness by SM2340B in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Were target analytes in the method blank less than DL?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Was an LCS/LCSD pair prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Were LCS/LCSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was the LCS/LCSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was a MS/MSD pair prepared with each batch?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were MS/MSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Was the MS/MSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were Post Spike (PS) recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a Post Spike sample was not prepared.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	Only water samples were included with this SDG.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-DUMP-SW-18-041922 is associated with field duplicate sample IINY-DUMP-SW-FD1-041922. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared
Was the Calibration within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.

Review Questions

Method: A2340B (Hardness by Calculation)

Review Questions	Yes	No	NA	Comment
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were CCVs run at the required frequency and within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were ICB/CCBs run at the required frequency and within acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were internal standard recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were instrument run logs present and filled out appropriately?			•	SM2340B is a calculation; therefore, instrument run logs were not prepared.
Were sample preparation sheets present and filled out appropriately?			•	SM2340B is a calculation; therefore, sample preparation sheets were not prepared.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			Note that the hardness result for one sample was J qualified during validation because the calcium result used in the calculation was J qualified, due to high %D for a serial dilution.
Were DoD QSM corrective actions followed if deviations were noted?			•	The hardness calculation is not included in the QSM.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Katahdin Analytical Services, Scarborough, ME and were reported under sample delivery group (SDG) SP2145. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

Lab Blank

LCS Recovery

MS Recovery

MS RPD

Prep Hold Time

Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 16 results (100.00%) out of the 16 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

This DVR for SDG "SP2145" addresses the Total Organic Carbon results for the samples included in SDG 280-161477-1.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
P2	Improper preparation/extraction
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: WBLACK (Walkley-Black Method, Organic Carbon (TOC))				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			No quantitation limit goals were specified for TOC in the QAPP. However, MDL/LOD/LOQ were consistent with those presented in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		An LCS was prepared and analyzed. Since an MS/MSD pair was included with the analysis batch, a LCSD was not required.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Since an MS/MSD pair was included with the analysis batch, a LCSD was not required.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	PS not applicable for method Walkley Black.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?			•	No field replicates were collected. Samples are from ISM survey units in a background sediment area.
Were reported sample concentrations within calibration range?			•	
Was the Calibration within project acceptance criteria?			•	
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?			•	
Were CCVs run at the required frequency and within project acceptance criteria?			•	

Review Questions

Method: WBLACK (Walkley-Black Method, Organic Carbon (TOC))				
Review Questions	Yes	No	NA	Comment
Were ICB/CCBs run at the required frequency and within acceptance criteria?			•	
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	
Were internal standard recoveries within project acceptance limits?			•	
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			The Case Narrative notes that results were calculated using 100% total solids, and that the 9 -11 gram sample aliquots provided had to be subsampled prior to analysis due to high carbon content. Sample results were flagged with a J qualifier, due to the additional subsampling combined with a lack of field triplicates to assess representativeness/precision.
Were DoD QSM corrective actions followed if deviations were noted?			•	TOC by Walkley Black is not included in the DoD QSM.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161477-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 22 results (7.24%) out of the 304 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

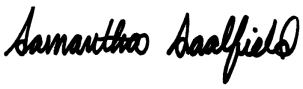
Reviewed by Christopher Ma, Chemist, EA Engineering Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering Science, and Technology

July 28, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-574426/1-A (LB)	Iron	13.40	< 8.3	< 80	mg/kg	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010C, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHHRS-SU-07-SEDIS-042122 (MS)	Aluminum	371.0	74 - 119	10 - 125	percent	J/None	M	Spike amount Insignificant
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Aluminum	243.0	74 - 119	10 - 125	percent	J/None	M	Spike amount Insignificant
IINY-CHHRS-SU-07-SEDIS-042122 (MS)	Iron	14.00	81 - 118	10 - 125	percent	J/UJ	M	Spike amount Insignificant
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Iron	-114.0	81 - 118	10 - 125	percent	J/X	M	Spike amount Insignificant

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-574723/1-A (LB)	Manganese	0.5610	< 0.19	< 2	mg/kg	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Quality Control Outliers for test method SW6020A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHMS-SU-02-SEDIS-042122 (SD)	Selenium	63.00	80 - 119	10 - 125	percent	J/UJ	M	
IINY-CHMS-SU-02-SEDIS-042122 (MS)	Thallium	63.00	83 - 118	10 - 125	percent	J/UJ	M	
IINY-CHMS-SU-02-SEDIS-042122 (SD)	Thallium	60.00	83 - 118	10 - 125	percent	J/UJ	M	
IINY-CHMS-SU-02-SEDIS-042122 (MS)	Zinc	158.0	82 - 119	10 - 125	percent	J/None	M	Spike amount Insignificant
IINY-CHMS-SU-02-SEDIS-042122 (SD)	Zinc	128.0	82 - 119	10 - 125	percent	J/None	M	Spike amount Insignificant

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW6020A

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Arsenic	22.80	< 20	< 20	rpd	J/UJ	D	
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Beryllium	23.66	< 20	< 20	rpd	J/UJ	D	
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Cadmium	29.97	< 20	< 20	rpd	J/UJ	D	
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Selenium	30.62	< 20	< 20	rpd	J/UJ	D	
IINY-CHHRS-SU-07-SEDIS-042122 (SD)	Thallium	31.92	< 20	< 20	rpd	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS RPD for SW6020A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method SW6010C

FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-CHHRS-SU-07-SEDIS-042122 280-161477-7	N	Aluminum	46.0	13000 J1	13000	13000 J	A
IINY-CHHRS-SU-07-SEDIS-042122 280-161477-7	N	Iron	74.0	19000 J1	19000	19000 J	A

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
A	Serial dilution
D	MS RPD
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?	•			
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Iron was detected in a method blank sample at a concentration exceeding the DL. However, all associated sample results for iron were greater than 5x the method blank detection; therefore, no qualification was necessary.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		The preparation batch included a LCS and a MS/MSD pair, but did not include a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Preparation batch 574426 included a LCS and a MS/MSD pair, but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		A MS/MSD was performed on sample IINY-CHHRS-SU-07-SEDIS-042122. Recoveries were outside acceptance limits, but the parent sample results were greater than 4x the spike concentration.
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?		•		A PS was performed on sample IINY-CHHRS-SU-07-SEDIS-042122. Recoveries were outside acceptance limits. Results were qualified based on serial dilution also outside QC limits (see next item).

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?		•		A serial dilution was performed on sample IINY-CHHRS-SU-07-SEDIS-042122, and the % difference for aluminum and iron (both results above 50x the LOQ) were above QC limits, at 13% and 16%. Associated results were flagged with a J qualifier.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?			•	No field replicates were collected. Samples are from ISM survey units in a background sediment area.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Were MS/MSD recoveries within project acceptance limits?		•		The MS/MSD %Rs prepared with project sample IINY-CHHRS-SU-07-SEDIS-042122 for the analysis of barium and vanadium were above QC limits. The associated sample results have been flagged with the J qualifier with positive bias. The %R for copper and zinc in the same MS/MSD were below QC limits. The associated sample results have been flagged with the J qualifier with negative bias. The MS/MSD %Rs prepared with project sample IINY-CHMS-SU-02-SEDIS-042122 for the analysis of lead and barium were above QC limits. The associated sample results have been flagged with the J qualifier with positive bias. The %Rs for arsenic, beryllium, cadmium, chromium, cobalt, copper, nickel, selenium, and thallium, in the same MS/MSD were below QC limits. The associated sample result has been flagged with the J qualifier with negative bias. Lead, manganese, and/or zinc also had high recoveries in these MS/MSDs, but the parent sample concentrations were more than 4x the spikes.
Was the MS/MSD RPD within project acceptance limits?		•		The RPDs for the MS/MSD prepared with project sample IINY-CHHRS-SU-07-SEDIS-042122 for the analysis of arsenic, beryllium, cadmium, selenium, and thallium were above QC limits. The associated sample results have been flagged with the J qualifier.
Were Post Spike (PS) recoveries within project acceptance limits?		•		A PS was performed on samples IINY-CHMS-SU-02-SEDIS-042122 and IINY-CHHRS-SU-07-SEDIS-042122. The %Rs for manganese were below acceptance limits; however, serial dilution results were within acceptance limits and the data were not qualified.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			Serial dilutions were performed on samples IINY-CHMS-SU-02-SEDIS-042122 and IINY-CHHRS-SU-07-SEDIS-042122. Recoveries were within acceptance limits.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?			•	No field replicates were collected. Samples are from ISM survey units in a background sediment area.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrations greater than 1/2 LOQ. The vendor acknowledges that barium is a trace impurity in the standard. No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that low-level CCVs (CCVLs, separate from the LLCCVs) had %Rs above QC limits for manganese and barium. The associated results were greater than 10 times the CCVL concentrations. No data were qualified based on CCVLs.
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•

Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?		•		Prep batch 574308 did not include a MS/MSD pair.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?		•		
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?			•	No field replicates were collected. Samples are from ISM survey units in a background sediment area.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			

Review Questions

Method: SW7471B (Mercury in Soil (Manual Cold-Vapor Technique))

Review Questions	Yes	No	NA	Comment
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	Separate LLCCVs were not required.
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data recommended for exclusion in the data validation process?		•		No DoD QSM deviations were noted.

Data Validation Report for 280-161508-1_52_2a_FUDSChem

Facility:	C02NY0744-02, Iona Island Naval Ammunition Depot, SI
Event:	Iona Island Naval Ammunition Depot, HTRW Sampling Phase II
SDG:	280-161508-1_52_2a_FUDSChem
Guidance Document:	UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020
Prime Contractor:	EA Engineering Science & Technology, Inc., Hunt Valley, MD
Project Manager:	Mike McGuire
Contract Laboratory(ies):	Eurofins Environment Testing TestAmerica, Arvada, CO
Data Review Contractor:	EA Engineering, Science, and Technology
Data Review Level:	S2BVEM

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 25 results (5.18%) out of the 483 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

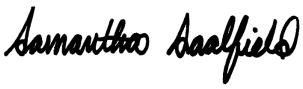
Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

August 24, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573688/1-A (LB)	Calcium	24.30	< 24	< 200	ug/l	U/None*	L	
MB 280-573688/1-A (LB)	Iron	26.50	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573688/1-A (LB)	Magnesium	4.590	< 4.2	< 200	ug/l	U/None*	L	
MB 280-573817/1-A (LB)	Iron	13.40	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573817/1-A (LB)	Sodium	145.0	< 97	< 1000	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-RRDS-SW-10-MSD-042022 (SD)	Zinc	131.0	83 - 119	10 - 125	percent	J/None	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, Total, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573998/1-A (LB)	Manganese	0.9980	< 0.31	< 3.5	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			Typo in some sample IDs (04022 versus 042022) was corrected after delivery to the laboratory.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Calcium, iron, magnesium, and sodium were detected in method blanks. Associated sample results for iron less than the LOQ were qualified U. Associated sample results for calcium, magnesium, and sodium were greater than the LOQ and more than 5x the blank detections and were not qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 573688 and 573817 were analyzed with a LCS, but not with a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 573688 and 573817 were analyzed with a LCS, but not with a LCSD.
Was a MS/MSD pair prepared with each batch?		•		Prep batch 573688 did not include MS/MSD. One MS/MSD pair was collected for the 20 field samples per the QAPP.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	Post Spike was not required as MS/MSD recoveries were within acceptance limits.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-RRDS-SW-10-042022 is associated with field duplicate sample IINY-RRDS-SW-FD1-042022. Parent/field duplicate RPDs were in control. Iron had an RPD>30%, but concentrations were less than the LOQ.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			Typo in some sample IDs (04022 versus 042022) was corrected after delivery to the laboratory.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Manganese was detected in a method blank. Associated sample results were greater than the LOQ and more than 5x the blank detection. No data were qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 573997 and 573998 included LCSs, and MS/MSD pairs, but did not include LCSD. LCSDs are not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 573997 and 573998 did not include LCSD.
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		A high recovery of zinc (131%) was reported in the MSD performed on sample IINY-RRDS-SW-10-042022. Zinc was not detected in the parent sample; therefore, data quality is not affected.
Was the MS/MSD RPD within project acceptance limits?		•		The RPD for zinc (23%) in the MS/MSD performed on sample IINY-RRDS-SW-10-MSD-042022 exceeded the acceptance limit. Zinc was not detected in the parent sample; therefore, data quality is not affected.
Were Post Spike (PS) recoveries within project acceptance limits?	•			
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-RRDS-SW-10-042022 is associated with field duplicate sample IINY-RRDS-SW-FD1-042022. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?		•		The CCV associated with batch 574452 recovered at 113% for manganese. Only a method blank was associated with this CCV; therefore, no data were qualified.
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			Three silver results and one beryllium result less than the LODs were U qualified at the LODs based on detections in the ICB and/or CCBs greater than the detection limits but less than 1/2 LOQ.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrations greater than 1/2 LOQ. The vendor acknowledges that barium is a trace impurity in the standard. No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that a low-level CCV (CCVL, separate from the LLCCV) had %R above QC limits for barium. The associated project sample results were greater than 10 times the CCVL concentration. No data were qualified based on CCVL.
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM corrective actions were noted.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-2_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

Field Duplicate RPD

Prep Hold Time

Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 21 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

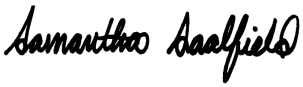
July 26, 2022

Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

August 09, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.

UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias	
-	The result may be biased low
+	The result may be biased high
Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result	

Review Questions

Method: A2340B (Hardness by Calculation)

Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			Typo in some sample IDs (04022 versus 042022) was corrected after delivery to the laboratory.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)			•	A PQL was not established for hardness by SM2340B in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Were target analytes in the method blank less than DL?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Was an LCS/LCSD pair prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Were LCS/LCSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was the LCS/LCSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was a MS/MSD pair prepared with each batch?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were MS/MSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Was the MS/MSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were Post Spike (PS) recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a PS sample was not prepared.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	Only water samples were included with this SDG.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-RRDS-SW-10-042022 is associated with field duplicate sample IINY-RRDS-SW-FD1-042022. Parent/field duplicate RPDs were in control.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-3_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 19 results (3.93%) out of the 483 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Quality Control Outliers for test method SW6010C, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573817/1-A (LB)	Iron	13.40	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573817/1-A (LB)	Sodium	145.0	< 97	< 1000	ug/l	U/None*	L	
MB 280-573818/1-A (LB)	Iron	40.50	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573818/1-A (LB)	Sodium	300.0	< 97	< 1000	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHMS-SW-01-042122 280-161508-22	N	Iron	100	36.0 J	100 U		ug/l	L
IINY-CHMS-SW-02-042122 280-161508-23	N	Iron	100	54.0 J	100 U		ug/l	L
IINY-CHMS-SW-03-042122 280-161508-24	N	Iron	100	52.0 J	100 U		ug/l	L
IINY-CHMS-SW-04-042122 280-161508-25	N	Iron	100	59.0 J	100 U		ug/l	L
IINY-CHMS-SW-05-042122 280-161508-26	N	Iron	100	110	110 J	+	ug/l	L

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHMS-SW-18-042122 280-161508-39	N	Iron	100	48.0 J	100 U		ug/l	L
IINY-CHMS-SW-19-042122 280-161508-40	N	Iron	100	48.0 J	100 U		ug/l	L
IINY-CHMS-SW-20-042122 280-161508-41	N	Iron	100	55.0 J	100 U		ug/l	L
IINY-CHMS-SW-FD1-042122 280-161508-42	FD	Iron	100	35.0 J	100 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHMS-SW-17-MS-042122 (MS)	Manganese	83.00	87 - 115	10 - 125	percent	J/UJ	M	
IINY-CHMS-SW-17-MSD-042122 (SD)	Manganese	84.00	87 - 115	10 - 125	percent	J/UJ	M	
IINY-CHMS-SW-17-MSD-042122 (SD)	Zinc	82.00	83 - 119	10 - 125	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW6020A, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHMS-SW-17-042122 280-161508-38	N	Manganese	3.50	17.0 J1	17.0 J	-	ug/l	M
IINY-CHMS-SW-17-042122 280-161508-38	N	Zinc	20.0	3.70 J J1	3.70 J	-	ug/l	M/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Total, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573998/1-A (LB)	Manganese	0.9980	< 0.31	< 3.5	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

No results associated with this QC element required qualification.

Table of All Qualified Results

Test Method: SW6010C		Extraction Method: FLDFLT						
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHMS-SW-01-042122 280-161508-22	N	Iron	100	36.0 J	100 U		ug/l	L
IINY-CHMS-SW-02-042122 280-161508-23	N	Iron	100	54.0 J	100 U		ug/l	L

IINY-CHMS-SW-11-042122 280-161508-32	N	Iron	100	200	200 J	+	ug/l	L
IINY-CHMS-SW-12-042122 280-161508-33	N	Iron	100	150	150 J	+	ug/l	L
IINY-CHMS-SW-13-042122 280-161508-34	N	Iron	100	160	160 J	+	ug/l	L
IINY-CHMS-SW-17-042122 280-161508-38	N	Iron	100	45.0 J	100 U		ug/l	L
IINY-CHMS-SW-18-042122 280-161508-39	N	Iron	100	48.0 J	100 U		ug/l	L
IINY-CHMS-SW-19-042122 280-161508-40	N	Iron	100	48.0 J	100 U		ug/l	L
IINY-CHMS-SW-20-042122 280-161508-41	N	Iron	100	55.0 J	100 U		ug/l	L
IINY-CHMS-SW-FD1-042122 280-161508-42	FD	Iron	100	35.0 J	100 U		ug/l	L

Test Method: SW6020A		Extraction Method: FLDFLT						
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHMS-SW-17-042122 280-161508-38	N	Manganese	3.50	17.0 J1	17.0 J	-	ug/l	M
IINY-CHMS-SW-17-042122 280-161508-38	N	Zinc	20.0	3.70 J J1	3.70 J	-	ug/l	M/TR
IINY-CHMS-SW-18-042122 280-161508-39	N	Silver	5.00	0.0350 J	0.100 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method SW6020A, Dissolved							
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-CHMS-SW-18-042122 280-161508-39	N	Silver	5.00	0.0350 J	0.0350 J	0.100 U	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Iron and sodium were detected in method blanks. Associated sample results for iron less than the LOQ were U qualified, and associated results for iron greater than the LOQ but less than 5x the blank detection were J qualified with a positive bias. Sodium concentrations in associated samples were more than 5x the blank detection and were not qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 573817 and 573818 included a LCS but did not include a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 573817 and 573818 included a LCS but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?		•		Prep batch 573817 did not include a MS/MSD pair. One MS/MSD pair was collected for the 20 field samples per the QAPP.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	Post Spike was not required as MS/MSD recoveries were within acceptance limits.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-CHMS-SW-17-042122 is associated with field duplicate sample IINY-CHMS-SW-FD1-042122. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•

Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Manganese was detected in a method blank sample. The associated sample results were greater than 5x the method blank detection, and no data were qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 574097 and 573998 included a LCS but did not include a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 574097 and 573998 included a LCS but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?		•		Prep batch 573998 did not include a MS/MSD pair. One MS/MSD pair was collected for the 20 field samples per the QAPP.
Were MS/MSD recoveries within project acceptance limits?		•		The %Rs for manganese and zinc in the MS and/or MSD prepared with project sample IINY-CHMS-SW-17-042122 were below QC limits. The manganese and zinc results for the parent sample have been flagged with the J qualifier.
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?	•			
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-CHMS-SW-17-042122 is associated with field duplicate sample IINY-CHMS-SW-FD1-042122. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?		•		The %R for manganese was above QC limits for CCV sample 280-574452/76. The CCV is not associated with any project samples, and no data were qualified.
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			One silver result less than the LOD was U qualified at the LOD based on detections in the ICB and CCBs greater than the detection limit but less than 1/2 LOQ.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrations greater than 1/2 LOQ. The vendor acknowledges that barium is a trace impurity in the standard. No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-4_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

Field Duplicate RPD

Prep Hold Time

Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 21 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.

UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias	
-	The result may be biased low
+	The result may be biased high
Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result	

Review Questions

Method: A2340B (Hardness by Calculation)				
Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?	•			
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)			•	A PQL was not established for hardness by SM2340B in the QAPP.
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Were target analytes in the method blank less than DL?			•	SM2340B is a calculation; therefore, a method blank was not prepared.
Was an LCS/LCSD pair prepared and analyzed with each batch?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Were LCS/LCSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was the LCS/LCSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a LCS/LCSD pair was not prepared.
Was a MS/MSD pair prepared with each batch?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were MS/MSD recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Was the MS/MSD RPD within project acceptance limits?			•	SM2340B is a calculation; therefore, a MS/MSD pair was not prepared.
Were Post Spike (PS) recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, a PS sample was not prepared.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	Only water samples were included with this SDG.
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-CHMS-SW-17-042122 is associated with field duplicate sample IINY-CHMS-SW-FD1-042122. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Was the Calibration within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.

Review Questions

Method: A2340B (Hardness by Calculation)

Review Questions	Yes	No	NA	Comment
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were CCVs run at the required frequency and within project acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Were ICB/CCBs run at the required frequency and within acceptance criteria?			•	SM2340B is a calculation; therefore, instrument calibration was not prepared.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?			•	Since SM2340B is a calculation, instrument calibration was not required.
Were internal standard recoveries within project acceptance limits?			•	SM2340B is a calculation; therefore, internal standards were not prepared.
Were instrument run logs present and filled out appropriately?			•	SM2340B is a calculation; therefore, instrument run logs were not prepared.
Were sample preparation sheets present and filled out appropriately?			•	SM2340B is a calculation; therefore, sample preparation sheets were not prepared.
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	The hardness calculation is not included in the QSM.
Were any data recommended for exclusion in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-5_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 11 results (2.28%) out of the 483 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

Quality Control Outliers for test method SW6010C, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-573818/1-A (LB)	Iron	40.50	< 9.1	< 100	ug/l	U/None*	L	
MB 280-573818/1-A (LB)	Sodium	300.0	< 97	< 1000	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6010C, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHHRS-SW-01-042122 280-161508-43	N	Iron	100	48.0 J	100 U		ug/l	L
IINY-CHHRS-SW-FD1-042122 280-161508-45	FD	Iron	100	82.0 J	100 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
MB 280-574107/1-A (LB)	Chromium	0.6620	< 0.5	< 10	ug/l	U/None*	L	
MB 280-574107/1-A (LB)	Zinc	4.920	< 2	< 20	ug/l	U/None*	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

*Blank flags displayed in the above table identify qualification of the sample result when it is less than or equal to the LOQ/RL. Sample results above the LOQ will be qualified based on the validation type such as J+ at the sample result.

Qualified Results associated with the Lab Blank for SW6020A, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHHRS-SW-12-042122 280-161508-55	N	Zinc	20.0	5.10 J	8.00 U		ug/l	L
IINY-CHHRS-SW-13-042122 280-161508-56	N	Chromium	10.0	0.540 J	1.80 U		ug/l	L
IINY-CHHRS-SW-13-042122 280-161508-56	N	Zinc	20.0	4.30 J	8.00 U		ug/l	L
IINY-CHHRS-SW-16-042122 280-161508-59	N	Zinc	20.0	2.90 J	8.00 U		ug/l	L
IINY-CHHRS-SW-17-042122 280-161508-60	N	Chromium	10.0	0.700 J	1.80 U		ug/l	L
IINY-CHHRS-SW-18-042122 280-161508-61	N	Zinc	20.0	3.20 J	8.00 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020A, Dissolved, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHHRS-SW-02-MSD-042122 (SD)	Zinc	193.0	83 - 119	10 - 125	percent	J/None	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020A, Dissolved, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
IINY-CHHRS-SW-02-MSD-042122 (SD)	Zinc	38.90	< 20	< 20	ug/l	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS RPD for SW6020A, Dissolved

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
IINY-CHHRS-SW-02-042122 280-161508-44	N	Zinc	20.0	8.00 U J1	8.00 UJ		ug/l	D

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Table of All Qualified Results

IINY-CHHRS-SW-18-042122 280-161508-61	N	Zinc	20.0	3.20 J	8.00 U		ug/l	L
IINY-CHHRS-SW-FD1-042122 280-161508-45	FD	Silver	5.00	0.0520 J	0.100 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method SW6020A, Dissolved							
FieldSample ID / LabSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
IINY-CHHRS-SW-12-042122 280-161508-55	N	Silver	5.00	0.0340 J	0.0340 J	0.100 U	L
IINY-CHHRS-SW-FD1-042122 280-161508-45	FD	Silver	5.00	0.0520 J	0.0520 J	0.100 U	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reason Code Definitions

Code	Definition
D	MS RPD
L	Lab Blank
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias

-	The result may be biased low
+	The result may be biased high

Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)

Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?		•		The sample container label "IINY-CHHRS-FD1-042122" did not match the COC ID "IINY-CHHRS-SW-FD1-042122". The COC ID was used for sample login.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Iron and sodium were detected in a method blank. Associates samples IINY-CHHRS-SW-02-042122 and IINY-CHHRS-SW-FD1-042122 had iron detections less than the LOQ and were U qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 573818 and 573819 included a LCS but did not include a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 573818 and 573819 included aLCS but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?		•		Prep batch 573818 did not include a MS/MSD pair.
Were MS/MSD recoveries within project acceptance limits?	•			
Was the MS/MSD RPD within project acceptance limits?	•			
Were Post Spike (PS) recoveries within project acceptance limits?			•	Post Spike was not required as MS/MSD recoveries were within acceptance limits.
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	

Review Questions

Method: SW6010C (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-CHHRS-SW-02-042122 is associated with field duplicate sample IINY-CHHRS-SW-FD1-042122. Parent/field duplicate RPDs were in control. The RPD for iron was >30%, but concentrations were less than the LOQ so no data were qualified.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?	•			
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)

Review Questions	Yes	No	NA	Comment
Were all samples documented correctly on the chain-of-custody (COC)?	•			
Did samples listed on COCs match the sample labels?		•		The sample container label "IINY-CHHRS-FD1-042122" did not match the COC ID "IINY-CHHRS-SW-FD1-042122". The COC ID was used for sample login.
Were samples relinquished properly on the COC?	•			
Were all samples properly preserved?	•			
Were sampling dates/times, date and time of laboratory receipt of samples, and sample conditions upon receipt at the laboratory (including preservation, pH, and temperature) are documented?	•			
Were sample results reported with percent moisture correction if required?			•	Only water samples were included with this SDG.
Were analytical methods performed and analysis dates present?	•			
Were all requested target analytes reported?	•			
Were QAPP specified Project Quantitation Limit Goals achieved? (The laboratory LOQ is compared to the QAPP Project Quantitation Goal)	•			
Were holding times met?	•			
Were trip blanks analyzed at the proper frequency and in control?			•	Trip blanks were not required.
Were field blanks analyzed at the proper frequency and in control?			•	Field blanks were not required.
Were equipment blanks analyzed at the proper frequency and in control?			•	Equipment blanks were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than DL?		•		Chromium and zinc were detected in a methodblank. The associated sample results whichwere less than the LOQs have been U qualified.
Was an LCS/LCSD pair prepared and analyzed with each batch?		•		Prep batches 574097 and 574107 had a LCS and a MS/MSD pair but did not include a LCSD. An LCSD is not required per the QAPP.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	Prep batches 574097 and 574107 had a LCS and a MS/MSD pair but did not include a LCSD.
Was a MS/MSD pair prepared with each batch?		•		Prep batch 574107 did not include a MS/MSD pair. One MS/MSD pair was collected for the 20 field samples per the QAPP.
Were MS/MSD recoveries within project acceptance limits?		•		Zinc had a recovery above QC limits in the MSD performed on sample IINY-CHHRS-SW-02-042122. The associated sample result was non-detect, so no data were qualified.
Was the MS/MSD RPD within project acceptance limits?		•		The RPD for zinc was above QC limits in the MS/MSD performed on sample IINY-CHHRS-SW-02-042122. The associated sample result was J qualified.
Were Post Spike (PS) recoveries within project acceptance limits?	•			A PS was performed in analytical batch 548387 and results are included in the report for SDG 280-161508-3.

Review Questions

Method: SW6020A (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Was a Dilution Test/Serial Dilution performed and within project acceptance critiera?	•			A serial dilution was performed in analytical batch 548387 and results are included in the report for SDG 280-161508-3.
If ISM was used for sample collection, were laboratory triplicates analyzed and within project acceptance limits?			•	
Were field replicates (duplicates, triplicates, etc.) analyzed at the proper frequency and in control?	•			One field duplicate was included with 20 project samples. Parent sample IINY-CHHRS-SW-02-042122 is associated with field duplicate sample IINY-CHHRS-SW-FD1-042122. Parent/field duplicate RPDs were in control.
Were reported sample concentrations within calibration range?	•			
Was the Calibration within project acceptance criteria?	•			
Was a ICV performed after each ICAL prior to sample analysis and within project acceptance criteria?	•			
Were CCVs run at the required frequency and within project acceptance criteria?	•			
Were ICB/CCBs run at the required frequency and within acceptance criteria?	•			Silver results less than the LOD for two samples were U qualified at the LOD based on detections in the ICB and CCBs greater than the detection limit but less than 1/2 LOQ.
Was a Low Level Calibration Check Verification (LLCCV) analyzed prior to sample and within acceptance criteria?	•			
Were Interference Check Solutions (ICS) or Spectral Interference Checks (SIC) performed at the requried frequency and within project acceptance limits?		•		Barium was detected in ICSA at concentrationsgreater than 1/2 LOQ. The vendor acknowledgesthat barium is a trace impurity in the standard.No data were qualified.
Were internal standard recoveries within project acceptance limits?	•			
Were instrument run logs present and filled out appropriately?	•			
Were sample preparation sheets present and filled out appropriately?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			In addition to the items on this checklist, the Case Narrative notes that low-level CCVs (CCVLs, separate from the LLCCVs) had %Rs above QC limits for beryllium, zinc, manganese, copper, lead, and barium. The associated results were greater than 10 times the CCVL concentrations. No data were qualified based on CCVLs.
Were DoD QSM corrective actions followed if deviations were noted?			•	No DoD QSM deviations were noted.
Were any data recommended for exclusion in the data validation process?		•		

Review Questions

Method: SW7470A (Mercury in Water (Manual Cold-Vapor Technique))

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2BVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the UFP-QAPP, Remedial Investigation, Iona Island Naval Ammunition Depot, Stony Point, NY, January 2020 and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by EA Engineering Science & Technology, Inc., Hunt Valley, MD; analyses were performed by Eurofins Environment Testing TestAmerica, Arvada, CO and were reported under sample delivery group (SDG) 280-161508-6_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

Field Duplicate RPD

Prep Hold Time

Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 0 results (0.00%) out of the 21 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency (X qualifier). Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

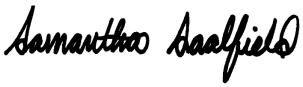
Narrative Comments

Analytical Method	Data Reviewer Comment
A2340B	No additional comments; see Checklist for detail.

July 26, 2022

Reviewed by Christopher Ma, Chemist, EA Engineering, Science, and Technology

As the First Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of the reported sample results and method quality control data between the two deliverables.



Reviewed by Samantha Saalfield, Project Chemist, EA Engineering, Science, and Technology

August 09, 2022

As the Second Reviewer, I certify that I have performed a quality assurance review of the report generated by the First Reviewer.

No Outliers were associated with this sample delivery group.

Qualified Results

No results associated with this sample delivery group required qualification.

Results with Modified Qualifiers

No qualifiers associated with this sample delivery group were modified manually.

Reason Code Definitions

Code	Definition

Flag Code and Definitions

Flag	Definition
J	Estimated Value
N	The analysis indicates the presence of an analyte for which there was presumptive evidence to make a tentative identification.
NJ	The analyte has been tentatively identified or presumptively as present and the associated numerical value was the estimated concentration in the sample.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
U	Undetected: The analyte was analyzed for, but not detected.

UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
X	Result may require rejection; PDT attention required

Bias	
-	The result may be biased low
+	The result may be biased high
Note - The bias field is a separate field; however, it is an integral part of the final flag (qualifier) on the sample result

1. SITE DESCRIPTION AND PROJECT SCOPE

1.1 INTRODUCTION

EA Engineering, P.C. and its affiliate EA Science and Technology (EA) has prepared this Data Usability Assessment Report (DUAR) Phase I in support of the Hazardous Toxic and Radioactive Waste (HTRW) Remedial Investigation (RI) at the Iona Island Naval Ammunition Depot Formerly Used Defense Site (FUDS), located in Stony Point, Rockland County, New York (FUDS Project Number [No.] C02NY074403) (Figure 1). The work is being performed under Contract No.W912DR-15-D-0014 Delivery Order No. W912DR18F0587, under the oversight of the U.S. Army Corps of Engineers (USACE) Baltimore and New England Districts.

The HTRW RI is being conducted to characterize the nature and extent of hazardous substances in environmental media attributable to past Department of Defense (DoD) activities and evaluate potential risk to human health and ecological receptors. From 9 to 20 March 2020 and from 30 March to 7 April 2020, EA conducted the Phase I HTRW project RI field activities at the Iona Island Naval Ammunition Depot FUDS located in Stony Point, Rockland County, New York, along the west bank of the Hudson River. Phase I field activities were conducted in accordance with the HTRW RI Uniform Federal Policy (UFP) – Quality Assurance Project Plan (QAPP) (EA 2020).

1.2 PROJECT SCOPE

A two-phased approach was employed during this RI to facilitate data collection, evaluation, and discussion. Phase I was conducted in March–April 2020 and included soil sampling within the FUDS boundary (surface soil from 0 to 6 inches [in.] below ground surface [bgs] and shallow subsurface soil from 6 to a maximum of 36 in. bgs or to refusal. In addition, Phase I included a shoreline reconnaissance survey and sediment sampling for total organic carbon (TOC) and grain size. The results of the Phase I investigation are the focus of this DUAR.

The Phase I investigation addressed the following:

- 19 AOCs encompassing the locations/footprints of former buildings/structures where contaminants related to the facilities or from historical processes during the site's commission as an ammunition depot may be present (Figure 2);

- Previous surface and subsurface soil sampling locations where COPCs were detected at concentrations above applicable screening levels (Figure 2); and

- 7 former buildings identified as having potential for exposure risk from remaining explosives residues in environmental media to human and ecological receptors (Figure 2).

Decision units (DUs) were established for onsite sampling locations following the procedures in the UFP-QAPP (EA 2020) (Figure 2). Phase I soil samples were collected within 30 of 32 DUs using incremental sampling methodology (ISM), with samples in each DU collected in triplicate (initial ISM sample plus two additional samples). The analytes to be sampled at each DU were based on previous investigation results and COPCs identified for each AOC. Samples were analyzed for Target Analyte List (TAL) metals, polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (benzene, toluene, ethylbenzene, and xylenes [BTEX]), polychlorinated biphenyls (PCBs), and/or explosives residues.

A shoreline reconnaissance survey was also conducted as part of Phase I (April 6-7, 2020) to identify potential pathways that lead to the shoreline environment, evaluate whether there are barriers to overland transport from Iona Island to the shoreline, and conduct a receptor and resource inventory evaluation. Seven discrete sediment samples were collected as part of the shoreline reconnaissance for analysis of grain size and TOC to identify physical characteristics of sediment and evaluate whether sediments could be a potential "sink" for site-related contaminants (Figure 3).

Background sampling was included in the Phase I investigation to establish regional background metal and PAH concentration ranges in surface and subsurface soil. Eight non-contiguous background DUs were established in Bear Mountain State Park outside the influence of the Iona Island Naval Ammunition Depot FUDS. Single surface soil samples (0-6 in. bgs) were collected from each DU using ISM (Figure 4). Samples were analyzed for TAL metals and PAHs.

1.3 PURPOSE AND ORGANIZATION OF THE DATA USABILITY ASSESSMENT REPORT

This DUAR provides a summary of the quality control (QC) practices employed in the production of definitive level data collected as part of Phase I RI sampling conducted in March–April 2020. The report summarizes the results of data validation and provides an assessment of the usability of the data for the intended purposes. Soil and sediment sampling and analysis and data validation were conducted according to the approved UFP-QAPP (EA 2020). Deviations from the UFP-QAPP are noted in this report.

The organization of the DUAR is as follows:

- ***Section 1 Site Description and Project Scope:*** Provides information regarding the history of the site and scope of the project, and the purpose of the DUAR.

- ***Section 2 Data Management and Reporting:*** Summarizes the sample management and data reporting procedures, and any deviations from the UFP-QAPP.

- ***Section 3 Chemical Data Quality Assessment:*** Summarizes the findings of the data validation and assesses the quality of the data.

- ***Section 4 Chemical Data Usability Assessment:*** Summarizes the usability of the data for each analysis.

- ***Section 5 References.***

This page left intentionally blank

2. DATA MANAGEMENT AND REPORTING

Phase I ISM soil samples and discrete sediment samples were collected in accordance with the standard operating procedures (SOPs) provided in the UFP-QAPP (EA 2020). Each ISM soil sample was analyzed for TAL metals, PAHs, BTEX, PCBs, and/or explosives residues. The discrete sediment samples were analyzed for TOC and grain size. Measurement of sample pH was also conducted.

2.1 SAMPLE MANAGEMENT

Laboratory analytical services for Phase I soil and sediment samples were provided by DoD-certified laboratories:

- Eurofins TestAmerica in St. Louis, Missouri: processing of ISM soil metals (including mercury), Aroclor PCBs, and explosives residue samples via air drying and grinding.
- Eurofins Test America in Denver, CO: analysis of ISM soil metals (including mercury), Aroclor PCBs, and explosives residue samples
- Eurofins TestAmerica, Denver, CO: processing and analysis of ISM soil BTEX samples.

The laboratories logged the samples into their laboratory information management systems and sent the work orders to EA for review and correction of any issues, if there were any (e.g., typos in sample names). Laboratory data were then generated in accordance with the laboratory SOPs listed in Worksheet #23 of the UFP-QAPP and included in Appendix G of the UPF-QAPP (EA 2020).

2.2 DATA REPORTING

The samples covered by this data quality assessment include 119 soil samples and 7 sediment samples, not including QC samples (field and trip blanks). These samples were sent to the laboratory as part of 10 sample delivery groups. Separate laboratory analytical reports were provided for each sample delivery group. Laboratory reports are included in Appendix B of the RI Report.

Data reporting requirements included quality assurance/QC reviews of the data by the laboratory prior to data upload into the FUDSChem database. When the laboratory loaded the staged electronic data deliverables (SEDD) files into FUDSChem, they were automatically checked against the sample chains-of-custody to ensure that the correct sample designations and analyses were included. If any non-conformances were found, the SEDD was corrected and re-checked before accepted into the FUDSChem database.

2.3 DEVIATIONS FROM THE UFP-QAPP

This section details deviations from the UFP-QAPP (EA 2020) that relate to the collection of validated data:

- Decision unit (DU)-08 not sampled – Following mark-out for DU-08 in the field and site reconnaissance conducted on 18 March 2020, numerous rusted and deteriorating 55-gallon drums, deteriorating pallets, piles of roofing shingles, chain-link fencing, and other debris were observed in DU-08. Several empty 55-gallon drums were lying on their sides, while other drums were upright and filled with fluid. The material contained within the drums is not known. Residue indicative of roofing tar was observed on the outside of several drums, and staining was noted on the ground surface. Per discussion with USACE on 24 March 2020, DU-08 was not sampled because it would not be possible to separate metals and PAH contaminants originating from former Building 207, from contaminants originating from drums and other debris observed in DU-08.

- DU-24 not sampled – A downed former electric pole was noted during a reconnaissance on 20 March 2020. The majority of DU-24 is exposed bedrock with little to thin soil cover. Sediment and soil were noted along the northeastern edge of DU-24 off the bedrock outcrop of Round Island; however, this sediment/soil is along the shoreline of the tidally influenced Hudson River. Per a call with USACE on 24 March 2020, DU-24 was not sampled. There is little/no soil available for sampling in the area of the former transformer. Any PCBs that may have been released from former transformers would have been transported via runoff and overland flow across the bedrock outcrop of Round Island to the Hudson River. However, as the Hudson River itself is a PCB source, collecting PCBs from soil/sediment along the Hudson River would not provide information that could be used to evaluate a potential release related to former transformers.

- Subsurface soil was not collected as stated in the UFP-QAPP (EA 2020) at the following DUs, due to refusal: DU-01, DU-02, DU-03, DU-04, DU-05, DU-06, DU-0 7, DU-09, DU-10, DU-11, DU-12, DU-13, DU-14, DU-515, DU-16, DU-22, DU-23, and DU-25. Additionally, at DU-20, the subsurface soil was up to 18 in. deep and at DU-24 the subsurface soil was up to 24 in. deep. The UFP-QAPP stated that subsurface soil would be collected from 6 to 36 in. (EA 2020).

- The ISM soil preparation was sent to Eurofins TestAmerica in St. Louis, Missouri, instead of Eurofins TestAmerica in Denver, Colorado. The change occurred because Eurofins TestAmerica's ISM preparation laboratory in Denver, Colorado, was over capacity at the time of sample collection.

3. CHEMICAL DATA QUALITY ASSESSMENT

This section summarizes the findings of the data validation, assesses whether data quality objectives were achieved, and describes the field and laboratory oversight activities and other measures used to ensure data reliability.

3.1 DATA QUALITY ASSESSMENT AND VALIDATION RESULTS

Table 1 provides a tabular summary that lists all the samples that were submitted to the laboratory, the sample delivery group number, sample depth, matrix, sampling method, validation level, and analysis.

Field triplicates of ISM samples were collected, and one trip blank and one methanol field blank were also collected with the BTEX samples. Laboratory QC samples analyzed included matrix spikes (MSs) and matrix spike duplicates (MSDs), method/preparation and calibration blanks, continuing calibration verification samples, interference check samples, serial dilutions, and laboratory control samples (LCSs).

Laboratory data were validated in accordance with the data validation methods and SOPs provided in the UFP-QAPP (EA 2020). Stage 2B Validation Electronic and Manual (S2BVEM) was completed using the FUDSChem software. Automated Data Review in FUDSChem was used to perform a Stage 2A data validation. The EA Project Chemist and Data Manager then performed a Stage 2B data validation, which included reviewing the Stage 2A validation report against the PDF laboratory report, verifying/modifying qualifiers applied during the Stage 2A review, and manually reviewing QC elements that were not included in the Stage 2A review. Validation was performed in accordance with the DoD Quality System Manual Version 5.3 (2019) and U.S. Environmental Protection Agency (EPA) National Functional Guidelines for Organic and Inorganic Superfund Methods Data Review (EPA 2017a, 2017b). The specific validation procedures are detailed in the validation reports included in Appendix C of the RI Report.

The field and laboratory QC samples listed above were reviewed as part of data validation, and the chain-of-custody records, holding times, instrument performance records, initial calibrations, compound quantitations, and data qualifiers were also reviewed. Sample results, with validation qualifiers and qualifier reason codes, are included in Table 2. The data assessed for precision, accuracy, representativeness, completeness, comparability, and sensitivity (PARCCS) are discussed in the following sections.

3.1.1 Data Validation Qualifiers

The analytical data were qualified and appropriately flagged during data validation. The qualifications were made by assessing the results submitted by the laboratory in terms of the technical requirements of the analytical methods (including QA/QC criteria) and data validation requirements. Qualifiers that were applied during data validation are discussed in detail in each

data validation report. The data usability assessment focused on results that were qualified due to QC issues. The following qualifiers were applied to the reported data (Table 2):

- No qualifier: The analyte was positively identified at the specified numerical value exceeding the LOQ, and no data quality issues necessitating validation were identified
- U: The analyte was not detected at a level greater than or equal to the associated numerical value (LOD or LOQ)
- J: The analyte was positively identified, and the associated numerical value is the approximate concentration of the analyte in the sample
- UJ: The analyte was not detected; however, the associated numerical value (LOD or LOQ) is approximate and may be inaccurate or imprecise
- -: Result may be biased low. May be applied to J or UJ qualified data
- +: Result may be biased high. May be applied to J or UJ qualified data
- R: The data are unusable. The sample results are rejected due to serious deficiencies in meeting the QC criteria. The analyte may or may not be present in the sample.

U qualified data were reported to either the LOQ or the LOD. The laboratory LOD is defined as the lowest concentration for reliable reporting of a non-detect of a specific analyte in a specific matrix with a specific method at 99 percent confidence (DoD 2017). The smallest concentration that produces a quantitative result with known and recorded precision and bias is known as the LOQ (DoD 2017). Instrument-specific detection limits (DLs) (e.g., the smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration with 99 percent confidence [DoD 2017]), as provided for each analyte by the laboratory, are reported along with the LODs and LOQs in the laboratory analytical reports. Non-detect (U qualified) data are typically reported to the LOD. Results that are reported to the LOQ are due to blank contamination, or due to the LOD and LOQ having the same value (e.g., for a few explosives analytes). Note that under the DoD QSM, it is acceptable that the LOD and LOQ are equal in some cases, because the definitions of these two limits yield potential overlap. Results were reported to the LOQ instead of the LOD due to blank contamination and are in accordance with the National Functional Guidelines as indicated on worksheet #36 of the UFP-QAPP (EA 2020). National Functional Guidelines guidance indicates to qualify results less than the LOQ to the LOQ and qualify them as "U."

Analytical results reported at estimated concentrations between the DL and LOQ were qualified as estimated (J) with a qualifier reason code of TR. Various data were also qualified as estimated (J or UJ) during data validation due to minor QC issues as follows:

- MS/MSD RPDs outside control limits (qualifier reason code = D)
- Serial dilutions outside QC limits (qualifier reason code = A)
- Dual column RPDs outside QC limits (qualifier reason code = P1)
- Percent recovery (%R) outside QC limits in LCSs (qualifier reason code = C)
- %R outside QC limits in MS/MSDs (qualifier reason code = M)
- %R outside QC limits in the post digestion spike (qualifier reason code = M)
- Surrogate %R outside QC limits (qualifier reason code = I)
- Percent difference (%D) outside QC limits (qualifier reason code = V2)
- Detections in the laboratory blank (blank contamination) (qualifier reason code = L)
- PAH Extraction outside of the maximum hold time (qualifier reason code = H2).

3.1.2 Measurement Performance Criteria

The following sections present the results of the data quality indicators used to validate and assess the data produced during the project (precision, accuracy/bias, representativeness, completeness, comparability, and sensitivity).

3.1.2.1 Precision

The precision of the analytical data was assessed through calculation of relative percent difference (RPD) for laboratory duplicates and dual columns and through evaluation of serial dilutions. Assessment was performed during data validation, as recorded in the validation reports included in Appendix C of the RI Report. QC deficiencies in laboratory duplicate, dual column, and serial duplicate runs that resulted in qualification of data are summarized below:

- The MS/MSD run on a sample from IINY-DU-19 had RPDs outside QC limits for several PAHs and metals. Results were J qualified due to RPDs outside control limits (qualifier reason code = D; Table 2).

- One iron result from each of 4 DUs (IINY-DU-09, DU-11, DU-14, and DU-19), one magnesium result from each of 4 DUs (IINY-BADU-05, DU-09, DU-10, and DU-19), one calcium result from each of 3 DUs (IINY-DU-09, DU-14, and DU-19), and one vanadium result from IINY-DU-18 were J qualified due to serial dilutions outside QC limits (qualifier reason code = A; Table 2).

- PCB Aroclor 1260 in samples from 4 DUs (IINY-DU-17, DU-19, DU-23, and DU-25) and explosive compounds 2,4-DNT and 1,3,5-trinitrobenzene in samples from IINY-EXDU-01 had dual column RPDs outside QC limits. Results had already been J qualified due to detection below the LOQ (qualifier reason code = TR), and a P1 reason code was added based on the dual column RPDs outside QC limits (Table 2).

Note that the relative standard deviation (RSD) was calculated for detected results for each analyte in each DU where triplicate samples were collected (all DUs except background DUs). RSDs are

presented in Tables 4-1a/b through 4-6a/b. As described in the ITRC guidance for ISM sampling (ITRC 2012a), RSD provides information about measurement precision but does not provide an indication of the accuracy of the estimate of the mean or the 95UCL. Therefore, a comment from the USACE Center of Expertise, provided on 1 August 2019 during preparation of the UFP-QAPP, indicated that an acceptance criterion for the RSD was unnecessary for this project because inferences about contamination are being made using a statistical approach that inherently takes the total measurement variability into account. Because no acceptance criterion was included in the UFP-QAPP, no data were qualified based on RSD.

3.1.2.2 Accuracy and Bias

The accuracy of the analytical data was assessed by comparing the results for spiked samples (MS, MSD, LCS, and post-digestion spikes), field, trip, and laboratory blanks, surrogates, and continuing calibration verifications to the project control limits. Percent recoveries and percent differences, and were within control limits, with the following exceptions.

Data for LCSs and laboratory control spike duplicates are generated to provide information on the accuracy of the analytical method and on the laboratory performance independent of the sample matrix effects. Recoveries of target analytes from the LCS associated with the analysis of all the samples collected during the reporting period were found to be within QC limits with the following exceptions:

- Explosive compounds had %R below QC limits in LCSs associated with samples from 10 DUs (IINY-DU-17, DU-18, DU-19, EXDU-01, EXDU-02, EXDU-03, EXDU-04, EXDU-05, EXDU-06, and EXDU-07). Positive results were J qualified and non-detects were UJ qualified due to %R outside QC limits (qualifier reason code = C; Table 2). These results may have a low bias (indicated by "-" added to qualifier).

Data for the MS/MSD and post digestion spikes are generated to assess the effects of the sample matrix on analytical efficiency and to evaluate the analytical accuracy. QC deficiencies in MS/MSD and post-digestion spike recoveries that resulted in qualification of data are summarized below:

- PAHs had %R outside QC limits in MS/MSDs associated with sample from 4 DUs (IINY-BADU-05, DU-09, DU-19, and DU-20). Results positive were J qualified (qualifier reason code = M). Recoveries for some PAHs were high, and others were low; bias is indicated in Table 2, where available.

- Metals including mercury had %R outside QC limits in MS/MSDs associated with sample from 5 DUs (IINY-BADU-05, DU-09, DU-11, DU-14, and DU-19). Positive results were J qualified (qualifier reason code = M). Recoveries for some metals were high and others were low; bias is indicated in Table 2, where available.

- PCB Aroclor 1260 had %R outside QC limits in the MS/MSD associated with samples from IINY-DU-19. Results had already been J qualified due to detection below the LOQ (qualifier reason code = TR), and a M reason code was added based on the MS/MSD recoveries (Table 2). These results may have a low bias.

- The explosive compound 3,5-Dinitroaniline had %R outside QC limits in the MS/MSD associated with samples from IINY-EXDU-04 and IINY-DU-19. The non-detect results were UJ qualified (qualifier reason code = M; Table 2).

- A few metals had %R outside QC limits in the post digestion spike associated with samples from 4 DUs (IINY-BADU-05, DU-05, DU-10, and DU-19). Positive results were J qualified and non-detects were UJ qualified due to %R outside QC limits (qualifier reason code = M2; Table 2).

Samples, blanks, and laboratory QC samples analyzed for organic compounds are spiked with surrogate compounds prior to extraction. Surrogate recoveries provide a means to evaluate the effects of individual sample matrices on analytical efficiencies. Surrogate recoveries outside QC limits can indicate that the sample matrix impacted analytical efficiency. The specific %Rs reported for each sample are evaluated to assess data quality and usability. QC deficiencies in surrogate compound recoveries that resulted in qualification of data are summarized below:

- PAHs in samples from 11 DUs (IINY-BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU-09, DU-16, DU-17, and DU-18) had surrogate %R outside QC limits. Positive results were J qualified and non-detects were UJ qualified due to %R below QC limits but greater than 10 percent (qualifier reason code = I; Table 2). Surrogate recoveries outside QC limits indicated a potential low bias (indicated by "-" added to qualifier). Bias is indicated in Table 2, where available. Sample IINY-BADU-04 had a 0 percent recovery for the surrogate associated with dibenz(a,h)anthracene. The dibenz(a,h)anthracene result was non-detect and was qualified R during validation, indicating that it is not usable, due to the extremely low recovery.

- PCB Aroclors in 3 DUs (IINY-DU-17, DU-18, and DU-19) had surrogate %R outside QC limits. Positive results were J qualified and non-detects were UJ qualified due to %R below QC limits but greater than 10 percent (qualifier reason code = I; Table 2). Possible low bias is indicated for PCB-1260 in one sample each from IINY-DU-17, DU-18 and DU-19 and for total PCBs and PCB-1248 in one sample from IINY-DU-18.

- Explosives in samples from IINY-DU-17 and IINY-DU-18 had surrogate %R outside QC limits. Non-detect results were UJ qualified due to %R outside QC limits but greater than 10 percent (qualifier reason code = I; Table 2).

The stability of the analytical system is monitored by analysis of continuing calibration standards at concentrations near the mid-point of the instrument calibration range. The %D values between the relative response factor in the initial calibration and the relative response factor in the continuing calibration are reviewed to ensure instrument calibration criteria are within method control limits. QC deficiencies in initial and continuing calibration verifications that resulted in qualification of data are summarized below:

- PCB Aroclor %Ds were outside QC limits in continuing calibration verification analyses associated with samples from 3 DUs (IINY-DU-17, DU-18, and DU-19). Positive results were J qualified and non-detects were UJ qualified due to %D outside QC limits (qualifier reason code = V2). No specific bias is associated with this issue. Bias is indicated in Table 2 where available.
-

QA blanks, such as method, field, trip, calibration, and preparation blanks, are prepared to identify any contamination that may have been introduced into the samples either in the field or at the laboratory. No BTEX was detected in the field or trip blank. The purpose of method blank analysis is to determine the presence and magnitude of contamination resulting from laboratory activities. Method blanks that indicate potential contamination during sample preparation or analysis and resulted in qualification of data are listed below:

- Silver was detected in the laboratory blank associated with samples from 6 DUs (IINY-DU-01, DU-02, DU-03, DU-05, DU-09, and DU-10). Results less than the LOQ were U qualified due to the blank contamination (qualifier reason code = L).

3.1.2.3 Representativeness

Representativeness is the measure of the degree to which data accurately and precisely represent a characteristic of a population, a parameter variation at a sampling point, a process condition, or an environmental condition. Representativeness is a qualitative parameter that is dependent upon the proper design and implementation of the sampling program and proper laboratory protocol. In order to meet the needs of the data users, project data must meet the measurement performance criteria for sample representativeness specified in the UFP-QAPP Worksheets #12 and #28 (EA 2020). Representativeness of the samples submitted for analysis is ensured by adherence to standard sampling techniques and standard analytical method protocols. Exceedances of maximum holding times that may have affected representativeness and resulted in qualification of data are summarized below:

- Several samples were extracted outside of the maximum hold time for PAH analysis (14 days) due to the time required for ISM preparation prior to extraction. ISM sample drying occurs at room temperature, and the drying time may have been prolonged due to characteristics of the samples, such as texture and moisture content. The samples were extracted within 28 days after collection; and thus, exceeded the maximum hold time by less than a factor of two. Positive results were therefore J qualified and non-detects were

UJ qualified for samples from 14 DUs (IINY-BADU-01, BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU-01, DU-03, DU-04, DU-11, DU-12, and DU-13) (qualifier reason code = H2; Table 2). The hold time exceedances are associated with potential low bias (indicated by "-" added to qualifier). However, these exceedances are expected to have only minor potential impacts on PAH data quality, particularly for high molecular weight (HMW) PAHs, which are persistent and not prone to degradation, and therefore not expected to experience a measurable decrease in concentration over a few weeks.

3.1.2.4 Completeness

The completeness goal for this project is 100 percent for each DU. Completeness for each analyte is calculated as the percentage of usable data points, which meet the measurement performance criteria. Rejected sample data, as described above, included 1 dibenz(a,h)anthracene result. Given a total of 71 dibenz(a,h)anthracene results generated and 1 rejected result, the completeness for this analyte is 99 percent. All other analysis achieved 100 percent completeness, achieving the project goal.

3.1.2.5 Comparability

Comparability is the degree to which different methods, data sets, and decisions agree or can be represented as similar. Comparability describes the confidence (expressed qualitatively or quantitatively) that two data sets can contribute to a common analysis and interpolation. In order to meet the needs of the data users, project data must meet the measurement performance criteria for comparability specified in the UFP-QAPP (EA 2020) Worksheets #12 and #28.

The extent to which the analytical data will be comparable depends on the similarity of sampling and analytical methods. This objective is met by using standard methods for sampling and analysis and by following techniques and methods set forth in the UFP-QAPP (EA 2020).

3.1.2.6 Sensitivity

Sensitivity is the capability of a test method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. Examples of QC measures for determining sensitivity include laboratory fortified blanks, an MDL study, and calibration standards at the quantitation limit.

To meet the needs of the data users, the LODs for non-detects and LOQs for detections need to be less than the project action levels included in Worksheet #15 of the UFP-QAPP (EA 2020). Several results were reported from diluted analysis, and LODs and LOQs were adjusted accordingly for the diluted results. The dilutions were necessary to bring the target analytes within the calibration range. Additionally, the results for internal standards must meet the measurement performance criteria specified in Worksheet #12 of the UFP-QAPP, Tables 12-4 (PAH) and 12-5 (BTEX) (EA

2020). Internal standard recoveries for PAH and BTEX analyses met the method criteria. No sensitivity problems were noted for this Phase I dataset; therefore, the sensitivity objectives set forth in the project UFP-QAPP were met.

3.2 SUMMARY OF VALIDATION RESULTS BY ANALYTE GROUP

The objective of the HTRW RI is to collect environmental analytical data at the Iona Island Naval Ammunition Depot FUDS that are scientifically defensible and representative of site conditions. The Phase I data will be used to evaluate the nature and extent of environmental impact and determine if concentrations of contaminants pose an unacceptable risk to human health and/or ecological receptors. Each DU was sampled for suspected contaminants based on historical sampling results and historical activities as presented in the RI Report.

3.2.1 Explosives

Explosives by Method SW8330B were analyzed at 10 DUs: IINY-DU-17, DU-18, DU-19, EXDU-01, EXDU-02, EXDU-03, EXDU-04, EXDU-05, EXDU-06, and EXDU-07 (Table 1). Explosive results had estimated (J and/or UJ) qualifiers added during data validation for the following reasons: low LCS recoveries (all samples), surrogate recoveries outside QC limits (IINY-DU-17 and DU-18), MS recoveries outside QC limits (IINY-DU-19 and IINY-EXDU-04), and dual column RPDs outside QC limits (IINY-EXDU-01). The remaining J qualifiers for the explosive data are due to trace detects between the LOQ and the DL (qualifier reason code = TR). The only detected results that were qualified during validation were three 2,4,6-trinitrotoluene results that were J qualified due to low LCS recoveries and two results qualified due to high column RPDs that had already been J qualified by the laboratory as trace detects. For surrogate and MS recoveries outside QC limits, only non-detect results were qualified. The total number of explosives results is 663; of these, 232 results were qualified during data validation due to minor QC issues. Of the 232 results qualified during validation, 227 were non-detect results that were UJ qualified to indicate that the LOD or LOQ is estimated. All results with the validation qualifiers and validation reason codes are included in Table 2.

3.2.2 Metals

Metals were analyzed using Methods SW6010C, SW6020A, and SW7471B in samples from 26 DUs: IINY-BADU-01, BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU-01, DU-02, DU-03, DU-04, DU-05, DU-06, DU-07, DU-09, DU-10, DU-11, DU-12, DU-13, DU-14, DU-15, DU-16, DU-17, DU-18, and DU-19 (Table 1). Results for calcium, iron, magnesium, and/or vanadium in samples from 6 DUs (IINY-DU-9, DU-10, DU-11, DU-14, DU-18, and DU-19) were J qualified due to serial dilutions outside QC limits. Several metals results for samples from IINY-DU-19 were J qualified due to MS/MSD RPD exceedances. Silver results less than the LOQ were qualified U (non-detect) for samples from IINY-DU-01, DU-02, DU-03, DU-05, DU-09, and DU-10 due to method blank contamination. MS recoveries were outside QC limits for metals in samples associated with IINY-BADU-05, DU-09, DU-11, DU-14,

and DU-19. Some MS recoveries were high, and others were low, leading to a mix of high and low bias for associated results (Table 2). A few metals at BADU-05, DU-05, DU-10, and DU-19 had post digestion spike recoveries outside QC limits. MS and post digestion spike QC issues resulted in J and UJ qualifiers. These MS and post digestion spike recovery issues likely resulted from the complexity of the matrices sampled. The remaining J qualifiers for the metals data are due to trace detects between the LOQ and the DL. The total number of results for metals Method SW6010C is 426 and the total number of qualified results due to minor QC issues is 34 (including 33 detected results for calcium, iron, magnesium, potassium, and sodium that were J qualified and 1 non-detect sodium result that was UJ qualified). The total number of results for metals Method SW6020A is 1,136 and the total number of qualified results due to minor QC issues is 60 (including 16 U qualified silver results and 44 J qualified results). The total number of results for mercury Method SW7471B is 62 and the total number of qualified results due to minor QC issues is 6 (J qualified detects). All results with the validation qualifiers and validation reason codes are included in Table 2.

3.2.3 Polycyclic Aromatic Hydrocarbons

PAHs by Method SW8270D SIM were analyzed at 23 DUs: IINY-BADU-01, BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU-02, DU-03, DU-04, DU-05, DU-09, DU-11, DU-12, DU-13, DU-16, DU-17, DU-18, DU-19, DU-20, DU-21, and DU-22 (Table 1). Naphthalene, acenaphthylene, and 2-methylnaphthalene results for samples from IINY-DU-19 were J qualified due to MS/MSD RPDs outside QC limits. Results from IINY-BADU-05, DU-09, DU-19, and DU-20 were J qualified due to MS/MSD recoveries outside QC limits. Results from IINY-BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU0-9, DU-16, DU-17, and DU-18 had surrogate recoveries outside QC limits. Results for samples with at least 10 percent surrogate recovery were qualified as estimated (J or UJ). Sample IINY-BADU-04 had a 0 percent recovery in the surrogate for dibenz(a,h)anthracene and the result was rejected during validation. The frequency of MS and surrogate recoveries outside control limits suggests that the project sample matrix interfered with the analysis of the target compounds. Samples from IINY-BADU-01, BADU-02, BADU-03, BADU-04, BADU-05, BADU-06, BADU-07, BADU-08, DU-01, DU-03, and DU-04, DU-11, DU-12, and DU-13 were extracted outside of hold time due to the time required for ISM preparation, and results were J or UJ qualified. These holding time exceedances are expected to have only minor impact on data quality, particularly for the HMW PAHs, which are not prone to degradation. The remaining J qualifiers for the PAH data are due to trace detects between the LOQ and the DL. The total number of PAH results is 1,278 and the total number of results qualified during data validation due to minor QC issues is 660. Of these, 237 were J or UJ qualified solely because of the holding time exceedance, and 143 were J qualified during validation but were also below the LOQ; and therefore, had already been J qualified by the laboratory. Additionally, 1 result was R qualified (rejected) due to a major QC issue. All results with the validation qualifiers and validation reason codes are included in Table 2.

3.2.4 Polychlorinated Biphenyls

PCB Aroclors by Method SW8082A were analyzed at 5 DUs: IINY-DU-17, DU-18, DU-19, DU-23, and DU-25. In samples from IINY-DU-17, DU-19, DU-23, and DU-25, results for PCB-1260 were J qualified due to dual column RPDs outside QC limits. The MS/MSD associated with samples from DU-19 also had recoveries below QC limits for PCB-1260. Samples from IINY-DU-17, DU-18, and DU-19 had surrogate recoveries outside QC limits. Continuing calibration verification %D outside QC limits was associated with samples from IINY-DU-17, DU-18, and DU-19. The remaining J qualifiers for the PCB data are due to trace detects between the LOQ and the DL. The total number of PCB results is 240 and the total number of results qualified during data validation due to minor QC issues is 67 (including 50 UJ qualified non-detects and 17 J qualified results, of which 12 were already J qualified as trace detects). Seven of the 17 PCB results that were J qualified had a potential low bias. All results with the validation qualifiers and validation reason codes are included in Table 2.

3.2.5 Total Organic Carbon

Seven sediment samples were analyzed for TOC by the Walkley Black method. No data were qualified due to QC issues. One J flag was applied due to the result falling between the LOQ and the DL. All results with the validation qualifiers and validation reason codes are included in Table 2.

3.2.6 Benzene, Ethylbenzene, Toluene, and Xylenes

BTEX by Method SW8260B was analyzed at IINY-DU-20 and DU-21. No data were qualified due to QC issues. All sample results were non-detect. All results with the validation qualifiers and validation reason codes are included in Table 2.

4. CHEMICAL DATA USABILITY ASSESSMENT

This section summarizes the usability of the Phase I data based on the data validation findings, the PARCCS data quality assessment, and achievement of data quality objectives.

As stated in Worksheet #11 Project Quality Objective of the UFP-QAPP (EA 2020), the HTRW RI is to collect environmental analytical data at the Iona Island Naval Ammunition Depot FUDS that are scientifically defensible and representative of site conditions to:

- Evaluate the nature and extent of potential impacts associated with former structures and/or operations
- Evaluate potential risks to human health and ecological receptors
- Collect sufficient data to complete a feasibility study, if necessary.

Various data were qualified as estimated (J or UJ) during data validation due to minor QC issues, as summarized in Section 3 and in the table below. Of the 3,848 results that were reported, 1,058 were qualified during validation. Overall, 27.5 percent of the dataset was qualified as estimated due to data quality issues and is considered usable. One result (dibenz[a,h]anthracene at BADU-4) was qualified as R (rejected) due to a major QC issue (0 percent recovery in the surrogate) and is not considered usable. The number of J qualified data in this dataset is relatively high due to the nature of the ISM soil samples (including chemical composition, texture, and moisture content) and the established laboratory procedures and methods that were required for this project, which resulted in analytical interferences as well as extended ISM processing times for some samples. However, based on evaluation against the project DQOs specified in the UFP-QAPP (EA 2020), the Phase I data, with the exception of the one rejected result, are usable for the intended purposes. The potential impacts of data qualified as estimated values will be addressed in uncertainty discussions in the human health and ecological risk assessments.

Summary of Results Qualified During Validation

Analyte Group	Total Results	Rejected Results	Qualified Results	J Qualified Detected Results	Qualified Results Greater than LOQ	Bias of Qualified Results		
						Low Bias	High Bias	Unknown Bias
Metals	1,624	0	100	83	73	28	32	40
PAHs	1,278	1	660	652	544	632	14	14
Explosives	663	0	232	5	3	186	0	46
PCBs	240	0	67	17	5	7	0	60
BTEX	36	0	0	0	0	NA	NA	NA
TOC	7	0	0	0	0	NA	NA	NA
