CERTIFICATION:

I hereby certify that the enclosed Report, shown and marked in this submittal, is that proposed to be incorporated with Contract Number W912WJ-18-C-0011. This document was prepared in accordance with the U.S. Army Corps of Engineers (USACE) Scope of Work and is hereby submitted for Government approval.

1.0 INTRODUCTION

KOMAN Government Solutions, LLC (KGS), on behalf of the U.S. Army Corps of Engineers (USACE) New England District, has prepared this Preliminary Site Characterization Summary (PSCS) for the Per- and Polyfluoroalkyl Substances (together, "PFAS") Remedial Investigation (RI) at the former Fort Devens Army Installation (Devens) located in Devens, Massachusetts.

The PSCS summarizes data that have been collected at numerous Areas of Contamination (AOC) identified in the *Draft Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018a) and as shown on Figure 1-1.

To expedite the field investigations, the identified AOCs, Grove Pond wellfield, and MacPherson, Patton, and Shabokin water supply well areas were grouped into three areas (Areas 1, 2, and 3). This PSCS addresses part of Area 2 as indicated below.

Area 2 (partial):

- AOC 32/43A Former Defense Reuse and Marketing Office(DRMO)/Petroleum, Oil, Lubricants (POL) Storage Area;
- AOC 76 Devens Fire Station;
- MacPherson Well Area; and,
- AOC 5 Shepley's Hill Landfill (SHL).

The Area 1 PSCS (KGS, 2020) addressed Area 1 and part of Area 2 as indicated below.

Area 1:

- AOC 57 Building 3713 Fuel Oil Spill Site;
- AOC 74 Barnum Road Firefighting Exercise Site;
- AOC 75 Former Building T-1445 Warehouse Fire; and,
- Grove Pond wellfield.

Area 2 (partial):

- AOC 40 Cold Spring Brook Landfill;
- AOC 43G Historical Gas Station G;
- AOC 43J Historical Gas Station J;
- Patton water supply well; and,
- Shabokin water supply well.

A future PSCS submittal will include Area 3.

The PSCS is a summary of site data following completion of the initial field sampling and analysis (EPA, 1988). The intent is to better understand and assess any potential data gaps remaining at the AOCs, and determine additional data gathering activities. The U.S. Army (Army) will prepare a bulleted list of data gaps following discussions at the Base Cleanup Team meetings, which will be used to develop specific Data Quality Objectives (DQO) for the development of an RI Addendum work plan.

1.1 Investigation Approach

The initial field activities for the AOCs covered in this PSCS were detailed in the *Draft Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018a) and the *Area 2 Field Sampling Plan (FSP) Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). The initial activities were planned based on results from the *Final Base-Wide Preliminary Assessment for Evaluation of Perfluoroalkyl Substances* (KGS, 2017), the *Site Inspection (SI) Addendum for Additional Per- and Polyfluoroalkyl Substances (PFAS) Sampling at Area of Contamination (AOC) 76-Devens Fire Department and Long Term Monitoring (LTM) Wells at AOCs 57, 43G, 43J, 32, 43A, 50 and Shepley's Hill Landfill (SHL) Former Fort Devens Army Installation Devens, Massachusetts* (BERS-Weston, 2018a), and the *Final Site Inspection Report for Per- and Polyfluoroalkyl*

Substances (PFAS) at Former Fort Devens Army Installation, Devens, MA (BERS-Weston, 2018b). Knowledge of the sites through previous investigations, operation and maintenance activities, and long-term monitoring activities, which included various groundwater models were also used to plan field activities.

The field work was conducted in an iterative manner. The field work commenced with the work detailed in the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). While executing the field work, analytical data from sampling of existing monitoring wells, groundwater vertical profiling, soil sampling, and surface water and sediment sampling was shared with U.S. Environmental Protection Agency (EPA) and Massachusetts Department of Environmental Protection (MassDEP) as it was received from the laboratory. The results were discussed with EPA and MassDEP and additional activities, not detailed in the field sampling plan (FSP), needed to achieve the study goals and DQOs were recommended. The recommendations were developed based on review of the analytical data and understanding of groundwater flow direction based on analysis of field data or review of information from previous field investigations or groundwater flow models. Further activities included additional vertical profiles, soil borings, surface water and sediment sampling, existing monitoring well sampling, installation of piezometers, and synoptic water level surveys. As additional results were received and reviewed, further work was conducted, which sometimes resulted in numerous phases of field activities at different AOCs. The field work at each AOC is discussed in subsequent sections.

After existing monitoring wells were sampled in Area 1 and Area 2, further sampling of existing monitoring wells was detailed in the *Work Plan for Additional Sampling of Existing Wells to Support the PFAS Remedial Investigation Former Fort Devens Army Installation, Devens, MA* (KGS, 2019). This supplemental sampling of existing monitoring wells was intended to provide additional data regarding the nature and extent of PFAS at these sites for the RI and will be used to support evaluation of trends in PFAS concentrations in groundwater over time.

There were minor deviations to the FSPs and FSP addendums related to locations of drilling activities, additions and deletions of locations, or activities at specific locations. As is typical with field investigations, some locations were adjusted based on field conditions (e.g., steep terrain, proximity to wetlands, safety considerations). None of the adjustments to the locations negatively impacted meeting the DQOs. There were no major deviations to the methods detailed in the work plan, FSPs, and FSP addendums.

1.2 Report Organization

The site characteristics, general geology, and regional hydrogeology at former Fort Devens are described in Section 2. The results of synoptic water level events conducted in the areas addressed in this report are reported in Section 2 and site-specific groundwater flow conditions are described in the subsequent site-specific sections. Sections 3 through 5 each address a specific area of investigation listed above. The PFAS results related to each area of investigation are discussed in the applicable section. The PFAS results in various media are described in each applicable section with respect to the media-specific criteria (Table 1-1). Section 6 addresses a sample collected from a well that is currently not associated with any AOC in the PFAS RI. The field sheets, soil boring logs, piezometer construction logs, and results are presented in appendices.

2.0 FORMER FORT DEVENS SITE LOCATION AND DESCRIPTION

Devens is located in the towns of Ayer and Shirley in Middlesex County, and the towns of Harvard and Lancaster in Worcester County, Massachusetts, approximately 35 miles northwest of Boston, Massachusetts. The installation occupied approximately 9,260 acres. Fort Devens was divided into the North Post, Main Post, and South Post. Route 2 divides the South Post from the Main Post. The Nashua River runs through the North, Main, and South Posts. The area surrounding Devens is primarily comprised of rural residential properties. Portions of Devens have been redeveloped for commercial/industrial use.

Camp Devens was established in 1917 as a temporary training area for soldiers during World War I. In 1932, the site was named Fort Devens and made a permanent installation with the primary mission of commanding, training, and providing logistical support for non-divisional troop units. Fort Devens was used for a variety of training missions between 1917 and 1990. Pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Fort Devens was placed on the National Priorities List on November 21, 1989, due to environmental contamination at several sites.

Fort Devens was identified for cessation of operations and closure under Public Law 101-510, the Defense Base Realignment and Closure (BRAC) Act of 1990, and officially closed in March 1996. As part of the Devens BRAC program, portions of the property formerly occupied by Devens were retained by the U.S. Army for reserve forces training and renamed the Devens Reserve Forces Training Area (DRFTA). Areas not retained as part of the DRFTA were transferred to new owners, the Massachusetts Development and Finance Agency (MassDevelopment), U.S. Department of Labor, U.S. Department of Justice, and the U.S. Fish and Wildlife Service, for reuse and redevelopment. In 2009, the DRFTA was renamed the U.S. Army Garrison Fort Devens.

2.1 Physical Characteristics

Devens lies within the Nashua River basin. The Nashua River flows north through the former North, Main, and South Posts (Figures 2-1 and 2-2). The Nashua River forms the western installation boundary on the former Main Post. Other notable surface water features include: Grove Pond located north of the Grove Pond wellfield, Plow Shop Pond located west of Grove Pond, Nonacoicus Brook flowing from Plow Shop Pond to the Nashua River, Cold Spring Brook located east of AOCs 57, 74, and 75, an unnamed stream located east of AOC 43G, Robbins Pond located east of AOC 43G, Willow Brook flowing north from Robbins Pond to Nonacoicus Brook, Cold Spring Brook Pond (AOC 40), and Mirror Lake and Little Mirror Lake located between Patton and Shabokin wells. The specific surface water bodies and their relations to specific areas of investigation are discussed in applicable sections.

The geography of Devens is characterized by undulating glacial terrain. The landforms are products of glacial erosion and deposition on a crystalline bedrock terrain. Terrain at Devens falls generally into three types. The least common is bedrock terrain, where rocks that have been resistant to both glacial and fluvial erosion remain as topographic highs, sometimes thinly veneered by glacial deposits. A more common terrain at Devens consists of tills deposited by glaciers. These landforms often conform to the shape of the underlying bedrock surface. They range from areas of comparatively low topographic relief to elongated hills (drumlins) [Harding Lawson Associates (HLA), 2000].

The most common terrain at Devens was formed by sediment accumulations in glacial-meltwater streams and lakes (glaciofluvial and glaciolacustrine deposits). Other prominent glacial meltwater features are kame and kettle topography present on the former Main Post near Mirror Lake and Little Mirror Lake located between the Patton and Shabokin wells.

2.2 Geology

The major glacial units consist of till, deltaic deposits from former glacial Lake Nashua, and deposits from glacial meltwater streams (Figure 2-3). Glacial till at Devens consists of unstratified gravel to silt and typically contains boulders. The till at the site is typically approximately 10 feet thick but is up to 60 feet

thick in the cores of drumlins. The glacial lake deposits consist chiefly of sand and gravelly sand. Lake bottom deposits consist of sand, silt, and clay. Post-glacial deposits consist of river terrace sands and gravels, fine alluvial sands and silts, as well as peat and silt and sands in swampy areas. Generalized surficial geology by AOC is described below and is based on the *2018 Surficial Materials Map of the Ayer Quadrangle, Massachusetts* (Stone and Stone) that in turn, was based on geologic units mapped by Richard Jahns in 1953 (Jahns, 1953).

- AOC 32/43A - coarse terrace deposits, chiefly kame terraces, coarse sand and pebble to boulder gravel, with bedrock outcrops and till over shallow bedrock to the east and west, and kame deposits farther to the east, and muck and peat in the wetland to the east.
- MacPherson – river terraces and floodplain silt and sand, terraces due in part to erosion.
- Shepley's Hill Landfill – primarily coarse sand and pebble to boulder gravel kame-plain or ice-contact deposits, with some swamp deposits chiefly muck and peat, some thin deposits of sand and gravel, some sand and pebble to cobble gravel in terrace and delta-outwash plain deposits, some small chiefly pebble to boulder gravel with some fine to coarse sand kame deposits and near Nonacoicus Brook some kame deposits of shore and near-shore deposits of glacial Lake Nashua.
- AOC 76 – artificial fill and a mix of thins deposits of sand and gravel, sand and pebble to cobble gravel kame deposits, sand and pebble to cobble gravel terrace and delta-outwash plain deposits, and river terraces and floodplain silt and sand to the north.

Bedrock beneath the portion of Devens covered under this PSCS has been mapped as part of the *Preliminary Bedrock Geologic Map of the Ayer Quadrangle, Massachusetts* (Kopera, 2006). Bedrock chiefly consists of low-grade metasedimentary rocks, gneisses, and granites. The principal bedrock units are described below and illustrated on Figure 2-4.

- The Oakdale Formation underlies AOC 76 and the MacPherson well. The formation is described by Kopera as thinly laminated, light tan micaceous quartz-muscovite-ankerite siltstone and quartzite interbedded with thin, dark greenish-grey, chlorite-muscovite-quartz- ankerite phyllite. At biotite and actinolite grade, consists of fine grained reddish and greenish siltstone granofels.
- The Devens Gneiss Complex underlies AOC 32/43A and SHL and is believed to be of Silurian age. The unit is described by Kopera as light to medium grey, buff to pink weathering, coarse-grained quartz-potassium-spar (k-spar) biotite granite-gneiss, with subordinate tonalitic and dioritic gneiss near Harvard Center. Biotite content varies locally as much as approximately 15 percent. Sheared to a medium to dark grey fine- to medium-grained S/C mylonite with k-spar porphyroclasts near the Clinton-Newbury fault zone. Intruded by the Ayer Granite.

Other bedrock units beneath or in the general vicinity of Devens and depicted on Figure 2-4 include:

- The Ayer Granite of Silurian age and described by Kopera as light to dark grey, buff weathering, coarse-grained, porphyritic quartz-k-spar biotite granite with distinctive k-spar megacrysts up to 8 centimeters in diameter. Locally foliated, sheared and altered to an augen gneiss and talc-bearing schist near the Clinton-Newbury fault zone. A non-porphyritic phase has been mapped separately northwest of Harvard center.
- The Chelmsford Granite of Devonian age and described by Kopera as white to buff weathering, light grey medium- to coarse-grained feldspar-quartzbiotite granite. Biotite occurs in isolated rusty weathering clots. Commonly contains screens and xenoliths of presumed Berwick formation. Distinctive quartz veins, up to 2 centimeters in width and several meters in length, are common. Locally foliated and/or sheared near the Clinton-Newbury fault zone. Also includes a medium grey, buff weathering, fine- to medium-grained quartz-feldspar-muscovite-biotite granite-gneiss, and a

well-foliated light grey k-spar-quartz-muscovite granite-gneiss near the Clinton-Newbury fault. Intrudes the Ayer granite and Devens gneiss complex.

- The Berwick Formation of Silurian age and described by Kopera as thinly to massively bedded, light green-grey, fine-grained metamorphosed calcareous siltstone, quartzite, and quartzo-feldspathic granofels. Also contains a fine-grained, massively bedded muscovite-quartz-biotite quartzite and schist containing distinctive 1-millimeter knots of biotite.
- The Tadmuck Brook Schist is possibly of late Proterozoic or early Paleozoic age. The formation is described by Kopera as rusty weathering, sulfidic, quartz-muscovite-biotite with or without sillimanite, andalusite, or staurolite, schist. Metamorphic grade increases from west to east across strike.

The bedrock elevation contours were mapped using data gathered as part of the PFAS RI, previous investigations at Devens, well drilling records available through the Massachusetts Energy & Environmental Affairs Data Portal (eeaonline.eea.state.ma.us), and Massachusetts Geological Survey (Figure 2-5, Table 2-1). There is significant relief in bedrock elevations across Devens and the surrounding area. The area shown has bedrock elevations ranging from -49 feet (ft) North America Vertical Datum 1988 (NAVD88) to 408 ft NAVD88.

2.3 Regional Hydrogeology

The Nashua River is the eventual discharge locus for surface water and groundwater flow at Devens. The tributaries of the Nashua River at Devens are Nonacoicus Brook and Walker Brook on the former North Post; Cold Spring Brook (which is a tributary of the Nonacoicus Brook through Grove Pond and Plow Shop Pond) on the former Main Post (Figure 2-2). There is also a lesser stream, Willow Brook that discharges to Nonacoicus Brook to the north. Willow Brook originates from Robbins Pond and is fed by Robbins Pond, surface water runoff, storm water discharge, and groundwater. On the west side of the Nashua River there are also a number of tributaries west of Devens, specifically Catacoonamug Brook, Trout Brook, Morse Brook, Walker Brook, and Mulpus Brook. The groundwater flow direction at each AOC is addressed in applicable sections.

Glacial meltwater deposits constitute the primary overburden aquifer at Devens. Groundwater also occurs in the underlying bedrock; however, flow is limited because regional bedrock lacks primary porosity and/or has been affected by metamorphism that limits transmissivity (an example would be the degree of development of transmissive partings parallel to layering). The result is bedrock groundwater flow that is primarily via fractures and dissolution voids.

The zones of highest transmissivity within the overburden are found in areas of thick glacial meltwater (outwash) deposits on the former Main Post at Devens, and these encompass deposits in which the Shabokin, Patton, MacPherson, and Grove Pond water supply wells are screened (Figure 2-6). Due to the high transmissivity of these overburden deposits, these areas are preferential groundwater flow areas. The zones of lowest transmissivity are typically associated with exposed till and bedrock.

Groundwater recharge occurs in upland areas and groundwater flows generally from the topographic highs to topographic lows. Groundwater discharges in wetlands, ponds, streams, and directly into the Nashua River.

The Devens Groundwater Use and Value is categorized as “High” as determined by MassDEP (MassDEP, 2003) and the MassDEP groundwater classification of GW-1 is applied throughout Devens. The MassDEP approved water supply Zone II’s, as well as the potentially productive aquifer areas, and the Devens Aquifer Protection and Watershed Protection Districts are shown on Figure 2-6.

The synoptic water level measurements taken for the PFAS RI in the areas addressed in this report are presented in Tables 2-2, 2-3, 2-4, and 2-6. The groundwater elevation contour maps based on those measurements are on Figures 2-7, 2-8, 2-9, 2-10, 2-12, and 2-13. A synoptic event was performed at SHL

in October 2019 (Table 2-5, Figure 2-11) in support of the long-term monitoring (LTM) program and is provided in this report for reference. The contour intervals vary between figures based on the level of scale and area of interest. The groundwater flow directions and gradients are discussed in the applicable sections.

3.0 AOC 32/43A PRELIMINARY SITE CHARACTERIZATION SUMMARY

3.1 Site Description

The AOC 32/43A and surrounding areas have been redeveloped and currently consist of large warehouse type buildings (constructed in 2001 and 2007) and paved areas. The area is generally flat with the land sloping down to a wetland north of the Devens Recycling Center.

The area is zoned Rail, Industrial & Trade Related. There are no wells in the area that are used for drinking water supply, irrigation water supply, or any other water supply purposes. A permit is required from Devens Enterprise Commission for installation of any water supply well.

3.2 Facility History and Utilities

AOC 32 (former DRMO Yard) historically consisted of three fenced areas (West Yard, East Yard, and Tire Recycling Area) along Cook Street (Figure 3-1). The West Yard, a paved area formerly used for the storage of used equipment containing lead-acid batteries, as well as for storage of telecommunications and administrative equipment; the former East Yard, a paved area that was used for disassembling vehicles for reusable parts; and the Tire Recycling Area, an unpaved area used for the storage and recycling of tires. Records indicated that the facility was actively used by the Army from approximately 1964 to 1995 (KGS, 2017). In addition, a former waste oil underground storage tank site, located just northeast of the former DRMO Office, was also incorporated into AOC 32.

South of AOC 32 is a series of underground storage tanks (UST), aboveground storage tanks (AST), and gasoline pump stations, that was name AOC 43A (former POL Storage Area). During the 1940s and 1950s, AOC 43A, was a fenced lot that served as a distribution facility for all the gasoline stations at Fort Devens. The distribution facility formerly consisted of a main gasoline station, a pump house (former building T-401) with five fuel USTs and four fuel ASTs, railroad tracks, an asphalt driveway led into the POL Storage Area from Antietam Street (Figure 3-1) [Stone & Webster Environmental Technology and Services (S&W), 1998].

The land where historic AOC 32/43A source areas are located was redeveloped to include paved areas and a large warehouse constructed in 2001 (Nobis, 2005). The current owner, O'Reilly Auto, purchased the property in 2013. The land where DRMO West Yard was located is owned by JPR Trust (purchased in 2000). The land east of AOC 32/43A was divided and the northern parcel sold to Devens Recycling Center, LLC (purchased in 2006) and the southern parcel is currently owned by National Ind Portfolio Borrower, LLC (purchased in 2007). The National Ind Portfolio Borrower, LLC property is undeveloped. The Devens Recycling Center was constructed by 2007. The Devens Recycling Center had a large fire at the facility in May 2015. Sixty 5-gallon pails of aqueous film forming foam (AFFF) were used to extinguish the fire (KGS, 2017). The facility is a construction and demolition debris processing center.

The current and previous subsurface features are shown on Figures 3-2 and 3-3. The current stormwater system around the Devens Recycling Center discharges storm water to detention areas south and southwest of the center and an infiltration gallery southeast of the center.

3.3 Remedial Status

Prior to the PFAS investigation, investigations, remediation, and post-remediation monitoring has occurred at AOCs 32 and 43A, under the CERCLA program, to address issues related to the USTs and ASTs identified at the sites described above. A brief summary of those activities is presented below.

At AOC 32, in 1991, a SI was performed at the DRMO Yard. Two operable units were included, a soils operable unit, that included the excavation and off-site disposal of soil and a groundwater operable unit associated with a waste-oil UST. Excavated soils were removed from the East Yard and the former Tire Recycling Yard (KGS, 2017). Analytical findings of the SI reported xylene and petroleum contamination in soil and groundwater.

In 1994, a RI was conducted and concluded that soil and groundwater contamination at the site required further remedial action [Ecology and Environment, Inc. (E&E), 1994]. Potential remedial alternatives were presented in a feasibility study (FS) and the preferred alternative was presented in a proposed plan. The record of decision (ROD) documented the final choice of remedy for cleanup of soils by excavation with off-site disposal and cleanup of groundwater by monitored natural attenuation (MNA) (Horne, 1998). Remedial actions for the soil included the removal and disposal of metal debris; the removal and disposal of soil contaminated with petroleum, pesticides, and lead; and the removal and disposal of non-hazardous soil containing shredded tire scrap (S&W, 2000a).

In 1999, MNA field activities commenced at AOC 32 and a final assessment and recommendations report concerning the effectiveness of the MNA based on ROD criteria was presented in February 2000. The report determined that natural attenuation, supplemented with long-term groundwater monitoring and the establishment of institutional controls, would be an effective remedial action for AOC 32 (S&W, 2000c). Monitoring of the groundwater at the site has continued and the results reported on an annual basis.

At AOC 43A, between 1965 and 1972, four fuel oil ASTs were removed. In 1989 and 1990, five fuel oil USTs were located, and the adjacent soils were excavated and removed from the site, respectively. Five USTs and 800 cubic feet of contaminated soil was removed from the site. Total petroleum hydrocarbons were detected in soil collected during the excavation (E&E, 1994). This remedial action removed the source from AOC 43A.

In 1991, five new USTs were installed in the POL Storage Area and were used to store fuel for military vehicles. In 1992, the Army conducted a SI and reported low levels of xylene and elevated petroleum in subsurface soils. In 1994 a RI was conducted to determine the nature and distribution of the detected contamination. Findings of the RI concluded that groundwater contamination required a remedial action evaluation (S&W, 2000b). Potential remedial alternatives were presented in a FS and the preferred alternative was presented in a proposed plan. The 1998 ROD documented the final remedy choice of institutional controls and MNA long-term monitoring (Horne, 1998).

Per the ROD, long-term monitoring has continued at AOC 32/43A.

3.4 PFAS Field Investigation

The RI field investigation at AOC 32/43A included sampling existing monitoring wells, collecting a surface water and sediment sample from the detention pond north of the Devens Recycling Center, groundwater vertical profiling using direct push technology (DPT), soil borings using DPT, piezometer installation, and synoptic water level events. The work was completed in general accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). Field activities were added as the data was received and reviewed. Sampling locations are presented on Figure 3-4 and summarized in Table 3-1. The results are discussed in Section 3.5.

3.4.1 Existing Wells

Groundwater samples were collected from existing monitoring wells at AOC 32/43A from November 2018 to January 2019 in accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b) (Table 3-1, Figure 3-4). A sample could not be collected from 32Z-01-11-XBR. The well was dry in the 2018/2019 Winter and in the 2019 Spring.

Groundwater samples were collected from one existing monitoring well (32M-01-14XBR) at AOC 32 in November 2019 and May 2020 in accordance with the *Work Plan for Additional Sampling of Existing Wells to Support the PFAS Remedial Investigation Former Fort Devens Army Installation, Devens, MA* (KGS, 2019). The groundwater results are discussed in Section 3.5.

3.4.2 Surface Water and Sediment

A surface water and sediment sample was collected from the detention pond north of the Devens Recycling Center in December 2018, in accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). The results are discussed in Section 3.5.

3.4.3 DPT Vertical Profiles

Two phases of DPT vertical profiles were conducted at AOC 32/43A. As results were received and reviewed, additional profiles were conducted to better delineate the PFAS contamination. The DPT vertical profiles are described below, are shown on Figure 3-4 and are summarized in Table 3-1.

AOC 32

The first round of vertical profiles at AOC 32 (32VP-19-01 through -08) was conducted from February into June 2019 downgradient of the area of historic AOC 32 contamination (Table 3-1, Figure 3-4).

Review of the initial vertical profile results and the existing monitoring well results at AOC 32 indicated that the highest concentrations in the area were north of the Devens Recycling Center at 32VP-19-01. Based on these results, a second set of vertical profiles (32VP-19-09 through -12) was completed. Two vertical profiles were conducted downgradient of 32VP-19-01 (32VP-19-09 and -10), one vertical profile was conducted northeast of the paved area where water and AFFF foam from extinguishing the fire may have runoff the pavement (32VP-19-11), and one vertical profile was conducted downgradient of the infiltration gallery that is a component of the storm water management system that collects storm water on the east side of the Devens Recycling Center (32VP-19-12). These four vertical profiles were conducted in September 2019. The results are discussed in Section 3.5.1.

AOC 43A

Four vertical profiles at AOC 43A (43AVP-19-01 through -04) were conducted in March to May 2019 downgradient of existing AOC 43A monitoring wells (Table 3-1, Figure 3-4). Based on review of the vertical profile results [maximum perfluorooctanoic acid (PFOA) + perfluorooctanesulfonic acid (PFOS) of 30.0 nanograms per liter (ng/L)] and existing monitoring well results (maximum PFOA + PFOS of 34.0 ng/L at 43M-01-17XBR) from AOC 43A and existing AOC 32 monitoring wells near AOC 43A, additional vertical profiles were not conducted at AOC 43A. The results are discussed in Section 3.5.1.

3.4.4 DPT Soil Borings

A total of 11 soil borings (32SB-19-01 through -11) were conducted at AOC 32 in October 2019. The locations of the soil borings were determined after review of the groundwater results from the existing wells and the vertical profiles (Figure 3-1). At 32SB-19-04, refusal occurred at a maximum depth of three feet below ground surface (bgs) during three attempts within the area cleared of subsurface utilities. Soil samples were not collected from this location. The soil borings activities were conducted accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). The results are summarized in Section 3.5.

3.4.5 Piezometer Installation

Two piezometers (32PZ-19-01 and -02) were installed in September and October 2019.

3.4.6 Synoptic Water Level Surveys

Two synoptic water level monitoring events that encompassed AOC 32/43A were conducted. One event was conducted in December 2018 and one was conducted in April 2020. All of the results are discussed in Section 3.5.

3.5 PFAS Nature and Extent

Groundwater PFAS results are summarized on Figure 3-5 and in cross section (Figures 3-6 through 3-8). Soil sampling results are summarized on Figure 3-9. Surface water and sediment sampling results are summarized on Figure 3-10. Site-specific groundwater contour figures are presented on Figures 2-7, 2-8, 2-12, 2-13, and 3-5. All of the PFAS results from the RI are presented in tables in Appendix H. The media specific criteria are presented in Table 1-1.

3.5.1 Groundwater

Groundwater at AOC 32 was characterized through existing monitoring wells and vertical profiles. At AOC 32, vertical profile samples were collected from 12 locations. A total of 87 vertical profile samples were collected from AOC 32. Table 3-2 provides summary statistics of the results of the vertical profile samples. Of those samples, 12 samples (14%) of the samples had concentrations greater than the EPA LHA and 57 samples (66%) had concentrations greater than the Massachusetts Contingency Plan (MCP) Method 1 Groundwater (GW-1) standard. Table 3-3 provides summary statistics of the results of the monitoring well samples in the AOC 32 area, which includes a few wells installed for SHL, specifically SHL-12, SHL-17, SHL-25, and SHM-93-24A. Of the 25 monitoring well samples collected, 7 samples (28%) had concentrations greater than the EPA LHA and 23 samples (92%) had concentrations greater than the GW-1. None of the concentrations were greater than the GW-3 standard (protective of surface water). The wells at AOC 32 are located in overburden and shallow bedrock.

The summary statistics table provides data with respect to individual compounds (e.g., number of samples with PFOA that exceed the EPA LHA and the GW-1 standard) and with respect to the sum of applicable compounds in the EPA LHA and the GW-1 standard (e.g., numbers of samples with the sum of PFOA+PFOS that exceed the EPA LHA, and number of samples with the sum PFOA+PFOS+ perfluorohexanesulfonic acid (PFHxS) + perfluorononanoic acid (PFNA) + perfluoroheptanoic acid (PFHpA)+perfluorodecanoic acid (PFDA) that exceed the GW-1 standard]. Due to the summing of concentrations needed for comparison to the EPA LHA and the GW-1 standard, the numbers of samples that exceed the EPA LHA or GW-1 standard for individual compounds may not equal the numbers of samples that exceed the sum of the appropriate compounds for the EPA LHA or GW-1 standard. One example is, if individual results of PFOA and PFOS were both below the EPA LHA, but the sum of the results exceeded the EPA LHA, then the sample would be counted as an exceedance of the EPA LHA even though the individual compounds would not be counted as exceedances.

At AOC 32, as indicated on Figure 3-5, PFAS was detected at concentrations greater than the EPA LHA at the tire recycling yard (32Z-01-07XOB), within and downgradient of the approximate historic extent of petroleum contamination (32M-01-14XBR and SHL-12), north of the Devens Recycling Center (32VP-19-01, -09, and -10), and downgradient of the infiltration gallery associated with the storm water collection system around the Devens Recycling Center (32VP-19-12 and -05). All of the locations had at least one groundwater sample that had PFAS concentrations greater than the GW-1 standard, except 32M-01-16XBR and SHL-17.

The maximum PFAS concentrations were detected off the north edge of the pavement from the Devens Recycling Center at 32VP-19-01, in the shallowest sample interval (17-21 ft bgs). The detected concentrations of PFOA + PFOS was 2,880 ng/L and the sum of the six GW-1 compounds was 4,300 ng/L. At 32VP-19-01, PFAS concentrations greater than the EPA LHA were detected from 17 to 41 ft bgs (24 ft thick) and concentrations above the GW-1 standard were detected from 17 to 51 ft bgs (34 ft thick). Downgradient (i.e., north/northeast) of 32VP-19-01 at 32VP-19-02, the maximum concentrations were detected at 32-36 ft bgs with lesser concentrations detected throughout the saturated overburden. PFAS concentrations greater than the GW-1 standard were detected at 32VP-19-02 from 12 to 70.5 ft bgs (except at 22-26 ft bgs). Downgradient of 32VP-19-01 at 32VP-19-09, and -10, PFAS concentrations greater than the EPA LHA and GW-1 standard were detected in the shallowest sample interval as well as deeper in the aquifer, but not continuously throughout the thickness of the saturated overburden. At 32VP-19-09 PFAS

concentrations greater than the EPA LHA were detected from 12 to 16 ft bgs and 49 to 73 ft bgs and PFAS concentrations greater than the GW-1 standard were detected from 12 to 16 ft bgs, 29 to 33, and 49 to 73 ft bgs. At 32VP-19-10, PFAS concentrations greater than the EPA LHA were detected from 9 to 13 ft bgs and from 79 to 83 ft bgs and PFAS concentrations greater than the GW-1 standard were detected from 9 to 23 ft bgs, 79 to 83 ft bgs, and 99 to 103 ft bgs.

The second highest PFAS concentrations were detected downgradient of the infiltration gallery at 32VP-19-12 with PFOA + PFOS = 449 ng/L and the sum of the six GW-1 compounds was 534 ng/L, in the shallowest sample interval (22 to 26 ft bgs). At 32VP-19-12, the PFAS concentrations greater than the EPA LHA were only detected from 22 to 26 ft bgs and PFAS concentrations greater than GW-1 standard were limited to the shallower portion of the aquifer (22 to 83 ft bgs at 32VP-19-12). Downgradient of 32VP-19-12 and 32VP-19-10, a transect of vertical profiles was conducted (32VP-19-04 through 07). PFAS concentrations were detected greater than the EPA LHA only at 32VP-19-05. At 32VP-19-05, the maximum concentration and the only sample interval with concentrations greater than the EPA LHA was detected in the shallowest sample interval (PFOA + PFOS = 108 ng/L, sum of the six GW-1 compounds = 154 ng/L, 22 to 26 ft bgs) with concentrations greater than the GW-1 standard detected down to 96 ft bgs. Additionally, PFAS concentrations were detected above the GW-1 standard at 32VP-19-04, -06 and -07, with the maximum concentrations at these three profiles detected at 32VP-19-04 (sum of the six GW-1 compounds = 75.4 ng/L, 27-31 ft bgs).

Groundwater at AOC 43A was characterized through existing monitoring wells and vertical profiles. During the RI, vertical profile samples were collected from four locations at AOC 43 A. Table 3-4 provides summary statistics of the results of the vertical profile samples. A total of 20 vertical profile samples were collected from AOC 43A. Of those samples, none of the samples had concentrations greater than the EPA lifetime health advisory (LHA) and 18 of 20 samples (90%) had concentrations greater than the Massachusetts Contingency Plan (MCP) Method 1 Groundwater (GW-1) standard. Table 3-5 provides summary statistics of the results of the monitoring well samples. Of the six monitoring well samples collected, none of the samples had concentrations greater than the EPA LHA and 5 samples (83%) had concentrations greater than the GW-1. None of the concentrations were greater than the GW-3 standard (protective of surface water). The wells at AOC 43A are located in overburden and shallow bedrock.

At AOC 43A, all of the groundwater samples collected from the vertical profiles and the existing monitoring wells were below the EPA LHA. The maximum concentration of PFOA + PFOS was 34.0 ng/L (43M-01-17XBR). All of the locations had at least one groundwater sample that had PFAS concentrations greater than the GW-1 standard, except 43M-01-20XBR. The maximum concentration of the sum of the six GW-1 PFAS compounds was 60.4 ng/L (43AVP-19-03, 27-31 ft bgs). Five to six samples intervals were collected at each of the vertical profile with all but two of the samples having PFAS concentrations greater than the GW-1 standard, indicating most of the thickness of the saturated overburden has concentrations greater than the GW-1 standard. Groundwater flows west from the former AOC 43A USTs and ASTs.

3.5.2 Soil

At AOC 32, 11 soil borings were advanced to a maximum depth of 25 feet bgs. At one boring (32SB-19-04) refusal occurred at 3 ft bgs and samples were not collected. Five locations had one or more sample intervals with detections of PFAS compounds greater than the MCP Method 1 S-1 Soil Category (S-1)/GW-1 standard. At 32SB-19-02, -03, -08, -09, and -10 PFAS compounds were not detected at concentrations greater than the S-1/GW-1 standards. Only PFOS and PFHxS were detected at concentrations above the S-1/GW-1 standards (Figure 3-9, Appendix H). Location 32SB-19-01 had the largest number of samples (three samples) with concentrations above the S-1/GW-1 standards and also had the highest concentrations of PFOS [6.30 micrograms per kilogram (µg/kg)]. The maximum concentration of PFHxS was detected at 32SB-19-06 (0.450 µg/kg).

3.5.3 Surface Water and Sediment

One surface water sample and one sediment sample were collected at AOC 32 (DP-18-01). The detections in surface water and sediment were below the EPA site-specific screening levels (SSSL) for PFAS at former Fort Devens (Table 1-1). The sampling location and data are summarized on Figure 3-10 and the data are presented in Appendix H.

The PFOA concentration in the surface water was 1.10 estimated result (J) ng/L and the PFOS and PFBS were non-detect. In the sediment sample, the PFOA, PFOS, and PFBS were non-detect.

4.0 AOC 76/MACPHERSON WELL PRELIMINARY SITE CHARACTERIZATION SUMMARY

During the RI field investigation, it became evident that the PFAS groundwater contamination at AOC 76 was related to the groundwater contamination detected at the MacPherson water supply well. For this PSCS, the AOC 76 and the MacPherson field activities and results will be discussed as part of a single site, specifically as part of AOC 76.

4.1 Site Description

AOC 76 (Devens Fire Station) is located at 182 Jackson Road at the intersection of Jackson Road and Barnum Road (Figure 4-1). The area is generally flat with the land sloping down toward the storm water retention pond located to the northeast of the Devens Fire Station building and east of the parking lot the land slopes down to Willow Brook, which is located east of the fire station.

Most of the area is zoned open space/recreation with some areas to the west zoned as Innovation & Technology Center, and some adjacent areas to the east zoned Gateway I Jackson and Residential II. It is not anticipated that the land use will change in the future. MassDevelopment operates the MacPherson water supply well (Figure 2-6) as part of the Devens municipal water supply. The MacPherson well is screened from 75 to 93 ft bgs. The well is operated at 350 gallons per minute. There are no other wells in the area that are used for drinking water supply, irrigation water supply, or any other water supply purposes. A permit is required from Devens Enterprise Commission for installation of any water supply well.

4.2 Facility History and Utilities

AOC 76 and the MacPherson water supply well were not identified as sites to be addressed under the CERCLA program prior to the PFAS investigations; therefore, there are no previous investigations or remedial activities associated with these sites.

AOC 76

The initial environmental investigation at the Devens Fire Station, designated as study area (SA) 76 at the time, was the PFAS Preliminary Assessment (KGS, 2017). The fire station at Jackson Road began operation in the 1940s by the Army for Fort Devens. No records have been found to document the potential storage/uses by the Army in this area before 1996 (KGS, 2017). The fire station was transitioned to MassDevelopment following base closure in 1996. The identified firefighting foam storage/use at the fire station post-dates the 1996 base closure (i.e., non-Army operations), although the Devens Deputy Fire Chief recalled that a dumpster fire at the fire station in the early 1990s was extinguished using foam. The Deputy Fire Chief indicated that since 1996, the Devens Fire Department has conducted some training in the paved area behind the fire station where fire-fighting foams were discharged to the ground. During training events, firefighting foams were sprayed over the paved area behind (southeast of) the fire station (KGS, 2017).

The Fire Chief has indicated that the Devens Fire Department currently stores small quantities of AFFF at the Jackson Road fire station. Engine #3 has a 30-gallon holding tank of AFFF; Engine #5 carries four 5-gallon pails; and 22 5-gallon pails are stored at the warehouse on Cook Street. When needed, the AFFF is connected to a truck sprayer and mixed with water at the point of use. There is no mixed foam stored on the truck or at the Devens Fire Station. The AFFF used since 1996 is "Universal Gold" manufactured by National Foam. The "Universal Gold" material safety data sheet indicates that the product contains a proprietary "fluoroalkyl surfactant" (KGS, 2017).

MacPherson Water Supply Well

MassDevelopment first sampled the MacPherson water supply well for PFAS in July 2016. MassDevelopment continued to sample the well on a quarterly basis until February 2018, when the well was taken out of service after MassDEP had informed MassDevelopment that MassDEP is considering

adopting recommendations addressing five PFAS chemicals (PFOS, PFOA, PFNA, PFHxS, and PFHpA) at a sum of 70 ng/L.

In August 2019, MassDevelopment installed a granular activated carbon treatment system at the MacPherson well to remove PFAS from the water and the well was brought back into service in August 2019. MassDevelopment is currently planning on installing a permanent PFAS removal system at the MacPherson well.

The current and previous subsurface features are shown on Figures 4-2 through 4-5.

4.3 PFAS Field Investigation

The RI field investigation at AOC 76 and MacPherson well area included collecting surface water and sediment samples in Willow Brook, groundwater vertical profiling using DPT, soil borings using DPT, installation of piezometers, and synoptic water level measurements. The work was completed in general accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). Field activities were revised and added as the data was received and reviewed. Sampling locations are presented on Figures 4-6 and 4-7 and summarized in Table 4-1. The results are discussed in Section 4.5.

4.3.1 Existing Wells

Groundwater samples were collected from existing monitoring wells at the MacPherson well area, including wells at AOC 69W and wells at the Town of Ayer sludge landfill from December 2018 to January 2019 in accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b) (Table 4-1 and Figures 4-6 and 4-7) with the following exceptions. Well 69WP-08-01 was not sampled initially because the well was frozen. Based on review of the vertical profiling conducted east and west of the well, a sample from 69WP-08-01 was not necessary for the PFAS RI at the time. A sample could not be collected from MPP-93-01 because the well could not be located. A monitoring well was found southeast of MacPherson water supply well (McPh-Sentinel) that was also sampled in April 2019. The well was installed to act as a sentry well for the MacPherson water supply well from potential groundwater contamination from 211 West Main Street.

Groundwater samples were collected from two existing monitoring wells (ZWM-95-17X and ZWM-95-15X) at AOC 69W in October 2019 and May 2020 in accordance with the *Work Plan for Additional Sampling of Existing Wells to Support the PFAS Remedial Investigation Former Fort Devens Army Installation, Devens, MA* (KGS, 2019c). The groundwater results are discussed in Section 4.4.

4.3.2 Surface Water and Sediment

Surface water and sediment samples were collected in Willow Brook in December 2018. The work was completed in general accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). Surface water and sediment samples were also collected in Nonacoicus Brook, which is adjacent to the MacPherson well area. These samples are addressed in Section 5.0. Surface water and sediment samples were also collected in the Nashua River, which is adjacent to the MacPherson well area. These samples will be addressed in the Area 3 PSCS.

4.3.3 DPT Vertical Profiles

Numerous phases of DPT vertical profiles were conducted at AOC 76 and the MacPherson well area. As results were received and reviewed, planned vertical profiles locations were moved, and additional profiles were conducted to better delineate the PFAS contamination. The DPT vertical profiles are described below, are shown on Figures 4-6 and 4-7 and are summarized in Table 4-1.

The AOC 76 vertical profiles in the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b) were positioned in locations that were thought to be within the source area as well as cross-gradient, upgradient, and downgradient of the suspected

source area to assess the nature and extent of PFAS in groundwater in this area. The first vertical profiles conducted included 76VP-19-03, -05, -10, -12, -14, and -18, which were conducted in January and February 2019 as planned in the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). Based on the results from those locations and the results from sampling existing monitoring wells at AOC 69W (ZWP-95-01X and ZWM-95-17X), the extent of PFAS contamination in groundwater at AOC 76 was more extensive than previously conceptualized. Particularly, PFAS contamination was detected farther east (76VP-19-12) and farther north (76VP-19-18, ZWP-95-01X, and ZWM-95-17X) than previously conceptualized. Based on the initial results, four vertical profiles were moved (76VP-19-07, -13, -16, and -19), eight additional vertical profiles were conducted (76VP-19-20 through -27), and the piezometer network from the Area 2 FSP was revised. The moved vertical profiles and the additional vertical profiles were conducted in areas that were cross-gradient and downgradient of the initial PFAS detections observed. The piezometer network was also broadened cross-gradient and downgradient of the initial PFAS detections observed. The vertical profiles were conducted in March through May 2019.

Based on review of results, a third set of vertical profiles were conducted at AOC 76. Specifically, based on review of vertical profile results at 76VP-19-07, -21, -22, and -27, which all had PFAS concentrations greater than the EPA LHA, three additional vertical profiles were conducted (76VP-19-28, -32, and -33) crossgradient to the west. Also based on review of vertical profile results from 76VP-19-13 and -20, which had concentrations greater than the EPA LHA, three additional vertical profiles were conducted (76VP-19-29, 30, and -31) crossgradient to the east and upgradient to the south. Additional piezometers were also installed at some of the new locations.

At the MacPherson well area, the groundwater vertical profiling was conducted along a perimeter transect that encircles the MacPherson water supply well to delineate the vertical and lateral extent of PFAS in groundwater in the immediate vicinity of the well. Due to difficulties caused by terrain and wetlands, location MPVP-19-06 was moved toward the MacPherson well and location MPVP-19-05 was deleted.

4.3.4 Soil Borings

The AOC 76 soil borings identified in the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b) (76SB-19-01 through -15) were drilled in June 2019. The data are discussed in Section 4.4.2.

4.3.5 Monitoring Wells and Piezometers

A series of piezometers (76PZ-19-01 through -19) were installed between February and June 2019. A series of three piezometers (MPPZ-19-01 through -03) were installed between April and June 2019.

4.3.6 Synoptic Water Level Event

An AOC 76 synoptic water level event was conducted on May 16, 2019.

An AOC 76/43G/MacPherson area synoptic water level event was conducted on June 28, 2019.

4.3.7 Town of Ayer Waste Water Treatment Plant Outflow

A grab sample was collected from the outflow from the Town of Ayer Waste-Water Treatment Plant and analyzed for PFAS.

4.4 Nature and Extent

Groundwater results are summarized on Figures 4-8 through 4-9 and in cross-section (Figures 4-10 through 4-14). Soil sampling results are summarized on Figure 4-15. Surface water and sediment sampling results are summarized on Figure 3-10. Site-specific groundwater contours are presented on Figures 2-9, 2-10, and Figure 4-8. All of the results are presented in tables in Appendix H. The media specific criteria are presented in (Table 1-1).

The results of the grab sample collected from the outflow from the Town of Ayer Waste-Water Treatment Plant are presented in Appendix H. The sum of PFOA + PFOS = 19.2 ng/L and 32.8 ng/L for the sum of the six GW-1 compounds.

4.4.1 Groundwater

Groundwater at AOC 76 was characterized through nine groundwater samples collected during the SI (BERS-Weston, 2018a), and during the RI via DPT vertical profiles and samples from existing monitoring wells. During the RI, vertical profile samples were collected from 40 locations. During the RI, a total of 260 vertical profile samples were collected. Table 4-2 provides summary statistics of the results of the vertical profile samples. Of those samples, 133 samples (51%) had concentrations greater than the EPA LHA and 244 samples (94%) had concentrations greater than the GW-1 standard. Table 4-3 provides summary statistics of the results of the monitoring well samples. Of the 15 monitoring well samples collected from December 2018 to May 2020, two samples (13%) had concentrations greater than the EPA LHA and 12 samples (8%) had concentrations greater than the GW-1 standard (Table 4-3). None of the concentrations were greater than the GW-3 standard (protective of surface water).

The maximum concentrations were detected at FH-17-09 (collected during the SI and therefore the sample was not analyzed for PFDA) at the water table (PFOA + PFOS = 4,160 ng/L and the sum of PFOA, PFOS, PFHpA, PFHxS, and PFNA = 5,090 ng/L). Location FH-17-09 is located in the storm water detention basin northeast of the fire station. The second highest concentrations were detected at adjacent location 76VP-19-08, also collected at the water table (7-11 ft bgs) (PFOA + PFOS = 2,750 ng/L and 2,960 ng/L for the sum of the six GW-1 compounds). The highest concentrations were detected in the shallowest and second shallowest sample interval at 76VP-19-08, at nearby 7VP-19-04, and at 76VP-19-07 (farther west) with a significant decrease in PFAS concentrations in deeper intervals, but PFAS concentrations remain greater the GW-1 standard. This pattern is not observed in vertical profiles downgradient (northeast) and in general, crossgradient to the east (southeast) of 76VP-19-08 where the PFAS concentrations are more consistent throughout the saturated overburden and are present at concentrations greater than the GW-1 standard. The pattern of PFAS concentrations observed at vertical profile 76VP-19-13, is different with the highest PFAS concentrations in the deepest sample intervals, with significantly lower PFAS concentrations shallower in the aquifer and with two intervals with PFAS concentrations less than the GW-1 standard.

Groundwater flows from the area of the fire station to the north, parallel to Willow Brook and Jackson Road (Figure 2-10). Downgradient of the fire station, PFAS concentrations generally decrease but the full saturated thickness of the overburden continues to have PFAS concentrations greater than the GW-1 standard. As groundwater approaches the MacPherson water supply well, the higher concentrations were generally observed in the middle of the saturated overburden with lower concentrations observed shallower and deeper in the aquifer. This pattern was observed in vertical profiles close to the MacPherson water supply well, specifically MPVP-19-02, -06, and -07.

Lower PFAS concentrations (below the EPA LHA) were detected upgradient of the fire station at 76VP-19-01 and -02, crossgradient of the high concentrations to the west at 76VP-19-32, -33, and -28, and crossgradient of the high concentrations to the east at 76VP-19-29, 76VP-19-31, 76VP-19-24, -26, and MPVP-19-04.

All of the locations had at least one groundwater sample that had PFAS concentrations greater than the GW-1 standard, except three monitoring wells at the Town of Ayer sludge landfill, specifically AYRMW001, -MW003, and -MW-004. The vertical profile conducted at the Town of Ayer sludge landfill had PFAS concentrations greater than the GW-1 standard in three intervals (the deepest sample interval and the shallowest two sample intervals) with a maximum concentration of 385 ng/L.

At most locations, the PFOS concentrations were higher than the PFOA concentrations. A few locations southeast of the fire station parking lot (i.e., 76VP-19-06, -14, -15, FH-17-01, -02, 03, -04) had some samples with PFOA concentrations higher than PFOS concentrations. The samples from near the Town of

Ayer sludge landfill were almost evenly split between higher concentrations of PFOA or PFOS. The location with the highest concentrations at the Town of Ayer sludge landfill had higher PFOA than PFOS concentrations (MPVP-19-08, Figure 4-14).

4.4.2 Soil

At AOC 76, nine soil borings were conducted during the SI (BERS-Weston, 2018a) and 15 borings were conducted during the RI. The SI soil samples were composite samples collected at 0 to 5 ft bgs. The RI soil samples were collected from 0-1 ft bgs, 3-7 ft bgs, and from the 2-foot interval above the water table. Nine soil samples were collected during the SI (BERS-Weston, 2018a) and 41 soil samples were collected during the RI. Table 4-4 provides summary statistics of the results of the SI and RI samples. The SI samples were not analyzed for PFDA. Of the SI samples,

- 2 samples (22%) had PFHpA concentrations greater than the S-1/GW-1,
- 3 samples (33%) had PFHxS concentrations greater than the S-1/GW-1,
- 4 samples (44%) had PFNA concentrations greater than the S-1/GW-1,
- 3 samples (33%) had PFOS concentrations greater than the S-1/GW-1, and
- 3 samples (33%) had PFOA concentrations greater than the S-1/GW-1.

Of the 41 RI samples collected,

- 14 samples (34%) had PFDA concentrations greater than the S-1/GW-1,
- 2 samples (5%) had PFHpA concentrations greater than the S-1/GW-1,
- 11 samples (27%) had PFHxS concentrations greater than the S-1/GW-1,
- 11 samples (27%) had PFNA concentrations greater than the S-1/GW-1,
- 16 samples (39%) had PFOS concentrations greater than the S-1/GW-1, and
- 6 samples (15%) had PFOA concentrations greater than the S-1/GW-1.

The maximum concentrations of the six PFAS compounds in the S-1/GW-1 standards detected in AOC 76 area are:

- PFDA = 3.40 µg/kg at 76SB-19-06
- PFHpA = 1.50 µg/kg at 76SB-19-13
- PFHxS = 26.0 µg/kg at 76SB-19-13
- PFNA = 10.0 µg/kg at FH-17-01
- PFOS = 130 µg/kg at 76SB-19-05
- PFOA = 5.30 µg/kg at FH-17-01

Soil boring 76SB-19-05 was collected in the general area where a dumpster fire was reported to have been extinguished using AFFF. The other locations with high concentrations and with a greater prevalence of exceedances of the S-1/GW-1, are located in the eastern part of the site. These data suggest that the largest amount of PFAS in the soil are related to these two areas.

4.4.3 Surface Water and Sediment

Six surface water and sediment samples were collected along Willow Brook. All of the detections in surface water and sediment in Willow Brook were below the EPA SSSLs for PFAS at former Fort Devens (Table 1-1). The sampling locations and data are summarized on Figure 3-10 and the data are presented in Appendix H.

The PFOA concentrations in the surface water ranged from 13.0 ng/L to 25.0 ng/L (the maximum concentration was detected at WB-18-05), the PFOS concentrations ranged from 23.0 ng/L to 72.0 ng/L (the maximum concentration was detected at WB-18-05), and the PFBS concentrations ranged from 2.30 ng/L to 4.60 ng/L (field duplicate) (the maximum concentration was detected at WB-18-05). The highest

concentrations were detected at WB-18-05 suggesting that area is receiving groundwater with the higher concentrations as compared to adjacent areas.

In the sediment samples, PFOA concentration ranged from non-detect to 0.430J µg/kg (the maximum concentration was detected at WB-18-06), PFOS concentrations ranged from 0.420J µg/kg to 7.90 µg/kg (the maximum was detected at WB-18-06), and PFBS was non-detect.

5.0 AOC 5 SHELPLEY'S HILL LANDFILL PRELIMINARY SITE CHARACTERIZATION SUMMARY

5.1 Site Description

Shepley's Hill Landfill is bordered to the east by Plow Shop Pond and land formerly containing a railroad roundhouse, to the west by Shepley's Hill, to the south by recent commercial development and AOC 32, and to the north by wooded and residential areas (Figure 5-1). Nonacoicus Brook, which drains Plow Shop Pond to the Nashua River, is located north of the landfill, and is identified as the northern boundary of what is called the North Impact Area (NIA) (i.e., the area downgradient of the landfill with groundwater that is believed to have been impacted by the presence of SHL).

Most of the area is zoned open space/recreation with the southern extent zoned Rail, Industrial & Trade Related. North of the landfill there are some residential and commercial properties. It is not anticipated that the land use will change in the future. There are currently no wells in the SHL area that are used for drinking water supply, irrigation water supply, or any other water supply purposes. A permit is required from Devens Enterprise Commission for installation of any water supply well within Devens.

Besides Shepley's Hill , the area is generally flat. There is a gentle slope from SHL to north toward Nonacoicus Brook and the land east of the landfill slopes down to Plow Shop Pond.

5.2 Site History and Utilities

The Army began landfill operations in the 1940s, although test pit evidence indicates that earlier use as a landfill was highly probable (ANL, 1992). The landfill was in a former wetlands area and formerly operated as an open burning site (ANL, 1992). Landfill operations ceased as of July 1, 1992. The principal waste types in SHL include incinerator ash, household refuse, glass, construction debris, asbestos-containing materials, and spent shell casings. Army documentation indicates that no hazardous wastes were disposed of in SHL after November 19, 1980.

The current and previous subsurface features are shown on Figures 5-2 and 5-3.

5.3 Remedial Status

There is an extensive investigative, remediation, and monitoring history at SHL. A brief orientation to SHL is provided below with greater detail available in referenced documents. The SHL is comprised of three AOCs. The 1995 ROD for SHL addresses AOC 4 which is the former sanitary landfill incinerator, located near the end of Cook Street; AOC 5 which is the sanitary landfill No. 1; and AOC 18 which contains the asbestos disposal cell. AOCs 4 and 18 are located within the capped area of SHL and all three AOCs are collectively referred to as SHL (USAEC, 1995) and in this document reference to AOC 5 includes AOCs 4 and 18.

The MassDEP approved the closure plan in 1985 and the Army capped the landfill in accordance with Massachusetts Regulations 310 CMR 19.000. The landfill was closed in five phases between 1986 and 1993 and was capped with a 30 to 40-mil polyvinyl chloride membrane and overlying soil cover. In 2006, the Army commenced operation of a groundwater extraction and treatment system to address arsenic contamination in groundwater emanating from the landfill toward the NIA. Two extraction wells and the treatment plant were constructed at the north (downgradient) end of the landfill. It was later determined that the landfill cap and groundwater extraction system did not eliminate groundwater flow and arsenic migration from SHL into Red Cove at Plow Shop Pond. In 2012, the Army installed a low permeable groundwater barrier wall through the overburden to the bedrock surface to mitigate landfill contaminant migration to Red Cove (Sovereign, 2013).

Per the ROD, operation and maintenance of the treatment plan, the landfill cap, and LTM activities have continued at SHL.

5.4 PFAS Field Investigation

The SHL field investigation included sampling of a subset of existing monitoring wells and collection of surface water and sediment samples. Synoptic water level measurements were conducted as part of LTM activities. The work was completed in general accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). Field activities were added as the data was received and reviewed. Vertical profiling was not conducted at SHL due to the large number of existing wells at the site. Sampling locations are presented on Figure 5-4 and summarized in Table 5-1. The results are discussed in Section 5.5.

5.4.1 Existing Wells

Groundwater samples were collected from a subset of the existing monitoring wells at SHL from December 2018 to November 2019 in accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b) (Table 5-1 and Figure 5-4).

Groundwater samples were collected from an additional set of monitoring well locations (i.e., SHM-13-05, SHM-99-32X, SHL-8D, N1-P1, N1-P2, N2-P2, SHL-20, N3-P1, N3-P2, SHL-3, SHM-93-01A, SHM-93-10D, SHM-93-18B) in October 2019.

Groundwater samples were collected from five existing monitoring wells (SHM-96-5B, N7-P2, N2-P1, SHL-12, SHP-99-33B) in October and November 2019 and May 2020 in accordance with the *Work Plan for Additional Sampling of Existing Wells to Support the PFAS Remedial Investigation Former Fort Devens Army Installation, Devens, MA* (KGS, 2019c). The groundwater results are discussed in Section 3.5.

5.4.2 Surface Water and Sediment

Surface water and sediment samples were collected in Plow Shop Pond and Nonacoicus Brook in December 2018. The work was completed in general accordance with the *Area 2 Field Sampling Plan Addendum to Remedial Investigation Work Plan for Per- and Polyfluoroalkyl Substances (PFAS)* (KGS, 2018b). These samples are addressed in Section 5.0.

5.4.3 Shepley's Hill Landfill Treatment Plant

A grab sample was collected from the outflow of the Shepley's Hill Landfill Treatment Plant in January 2019 and analyzed for PFAS.

5.5 NATURE AND EXTENT

Groundwater results are presented on Figure 5-5 and in cross section (Figures 5-6 through 5-9). For this discussion, results of samples collected from monitoring wells that are located in areas presumed to be related to AOC 32, specifically SHL-12, -17, -24, -25, and SHM-93-24A are discussed in Section 3.5. Surface water and sediment sampling results are summarized on Figure 3-9. Site-specific groundwater contours are presented on Figure 2-11 and Figure 5-5. All of the results are presented in Appendix H. The discussions below are focused on results with respect to the media specific criteria (Table 1-1).

The results of the grab sample collected from the Shepley's Hill Landfill Treatment Plant are presented in Appendix H. The sum of PFOA + PFOS = 23.0 ng/L and 46.7 ng/L for the sum of the six GW-1 compounds.

Groundwater in the overburden and bedrock at SHL was characterized through groundwater samples collected from existing monitoring wells and the extraction wells during the SI (BERS-Weston, 2018b) and from existing monitoring wells during the RI. During the RI, samples were collected from 65 monitoring wells. Table 5-2 provides summary statistics of the results of the monitoring well samples. Of those samples, 22 samples (34%) had concentrations greater than the EPA LHA and 49 samples (75%) had concentrations greater than the GW-1 standard. Table 5-2 provides summary statistics of the results of the monitoring well samples in SHL, except a few wells installed for SHL that are located within the AOC 32

area, specifically SHL-12, SHL-17, SHL-25, and SHM-93-24A. None of the concentrations were greater than the GW-3 standard (protective of surface water).

5.5.1 Groundwater in Overburden

In the overburden, most locations with PFAS concentrations greater than the EPA LHA are located east, northeast, and north of the landfill, except for one well in the upgradient portion of SHL (N7-P2). The highest PFAS concentrations were detected at N7-P2 (PFOA + PFOS = 170 ng/L and the sum of the six GW-1 compounds = 275 ng/L). The well screen at N7-P2 is located shallow in the aquifer (224.18 to 219.18 ft NAVD88). Northeast of N7-P2, PFAS was detected greater than the EPA LHA at SHM-93-18B (120 ng/L) at an elevation at the bottom of the saturated overburden (156.71 to 146.71 ft NAVD88).

Most of the other locations with PFAS concentrations greater than the EPA LHA are located northeast and north of the landfill. The maximum PFOA + PFOS concentrations in this area was 127 ng/L (N2-P1).

The locations northeast of the SHL with concentrations greater than the EPA LHA are at locations lower in elevation than N7-P2, specifically SHM-11-06 (208.33 to 198.33 ft NAVD88), SHL-20 (195.72 to 185.72 ft NAVD88), N1-P2 (187.88 to 182.78 ft NAVD88), SHP-05-43 (207.88 to 197.88 ft NAVD88), and N2-P2 (185.55 to 180.55 ft NAVD88).

Farther downgradient at the locations near the SHL extraction wellfield, locations with concentrations greater than the EPA LHA are at well screens that are lower in elevation, specifically at SHM-10-06 (160.53 to 150.53 ft NAVD88), SHP-05-46B (161.03 to 151.03 ft NAVD88), EPA-PZ-2012-3B (150.55 to 145.55 ft NAVD88), SHM-96-5B (137.38 to 127.38 ft NAVD88), and EPA-PZ-2012-2B (146.60 to 141.60 ft NAVD88).

The farthest downgradient locations with concentrations greater than the EPA LHA are at locations deep in the overburden, specifically at SHP-99-3B (146.66 to 141.66 NAVD88) and SHM-10-16 (141.72 to 131.72 ft NAVD88). The ten most downgradient wells that were sampled all had concentrations less than the EPA LHA.

Most of the samples had concentrations greater than the GW-1 standard (75%). The locations with PFAS concentrations less than the GW-1 standard are located along the east, northeast and north of SHL. The higher concentrations with respect to the GW-1 standard (greater than 150 ng/L for the sum of the six GW-1 compounds) are collocated with the PFAS concentrations that are greater than the EPA LHA.

5.5.2 Groundwater in Bedrock

Seven wells installed in bedrock at SHL were sampled for PFAS. All of the wells had concentrations less than the EPA LHA. Results from two of the wells (SHP-2016-06B and C) were non-detect for the sum of the six GW-1 compounds and collocated well (SHP-2016-06A) had PFAS concentrations less the GW-1 standard. The other five wells (N7-P1, N6-P1, N2-P1, N3-P1, SHM-93-10D) had concentrations greater the GW-1 standard.

5.5.3 Surface Water and Sediment

Six locations were sampled in Plow Shop Pond and seven locations were sampled in Nonacoicus Brook. All of the detections in surface water and sediment in Nonacoicus Brook and Plow Shop Pond were below the EPA SSSLs for PFAS at former Fort Devens (Table 1-1). The sampling locations and data are summarized on Figure 3-10 and the data are presented in Appendix H.

In Plow Shop Pond, the PFOA concentrations in the surface water ranged from 3.90 ng/L to 9.80 ng/L (the maximum concentration was detected at PS-18-03), the PFOS concentrations ranged from 3.70 ng/L to 9.80 ng/L (the maximum concentration was detected at PS-18-06), and the PFBS concentrations ranged from 0.610J ng/L to 1.30J ng/L (the maximum concentration was detected at PS-18-03).

In Plow Shop Pond, PFOA concentrations in sediment were non-detect, PFOS concentrations ranged from non-detect to 1.70 µg/kg (the maximum was detected at PS-18-02), and PFBS was non-detect.

In Nonacoicus Brook, the PFOA concentrations in the surface water ranged from 6.40 ng/L to 12.0 ng/L (the maximum concentration was detected at NB-18-05), the PFOS concentrations ranged from 3.00J ng/L to 17.0 ng/L (the maximum concentration was detected at NB-18-05), and the PFBS concentrations ranged from 1.20J ng/L to 3.20 ng/L (the maximum concentration was detected at (NB-18-07).

In Nonacoicus Brook, PFOA concentrations in sediment ranged from non-detect to 0.930 µg/kg (the maximum concentration was detected at (NB-18-05), PFOS concentrations ranged from non-detect to 6.40 µg/kg (the maximum was detected at NB-18-05), and PFBS was not detected.

6.0 DEVENS CAR WASH WELL

A grab sample was collected from the Devens Car Wash Well (A2-IG1) in September 2019 and analyzed for PFAS. The sample was collected from the outflow of the pump in the well. The well is shown on Figure 4-6 and summarized in Table 6-1. The only information on the well construction that is available via https://eeaonline.eea.state.ma.us (the well owner was not able to provide more detailed well construction information) is that the well is 420 feet deep, the depth to bedrock recorded in the drilling record is 20 ft, and there are 40 ft of casing. The results are presented in Appendix H. The sum of PFOA + PFOS = 12.6 ng/L and 28.7 ng/L for the sum of the six GW-1 compounds.

Legend

- Soil Boring Location
- Former Storage Tank(s)
- Former Building
- T-247 — Former Building Number
- TPHC Soil Contamination
- Approximate Historical Extent of Groundwater Contamination in Exceedance of Cleanup Goals (based on April 2002 to October 2008 analytical data) (2008 Annual Report, HGL, 2009)

Notes:

Criteria = S-1/GW-1,Massachusetts Contingency Plan, 2019 Proposed PFAS Revisions

PFAS	Limits (µg/kg)
Perfluorodecanoic acid (PFDA)	0.300
Perfluoroheptanoic acid (PFHpA)	0.500
Perfluorohexanesulfonic acid (PFHxS)	0.300
Perfluorononanoic acid (PFNA)	0.320
Perfluorooctanesulfonic acid (PFOS)	2.00
Perfluorooctanoic acid (PFOA)	0.720

2.00 = detection of PFAS

2.00 = detection of PFAS above criteria

Data reported to three significant figures

µg/kg = micrograms per kilogram
U = non-detect
J = estimated result

AST = Above ground storage tank
UST = Underground storage Tank
DRMO = Defense Reutilization and Marketing Office
TPHC = Total petroleum hydrocarbons

Notes:
EPA LHA (Lifetime Health Advisory) = sum of PFOA and PFOS
EPA LHA Exceedance Criteria is defined as equal to or greater than 70 ng/L

MassDEP GW-1 = sum of PFOS + PFOA + PFDA + PFHpA + PFHxS + PFNA
MassDEP Exceedance Criteria is defined as equal to or greater than 20 ng/L

SI GW results were not analyzed for PFDA.

Figure 5-6

KGS

File: PFAS_RI_A2_PSCS_F5-6_SHL_XSLoc.mxd

Legend

Vertical Profile

1.39 U
EPA LHA Concentration (sum of PFOA and PFOS)

2.59 U
MassDEP Concentration (sum of PFOS + PFOA + PFDA + PFHpA + PFHxS + PFNA)

Monitoring Well

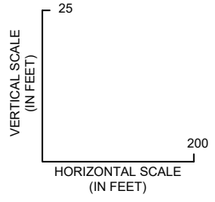

Screened Interval

- Sand with Gravel/Sand
- Sand with Silt/Silty Sand
- Silt
- Silt, Sand, Gravel, with Clay
- Till
- Weathered Bedrock
- Bedrock
- Unknown
- Water Table

Notes:

All results in ng/L
ng/L = nanograms per liter
ND = non-detect
NS = no sample
( ) = field duplicate

Perfluorooctanesulfonic acid (PFOS)
Perfluorooctanoic acid (PFOA)
Perfluorodecanoic acid (PFDA)
Perfluoroheptanoic acid (PFHpA)
Perfluorohexanesulfonic acid (PFHxS)
Perfluorononanoic acid (PFNA)

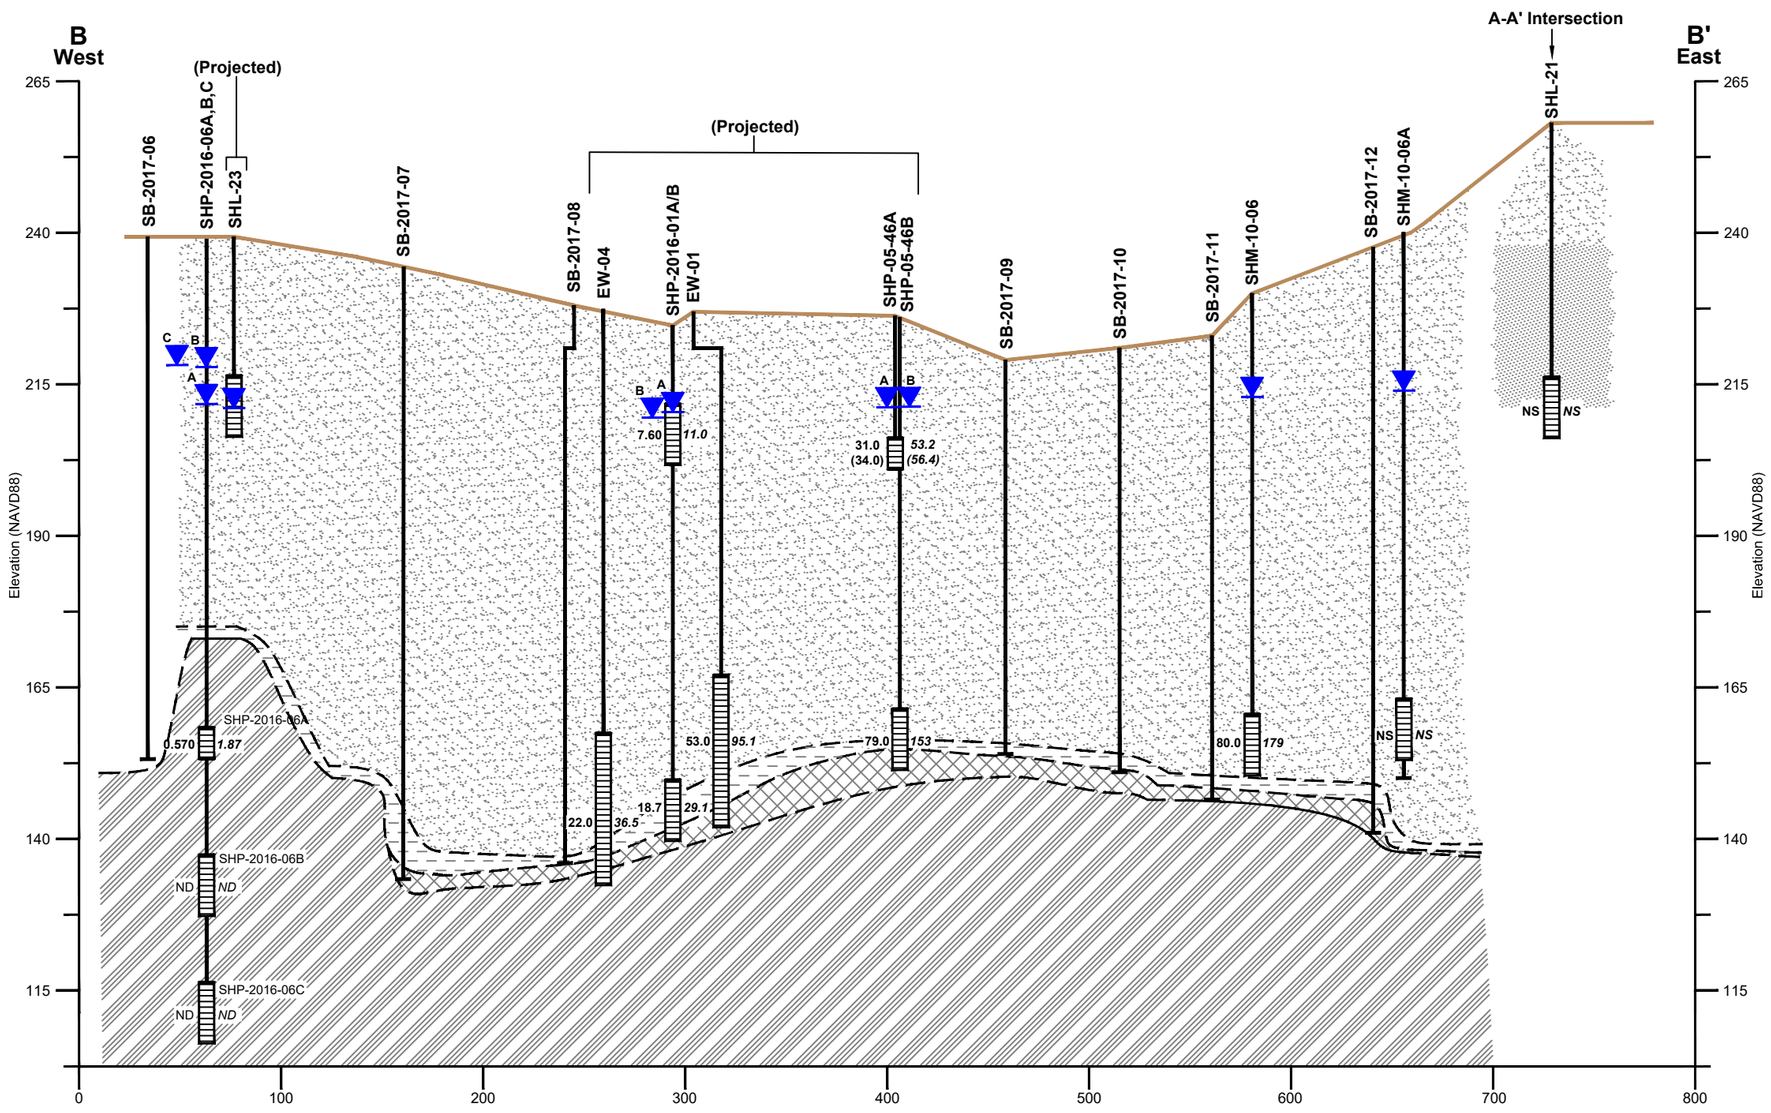

Shepley's Landfill Cross Section, A-A'
Devens PFAS RI - Area 2 PSCS

Former Fort Devens Army Installation and Sudbury Annex
Devens, Massachusetts

Legend

- Monitoring Well/Vertical Profiling Location
- Water Supply Well
- Former Fort Devens Boundary

EPA LHA
(sum of PFOA and PFOS) (ng/L)

- EPA LHA ≥ 70 ng/L
- EPA LHA < 70 ng/L
- EPA LHA No detection

MassDEP
(sum of PFOS + PFOA + PFDA + PFHpA + PFHxS + PFNA) (ng/L)

- MassDEP ≥ 20 ng/L
- MassDEP < 20ng/L
- MassDEP no detection

Notes:

MassDEP GW-1 = sum of PFOS + PFOA + PFDA + PFHpA + PFHxS + PFNA
MassDEP Exceedance Criteria is defined as equal to or greater than 20 ng/L

EPA LHA (Lifetime Health Advisory) = sum of PFOA and PFOS
EPA LHA Exceedance Criteria is defined as equal to or greater than 70 ng/L

ORSG = Office of Standards and Guidelines
PFBS = Perfluorobutanesulfonic Acid
PFDA = Perfluorodecanoic Acid
PFHpA = Perfluoroheptanoic Acid
PFHxS = Perfluorohexanesulfonic Acid
PFNA = Perfluorononanoic Acid
PFOS = Perfluorooctanesulfonic Acid
PFOA = Perfluorooctanoic Acid
ng/L = nanograms per liter
µg/L = micrograms per liter
mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram

Data if from the Draft 2019 Annual Operations, Minatenance, and Monitoring Report Shepley's Hill Landfill. Bedrock wells were not used to contour groundwater elevations. The average of water elevations was used at well clusters to contour groundwater elevations.

MPE = Measuring Point Elevation

NA = not applicable

NAVD88 = North America Vertical Datum 1988

Blue highlighlighting indicates the monitoring well was sampled for the PFAS RI.

[a] Initially the well was frozen and based on surrounding vertical profile data it was determined the sample from the monitoring well was unnecessary.

[b] Not able to locate well

[c] Location was not drilled

BGS = below ground surface

ft = feet

NA = not applicable

UKN = unknown

NAD83 = North American Datum 1983

NAVD88 = North American Vertical Datum 1988

Low Flow/ Low Stress Groundwater Sampling Log

Well Identification: ZWM-95-17X **AOC Name:** 69W

Project: Spring 2020 Supplemental Event
Location: Fort Devens, Massachusetts

Date: 5/18/20
Sampler: MM

Well Integrity

	Yes	No	N/A
Casing Secure	✓		
Concrete Pad intact	✓		
PVC casing intact	✓		
Well gripper present	✓		✓
Bolts present			✓
Locked (stickup wells)		added lock	

Well Information

Diameter	4"
Material	PVC
Depth to water (ft BTOR)	13.21
Depth to bottom (ft BTOR)	16.74
Pump Set Depth (ft BTOR)	~~16~~ 16'
Screen Interval (ft BTOR)	12.2-24.7
Total volume purged (gal)	3.0

Sampling Type

Purging Method: Peristaltic
Purge start/stop time: 725/805
Tubing type: HDPE
Tubing diameter: 1/4"
Dedicated pump (Y/N): Tubing
Air source: N/A

Field Instrument (Model/S/N): YSI 556 MPS 05619418
Formate 2 Flow 5088-3014

Stabilization Parameters

Low Flow/ Low Stress Groundwater Sampling Log

Well Identification: SHM-05-41B

Project: Devens Shepley's Hill Landfill - Fall 2018 Date: 11/16/18

Location: Fort Devens Massachusetts Sampler: S. GEORGES

Well Integrity

	Yes	No	N/A
Casing Secure	✓		
Concrete Pad intact	✓		
PVC casing intact	✓		
Well gripper present	✓		
Bolts present	✓		
Locked (stickup wells)			✓

Well Information

Diameter	2"
Material	PVC
Depth to water (ft BTOR)	8.15'
Depth to bottom (ft BTOR)	66.23'
Screen Interval (ft BTOR)	
Total volume purged (gal)	

Sampling Type

Purging Method GEOPUMP Tubing type _____ Dedicated pump (Y/N) N

Purge start/stop time 1035 / 1150 Tubing diameter _____ Air source N/A

Field Instrument (Model/S/N) YSI 556 / 06J1595AF / HACH 2100Q / 16120C054715

Stabilization Parameters

Time (hhmm)	Flow Rate (ml/min)	Depth to Water (ft)	Temp (°C)	pH (STD)	SPC (µS/cm^c)	DO (mg/L)	ORP (mv)	Turbidity (NTU)	Color/Clarity

Notes:

[1] = Groundwater Elevations used to construct 2017 SHL Annual Report Figures 5-2 and 5-3, unless rejected or **bolded**

[2] = wells listed in LTMMP Table 1 as located in NIA but verified to be in Nearfield Area

[3] = screen interval approximated based boring log depth and DTB (no well construction log)

R = rejected gauging measurement

TOR = top of riser (referenced measuring point)

ft bPVC = feet below top of PVC riser

ft bTOR = feet below top of riser

Destroyed wells removed from program (2017): N4-P1, N4-P2, N4-P3, and SHP-99-34A

All coordinates are on the Massachusetts State Plane Coordinate System of NAD 1983 and vertically on NAVD

Control Point S127-S is referenced benchmark per 2017 Survey Report Rev 3 (November 2017)

S = shallow overburden

M = mid overburden

D = deep overburden

O = overburden

T = till

B = bedrock

SW = surface water

"--" = no data

Indicates well clusters

APPENDIX F MONITORING WELL AND PIEZOMETER CONSTRUCTION LOGS

AOC 32

KGS	Project: PFAS RI	Piezometer Identification: 32PZ-19-01
	Project Number: 1082	

PIEZOMETER CONSTRUCTION DIAGRAM

Client: USACE	Location: Located in grass south of Shepley's Landill.
Drilling Company: Technical Drilling Services	
Drilling Method and Equipment: Direct Push	
Drilling Date(s): 9/16/2019-9/19/2019	Well Construction Date: 9/19/2019
Potable Water Used: (Y/N) Source: N	Drums of IDW: N/A
KGS Field Personnel: Kristen Esser (Jacobs)	Associated Vertical Profile: 32VP-19-10
Ground Elevation (ft NAVD88): 235.86	Top of PVC Elevation (ft NAVD88): 238.20
Easting (State Plane NAD83 [FT]): 630756.50	Northing (State Plane NAD83 [FT]): 3025650.80

1. Well Protection Type:	Steel Stickup
Stickup ht.	2.34 ft
2. Concrete Pad Depth:	1 ft
3. Diameter/Type of well casing:	1 inch/PVC schedule 40
4. Type/Screen Slot:	Schedule 40 PVC/0.010 inch
5. Type of Filter Sand:	#1 Silica
Quanity Used:	50-lbs
Top/Bottom of Pack:	5.5-17.5 ft bgs
6. Type of Seal:	Bentonite Chips
6a.Top/Bottom of Seal:	0-5.5 ft bgs
7. Backfill Mixture Used:	Bentonite
7a. Placement Method:	gravity
8. Screen length:	10 feet
9. Screen interval:	7.5-17.5 ft bgs
10. Sump Length:	1-inch
11. Bottom of Boring:	17.5 ft bgs
12. Diameter of borehole:	2.25-inch

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.
ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory.
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.
ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory.
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.
ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory.
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.
ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.
ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

Notes:
Results shown are displayed as parts per trillion (ppt).
bgs = below ground surface.

PFAS in Groundwater at Vertical Profile Locations
MacPherson

Location	Top of Sample (ft bgs)	Bottom of Sample (ft bgs)	Ground Surface Elevation (ft NAVD88)	Midpoint Sample Elevation (ft NAVD88)	Sample Date	Sample Type	EPA LHA	MassDEP GW-1	PFOS	PFOA	PFDA	PFHPA	PFHXS	PFNA	62FTS	82FTS	NETFOSAA	NMEFOSAA	PFBS	PFDOA	PFHXA	PFTEA	PFTRIA	PFUNA

ft = feet.
EPA = U.S. Environmental Protection Agency.
LHA = Lifetime Health Advisory.
MassDEP = Massachusetts Department of Environmental Protection.
MassDEP GW-1 denotes sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).
NAVD88 = North American Vertical Datum 1988.
Result exceeds the EPA LHA (70 ppt) for either PFOA, PFOS, and/or the sum of PFOA+PFOS).
Result exceeds the MassDEP GW-1 (20 ppt) sum of 6 compounds (PFOS, PFOA, PFDA, PFHpA, PFHxS, PFNA).

PFAS Summary Report – Soil, Sediment, and Surface Water
Former Fort Devens, PFAS Remedial Investigation
KOMAN, PFAS RI, Surface Water/Sediment-Area2
Nonacoicus Brook

	Location	NB-18-07
	Field Sample ID	NB-SW-18-07-DEC18
	Sampling Depth	0.00 - 0.00
	Sampling Date	12/11/2018
	SDG	320461241
	Sample Type	Normal
PFAS Isotope Dilution	**Limits (ng/l)**	Results (ng/L)
6:2 Fluorotelomer sulfonate (6:2 FTS)		17.0 U
8:2 Fluorotelomer sulfonate (8:2 FTS)		8.50 U
N-Ethyl perfluorooctanesulfonamidoacetic acid (NEtFOSAA)		8.50 U
N-Methyl perfluorooctanesulfonamidoacetic acid (NMeFOSAA)		8.50 U
Perfluorobutanesulfonic acid (PFBS)	2030000	**3.20**
Perfluorodecanoic acid (PFDA)		0.850 U
Perfluorododecanoic acid (PFDoA)		1.30 U
Perfluoroheptanoic acid (PFHpA)		**2.00**
Perfluorohexanesulfonic acid (PFHxS)		**5.90**
Perfluorohexanoic acid (PFHxA)		**2.90**
Perfluorononanoic acid (PFNA)		1.30 U
Perfluorooctanesulfonic acid (PFOS)	2030	**3.60**
Perfluorooctanoic acid (PFOA)	2030	**6.40**
Perfluorotetradecanoic acid (PFTA)		2.60 U
Perfluorotridecanoic acid (PFTrDA)		2.60 U
Perfluoroundecanoic acid (PFUnA)		1.30 U

Notes:

ng/L = nanograms per liter; ug/kg = micrograms per kilogram; U = not detected; J = estimated

The LOQ value will be used to report non-detects when blank contamination occurs

Bolded results indicate detections of PFAS

Bolded and highlighted results indicate detections of PFAS above criteria

Criteria = EPA Region 1 Memorandum - Surface Water 2/28/2019
