LABORATORY QC RESULTS

1.0 QUALITY CONTROL BLANK RESULTS FOR GROUP 1A, ROUND 1

1.1 INTRODUCTION

This data quality report provides an evaluation of method blanks, rinsate blanks, and field quality control sample data generated for the supplemental RI activities conducted at Fort Devens, Massachusetts. Data were generated by ESE Laboratories from the analyses of soil and water samples collected during the fall of 1992 through the Spring of 1993. Data from Round 2 groundwater sampling are contained in Section 3.0 of this Appendix. All data used in this report came directly off USAEC's IRDMIS system. Samples originated from study area Group 1A.

Quality Control Frequency Tables. Frequency tables were generated for all quality control blanks that were analyzed during the Fort Devens RI. These include trip blanks, rinsate blanks and method blanks. The results are listed by analytical method and were used to identify any target analytes that appeared in the blanks. The frequency tables are provided to give an overview of blank contamination with respect to the number of blanks analyzed and the range of chemical contamination associated with each blank type. Tables H3, H4, and H5 represent the frequency of detected analytes for rinsate, method and trip blanks, respectively. Analytes which are not listed in the frequency tables were not detected at a concentration above the Certified Reporting Limit (CRL). They are listed, however, in Tables H6, H7, and H8.

The frequency tables are arranged by QC type, method blanks, rinsate blanks, and trip blanks. Both method blanks and trip blanks were associated with their corresponding samples and evaluated following USEPA Region I Guidelines for data validation. Sample results that fell within either the 5X or 10X rule for blank contamination are listed in Table H17. No results were eliminated or removed from the data set. The results were tabulated by method, sample ID, site, and lot for use in interpreting the data for the Remedial Investigation.

1.2 METHOD BLANKS

Method blanks were analyzed to determine if compound analytes were introduced during the processing of the field samples. Chemically pure deionized water was

used to collect method blanks at the laboratory. The method blanks were analyzed following the same procedures used to analyze field samples. Any compounds that were detected in the method blanks are attributed to laboratory contamination.

Method blanks were analyzed for the following parameters: inorganics (soil and water), SVOCs (soil and water), VOCs (soil and water), explosives (soil and water), pesticides/PCBs (water only), alkalinity (water only), hardness (water only), TOC (water and soil), TSS (water only) and TPHC (water and soil).

Inorganics. Soil method blanks for inorganics involve the use of USAEC approved soil that is analyzed as an ordinary field sample. The soil that is used is called a Tampa Bay soil. Table H17 lists the metals results above the CRL that were reported for the inorganic method blanks. Aluminum, Barium, Calcium, Chromium, Copper, Iron, Potassium, Magnesium, Manganese, Sodium, Nickel, Lead, Vanadium and Zinc were identified in Group 1A method blanks. Table H17 lists the samples affected by the associated method blanks for these elements based on USEPA validation guidelines.

The only inorganic element detected in the water method blanks was potassium. The presence of potassium in the water method blanks indicates laboratory contamination. The affected samples and results are listed in Table H17.

SVOCs. USAEC methods LM18 and UM18 were used to analyze method blanks in soil and water, respectively. One compound was detected in the soil method blanks for Group 1A, 1,2-Epoxycyclohexane. Bis(2-ethylhexyl)phthalate was reported in a SVOC water method blank (see Table H8 for the associated sample results).

VOCs. USAEC methods LM19 and UM20 were used to analyze soil and water for both method and trip blanks for VOCs. Tetrachloroethene was the only volatile compound detected in either method or trip blanks that affected samples (based on validation guidelines) in Group 1A. The eight affected samples are listed on Table H17.

Explosives. There were no explosive compounds detected above the CRL in any of the Groups 1A method blanks.

Pesticides/PCBs. There were no pesticide or PCB compounds detected in any of the Groups 1A method blanks.

Other Methods. Two alkalinity results and one TDS result were affected by their corresponding method blank results. The three affected samples are listed on Table H17.

1.3 FIELD QUALITY CONTROL

1.3.1 Group 1A Field Quality Control Blanks

The field quality control blanks include both equipment rinsate blanks and source water blanks. The rinsate blanks were collected from deionized, chemically pure water. The results from the field quality control blanks are applied to the entire sampling set and not to individual samples.

Inorganics. Thirty-two rinsate/source water blanks were analyzed for metals. Seven metals were detected with potassium, manganese, and lead occurring at the highest frequencies (see Table H3).

SVOCs. Two SVOC target compounds were detected in the rinsate/source blanks, bis(2-ethylhexyl)phthalate and di-n-octylphthalate. Both compounds were detected at low frequencies (2/20 and 1/20 respectively).

VOCs. Five VOC target compounds were detected in the rinsate/source blanks. Both 1,1,1,-trichloroethane and acetone were observed in only one of the twenty-one blanks analyzed. Methylene chloride and toluene were detected in five of the blanks while chloroform was detected at the highest frequency of sixteen out of twenty-one (Table H3).

Explosives. There were no explosive compounds detected in any rinsate/source blanks.

Pesticides/PCBs. There were no pesticide or PCB compounds detected in any rinsate/source blanks.

Other Methods. Rinsate/source blanks analyzed for the following methodologies: nitrate/nitrite as nitrogen, total phosphates, alkalinity, TPHC, total Kjeldahl nitrogen, TSS and hardness. The frequencies and concentrations of these results are listed in Table H3.

2.0 MATRIX SPIKES AND DUPLICATE QUALITY CONTROL

2.1 INTRODUCTION

Matrix Spikes. Matrix spike and matrix spike duplicate samples were collected at a rate of one each per 20 environmental samples. The purpose of collecting these samples was to measure the effect of the matrix on the recovery of known concentrations of target analytes. A summary of matrix spike data is presented for Group 1A in Table H2. Data have been segregated by method to show recovery trends of particular analytes. Matrix spikes have been paired with the corresponding matrix spike duplicates to make recovery comparisons. The relative percent differences (RPD) between recoveries of the matrix spikes and the matrix spike duplicates have been calculated and are listed. The relative percent difference is used to measure the analytical precision of the results. The average recoveries, and maximum and minimum recoveries for each method are also included as a way of measuring trends.

The criteria used for interpreting MS/MSD data are from the analytical USEPA CLP protocols and Vol. III of the POP for Fort Devens. Interpretations of the matrix spike/matrix spike duplicate (MS/MSD) results for Group 1A samples are contained in Section 2.2 of this Appendix.

Duplicates. Field duplicate samples were collected at the same rate as the MS/MSD samples. Duplicates are differentiated from samples in the identification code. The second digit in the code will have a "D" in place to denote the duplicate.

The purpose of analyzing duplicate samples is to measure the precision of the sampling and analytical results. This is measured by the calculation of the RPD for each sample/duplicate pair. The RPD is the difference of the results divided by the average of the results. The smaller the RPD, the greater the precision. The RPD has been calculated for each pair of duplicates and replicates. They are

presented with the duplicate data for Group 1A in Table H1. Interpretations of the Group 1A duplicate data are presented in Section 2.3 of this Appendix.

USEPA Region 1 guidelines were used to assess the RPDs of duplicate and replicate pairs. The guidelines were used to assess the variability and reproducibility of the results.

2.2 GROUP 1A MATRIX SPIKES

Matrix spike data for Group 1A are presented in Table H2. MS/MSD samples were collected to determine the effect the matrix had on spike recoveries of inorganics, explosives and pesticides/PCBs. USEPA CLP criteria, where applicable, and matrix spike protocols specified in Vol. III of the Fort Devens POP were used to determine whether the matrix affected the recoveries of the various analytes. The RPD was also calculated to measure the precision of the analyses.

Inorganics. Matrix spike analysis included the following elements for Group 1A soil and water samples:

- aluminum
- antimony
- arsenic
- barium
- beryllium
- cadmium
- calcium
- chromium
- cobalt
- copper
- iron
- lead
- magnesium
- manganese
- mercury
- nickel
- potassium
- selenium
- silver
- sodium
- thallium
- vanadium
- zinc

Inorganic recoveries within 25 percent +/- of 100 percent are required in order to meet CLP requirements. The CLP requirements are identical to those specified in the ABB-ES Fort Devens POP, Vol III.

A total of 12 soil samples were collected and spiked with the various inorganic elements. The recoveries were measured to determine if the matrix had an effect on the sample results. The 12 soil samples that were spiked for analysis are:

- BX250201
- BX320903
- DXCR0200
- DXCS0502
- DXCS1002
- DXCS1200
- DXCS1201
- DXSH1003
- DXSH1305
- DXSH1800
- DXSH2003
- SX3204X1

The recoveries of the following elements met CLP requirements for inorganics for all 12 of the above soil samples:

- antimony
- barium
- beryllium
- cadmium
- calcium
- chromium
- cobalt
- copper
- magnesium
- nickel
- potassium
- silver
- sodium
- thallium
- vanadium
- zinc

Elements for which at least one sample either exceeded or fell below the CLP limits are listed below.

ELEMENT	SAMPLE ID	% MS REC.	% MSD REC.	% RPD
Aluminum	BX250201	327	225	37
	BX320903	401	416	4
	DXCR0100	64	59	8
	DXCS0502	127	1	197
	DXCS1002	42	1	191
	DXCS1200	354	87	121
	DXCS1201	1	1	0
	DXSH1305	179	127	34
	DXSH2003	89	41	74
	SX3204X1	382	365	4
Arsenic	BX250201	137	72	62
	BX320603	161	139	15

ELEMENT	SAMPLE ID	% MS REC.	% MSD REC.	% RPD
	BX320903	30	12	83
	DXCS1200	235	75	100
	DXCS1201	146	79	60
	DXSG1993	141	128	9
	DXSH1800	224	135	50
	DXSH2003	146	124	16
	SX3204X1	167	150	11
Iron	BX320903	212	176	19
	DXCS0502	73	60	19
	DXCS1002	78	60	26
	DXCS1200	0.3	0.3	0
	DXCS1201	190	30	145
	SX3204X1	207	198	4
Lead	BX250201	21	21	9
	BX320903	34	21	47
	DXR0200	4	4	0
Manganese	BX320903	130	101	25
	DXCS1201	96	63	41
	SX3204X1	162	159	2
Mercury	DXSH1003	47	40	15
	DXSH1800	70	66	5
Selenium	BX320303	71	65	9
	DXSH1003	130	129	1
	DXSH1800	137	137	0
	DXSH2003	134	135	1

The recoveries for the selected elements are varied. Some of the recoveries exceed the CLP limit for both the MS and MSD. Others exceed the limit for only one of the samples. These results may be due to the non-uniform distribution of elements in the soil matrix. Other recoveries were consistently below the CLP recovery limits for both the MS and MSD. For these samples, there may have been sorption of some of the metals. The RPD between MS and MSD was greater than 50% in only 10 of 37 sample pairs.

Two water samples (WX2606X1 and WX3201X1) were spiked with the same elements as the soil samples to assess matrix effect. Both water samples had recoveries that fell within CLP recovery limits for all elements. No matrix effect was noted for the water samples.

Explosives. USAEC methods LW12 and UW32 were used to analyze recovery of spiked explosive compounds in soil and water, respectively. There are no USEPA CLP Region 1 guidelines for explosive compounds. The guidelines that were used are specified in Vol. III of the Fort Devens POP, and are listed below.

COMPOUND	WATER $\bar{X}$%	SOIL $\bar{X}$%
2,4-Dinitrotoluene	82	87
Nitrobenzene	86	94
Cyclonite	85	94
1,3,5-Trinitrobenzene	85	96
2,4,6-Trinitrotoluene	85	97

The above recoveries represent the current daily means for the respective explosive compounds. The matrix spike recovery criteria for explosives is 25% $\pm$ of the above values for the appropriate matrix.

Four pairs of MS/MSD soil samples were spiked with explosive compounds. (BX250201, DXCS1200, DXCS1201 and SX2501X1). All four soil samples had recoveries within the specified limits for all of the above compounds. Nitroglycerine (NG) and pentaerythritol tetranitrate (PETN) spike results were also included in the explosive method. Although no spike criteria exists for NG and PETN, the recoveries of spikes for these compounds were within 10% $\pm$ of 100% for all four pairs of samples.

Four pairs of MS/MSD water samples were spiked with explosive compounds (MX2508X1, MX2604X1, MXMW06X2 and WX2606X1). The same USEPA criteria used to assess the soil samples was applied to the water samples. The samples MX2508X1, MXMW06X2 and WX2606X1 had recoveries within 25% of the current daily means for 1,3,5-Trinitrobenzene, 2,4,6-Trinitrotoluene, 2,4-Dinitrotoluene, nitrobenzene and cyclonite.

2,4-Dinitrotoluene and cyclonite recoveries exceeded criteria for both the MS and MSD for sample MX2604X1. The recoveries for 2,4-Dinitrotoluene were 136% and 131%. The cyclonite recoveries were both 50%. The RPDs were 3% for 2,4-Dinitrotoluene and 0% for cyclonite.

Pesticides/PCBs. The primary assessment of matrix effects for pesticides and PCBs were based upon the recovery of the surrogate decachlorobiphenyl (Fort Devens POP, Vol. III). In addition, other pesticide/PCB compounds were spiked into soil and water samples. Refer to Tables H14 and H15 for the list of these compounds. Spike recoveries of these compounds are listed in Table H2.

USAEC methods LH10 and LH16 were used for the analysis of pesticides and PCBs, respectively. The surrogate decachlorobiphenyl was spiked into the samples and the recovery measured to assess matrix effects and extraction efficiencies. The USEPA advisory limits for the recovery of this surrogate are 60% to 150%. Six soil samples were spiked with surrogate. The samples (BX250201, BX320903, CX3208X1, DX3201X1, DXCS1200 and SX3204X1) were analyzed by both the pesticide and PCB soil methods. More than one pair of MS/MSD samples were analyzed for all of the above samples. Refer to Table H2 to see how many were run for each.

The recoveries for most analyses were within the specified 60% to 150% recovery range (Table H2). Samples BX320903 and CX3208X1 exceeded criteria for both the LH10 and LH16 methods. Refer to Table H2 to see these exceedances.

Four water samples (WX2604X1, MX3202X1, WX2606X1 and WX3201X1) were spiked with decachlorobiphenyl. USAEC methods UH13 and UH02 were used for analysis of pesticides and PCBs, respectively. USEPA criteria was employed to evaluate the recoveries of the surrogate. The recoveries for sample runs are listed in Table H2.

The decachlorobiphenyl recoveries for PCBs, method UH02, are also listed in Table H2.

2.3 GROUP 1A DUPLICATES

Water and soil samples were collected for duplicate analysis. Table H1 summarizes these results by analytical method. The table includes duplicate as well as replicate results. The following methodologies were used to assess the variability and reproducibility of the results:

- Inorganics
- SVOCs
- VOCs
- Explosives
- Alkalinity
- Hardness
- TDS
- TOC
- TSS

Refer to Table H9 for a description of the soil and water methods used in the analyses.

Inorganics. Soil and water samples from Group 1A were analyzed for the following elements:

ELEMENT	USAEC METHOD
Mercury	SB01
Selenium	JD15, SD21
Lead	JD17, SD20
Arsenic	JD19, SD22
Thallium	JD24, SD09
Antimony	JD25, SD28
Silver	JS16, SS10
Aluminum	
Barium	
Beryllium	
Calcium	
Cadmium	
Cobalt	
Chromium	

(continued)

ELEMENT	USAEC METHOD
Copper	
Iron	
Magnesium	
Manganese	
Mercury	
Nickel	
Potassium	
Sodium	
Vanadium	
Zinc	

A total of six soil samples and their duplicates (DXCR0100, DXCS0102, DXCS0903, DXSH0303, DXSH2104, and DXSH2503) were analyzed using inorganic soil methods.

The USEPA Region I criteria for the RPD of inorganic duplicates for soil methods is 50 percent. The RPDs of sample/duplicate pairs exceeded this limit for the elements listed below.

ELEMENT	FREQUENCY OF USEPA CRITERIA EXCEEDANCE	RANGE OF RPDS (%)
Aluminum	3/6	15 to 71
Arsenic	3/6	13 to 74
Barium	1/6	9 to 77
Beryllium	3/6	0 to 173
Calcium	2/6	0 to 80
Chromium	4/8	23 to 90
Cobalt	3/6	0 to 108
Copper	4/6	17 to 175
Iron	1/6	8 to 58

(continued)

ELEMENT	FREQUENCY OF USEPA CRITERIA EXCEEDANCE	RANGE OF RPDS (%)
Lead	2/6	21 to 76
Magnesium	1/6	16 to 56
Manganese	2/6	3 to 59
Mercury	2/6	0 to 157
Nickel	2/6	0 to 157
Potassium	3/6	0 to 165
Selenium	2/6	0 to 162
Silver	1/6	0 to 168
Vanadium	1/6	0 to 66
Zinc	3/6	0 to 131

Cadmium, sodium, and thallium were not detected above their respective CRL values in any of the sample duplicate pairs.

The high RPD values for many of the duplicates as well as the relatively high frequency at which they occurred indicates that there was some degree of variability in the reported concentrations of elements in the soil samples. Variability of reported concentrations may be due to non-uniform distribution of the elements in the samples or variability in the analysis. Since some of the duplicates were run in different lots and on different dates than the original sample, instrument response may have been different.

Group 1A water samples were analyzed for the same list of elements as the soil samples. A total of 3 duplicate pairs were used in the analysis. These samples were identified within the IRDMIS sample numbers MX(D)CS07X1 and MX(D)SH10X1. A filtered sample of MXSH10X1 was included in the duplicate comparisons. The filtered sample is differentiated by the unfiltered sample by having the upper case of the letter "X" in the seventh digit of the sample number. The unfiltered sample has the same number but has a lower case "x" in the seventh digit. In summary, two locations were sampled but one location had a filtered and unfiltered duplicate pair for a total of three duplicate pairs for the first groundwater sampling round. USEPA Region 1 criteria were also used for these water samples to assess the variability of reported concentrations of

inorganic elements. The criteria used for water samples was an RPD of 30% or less. A summary of the elements for which this criteria was not met is provided below.

ELEMENT	FREQUENCY OF USEPA CRITERIA EXCEEDANCE	RANGE OF RPDS (%)
Aluminum	2/3	0 to 132
Arsenic	2/3	0 to 131
Barium	1/3	3 to 127
Calcium	1/3	3 to 37
Chromium	1/3	0 to 122
Cobalt	1/3	0 to 74
Copper	1/3	0 to 144
Iron	2/3	12 to 136
Lead	2/3	11 to 127
Magnesium	1/3	3 to 125
Manganese	2/3	7 to 129
Nickel	1/3	0 to 135
Potassium	3/3	58 to 139
Sodium	1/3	1 to 34
Vanadium	1/3	0 to 113
Zinc	1/3	0 to 125

Results for antimony, beryllium, mercury, selenium, and thallium were reported at below CRL for all duplicate pairs. The unfiltered MXSH10x1 showed the highest degree of disagreement in the results. Every element listed in the table above had reported results with RPD over the 30% EPA maximum for this sample.

SVOCs. Both soil and water duplicate/replicate samples were analyzed to assess the precision of SVOC results for Group 1A samples. USEPA Region 1 protocols for RPD between duplicate SVOC results were used. SVOC duplicate data are reported in Table H1. USAEC Methods LM18 and UM18 were used in the

analyses. The USEPA Region 1 requirement for duplicate SVOC soil samples is an RPD of no greater than 50%.

A total of three duplicate soil sample pairs (DXCS0102, DXCR0100, and DXCS0903), were analyzed using the USAEC method LM18.

The soil SVOC results for the above samples were, in general, all below the CRL for most of the SVOC compounds. There were instances where SVOCs were detected and the RPD exceeded the USEPA 50% limit. The compounds for which this occurred are listed below along with the samples in which they were detected.

COMPOUND	SAMPLE	%RPD
Acenaphthalene	DXCS0102	86
Anthracene	DXCS0102	86
Benzo(A)anthracene	DXCS0102	86
Benzo(B)fluoranthene	DXCS0102	86
Benzo(k)fluoranthene	DXCS0102	86
Chrysene	DXCS0102	86
Fluoranthene	DXCS0102	67
Fluorene	DXCS0102	86
Naphthalene	DXCS0903	160
Phenanthrene	DXCS0102	86
	DXCS0200	197
Pyrene	DXCS0102	100

For all compounds except naphthalene the duplicate pair of DXCS0102 had RPD values greater than 50%. The high degree of variability for these results could be due to high sorption coefficients of most of the detected compounds. Several unknown compounds were also detected in these duplicates with varying amounts of precision. These are listed in Table H1.

One water sample duplicate (MDCS07X1) was analyzed for SVOCs using USAEC method UM18. The USEPA Region 1 requirement of RPD of 30% or less for

SVOC duplicate water samples was used to assess the precision of the reported concentrations.

No SVOCs were detected in the duplicate pair MXCS07X1.

VOCs. USAEC methods LM19 and UM20 were used for the analysis of VOCs in soil and water, respectively. USEPA Region 1 protocols were used to assess the precision of the reported concentrations. DXCR0100 and its associated duplicate was used for the soil analysis. No VOCs were detected in DXCR0100 or its duplicate.

One duplicate sample (MXSH10x1) was analyzed using the VOC water method UM20. USEPA Region 1 CLP criteria of 30% RPD or less was used for VOA duplicates.

The USEPA RPD limit was not exceeded in the water VOC analyses. All VOCs were reported at or below CRL.

Explosives. USAEC method LW12 was used for the soil analysis of explosives. A total of three duplicate pairs were analyzed (DXCS0200, DXCR0100, DXCS0102 and DXCS0903). There are currently no USEPA CLP guidelines to measure the precision and accuracy for explosive compounds. No explosives were detected above respective CRLs in any of the samples.

USAEC methods UW19 and UW32 were used to assess the precision of explosives data of Group 1A water samples. Two duplicate pairs (MXCS07X1, MXSH10x1), were used in the analysis. All explosive results for both of the duplicates were below CRL.

Other Methods. Duplicate samples were collected from Group 1A and analyzed using other methods. These include the following: alkalinity, hardness, TDS, TOC and TSS. There are no USEPA CLP criteria to use as guidance in assessing the precision for these methods. All results are tabulated in Table H1.

3.0 QUALITY CONTROL BLANK RESULTS FOR GROUP 1A, ROUND 2

3.1 INTRODUCTION

This data quality report provides an evaluation of methods blanks, rinsate blanks, and other field quality control sample data generated for the supplemental RI activities conducted at Fort Devens, Massachusetts. Data were generated by the USAEC contract laboratory, ESE Laboratories, from water samples collected during the summer of 1993. All data used in this report came directly from the USAEC's IRDMIS system. Samples discussed in Section 3 pertain only to those collected for the second round from Group 1A.

Quality Control Frequency Tables. Frequency tables were generated for all quality control blanks that were analyzed during the Fort Devens RI. These include trip blanks, rinsate blanks and method blanks. The results are listed by analytical method and were used to identify any target analytes that appeared in the blanks. The frequency tables are provided to give an overview of blank contamination associated with each blank type. Tables H-20, H-21 and H-22 represent the frequency of detected analytes for rinsate, method and trip blanks, respectively. Analytes which are not listed in the frequency tables were not detected at a concentration above the CRL. They are listed, however, in Tables H-23, H-24, and H-25.

3.2 METHOD BLANKS

Method blanks were analyzed to determine if compound analytes were introduced during the processing of the field samples. Chemically pure deionized water was used to collect method blanks at the laboratory. The method blanks were analyzed following the same procedures used to analyze field samples. Any compounds that were detected in the method blanks were attributed to laboratory contamination. The detected compounds are identified in the method blank frequency table (Table H-21).

Group 1A Round 2 method blanks were analyzed for the following parameters: inorganics, SVOCs, VOCs, pesticides/PCBs, explosives, TOC, TSS, TDS, hardness, and alkalinity.

Inorganics. Method blanks from Group 1A Round 2 were tested for the following elements: antimony, aluminum, arsenic, barium, beryllium, calcium, cadmium, chromium, cobalt, copper, iron, lead, mercury, magnesium, manganese, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc. None of these elements were found in concentrations above CRL for any of the method blanks.

SVOCs. USAEC method UM18 was used to analyze the method blank for SVOC contamination. One compound, 1,2-Epoxycyclohexene, was detected in this blank. The concentration at which it was measured was 6 μg/L. All other SVOC compounds were undetected in concentrations above CRL.

VOCs. USAEC method UM20 was used to analyze the method blanks for VOCs. Two method blanks were used. The only VOC that was reported above CRL was chloroform which was present in one of two blanks. Refer to Table H-21 for the concentration of this contaminant.

Pesticides/PCBs. USAEC methods UH02 and UH13 were used to determine pesticide/PCB contamination in two method blanks. Pesticide/PCB compounds were not reported above respective CRLs in either of the blanks.

Explosives. USAEC methods UW19 and UW32 were used to measure contamination of explosive compounds in four method blanks. The reported results were below CRL for all explosives.

Other Methods. Method blank data was also available for the following parameters: TOC, TSS, TDS, hardness, and alkalinity. All method blanks had reported values below CRL for all of the above.

3.3 TRIP BLANKS

Trip blanks consist of chemically pure water sent by the contractor laboratory to be shipped with environmental samples. Trip blank data are presented in Table H-23. The trip blanks were analyzed at the laboratory to determine if cross contamination of volatile compounds occurred during the handling and shipment of the samples. A summary of compounds detected above CRL in the trip blanks is found in Table H-22.

A total of two trip blanks were sent with samples during the Group 1A Round 2 groundwater sampling effort. These trip blanks were identified as DVTRP053 and DVTRP056. USAEC method UM20 was used to analyze both blanks for VOC contamination. The only VOC reported above CRL was chloroform. It was detected in DVTRP056 at 0.82 μg/L.

3.4 FIELD QUALITY CONTROL

The field quality control blanks include a rinsate blank and a field blank. The role of these blanks in completing the data quality assessment is discussed in Section 2 of the text in this report.

3.4.1 Group 1A Round 2 Rinsate Blank Results

One rinsate blank, SBK93129, was collected during the Group 1A Round 2 groundwater sampling event. This blank was analyzed for inorganics, SVOCs, VOCs, pesticides/PCBs, explosives, TSS, TDS, TOC, alkalinity, and hardness. All rinsate results are found in Table H-25. A summary of detected compounds is found in Table H-20.

Inorganics. The rinsate blank SBK93129 was analyzed for the following elements: aluminum, antimony, arsenic, barium, beryllium, calcium, cadmium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc. The only element reported in concentrations above CRL was manganese at 5.8 μg/L.

SVOCs. USAEC method UM18 was used to measure SVOCs in the rinsate blank. None of the SVOCs were reported above CRL except for Di-N-butyl phthalate. Two other unidentified compounds were also observed at concentrations of 6 μg/L and 10 μg/L.

VOCs. USAEC method UM20 was used to analyze VOCs in the rinsate blank. Two VOCs, 1,1,1-trichloroethane and chloroform, were reported in concentrations above respective CRLs.

Pesticides/PCBs. USAEC methods UH02 and UH13 were used to determine pesticide/PCB concentrations in the rinsate blank, SBK93129. There were no pesticide/PCB compounds detected above CRL.

Explosives. USAEC methods UW19 and UW32 were used to measure concentrations of explosives in the rinsate blank. There were no explosive compounds reported above CRL.

Other Methods. SBK93129 was also analyzed for TSS, TDS, TOC, alkalinity, and hardness. The concentrations reported for all of these parameters were below respective CRLs except for TOC. A result of 6,740 μg/L was measured for this parameter.

3.4.2 Source Water/Field Blank Results

A sample of the USAEC approved water (a field blank) used to decontaminate sampling equipment was collected in March, 1993. The sample was sent to the contract laboratory for analysis. Analysis was completed for the following parameters: inorganics, SVOCs, VOCs, pesticides/PCBs, explosives, hardness, and TPHC. The results from these analyses provide background data on the decontamination water. Source water results are summarized in Table H-26.

Inorganics. The field blank collected at Fort Devens was analyzed for the following elements: antimony, aluminum, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc. Elements which were reported at concentrations above CRL are listed in the table below.

ELEMENT	CONCENTRATION (μg/L)
Calcium	6,040
Iron	113
Magnesium	1,760
Manganese	4.02

Potassium	1,210
Sodium	2,640

SVOCs. SVOCs in the field blank were all below CRL except for 2-Ethyl-1-hexanol. This compound was measured at 10 μg/L. One unknown compound was also detected at 5.0 μg/L.

VOCs. All VOCs in the filter blank were reported in concentrations below respective CRLs except for chloroform. It should be noted that chloroform was also detected in the method blank in roughly the same concentration (1.7 μg/L for field blank versus 1.8 μg/L for method blank) as in the field blank. Introduction of chloroform could have occurred at the laboratory.

Pesticides/PCBs. All pesticide/PCB compounds were reported below CRL in the field blank.

Explosives. All explosive compounds were reported below CRL in the field blank.

Other Methods. The field blank was also analyzed for TPHC and hardness. TPHC concentrations were below CRL. However, a concentration of 20,000 μg/L was measured for hardness.

4.0 GROUP 1A ROUND 2 MATRIX SPIKES AND DUPLICATE QUALITY CONTROL

4.1 INTRODUCTION

Matrix Spikes. MS/MSDs were collected at a rate of one each per 20 environmental samples. All MS/MSD samples have been tabulated and are presented in Table H-19. For some analyses more than one set of MS/MSDs were spiked by the contract laboratory. Data have been segregated by method to show recovery trends of particular analytes. Matrix spikes have been paired with corresponding matrix spike duplicates to make recovery comparisons. The RPDs between recoveries of the matrix spikes and matrix spike duplicates have been calculated and are included in Table H-19. The RPD was used to measure the

analytical precision of the results. The average recoveries, and maximum and minimum recoveries for each method are also included as a way of measuring trends.

The criteria used for interpreting MS/MSD data are from the analytical USEPA CLP protocols and the POP for Fort Devens, Volume III. Interpretations of the MS/MSD results are contained in Section 4.2 of this Appendix.

Duplicates. Field duplicate samples were collected at the same rate as the MS/MSD samples. Duplicates were differentiated from samples in the IRDMIS sample identification number. The second digit in the number had a "D" in place to denote the duplicate.

The purpose of analyzing duplicate samples was to measure the precision of the sampling and analytical results. This was measured by the calculation of the RPD for all runs of a particular method. The RPD was calculated as the difference between the maximum and minimum result divided by the average of all results. Duplicate data are presented for Group 1A Round 2 data in Table H-18.

USEPA Region 1 guidelines were used to assess the RPDs of duplicate and replicate results. The guidelines were used to assess the variability and reproducibility of the results.

4.2 GROUP 1A ROUND 2 MATRIX SPIKES

Matrix spike data for Group 1A Round 2 are presented in Table H-19. MS/MSD samples were collected to determine the effect of the matrix on spike recoveries of inorganics, explosives, and pesticides/PCBs. USEPA CLP criteria, where applicable, and matrix spike protocols specified in the Fort Devens POP, Vol. III were used to determine whether the matrix affected the recoveries of these analytes. The RPD was also calculated to measure the precision of the analyses.

Inorganics. Matrix spike analysis included the following elements for Group 1A water samples:

- aluminum
- antimony
- cobalt
- copper
- potassium
- selenium

- arsenic
- barium
- beryllium
- cadmium
- calcium
- chromium
- iron
- lead
- magnesium
- manganese
- mercury
- nickel
- silver
- sodium
- thallium
- vanadium
- zinc

Inorganic recoveries of 25 percent ± of 100 percent are required in order to meet CLP requirements.

One water sample was collected and submitted to the contract laboratory for matrix spike analysis. This water sample was identified as MXSH01A2. For some methods the MS and MSD were spiked and analyzed more than once (replicate runs).

The spike recoveries for all elements were within 25 percent of full recovery except for one run for the element thallium. The recovery of one of the replicate runs was 73%.

Explosives. USAEC methods UW19 and UW32 were used to analyze recoveries of spiked explosive compounds in water. The sample MXSH01A2 was used for this analysis. There are no USEPA CLP Region 1 guidelines for explosive compounds. The guidelines that were used are specified in the Fort Devens Project Operations Plan and also on pg. H-8 of the Group 1A Round 1 section of this Appendix.

The recoveries of 2,4-Dinitrotoluene, nitrobenzene, cyclonite, 1,3,5-Trinitrobenzene, and 2,4,6-Trinitrotoluene all met the established criteria. NG and PETN results were also included in the explosive method. Although no spike criteria exists for these compounds, the recoveries for two out of three replicate runs were 6.3 percent for both compounds.

Pesticides/PCBs. The primary assessment of matrix effects for pesticides and PCBs was based upon the recovery of the surrogate decachlorobiphenyl. In addition other pesticide/PCB compounds were spiked into the water sample MXSH01A2. These compounds are listed in Table H-19 along with other MS/MSD results.

USAEC methods UH13 and UH02 were used for pesticide/PCB spike recovery analysis. The USEPA advisory limits for the recovery of the surrogate decachlorobiphenyl and the pesticide/PCB compounds are 60% to 150%. Decachlorobiphenyl recoveries were all below the 60% USEPA minimum for three replicate runs using the UH02 method. Recoveries ranged from 41% to 55%. Recoveries for all other PCB compounds that were spiked and run using the UH02 method were all within advisory limits. Recoveries for all compounds (including decachlorobiphenyl) spiked into MXSH01A2 using the UH13 method were all within the USEPA limits.

4.3 GROUP 1A ROUND 2 DUPLICATES

Group 1A Round 2 water sample duplicates are summarized by analytical method in Table H-18. The following methodologies were used to assess the variability and reproducibility of the results:

- Inorganics
- SVOCs
- VOCs
- Explosives
- Pesticides/PCBs

Refer to Table H-18 for a description of water methods used in the analyses.

Inorganics. Three sets of water samples (MXCS01A2, MXSH24A2, and MXSH24a2) along with duplicate and replicate runs of each) were analyzed for elements listed below. MXSH24A2, and MXSH24a2 were both collected from the same location. MXSH24A2 is a filtered sample whereas MXSH24a2 is a non-filtered sample.

- aluminum
- antimony
- arsenic
- barium
- beryllium
- cadmium
- calcium
- cobalt
- copper
- iron
- lead
- magnesium
- manganese
- mercury
- potassium
- selenium
- silver
- sodium
- thallium
- vanadium
- zinc

- chromium
- nickel

The USEPA Region 1 criteria for the RPD of inorganic duplicates of water samples is 30 percent. The RPDs of sample/duplicate pairs exceeded this limit for the element barium only. The RPD for MXSH24A2 results was calculated at 39% for this element. The RPDs for all other elements of the other duplicates were all below 30%.

SVOCs. The water sample MXCS01A2 and its associated duplicate were used to measure the precision of SVOC analysis using method UM18. The USEPA Region I limit which was used to measure this precision is 30% RPD between duplicate sample SVOC results.

The SVOC results for the sample/duplicate pair of MXCS01a2 were all reported in concentrations below CRL for all compounds except bis(2-ethylhexyl)phthalate.

VOCs. The water sample MXCS01A2 and its associated duplicate were used to measure the precision of VOC analysis using water method UM20. USEPA Region 1 protocols for the RPD between the results was used.

The VOC results for the sample/duplicate pair of MXCS01A2 were all reported in concentrations below CRL.

Pesticides/PCBs. The water sample MXCS01a2 and its associated duplicate were used to measure the precision of pesticide/PCB water methods using method UM18.

All pesticide/PCB concentrations for the sample/duplicate pair of MXCS01A2 were reported in concentrations below CRL.

Explosives. Methods UW19 and UW32 were used to obtain results for explosives compounds. The precision of these results was measured using the RPD between the sample and duplicate results.

The sample/duplicate pairs of MXCS01A2 and MXSH24a2 were analyzed for explosives. The results for all explosive compounds were all reported at below CRL.
