1 Introduction

SERES-Arcadis 8(a) Joint Venture 2, LLC (S-A JV) prepared this 2023 Annual Operations, Maintenance, and Monitoring Report for the United States Army Corps of Engineering (USACE) – New England District, under Contract Number W912WJ-19-D-0014. This report summarizes the long-term monitoring (LTM) program and operation and maintenance (O&M) activities conducted during 2023 at the Shepley's Hill Landfill (SHL) site, located at the former Fort Devens Army Installation (Fort Devens) in Devens, Massachusetts (Figure 1). LTM and O&M activities were conducted in accordance with the Long-Term Monitoring and Maintenance Plan Update (LTMMP Update; Sovereign Consulting, Inc. [Sovereign] 2015), the 2018 Addendum to the Long-Term Monitoring and Maintenance Plan Update (LTMMP Addendum; KOMAN Government Solutions, LLC [KGS] 2018), and the Quality Assurance Project Plan (QAPP) for the Annual Long-Term Monitoring and Maintenance Program (S-A JV 2020).

1.1 Site Location

Fort Devens is located approximately 35 miles northwest of the city of Boston, within the towns of Ayer and Shirley in Middlesex County and Harvard and Lancaster in Worcester County. Fort Devens was established in 1917 for military training and logistical support during World War I and operated as a permanent base from 1931 until closure by the Base Realignment and Closure Committee in 1996.

SHL encompasses approximately 84 acres in the northeast corner of the Main Post of Fort Devens (Figure 2). The landfill is bordered to the east by Plow Shop Pond and land formerly containing a railroad roundhouse, to the west by Shepley's Hill, to the south by recent commercial development, and to the north by wooded and residential areas. Plow Show Pond to the east drains to Nonacoicus Brook to the north, which flows north/northwest and discharges to the Nashua River. Nonacoicus Brook is located north of the landfill in the North Impact Area (NIA; Figure 3).

1.2 Site Background

The United States Army (Army) reportedly began operating SHL by the early 1940s; however, evidence from test pits within the landfill suggests earlier usage, possibly as early as the mid-19th century. SHL contains a variety of waste materials (more than 1.5 million cubic yards) that extend to a depth of approximately 40 feet (ft) below ground surface in the central portion of the landfill. Approximately 160,000 cubic yards (11% of the total waste mass) appear to have been emplaced below the water table in a former wetland, and peat deposits have been identified below the waste (Harding ESE 2003; Sovereign 2011).

The Massachusetts Department of Environmental Protection (MassDEP) approved the landfill closure plan for SHL in 1985. The landfill was closed in five phases between 1987 and 1993 in accordance with 310 Code of Massachusetts Regulations 19.000. Closure consisted of capping the landfill, covering the cap with soil and vegetation, installing gas vents and groundwater monitoring wells, and constructing drainage swales. The MassDEP issued a Landfill Capping Compliance Letter approving the closure in February 1996 (Harding ESE 2003; Sovereign 2011).

After closure of SHL, the Army completed remedial investigations (RIs) under the Comprehensive Environmental Response, Compensation, and Liability Act to characterize soil, sediment, surface water, and groundwater. RIs

confirmed the presence of various contaminants at the site, the most predominant of which is arsenic. A subsequent feasibility study and Record of Decision (ROD; USACE 1995) resulted in a remedial action, which included long-term O&M of the landfill cap, groundwater monitoring, and a contingent remedial component requiring the design and construction of a groundwater extraction and treatment system if the landfill cap did not result in a reduction of groundwater contaminant concentrations (primarily arsenic) below risk-based cleanup goals by 2008. The remedial action objectives for SHL are to:

- Protect potential residential receptors from exposure to impacted groundwater migrating from the landfill that contains chemicals in excess of United States Environmental Protection Agency (USEPA) maximum contaminant levels (MCLs).
- Prevent impacted groundwater from contributing to the contamination of Plow Shop Pond sediments in excess of human health and ecological risk-based concentrations.

Table 1, below, lists the contaminants of concern (COCs) identified in the ROD and their target cleanup levels (CLs). Of the COCs listed below, only arsenic, iron, and manganese are currently sampled as part of the LTM program, in accordance with the LTMMP Update and LTMMP Addendum (Sovereign 2015; KGS 2018, respectively).

Groundwater Extraction and Treatment

In March 2006, the Army installed two extraction wells (EW-01 and EW-04) near the downgradient edge of the landfill (the "toe" of the landfill) to capture groundwater flowing from beneath the landfill and constructed a groundwater extraction and treatment system. The system was designed to remove dissolved arsenic through oxidation using chlorine dioxide co-precipitation with iron and manganese, and microfiltration. System operation

started with an initial pumping rate of 25 gallons per minute (gpm) in 2006, and then gradually increased the combined extraction rate to approximately 50 gpm by 2014.

In 2023, the system operated similarly to the previous years of operation for the first eight months of the year extracting approximately 50.3 gpm on average with an up-time of approximately 89%. On August 25, 2023, the system was shut down for significant upgrades. The purpose of the upgrades was to install an alternative oxidation system using potassium permanganate in place of the existing chlorine dioxide generation and dosing system to improve the performance and overall safety of the plant. The upgrades included the removal of all chlorine dioxide generation and dosing equipment and the installation potassium permanganate injection and clarification systems. This change was accompanied by a set of changes to mixing vessels, pumps, settling tanks, etc. These changes are described in more detail in Section 4. Due to these changes, the operation of the system was curtailed for the last four months of 2023 while the upgraded system was brought on-line.

Between September 5 and September 11, 2023, a new additional extraction well (EW-03) was installed southeast of the treatment building and near the landfill access gate. Once the treatment system came back on-line and following prove-out testing, groundwater extraction was performed from all three wells; EW-01, -04, and -03. The target for the upgraded system operation is to maintain the overall 50 gpm flow rate by reducing pumping EW-04 to 10 gpm and extract water from EW-03 at a rate of 15 gpm.

Plow Shop Pond and Red Cove

In 2011, the Army investigated Red Cove/Plow Shop Pond (known as Area of Contamination [AOC] 72) located east of SHL. The AOC 72 RI (AMEC 2011) concluded that the SHL remedy in place in 2011 (landfill capping and groundwater extraction) did not eliminate groundwater flow and arsenic migration from SHL to Red Cove/Plow Shop Pond, and that groundwater discharge was contributing arsenic to sediment that could accumulate to levels that posed unacceptable risk to receptors. As a result, in August and September 2012, the Army installed a barrier wall between SHL and AOC 72 as a non-time critical removal action. Documentation of the barrier wall installation was provided in a Removal Action Completion Report (Sovereign 2013a).

In addition to LTM and O&M activities, land use controls (LUCs) were established for the NIA in 2013 (Sovereign 2013b), and the Army subsequently issued an LUC Implementation Plan (LUCIP) for SHL in 2014 (Sovereign 2014). The LUC area is shown on Figure 4 and discussed in Section 5.

2 Groundwater and Hydraulic Monitoring

Groundwater monitoring was conducted at SHL in 2023 in accordance with the LTMMP Update, LTMMP Addendum, additional work requested by USEPA, and QAPP (Sovereign 2015; KGS 2018; S-A JV 2020, respectively). Sampling events for 2023 occurred in June and October/November. Results of sampling are presented in the following sections.

The LTM program includes wells in the Barrier Wall Area, Landfill Area, Nearfield Area, NIA, and Upgradient Area. These sampling and hydraulic monitoring locations are summarized in Tables 2 and 3, respectively. A site plan showing the LTM well network is provided on Figure 5. Groundwater monitoring field forms, laboratory analytical reports, and data validation reports are provided in Appendix A, Appendix B, and Appendix C, respectively.

2.1 Hydraulic Monitoring

Groundwater elevations at SHL monitoring wells and piezometers, including piezometers used to monitor performance of the barrier wall, were gauged on June 12 and November 20, 2023, while the ATP was online and groundwater was being pumped from extraction wells (EW-01 and EW-04 during the spring event and EW-01 and EW-04 during the fall event). Hydraulic monitoring data are provided in Table 4. During each monitoring event, an electronic water level meter was used to measure depth to water with an accuracy of ±0.01 foot from the marked reference point at the top of the inside casing of each monitoring well/piezometer. LTM network wells were inspected, and new well locks were installed during the 2023 monitoring events where replacements were needed.

A total of 62 monitoring wells were measured during the spring 2023 monitoring event. In fall 2023, 154 monitoring wells and one staff gauge was measured; three of the four stream gauges included in Table 4 could not be accessed or viewed, as they are located in wetland areas and were partially obscured by dirt and mud.

Groundwater elevation contour maps for June 12 and November 20, 2023 (Figures 6 and 7, respectively) were developed using survey data from the 2017 and 2018 monitoring well survey reports, which use the Massachusetts State Plane Coordinate System of North American Datum of 1983 for horizontal control and the North American Vertical Datum of 1988 (NAVD88) for vertical control. As described in Table 4 (last column) each groundwater contour map includes contour values for shallow overburden wells only; deep paired overburden well and bedrock well data were excluded, but several were used to assess vertical gradients. Similar to previous monitoring events, the water levels measured on November 20, 2023, illustrate that groundwater flows generally from the southwest to the north toward Nonacoicus Brook, with a deflection of groundwater flow to the north by the barrier wall in the area west of the wall. Groundwater elevations in overburden well locations were observed to be lower on June 12 than November 20 by an average of 0.90 ft (Table 4). Historical groundwater elevations from the last 5 years (2019 through 2023) are included in Appendix D; groundwater elevations in overburden well locations were observed to be lower in fall 2022 compared to November 20, 2023, by an average of 1.91 ft. The following groundwater hydraulic gradients were calculated in 2023:

- The gradient across the southern portion of the Landfill Area was calculated as 0.012 foot per foot (ft/ft) on November 20, 2023, using wells SHL-15 (Upgradient Area) and PZ-12-10 (Barrier Wall Area).

- The gradient across the northern portion of the Landfill Area was calculated as 0.009 ft/ft on November 20, 2023, using wells SHM-10-15 (Landfill Area) and SHL-23 (Nearfield Area).
- The gradient across the Nearfield Area ranged from 0.002 ft/ft (June 12, 2023) using wells EPA-PZ-2012-1A and SHP-2016-2A (Nearfield Area) to 0.005 ft/ft (November 20, 2023) using wells SHM-10-06A and SHM-10-16 (Nearfield Area).
- The gradient across the NIA ranged from 0.003 ft/ft (June 12, 2023) using wells SHM-05-40X and SHM-13-08 (NIA) to 0.004 ft/ft (November 20, 2023) using wells SHM-05-40X and SHM-13-03 (NIA), respectively.
- The gradient across the Barrier Wall Area was calculated as 0.088 ft/ft on June 12, 2023, and 0.101 ft/ft on November 20, 2023, using wells PZ-12-05 and PZ-12-06 (Barrier Wall Area).
- In general, the horizontal hydraulic gradient is steepest across the Landfill Area and across the barrier wall (typically two to three times greater in 2023) compared to other areas, and the gradient across the NIA is comparable to the gradient of the Nearfield Area.

The four sets of overburden and bedrock well pairs gauged during the November 20, 2023, monitoring event were assessed with respect to the presence of vertical gradients, as shown in Table 5. The vertical gradient observations are summarized below:

- A positive vertical gradient (downward flow component) was observed in the Upgradient Area from overburden to bedrock. This is consistent with recent historical observations. The Upgradient Area cluster had a vertical gradient equal to that of the horizontal gradient in the southern part of the landfill (Table 5).
- A negative vertical gradient (upward flow component) was observed in the Barrier Wall Area near Red Cove. Gradients have fluctuated between positive and negative over the last six fall gauging events (-0.006 to 0.002), most likely due to the relative degree of groundwater discharge from the bedrock towards Plow Shop Pond, compared to the relative degree of influence from the water levels in Plow Shop Pond at the time of gauging.
- A negative vertical gradient (upward flow component) was observed in the Nearfield Area. The gradient in this area has fluctuated between positive/downward flow component in previous fall gauging events. These fluctuations are likely due to changes in precipitation from year to year and/or flow rates at the extraction wells at the time of gauging. At overburden triplet monitoring well SHM-05-41A/B/C, groundwater flow had both an upward and downward component from 64 ft bgs toward the 44 ft bgs and 93 ft bgs intervals (Table 5).
- In the North Impact Area, the vertical gradient was two-times greater than the horizontal gradient in the landfill indicating primarily vertical flow (Table 5).

2.2 Groundwater Sampling

A total of 62 and 121 well locations were sampled in spring and fall 2023, respectively. All locations were sampled in accordance with the LTMMP Update, LTMMP Addendum, and QAPP (Sovereign 2015; KGS 2018; S-A JV 2020, respectively).

Samples were collected in accordance with the procedures outlined in the Low Stress (low flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells Revision 3 and 4 (USEPA 2017). Dissolved metals and dissolved organic carbon samples were field-filtered using a 0.45-micrometer polyethersulphone filter. Groundwater was purged using a bladder pump or peristaltic pump,

depending on the measured water level. Groundwater was purged through a calibrated YSI multi-meter and a turbidity meter to monitor groundwater chemistry parameters, and samples were collected upon achievement of field parameter stability. Calibration records are included in Appendix A.

Groundwater samples were submitted to Eurofins TestAmerica Laboratories (Eurofins) of Savannah, Georgia for the following analyses: dissolved metals (arsenic, iron, and manganese), chloride/sulfate, total alkalinity, and dissolved organic carbon. In accordance with the QAPP (S-A JV 2020), quality assurance / quality control (QC) procedures included the collection of field duplicate samples, matrix spike (MS)/matrix spike duplicate (MSD) samples, and equipment blank samples.

2.2.1 2023 Data Summary

The spring and fall 2023 sampling results are summarized in Tables 6 and 7, respectively. A summary of historical groundwater sampling results is provided in Appendix E. Figures 8 and 9 present dissolved arsenic concentration results for the spring and fall 2023 sampling events, respectively. The following is a summary of dissolved metals results from the sampling events conducted in 2023:

Spring 2023 Sampling Event

- Dissolved arsenic concentrations in groundwater exceeded the CL of 10 µg/L at 41 of the 62 sampled locations (66%, compared to 63% in 2022), with the highest concentration of 3,100 µg/L detected in extraction well EW-04 (Nearfield Area).
- Dissolved iron concentrations in groundwater exceeded the CL of 9,100 µg/L at 30 of the 62 sampled locations (48%, compared to 44% in 2022), with the highest concentration of 74,000 µg/L detected in well SHL-11 (Barrier Wall Area, east of Landfill Area, north of the barrier wall).
- Dissolved manganese concentrations in groundwater exceeded the CL of 1,715 µg/L at 20 of the 62 sampled locations (32%, equal to that in 2022), with the highest concentration of 10,000 µg/L detected in well EPA-PZ-2012-5B (Nearfield Area).

- Dissolved iron concentrations in groundwater exceeded the CL of 9,100 µg/L at 52 of the 121 sampled locations (43%, equal to that in 2021), with the highest concentration of 79,000 µg/L detected in well PZ-12-02 (Barrier Wall, east of Landfill Area, west of the barrier wall).

2.2.2 Arsenic Concentration Trends

Arsenic concentration trends over time were performed at 61 wells specified in the LTMMP Update (Sovereign 2015). Criteria for performing the statistical analyses include using wells that have a minimum of four rounds of data available and have dissolved arsenic concentrations greater than or equal to 10 µg/L. Of the 61 wells

specified in the LTMMP Update, a total of 23 wells (37%) had arsenic concentrations less than the CL in 2023, and a total of 38 wells (62%) exceeded the CL in 2023.

Arsenic data for the subset of 38 wells exceeding the CL in 2023 were evaluated using the Mann-Kendall trend test available in the ProUCL statistical software for environmental applications. The wells were evaluated to identify whether there are statistically significant trends for arsenic concentrations over time at each location at a 95% confidence level.

The evaluation identified that of the 38 wells statistically tested, 23 wells (61%) exhibited statistically significant decreasing concentrations, 13 wells (34%) exhibited no statistically significant trend, and two wells (5%; SHM-10-07 and SHM-10-11) exhibited increasing concentrations at the selected 95% confidence level. Monitoring wells SHM-10-07 and SHM-10-11 are in the east-central portion and southern portion of the Landfill Area, respectively. Results are shown in Table 8, below. Figure 10 shows the arsenic concentration trend results and identifies locations included in the LTMMP Update (Sovereign 2015) for trend evaluation that exhibited arsenic concentrations less than the CL in 2023. ProUCL outputs for each well are included in Appendix F.

2.2.3 Groundwater Monitoring Field Parameters

Water quality parameters (including pH, specific conductivity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]) were collected during each of the 2023 sampling events. ORP and DO are particularly significant field parameters at SHL, as they can be used as indicators of oxidation-reduction (redox) conditions in the aquifer (ITRC 2022). Under the reducing conditions present at much of the site, naturally occurring arsenic associated with iron and manganese oxyhydroxide minerals is released into solution due to reductive dissolution. For example, ferric iron present in the oxides is reduced to ferrous iron, which is more soluble. Similarly, solid manganese (Mn^{4+}) minerals are reduced to more soluble manganese (Mn^{2+}). These dissolution processes also release arsenic associated with the minerals; and the iron, manganese, and arsenic can then be detected in dissolved metals analyses. Microbial reduction of iron and manganese (frequently coupled to organic matter oxidation) is most favorable in the absence of oxygen, and dissolved oxygen can reoxidize iron and manganese; therefore, low DO is expected in zones with elevated iron and manganese. The ORP is a measure of the presence of redox-sensitive species in solution (including iron and manganese). Therefore, higher concentrations of iron and manganese would be expected in locations where low/negative ORP values and low DO concentrations are measured (Gannett Fleming, Inc. 2011). There are two sources of carbon reducing conditions at SHL. Historically, the peat and wetlands underlying the landfill likely provided reducing conditions and mobilized arsenic through reductive dissolution of iron hydroxyoxides on which arsenic was entrained (KGS 2016). In addition, the presence of the cap deters the percolation of oxygenated waters enhancing the reducing conditions in the aquifer.

Metals concentrations and associated field ORP measurements from the spring and fall 2023 groundwater sampling events are shown in Tables 6 and 7. The summary of correlations presented below indicates that dissolved metals in groundwater at SHL are more likely to exceed the CL when the redox state in groundwater is reducing and that the redox condition of the aquifer influences whether groundwater meets or exceeds the CLs for arsenic, iron, and manganese.

Spring 2023 Sampling Event

- Of the 62 groundwater samples collected and analyzed for arsenic during the spring 2023 event, 41 samples had concentrations exceeding the CL for arsenic and 21 samples had concentrations that either were not detected above the limit of detection or were detected below the CL:
  - Of the 21 samples that met the CL for arsenic, DO and ORP measurements indicate that 11 samples (52%) were collected from locations where the aquifer was oxidizing (ORP greater than 50 millivolts [mV] and DO greater than 1 milligram per liter [mg/L]), 5 samples (24%) were collected from locations screened in groundwater that was moderately reducing (where either ORP was greater than 50 mV or DO was greater than 1 mg/L), and 4 samples (19%) were collected at locations with groundwater that was reducing (ORP less than 50 mV and DO less than 1 mg/L).
  - In comparison, of the 41 samples that exceeded the CL for arsenic, samples were generally collected from locations with more strongly reducing geochemical conditions: no samples were collected from oxidizing conditions, six samples (15%) from moderately reducing conditions, and 35 samples (85%) where the aquifer was reducing.
  - Of the samples that met the CL for arsenic, the average ORP value was 80.9 mV (median of 90.3 mV) and the average DO concentration was 3.63 mg/L (median of 2.88 mg/L).

  - In comparison, samples that exceeded the CL for arsenic had a lower ORP and DO concentration: an average ORP of -67.3 mV (median of -71.3 mV) and an average DO concentration of 1.00 mg/L (median of 0.73 mg/L).
- Locations where iron and/or manganese concentrations exceeded the CL generally overlapped with locations that exceeded the CL for arsenic, indicating reducing conditions in groundwater has affected all three of these naturally occurring metals:
  - Of the 30 samples that exceeded the CL for iron in spring 2023, 29 samples (97%) also exceeded the CL for arsenic.
  - Of the 20 samples that exceeded the CL for manganese in spring 2023, 19 samples (95%) also exceeded the CL for arsenic.

Fall 2023 Sampling Event

- Of the 121 groundwater samples collected and analyzed for arsenic during the fall 2023 sampling event, 67 samples had concentrations exceeding the CL for arsenic and 54 samples had concentrations that either were not detected above the limit of detection or were detected at concentrations equal to or below the CL:
  - Of the 54 samples that met the CL for arsenic, DO and ORP measurements indicate that 21 samples (39%) were collected from locations where the aquifer was oxidizing, 21 samples (39%) were collected from locations screened in groundwater that was moderately reducing, and 12 samples (22%) were collected at locations with groundwater that was reducing.
  - In comparison, of the 67 samples that exceeded the CL for arsenic, samples were collected from locations with more strongly reducing geochemical conditions: one sample (2%) from groundwater under oxidizing conditions, 15 samples (22%) from moderately reducing conditions, and 51 samples (76%) where the aquifer was reducing.
  - Of the samples that met the CL for arsenic, the average ORP value was 73.6 mV (median of 86.3 mV) and the average DO concentration was 2.64 mg/L (median of 1.28 mg/L).
  - In comparison, samples that exceeded the CL for arsenic had a lower ORP and DO concentration: an average ORP of -53.8 mV (median of -55.0 mV) and an average DO concentration of 0.69 mg/L (median of 0.49 mg/L).
- Locations where iron and/or manganese concentrations exceeded the CL generally overlapped with locations that exceeded the CL for arsenic, indicating reducing conditions in groundwater has affected all three of these naturally occurring metals:
  - Of the 52 samples that exceeded the CL for iron in fall 2023, 51 samples (98%) also exceeded the CL for arsenic.
  - Of the 44 samples that exceeded the CL for manganese fall 2023, 34 samples (77%) also exceeded the CL for arsenic.

2.2.4 Quality Assurance/Quality Control

Eurofins was the primary contract laboratory used for the spring and fall 2023 LTM sampling events. Eurofins is compliant with the United States Department of Defense (DoD) and Department of Defense (DOE) Consolidated Quality Systems Manual for Environmental Laboratories, Version 5.4 (Quality Systems Manual; DoD and DOE

2021) under the DoD Environmental Laboratory Accreditation Program and holds current National Environmental Laboratory Accreditation Program accreditation for applicable analytical methods.

As part of the 2023 groundwater sampling events, quality assurance/QC samples were collected to confirm that the data quality objectives were met for the laboratory analysis. Field duplicate samples were collected during sampling events to evaluate field precision at the rate of 10% (1 per 10 samples). MS/MSD pairs were also submitted at a rate of 5% (1 per 20 samples) to evaluate matrix effects on analytical precision and accuracy.

Analytical results from the 2023 sampling events were reviewed and evaluated for data acceptability by Laboratory Data Consultants, Inc. of Carlsbad, California in accordance with the USEPA Region 1 Environmental Data Review Program Guidance (USEPA 2018), the QAPP (S-A JV 2020), and the DoD General Data Validation Guidelines (DoD 2019). The method requirements from the Quality Systems Manual (DoD and DOE 2021) and the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846 (USEPA 2014) were also used as supplemental information.

Laboratory Data Consultants, Inc. of Carlsbad, California reviewed and updated the database with appropriate data qualifiers as needed. Laboratory analyses were confirmed to have been performed in general compliance with the precision, accuracy, representativeness, completeness, comparability, and sensitivity requirements listed in the QAPP (S-A JV 2020). Sample results that were qualified as estimated (UJ/J) due to QC exceedances are usable with caution; no results were rejected. Analytical results reported for the 2023 LTM samples were deemed valid and usable for intended purposes. The data validation reports and a summary of quality control exceptions noted for the SHL 2023 LTM sampling data are presented in Appendix C.

2.3 Conclusions

The results of the spring monitoring event and the more comprehensive fall 2023 site-wide monitoring event continue to illustrate a general groundwater flow direction from the west/southwest to the north toward Nonacoicus Brook, with a deflection of groundwater flow to the north in the area west of the barrier wall near Red Cove at Plow Shop Pond. Concentrations of arsenic, iron, and manganese in groundwater continue to exceed CLs in various wells at SHL and in the NIA (Tables 6 and 7). Locations where dissolved metals (arsenic, iron, and manganese) concentrations exceed the CL are generally under more reducing geochemical conditions than locations where dissolved metals concentrations meet the CL.

The groundwater monitoring program will continue in accordance with the LTMMP Update and LTMMP Addendum (Sovereign 2015; KGS 2018, respectively) until a new Long-Term Monitoring and Maintenance Plan (LTMMP) is prepared.

The 2023 scope included the following additional work requested by USEPA in addition to what is included in the LTMMP Update and LTMMP Addendum:

- Continued collection of geochemical and hydrologic data from the nested piezometers (SHP 2016-1A/B through SHP 2016-5A/B) in spring and fall.
- Continued collection of geochemical and hydrologic data for USEPA-monitoring network added wells (SHM-05-39A/B, SHM-99-31A/B).
- Continued collection of water level data from piezometers SHP-2017-01 and SHP-2017-02 located near the extraction wells in spring and fall.

- Continued collection of geochemical and hydrologic data from bedrock wells SHP-2016-06A/B/C and SHP-2016-07A/B in spring and fall.
- Continued collection of hydrologic data from wells SHM-10-11, N6-P1, and SHP-99-35X in spring and fall to provide more hydraulic control in the southern portion of the landfill.

Geochemical and hydrologic data was collected from 10 newly installed monitoring wells (SHP-2023-1A,B; SHP-2023-2A,B; SHP-2023-3A,B; SHP-2023-4A,B, SHP-2023-5A,B) and one newly installed extraction well (EW-03) in the fall as part of the effort to re-evaluate and optimize the capture of the arsenic plume (USACE 2022, S-A JV 2023).

The Army is currently conducting an assessment to confirm the effectiveness of the barrier wall installed adjacent to Red Cove. The results of the assessment will be reported under a separate cover and will be considered as part of the LTMMP update.

3 Landfill Maintenance and Monitoring

In accordance with the LTMMP Update (Sovereign 2015), SHL was inspected, and routine maintenance was performed during 2023. All landfill maintenance and monitoring activities were completed by Sovereign.

3.1 Landfill Inspection

The annual inspection identifies and corrects problems pertaining to the effectiveness of the cap system, erosional controls, gas vents, and sampling points. The landfill inspection report with supporting photographs is presented in Appendix G. A summary of the report findings is provided below:

- The surface cover had no new depressions. No tree or shrub growth was observed on the landfill surface during the inspection. Small tree and shrub growth on the margins of the landfill were removed during the annual mowing event.
- An annual inspection of the landfill and adjacent areas was conducted on October 19, 2023. The overall condition of the landfill, utility berm, and culverts was found to be satisfactory. Vegetation atop the utility berm was mowed during the annual mowing event between October 3 and October 5, 2023. The southern drainage swale exhibited large vegetative growth that was removed during annual mowing activities. Small growth and wetland plant life were not disturbed, as they have become a natural retardant to erosive forces. Vegetation in the northern drainage swales was also removed during annual mowing activities. No new topographic depressions or significant erosion was observed.
- As noted in previous reports, gas vent GV-3 continues to be leaning at a 15 to 20 angle off-center. This includes the concrete pad the vent is set in. The vent is still firmly in the ground, is stable, and does not rock or move in any way. There is no evidence that the vent was struck by a vehicle, and the vent still appears to be functional and appears to be in otherwise good condition (see photograph in Appendix G). The remaining landfill gas points (LGPs) and gas vents (Figure 11) were in good condition.
- Monitoring wells and piezometers located on the landfill cap or perimeter that are currently part of the LTM network were observed to be in good condition overall.
- The landfill access road was observed to be in good condition.
- Perimeter fencing was not installed historically along much of the western boundary of the landfill (wooded area along Shepley's Hill) and along the southeastern boundary near the railroad tracks. No roads have open access to the landfill and the fence gates across roads that access the landfill are secured with chains and padlocks.
- Wetland encroachment was observed in the swales located in the southern portion of the landfill. Overall, the areas of encroachment are small and confined to the swales.
- The recreational field located south of the access road in the middle of the southern half of the landfill appeared to be in good condition. There was no tire rutting observed between the field and the landfill access road.

Sovereign provided the following recommendations for 2024:

- Continue monitoring for settlement that creates depressions.
- Continue monitoring for tree and shrub growth on the surface cover. Remove tree/shrub growth as necessary.
- Continue monitoring the utility berm for negative impacts on the drainage patterns.

- Continue annual inspections and mowing of the landfill cap, utility berm, drainage swales, and culverts (including removal of tree and shrub growth).
- Continue to monitor GV-3 to ensure the angle of the vent does not worsen. Continue monitoring the condition of the remaining LGPs and monitoring wells.
- Continue monitoring for erosion and depressions/settlement within the landfill and repair, as necessary.
- Conduct routine checks of the recreational field to confirm the integrity of the landfill cover, gas vents, and monitoring wells in this area.
- Continue to monitor road condition and repair as needed.

3.2 Landfill Gas Monitoring

Sovereign completed annual sampling of landfill gas vents and LGPs (Figure 11) on October 19, 2023. Sampling activities were conducted in accordance with procedures described in the MassDEP Landfill Technical Guidance Manual, as revised May 1997 (MassDEP 1997):

- Landfill gas monitoring is conducted by first capping off the gas vents and connecting the handheld monitoring devices to the sample port on the cap for the initial readings.
- Following collection of the initial readings, an adjustable flow rate sampling pump is connected to the sample port on the cap. Two vent volumes are purged from the gas vents using the sampling pump, and the post-purge monitoring readings are collected with the handheld monitoring device.
- Each handheld monitoring device is equipped with an internal pump and is allowed to operate for approximately one minute before recording the monitoring data.

Landfill gas sampling was conducted with a multi-gas meter and landfill gas meter and included the following parameters: volatile organic compounds (VOCs), oxygen, hydrogen sulfide, lower explosive limit (LEL), carbon monoxide, carbon dioxide, and methane. Each parameter was measured and recorded twice (initial reading and post-purge reading). Gas monitoring results (Table G-1 and Table G-2) and gas probe construction details (Table G-3) are provided in Appendix G. Results appear to be generally consistent or lower than historical observations. The landfill gas monitoring results are summarized below:

- Field readings of barometric pressure were variable and ranged from 29.70 to 30.45 inches of mercury. The background barometric pressure ranged from 29.88 at the start of the day to 30.45 at mid-day and decreased to 29.70 at the end of the day.
- VOC detections ranged from 0.0 to 1.4 parts per million (ppm) in initial readings, and ranged from 0.0 to 0.6 ppm in post-purge readings. The highest initial reading of 1.4 ppm (gas probes LGP-09-08X) decreased to 0.5 ppm post-purge.
- Oxygen ranged from 6.0 to 20.9% in initial readings; and 4.9 to 20.9% post-purge.
- Hydrogen sulfide remained at 0.0 ppm for all initial and post purge readings.
- The LEL ranged from 0.0 to 99% (initial) and 0.0 to 99% (post-purge).
- Carbon monoxide remained at 0.0 ppm for all initial and post purge readings.
- Carbon dioxide detections ranged from 0.0 to 15.5% (initial) and 0.0 to 0.7% (post-purge).
- Methane detections ranged from 0.0 to 16.8% in initial readings; and 0.0 to 11.7% post-purge. The highest initial readings were detected at gas probe LGP-09-08X.

4 Arsenic Treatment Plant Operations, Maintenance, and Monitoring

The SHL ATP treated and discharged 19,026,200 gallons of groundwater between January 1 and December 31, 2023 (Table G-4 and Table G-5), bringing the cumulative treated volume total to approximately 393,329,675 gallons since system startup in 2006 (Table G-6). All ATP operations, maintenance, and monitoring in 2023 was conducted by Sovereign; data are presented in the following sections.

4.1 System Description

The ATP is designed to remove dissolved arsenic from extracted groundwater through oxidation and precipitation of dissolved iron and co-precipitation of the arsenic. Until September 2023, the ATP consisted of the following components:

- Extraction system (extraction wells EW-01 and EW-04)
- Chlorine dioxide generation and addition in order to oxidize iron
- Coagulation via a contact tank with a direct drive batch tank mixer
- Microfiltration (MF) of the water to concentrate precipitated solids
- Solids removal via an inclined plate clarifier
- Bag filtration and discharge of the inclined plate clarifier decant water
- Polymer-aided flocculation of sludge using a filter bed roll-off (FBRO)
- Treated water discharge to the Devens publicly owned treatment works.

Historical monthly discharge totals and an operational summary of the monthly online hours, flow totals, and operating status during the first eight months of 2023 are presented in Appendix G.

In September and October 2023, the ATP was upgraded and modified to replace the existing onsite 17-year old chlorine dioxide generation and dosing system with a new potassium permanganate oxidation and clarification system to improve the performance and safety of the plant. Following completion of the upgrades, the system continued to utilize oxidation and co-precipitation of iron and arsenic as the primary treatment methodology, but system operations were significantly altered from those utilized between 2006 and the first half of 2023.

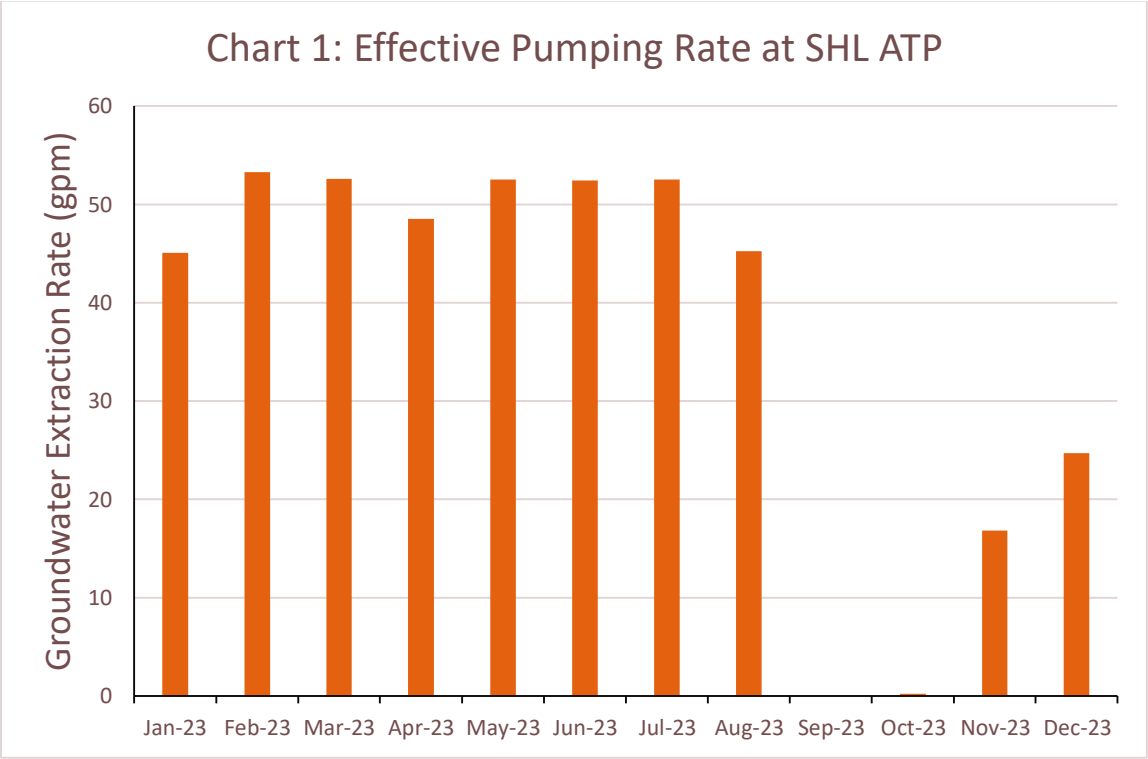
The upgraded ATP now consists of the following components (the changed processes are **bolded**).

- Extraction system (extraction wells EW-01, **EW-03**, and EW-04)
- **Potassium permanganate addition to oxidize dissolved iron**
- Coagulation via contact tanks with a direct drive batch tank mixers
- **Precipitated solids separation and removal via new Lamella Gravity Settler inclined plate clarifiers**
- **MF of the water exiting the Lamella clarifies to "polish" the decant water and concentrate residual precipitated solids**
- **Tertiary solids removal via an inclined plate clarifier**
- Bag filtration and discharge of the inclined plate clarifier decant water

- Polymer-aided flocculation of sludge using a filter bed roll-off (FBRO)
- Treated water discharge to the Devens publicly owned treatment works

4.1.1 System Efficiency and Routine Maintenance

Routine Operations from January 1 through August 25, 2023



During the first eight months of 2023, prior to system upgrades, and during a period of typical operation, the treatment plant was operational approximately 89% of the total available hours during the calendar year (i.e., "uptime"), which is similar to the uptime in 2022 of 88% (Table G-4). When online before September 2023, the plant achieved an effective average extraction rate (i.e., the extraction rate calculated by dividing the volume pumped by the elapsed time during the eight months, not the actual system online time) of 50.3 gpm in 2023 (compared to 48.05 gpm in 2022). The monthly effective pumping rates for 2023 are displayed in Chart 1 below.

Non-operational time during the period through August 2023 is associated with both routine and non-routine system maintenance, repairs, and upgrades (Section 4.1.2). The ATP MF system continued to require monthly clean-in-place (CIP) procedures to prevent long-term fouling of the filter membranes (Table G-8). Extended CIP events have been conducted only in situations when the level of filter fouling is greater than normal, most likely because of a non-optimal dosage concentration of chlorine dioxide.

The FBRO was emptied routinely (every 1 to 2 weeks) in 2023 due to high sludge generation from inorganics (primarily iron) in the influent. This is consistent with historical FBRO maintenance. A total of 203.45 tons of sludge were removed in 2023 by Global Remediation Services, Inc. (Table G-7). The sludge removal process was optimized, which resulted in zero downtime attributable to FBRO operations for the ATP in 2023.

ATP System Upgrades and Testing – September through December 2023

The system was offline from August 25 to October 31, 2023, for system upgrade activities, with minor on periods for system testing, and during this period during which time almost no groundwater was extracted and treated. In November and December 2023, the newly upgraded system was operated intermittently during startup and shakedown in an effort to optimize the performance of the revised system. During November and December, the system extracted and treated groundwater at effective pumping rates of approximately 17 and 25 gpm, respectively, as shown in Chart 1 below, and groundwater was extracted at varying rates from EW-01, EW-03, and EW-04 as part of system testing. Also during this period, the FBRO was again emptied routinely (every 2 weeks), and due to reduced filter loading as a result of the upgrades, no CIP events were conducted as well.

Note: System offline between August 25 and October 31, 2023 for upgrades.

4.1.2 Non-Routine System Maintenance, Repairs, and Upgrades

This section details major system non-routine maintenance and upgrade activities encountered or implemented during 2023. Monthly shutdown and maintenance events, along with associated system downtimes, are presented in Table G-8. The non-routine maintenance activities are summarized below:

Non-Routine Maintenance Activities of the System through August 2023

- January 5, 2023 – The system could not be restarted following a regularly scheduled clean-in-place (CIP) due to a fault on the chlorine dioxide skid Programmable Logic Controller (PLC). On January 9, 2023, a programmer inspected the PLC and reset the fault.
- January 9, 2023 – The system was offline briefly to repair a leaking potable water backflow preventor.
- January 16, 2023 – The system was offline briefly to clean the chlorine dioxide eductor.
- January 26, 2023 – The system was shut down to facilitate the replacement of microfilter Pump P2 and microfilter valve V4. The pump and valve were observed to be leaking, and each was replaced in kind.
- January 30, 2023 – The seal in Effluent Pump 1 was found to be leaking and was replaced. The work was completed during a CIP to minimize downtime.
- February 9, 2023 – The system was shut down due to a failure of a fitting on the potable water line of the polymer skid. The fitting was subsequently replaced, and the system was restarted on February 10, 2023.
- May 22, 2023 – The system shut down briefly to clean and inspect the microfilter basket strainer due to observed high pressure. The system was subsequently restarted following the cleaning.

- June 7, 2023 – The oil cooler was replaced in the original air compressor for the system, and this air compressor was subsequently brought back online. As a result, the temporary air compressor rented to replace the original air compressor was removed from the facility. This work was conducted during a routine CIP resulting in no additional downtime.
- August 20, 2023 – A piping union on Effluent Pump 2 failed resulting in system shutdown. The union was subsequently replaced on August 21, 2023, during a CIP to minimize downtime.
- August 24, 2023 – The input/output (I/O) card for the microfilter skid failed due to normal wear. A new I/O card was subsequently installed on August 25, 2023, and the system was restarted.

Maintenance Activities Associated with the Upgrade of the System through from September through December 2023

- August 25, 2023 – The system was shut down and drained ahead of upgrade activities. The purpose of the upgrades was to install an alternative metals removal system to replace the existing chlorine dioxide dosing system and improve the performance and safety of the ATP.
- Between August 28 and September 1, 2023 – The chlorine dioxide dosing system was subsequently removed. This included the removal of the chlorine dioxide generation skid, the chlorine gas cabinet, and the sodium chlorite storage tank.
- Between September 5 and September 11, 2023 – A new extraction well (EW-03) was installed using a mini-sonic drill rig southeast of the treatment building and near the landfill access gate. The new extraction well was completed to 74 ft bgs as a 6-inch diameter PVC well with 25 ft of stainless steel 20-slot well screen.
- Between September 5 and October 30, 2023 – Two Lamella Gravity Settlers with flash mix and flocculator tanks and an associated access platform as well as potassium permanganate injection pumps with an associated chemical storage area were installed. In addition, the existing water conveyance piping and sludge transfer piping were replaced and reconfigured for the upgraded system.
- The system was leak tested with potable water on October 23, 2023, and beginning on October 31, 2023, the system was restarted for testing using extracted groundwater. Throughout November and December 2023, the upgraded system was operated intermittently at flow rates between 10 and 50 gpm using a combination of extraction wells EW-01, EW-03, and EW-04 to test system components. Control system modifications were also implemented in November and December 2023 to incorporate new system components within the existing PLC for the facility.
- December 15, 2023 – The electrical contactor for extraction well EW-04 failed, and the well was brought offline. The system was subsequently operated using only extraction wells EW-01 and EW-03 until the contactor could be subsequently replaced on December 29, 2023.

4.2 Arsenic Treatment Plant Monitoring

This section describes the ATP influent and effluent sampling conducted in 2023 to monitor for arsenic and other parameters. Samples were analyzed by SGS Laboratories of Orlando, Florida. The associated laboratory analytical reports and data validation reports for the ATP monitoring conducted by Sovereign are included in Appendix B and Appendix C, respectively.

4.2.1 Influent

ATP influent was sampled for metals (arsenic, iron, and manganese), VOCs, and dissolved gases (methane and ethane), as described in the sections below.

4.2.1.1 Metals

The ATP system influent is sampled quarterly for metals (arsenic, iron, and manganese). Although influent inorganic sampling is not required by ATP Landfill Discharge Permit Number 020 (Massachusetts Development and Finance Agency [MassDevelopment] 2019) or by the LTMMP Update (Sovereign 2015), it is monitored to gauge system loading and to verify that a sufficient iron concentration is maintained to promote iron and arsenic co-precipitation and coagulation. The original system design recommended a minimum iron concentration of 40 mg/L. Current influent iron concentrations remain above this level (average of 60.2 mg/L in 2023). The ATP was designed with a ferric chloride addition system with the ability to add ferric chloride to the influent if deemed necessary based on results of influent inorganic sampling; this component of the system has not been needed and has been decommissioned.

Average concentrations for arsenic, iron, and manganese in extraction well EW-01 since 2006 are 1.66, 65.5, and 2.15 mg/L, respectively; compared to average concentrations of 1.70, 67.3, and 2.16 mg/L in 2023. Average concentrations for arsenic, iron, and manganese in extraction well EW-04 since 2006 are 3.49, 41.9, and 2.49 mg/L, respectively; compared to average concentrations of 4.15, 54.1, and 2.79 mg/L in 2023. Average concentrations in extraction well EW-03, installed in 2023, for arsenic, iron, and manganese are 1.14, 58.4, and 1.98 mg/L, respectively, in 2023. Influent loading concentrations of iron, arsenic, and manganese are presented and graphically illustrated in Table G-9.

4.2.1.2 Volatile Organic Compounds and Dissolved Gases

In accordance with the LTMMP Update (Sovereign 2015), and as part of the landfill closure monitoring program, annual ATP influent sampling was conducted for VOCs and dissolved gases (methane and ethane) in November 2023. Results are documented in Table G-10 and summarized below:

- Methane was detected at concentrations of 3,810 µg/L (EW-01), 156 µg/L(EW-03), and 2,360 µg/L (EW-04) in the sampled influent, compared to the 2022 sampling results of 2,120 µg/L (EW-01) and 1,060 µg/L (EW-04), before EW-03 was installed in 2023.
- Ethane was detected at concentrations of 2.0 µg/L (EW-01) and non-detect (EW-03 and EW-04), compared to the 2022 concentrations of 0.68 µg/L (EW-01) and non-detect (EW-04), prior to EW-03 installation in 2023.
- Total VOC concentrations were 0.53J µg/L (EW-01), 0.84J µg/L (EW-03), and 0.65J µg/L (EW-04). All VOC detections were of benzene which has an MCL of 5.0 µg/L. These low concentrations are consistent with historical observations.

4.2.2 Effluent

The USACE is authorized to discharge treated groundwater from the ATP to the Devens municipal sewerage system in accordance with Landfill Discharge Permit Number 020 (MassDevelopment). The current permit, which mandates effluent sampling for arsenic and other select parameters on a monthly, quarterly, and/or annual basis and a maximum daily flow of 93,600 gallons per day (65 gpm), was last renewed on June 28, 2022, and is in

effect until June 28, 2025 (MassDevelopment 2022). There were no changes made to the permit conditions. Effluent sampling results are included in Appendix G and summarized below:

- Arsenic samples were collected monthly, with results ranging from 4.88 to 30.9 µg/L. As shown in Table G-11, each sampling result was below the effluent limitation of 75 µg/L (MassDevelopment 2022).
- Select metals (barium, manganese, and magnesium) and other parameters (chloride, nitrate, and sulfate) were sampled quarterly (March, June, November, and December 2023) (Table G-12). Sampling for these parameters is required by the permit, but no effluent limitations have been established.
- Select metals (chromium [total], cadmium, copper, lead, silver, selenium, and mercury) along with total toxic organics and total petroleum hydrocarbons were sampled on an annual basis in November 2023 (Table G-13). Total toxic organics are equal to the sum of total VOCs, semi-volatile organic compounds, pesticides, and polychlorinated biphenyls. Concentrations of all parameters were within permit-defined discharge limitations.

4.3 Arsenic Treatment Plant Optimization and Recommendations

In September and October 2023, the Army upgraded the ATP to install an alternative metals removal system which replaced the chlorine dioxide generation and dosing system with a new potassium permanganate oxidation and clarification system in order to improve the performance and safety of the ATP. This upgrade included from the removal of all chlorine dioxide related components originally installed in 2006 and the installation of potassium permanganate injection equipment and two inclined plate settlers (e.g., a Lamella Gravity Settler).

Although no additional significant changes are proposed for the ATP operation and maintenance based on the data presented herein, the system continues to be optimized following the upgrade to increase operational efficiency. The plant will also continue to operate at a flow rate of approximately 50 gpm each month, with continued maintenance to include the following:

- The influent piping will be inspected annually and cleaned, if necessary, during scheduled CIP events. This will prevent the build-up of precipitate within the system that could restrict flow.
- System components will be regularly inspected and replaced before the end of their operational life. This will minimize operational downtime associated with equipment failure.

5 Land Use Controls

In accordance with the LUCIP (Sovereign 2014), the Army conducts annual monitoring and maintenance activities, which include institutional controls (ICs) and affirmative measures.

5.1 Institutional Controls

The LUC area (Figure 4) is actively monitored, and any required changes to the area are updated in the LUCIP (Sovereign 2014), in consultation with and concurrence from the USEPA and MassDEP. Reports on the implementation and enforcement of the ICs are provided to the Town of Ayer and MassDEP, including any instances where groundwater extraction is observed.

A review of the ICs was conducted during 2023. The Town of Ayer will be completing the West Main Street Massworks project in 2023, which involves sidewalks, curbing, and paving. The West Main Street bridge (crossing the Nonacoicus Brook) is also scheduled to be replaced; no other new construction activities or other changes were observed.

5.2 Affirmative Measures

Affirmative measures for the SHL LUCs include the following:

- Annual informational pamphlets with contact information were distributed to properties within the NIA via the United States Postal Service in September 2023. The pamphlet was also provided to the Town of Ayer Board of Health on January 11, 2024, to post on its public website. A copy of the pamphlet is included in Appendix H.
- A door-to-door survey is conducted every 5 years at residences within the LUC area to provide the information pamphlet in person and general information on the groundwater moratorium. A survey was completed in 2019, with the next survey scheduled for 2024.
- A list of property owners and resident addresses within the LUC area is updated annually for implementation of the LUCIP actions noted; the LUCIP (Sovereign 2014) is distributed to appropriate parties.
- The Army meets with the Town of Ayer Board of Health annually or as needed if a change in the groundwater contamination distribution in the aquifer occurs. The Army met with Nashoba Board of Health Agency, Town Engineer and Town Manager on March 7, 2024, to discuss implementation of the land use controls. It was discussed that prior to the door-to-door survey in 2024 a notification will be provided by Army to the town to send to property owners and residents so they are aware of the survey.

In summary, no deficiencies or deviations from the LUCs were noted; no corrective actions are required. The completed LUCIP checklist, list of properties/addresses within the LUC area, and educational pamphlet are included in Appendix H.

Receipt
The samples were received on 6/16/2023 10:08 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.0°C and 3.9°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9060A_Diss: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-785368 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
U	Undetected at the Limit of Detection.

Narrative

Job Narrative
680-242110-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 10/24/2023 10:02 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.6°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6010C_DOD5: The method blank for preparation batch 680-804427 and analytical batch 680-804706 contained iron above the <CHOOSE_ONE> method detection limit (MDL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9060A_Diss: The low level check standard recovery associated with batch 680-805419 is outside the acceptance criteria for the following analyte(s): TOC.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description

Narrative

Job Narrative
680-242420-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/1/2023 10:12 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 0.8°C, 1.4°C, 2.6°C and 5.4°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-806892 was outside control limits: (680-242420-A-6 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 9060A_Diss: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 680-808659. A sample duplicate was analyzed with the batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Narrative

Job Narrative
680-242429-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/1/2023 10:12 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 0.6°C, 1.5°C and 3.2°C

Receipt Exceptions
The container label for the following samples did not match the information listed on the Chain-of-Custody (COC): SHL-5-FAL23 (680-242429-10).

-Sample -12 label does not match COC. Label on sample is "SHL-05-FAL23" collected @ 920. Time does not match sample with the same ID (sample 10).

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

REVISION

The report being provided is a revision of the original report sent on 11/22/2023. The report (revision 1) is being revised to report the re-analyzed metals results which were more consistent with historical site results.

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/2/2023 10:08 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 0.4°C, 0.6°C and 1.2°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9060A_Diss: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 680-808659. A sample duplicate was analyzed with the batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

REVISION

The report being provided is a revision of the original report sent on 11/22/2023. The report (revision 1) is being revised due to Revision to change -21 and -22 sample IDs per client request..

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/7/2023 9:53 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.1°C and 5.0°C

HPLC/IC
Method 9056A_OF_28D_D5: Due to the high concentration of Chloride, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 680-809261 could not be evaluated for accuracy and precision. The associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-807616 was outside control limits: (680-242677-B-28 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 9060A_Diss: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-808927. A sample duplicate was analyzed with the batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Narrative

Job Narrative
680-242827-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 11/10/2023 10:06 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 2.2°C

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 9060A_Diss: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 680-811544. A sample duplicate was analyzed with the batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

On 01/10/2023, 1 Sample(s), 0 Trip Blank(s) and 0 Field Blank(s) were received at SGS North America Inc - Orlando. at a maximum corrected temperature of 2.4 C. Samples were intact and chemically preserved, unless noted below. A SGS North America Inc. - Orlando Job Number of FC1773 was assigned to the project.

Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section. Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Metals Analysis By Method SW846 6020B

Matrix: AQ **Batch ID:** MP41715

Sample(s) FC1721-2DUP, FC1721-2MS, FC1721-2MSD, FC1721-2SDL were used as the QC samples for metals.

RPD(s) for Serial Dilution for Arsenic are outside control limits for sample MP41715-SD1. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).

SGS North America Inc. - Orlando certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. SGS North America Inc.- Orlando is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.

Metals Analysis By Method SW846 6020B

Matrix: AQ **Batch ID:** MP41796

Sample(s) FC2279-1MS, FC2279-1MSD, FC2279-1SDL, FC2279-1DUP were used as the QC samples for metals.

RPD(s) for Duplicate for Arsenic are outside control limits for sample MP41796-D1. RPD acceptable due to low duplicate and sample concentrations.

SGS North America Inc. - Orlando certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted. Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria. SGS North America Inc.- Orlando is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety.
