1 Introduction

SERES-Arcadis 8(a) Joint Venture 2, LLC (S-A JV) prepared this 2022 Annual Operations, Maintenance, and Monitoring Report for the United States Army Corps of Engineering (USACE) – New England District, under Contract Number W912WJ-19-D-0014. This report summarizes the long-term monitoring (LTM) program and operation and maintenance (O&M) activities conducted during 2022 at the Shepley's Hill Landfill (SHL) site, located at the former Fort Devens Army Installation (Fort Devens) in Devens, Massachusetts (Figure 1). LTM and O&M activities were conducted in accordance with the Long-Term Monitoring and Maintenance Plan Update (LTMMP Update; Sovereign Consulting, Inc. [Sovereign] 2015), the 2018 Addendum to the Long-Term Monitoring and Maintenance Plan Update (LTMMP Addendum; KOMAN Government Solutions, LLC [KGS] 2018), and the Quality Assurance Project Plan (QAPP) for the Annual Long-Term Monitoring and Maintenance Program (S-A JV 2020).

1.1 Site Location

Fort Devens is located approximately 35 miles northwest of the city of Boston, within the towns of Ayer and Shirley in Middlesex County and Harvard and Lancaster in Worcester County. Fort Devens was established in 1917 for military training and logistical support during World War I and operated as a permanent base from 1931 until closure by the Base Realignment and Closure Committee in 1996.

SHL encompasses approximately 84 acres in the northeast corner of the Main Post of Fort Devens (Figure 2). The landfill is bordered to the east by Plow Shop Pond and land formerly containing a railroad roundhouse, to the west by Shepley's Hill, to the south by recent commercial development, and to the north by wooded and residential areas. Plow Show Pond to the east drains to Nonacoicus Brook to the north, which flows north/northwest and discharges to the Nashua River. Nonacoicus Brook is located north of the landfill in the North Impact Area (NIA; Figure 3).

1.2 Site Background

The United States Army (Army) reportedly began operating SHL by the early 1940s; however, evidence from test pits within the landfill suggests earlier usage, possibly as early as the mid-19th century. SHL contains a variety of waste materials (more than 1.5 million cubic yards) that extend to a depth of approximately 40 feet (ft) below ground surface in the central portion of the landfill. Approximately 160,000 cubic yards (11% of the total waste mass) appear to have been emplaced below the water table in a former wetland, and peat deposits have been identified below the waste (Harding ESE 2003; Sovereign 2011).

The Massachusetts Department of Environmental Protection (MassDEP) approved the landfill closure plan for SHL in 1985. The landfill was closed in five phases between 1987 and 1993 in accordance with 310 Code of Massachusetts Regulations 19.000. Closure consisted of capping the landfill, covering the cap with soil and vegetation, installing gas vents and groundwater monitoring wells, and constructing drainage swales. The MassDEP issued a Landfill Capping Compliance Letter approving the closure in February 1996 (Harding ESE 2003; Sovereign 2011).

After closure of SHL, the Army completed remedial investigations (RIs) under the Comprehensive Environmental Response, Compensation, and Liability Act to characterize soil, sediment, surface water, and groundwater. RIs

confirmed the presence of various contaminants at the site, the most predominant of which is arsenic. A subsequent feasibility study and Record of Decision (ROD; USACE 1995) resulted in a remedial action, which included long-term O&M of the landfill cap, groundwater monitoring, and a contingent remedial component requiring the design and construction of a groundwater extraction and treatment system if the landfill cap did not result in a reduction of groundwater contaminant concentrations (primarily arsenic) below risk-based cleanup goals by 2008. The remedial action objectives for SHL are to:

- Protect potential residential receptors from exposure to impacted groundwater migrating from the landfill that contains chemicals in excess of United States Environmental Protection Agency (USEPA) maximum contaminant levels (MCLs).
- Prevent impacted groundwater from contributing to the contamination of Plow Shop Pond sediments in excess of human health and ecological risk-based concentrations.

Table 1, below, lists the contaminants of concern (COCs) identified in the ROD and their target cleanup levels (CLs). Of the COCs listed below, only arsenic, iron, and manganese are currently sampled as part of the LTM program, in accordance with the LTMMP Update and LTMMP Addendum (Sovereign 2015; KGS 2018, respectively).

µg/L = microgram per liter

In March 2006, the Army installed two extraction wells (EW-01 and EW-04) and constructed a groundwater extraction and treatment system. The system started with an initial pumping rate of 25 gallons per minute (gpm), which was gradually increased to a combined extraction rate of at least 50 gpm by 2014. In 2022, the arsenic treatment plant (ATP) average online extraction flow rate was 54.73 gpm, with an average effective flow rate (including downtime) of 48.05 gpm. During 2022, the system had an uptime of approximately 88%, with downtime due to routine O&M as well as periodic non-routine maintenance and repairs. System O&M is discussed in detail in Section 4.

In 2011, the Army investigated Red Cove/Plow Shop Pond (known as Area of Contamination [AOC] 72) located east of SHL. The AOC 72 RI (AMEC 2011) concluded that the SHL remedy in place in 2011 (landfill capping and groundwater extraction) did not eliminate groundwater flow and arsenic migration from SHL to Red Cove/Plow Shop Pond, and that groundwater discharge was contributing arsenic to sediment that could accumulate to levels that posed unacceptable risk to receptors. As a result, in August and September 2012, the Army installed a barrier wall between SHL and AOC 72 as a non-time critical removal action. Documentation of the barrier wall installation was provided in a Removal Action Completion Report (Sovereign 2013a).

In addition to LTM and O&M activities, land use controls (LUCs) were established for the NIA in 2013 (Sovereign 2013b), and the Army subsequently issued an LUC Implementation Plan (LUCIP) for SHL in 2014 (Sovereign 2014). The LUC area is shown on Figure 4 and discussed in Section 5.

2 Groundwater and Hydraulic Monitoring

Groundwater monitoring was conducted at SHL in 2022 in accordance with the LTMMP Update, LTMMP Addendum, additional work requested by USEPA, and QAPP (Sovereign 2015; KGS 2018; S-A JV 2020, respectively). Sampling events for 2022 occurred in May/June and October/November. Results of sampling are presented in the following sections.

The LTM program includes wells in the Barrier Wall Area, Landfill Area, Nearfield Area, NIA, and Upgradient Area. These sampling and hydraulic monitoring locations are summarized in Tables 2 and 3, respectively. A site plan showing the LTM well network is provided on Figure 5. Groundwater monitoring field forms, laboratory analytical reports, and data validation reports are provided in Appendix A, Appendix B, and Appendix C, respectively.

2.1 Hydraulic Monitoring

Groundwater elevations at SHL monitoring wells and piezometers, including piezometers used to monitor performance of the barrier wall, were gauged on April 28 and October 11, 2022. while the ATP was online and groundwater was being pumped from extraction wells EW-01 and EW-04. Hydraulic monitoring data are provided in Table 4. During each monitoring event, an electronic water level meter was used to measure depth to water with an accuracy of ±0.01 foot from the marked reference point at the top of the inside casing of each monitoring well/piezometer. LTM network wells were inspected, and new well locks were installed during the 2022 monitoring events where replacements were needed.

A total of 63 monitoring wells were measured during the spring 2022 monitoring event. In fall 2022, 143 monitoring wells and two staff gauges were measured; two of the four stream gauges included in Table 4 could not be accessed or viewed, as they are located in wetland areas and were partially obscured by vegetation.

Spring and fall 2022 groundwater elevation contour maps (Figures 6 and 7, respectively) were developed using survey data from the 2017 and 2018 monitoring well survey reports, which use the Massachusetts State Plane Coordinate System of North American Datum of 1983 for horizontal control and the North American Vertical Datum of 1988 (NAVD88) for vertical control. As described in Table 4, each groundwater contour map includes contour values for shallow overburden wells only; deep paired overburden well and bedrock well data were excluded, but several were used to assess vertical gradients. Similar to previous monitoring events, the water levels measured in fall 2022 illustrate that groundwater flows generally from the southwest to the north toward Nonacoicus Brook, with a deflection of groundwater flow to the north by the barrier wall in the area west of the wall. Groundwater elevations in overburden well locations were observed to be higher in spring than fall by an average of 1.78 feet (Table 4). Historical groundwater elevations from the last 5 years (2017 through 2022) are included in Appendix D; groundwater elevations in overburden well locations were observed to be lower in fall 2022 compared to fall 2021 by an average of 2.20 feet. The following groundwater hydraulic gradients were calculated in 2022:

- The gradient across the southern portion of the Landfill Area was calculated as 0.011 foot per foot (ft/ft) in fall 2022 using wells SHL-15 (Upgradient Area) and PZ-12-10 (Barrier Wall Area).
- The gradient across the northern portion of the Landfill Area was calculated as 0.010 ft/ft in fall 2022 using wells SHM-10-15 (Landfill Area) and SHL-23 (Nearfield Area).

- The gradient across the Nearfield Area ranged from 0.002 ft/ft (spring 2022) using wells EPA-PZ-2012-1A and SHP-2016-2A (Nearfield Area) to 0.004 ft/ft (fall 2022) using wells SHM-10-06A and SHM-10-16 (Nearfield Area).
- The gradient across the NIA ranged from 0.003 ft/ft (fall 2022) using wells SHM-05-40X and SHM-13-08 (NIA) to 0.004 ft/ft (spring 2022) using wells SHM-05-40X and SHM-13-03 (NIA), respectively.
- The gradient across the Barrier Wall Area was calculated as 0.097 ft/ft in spring 2022 and 0.032 ft/ft in fall 2022 using wells PZ-12-05 and PZ-12-06 (Barrier Wall Area).
- In general, the horizontal hydraulic gradient is steepest across the Landfill Area (typically two to three times greater in 2022) compared to other areas, and the gradient across the NIA is comparable to the gradient of the Nearfield Area.

The three sets of overburden and bedrock well pairs gauged during the fall 2022 monitoring event were assessed with respect to the presence of vertical gradients, as shown in Table 5. The vertical gradient observations are summarized below:

- A positive vertical gradient (downward flow component) was observed in the Upgradient Area from overburden to bedrock. This is consistent with recent historical observations.
- A positive vertical gradient (downward flow component) was observed in the Barrier Wall Area near Red Cove. Gradients have fluctuated between positive and negative over the last five fall gauging events (-0.006 to 0.002), most likely due to the relative degree of groundwater discharge from the bedrock towards Plow Shop Pond, compared to the relative degree of influence from the water levels in Plow Shop Pond at the time of gauging.
- A negative vertical gradient (upward flow component) was observed in the Nearfield Area. The gradient in this area has generally been positive/downward flow component in recent fall gauging events. However, some instances of upward flow have been observed in fall gauging events, with a similar gradient being observed in the fall 2018 event. These minor fluctuations are likely due to changes in precipitation from year to year and/or flow rates at the extraction wells at the time of gauging. At overburden triplet monitoring well SHM-05-41A/B/C, groundwater flow had both an upward and slight downward component from approximately 60 feet bgs toward the approximate 40 feet bgs and 95 feet bgs intervals.

2.2 Groundwater Sampling

A total of 63 and 109 well locations were sampled in spring and fall 2022, respectively. All locations were sampled in accordance with the LTMMP Update, LTMMP Addendum, and QAPP (Sovereign 2015; KGS 2018; S-A JV 2020, respectively). Two locations could not be sampled in fall 2022: monitoring well SHP-2016-07A did not have enough water to sample (0.19 feet) and monitoring well SHM-07-03 was observed to be destroyed during a Town of Ayer water main replacement project and subsequent roadwork/re-paving activities on Sculley Road.

Samples were collected in accordance with the procedures outlined in the Low Stress (low flow) Purging and Sampling Procedure for the Collection of Groundwater Samples from Monitoring Wells Revision 3 and 4 (USEPA 2017). Dissolved metals and dissolved organic carbon samples were field-filtered using a 0.45-micrometer polyethersulphone filter. Groundwater was purged using a bladder pump or peristaltic pump, depending on the measured water level. Groundwater was purged through a calibrated YSI multi-meter and a turbidity meter to

monitor groundwater chemistry parameters, and samples were collected upon achievement of field parameter stability. Calibration records are included in Appendix B.

Groundwater samples were submitted to Eurofins TestAmerica Laboratories (Eurofins) of Savannah, Georgia for the following analyses: dissolved metals (arsenic, iron, and manganese), chloride/sulfate, total alkalinity, and dissolved organic carbon. In accordance with the QAPP (S-A JV 2020), quality assurance / quality control (QC) procedures included the collection of field duplicate samples, matrix spike (MS)/matrix spike duplicate (MSD) samples, and equipment blank samples.

2.2.1 2022 Data Summary

The spring and fall 2022 sampling results are summarized in Tables 6 and 7, respectively. A summary of historical groundwater sampling results is provided in Appendix E. Figures 8 and 9 present dissolved arsenic concentration results for the spring and fall 2022 sampling events, respectively. The following is a summary of dissolved metals results from the sampling events conducted in 2022:

Spring 2022 Sampling Event

- Dissolved arsenic concentrations in groundwater exceeded the CL of 10 µg/L at 40 of the 63 sampled locations (63%, compared to 67% in 2021), with the highest concentration of 3,000 µg/L detected in extraction well EW-04 (Nearfield Area).
- Dissolved iron concentrations in groundwater exceeded the CL of 9,100 µg/L at 28 of the 63 sampled locations (44%, compared to 49% in 2021), with the highest concentration of 87,000 µg/L detected in well SHL-11 (Barrier Wall Area, east of Landfill Area, north of the barrier wall).
- Dissolved manganese concentrations in groundwater exceeded the CL of 1,715 µg/L at 20 of the 63 sampled locations (32%, compared to 33% in 2021), with the highest concentration of 8,800 µg/L detected in well EPA-PZ-2012-5B (Nearfield Area).

Fall 2022 Sampling Event

- Dissolved arsenic concentrations in groundwater exceeded the CL of 10 µg/L at 63 of the 109 sampled locations (58%, compared to 57% in 2021), with the highest concentration of 7,500 µg/L detected in well SHM-10-15 (Landfill Area).
- Dissolved iron concentrations in groundwater exceeded the CL of 9,100 µg/L at 43 of the 109 sampled locations (39%, equal to that in 2021), with the highest concentration of 80,000 µg/L detected in well SHM-10-14 (Landfill Area).
- Dissolved manganese concentrations in groundwater exceeded the CL of 1,715 µg/L at 37 of the 109 sampled locations (34%, compared to 31% in 2021), with the highest concentration of 9,600 µg/L detected in well EPA-PZ-2012-5B (Nearfield Area).

2.2.2 Arsenic Concentration Trends

Arsenic concentration trends over time were performed at 61 wells specified in the LTMMP Update (Sovereign 2015). Criteria for performing the statistical analyses include using wells that have a minimum of four rounds of data available and have dissolved arsenic concentrations greater than or equal to 10 µg/L. Of the 61 wells

specified in the LTMMP Update, a total of 26 wells (43%) had arsenic concentrations less than the CL in 2022, and a total of 35 wells (57%) exceeded the CL in 2022.

Arsenic data for the subset of 35 wells exceeding the CL in 2022 were evaluated using the Mann-Kendall trend test available in the ProUCL statistical software for environmental applications. The wells were evaluated to identify whether there are statistically significant trends for arsenic concentrations over time at each location at a 95% confidence level.

The evaluation identified that of the 35 wells statistically tested, 22 wells (63%) exhibited statistically significant decreasing concentrations, 11 wells (31%) exhibited no statistically significant trend, and two wells (6%; SHM-10-11 and SHM-13-05) exhibited increasing concentrations at the selected 95% confidence level. Monitoring well SHM-10-11 is in the southern portion of the Landfill Area. Monitoring well SHM-13-05 is located in the NIA; the concentration of arsenic at this well has fluctuated from approximately 6 µg/L to 18 µg/L (Appendix F). Results are shown in Table 8, below. Figure 10 shows the arsenic concentration trend results and identifies locations included in the LTMMP Update (Sovereign 2015) for trend evaluation that exhibited arsenic concentrations less than the CL in 2022. ProUCL outputs for each well are included in Appendix F.

b. SHM-13-03 was incorrectly listed twice in Data Quality Objective Step 5 of the LTMMP Update as SHP-13-03.
c. SHM-96-5B was incorrectly listed in Data Quality Objective Step 5 of the LTMMP Update as SHL-96-5B.

2.2.3 Groundwater Monitoring Field Parameters

Water quality parameters (including pH, specific conductivity, dissolved oxygen [DO], temperature, and oxidation-reduction potential [ORP]) were collected during each of the 2022 sampling events. ORP and DO are particularly significant field parameters at SHL, as they can be used as indicators of oxidation-reduction (redox) conditions in the aquifer (ITRC 2022). Under the reducing conditions present at much of the site, naturally occurring arsenic associated with iron and manganese oxyhydroxide minerals is released into solution due to reductive dissolution. For example, ferric iron present in the oxides is reduced to ferrous iron, which is more soluble. Similarly, solid manganese (Mn^{4+}) minerals are reduced to more soluble manganese (Mn^{2+}). These dissolution processes also release arsenic associated with the minerals; and the iron, manganese, and arsenic can then be detected in dissolved metals analyses. Microbial reduction of iron and manganese (frequently coupled to organic matter

oxidation) is most favorable in the absence of oxygen, and dissolved oxygen can reoxidize iron and manganese; therefore, low DO is expected in zones with elevated iron and manganese. The ORP is a measure of the presence of redox-sensitive species in solution (including iron and manganese). Therefore, higher concentrations of iron and manganese would be expected in locations where low/negative ORP values and low DO concentrations are measured (Gannett Fleming, Inc. 2011).

Metals concentrations and associated field ORP measurements from the spring and fall 2022 groundwater sampling events are shown in Tables 6 and 7. The summary of correlations presented below indicates that dissolved metals in groundwater at SHL are more likely to exceed the CL when the redox state in groundwater is reducing and that the redox condition of the aquifer influences whether groundwater meets or exceeds the CLs for arsenic, iron, and manganese.

Spring 2022 Sampling Event

- Of the 63 groundwater samples collected and analyzed for arsenic during the spring 2022 event, 40 samples had concentrations exceeding the CL for arsenic and 23 samples had concentrations that either were not detected above the limit of detection or were detected below the CL:
  - Of the 23 samples that met the CL for arsenic, DO and ORP measurements indicate that 12 samples (52%) were collected from locations where the aquifer was oxidizing (ORP greater than 50 millivolts [mV] and DO greater than 1 milligram per liter [mg/L]), 5 samples (22%) were collected from locations screened in groundwater that was moderately reducing (where either ORP was greater than 50 mV or DO was greater than 1 mg/L), and 6 samples (26%) were collected at locations with groundwater that was reducing (ORP less than 50 mV and DO less than 1 mg/L).
  - In comparison, of the 40 samples that exceeded the CL for arsenic, samples were generally collected from locations with more strongly reducing geochemical conditions: three samples (7.5%) from groundwater under oxidizing conditions, three samples (7.5%) from moderately reducing conditions, and 34 samples (85%) where the aquifer was reducing.
  - Of the samples that met the CL for arsenic, the mean ORP value was 106.7 mV (median of 111.0 mV) and the mean DO concentration was 2.16 mg/L (median of 2.51 mg/L).
  - In comparison, samples that exceeded the CL for arsenic had a lower ORP and DO concentration: a mean ORP of -78.3 mV (median of -84.7 mV) and a mean DO concentration of 0.70 mg/L (median of 0.75 mg/L).
- Locations where iron and/or manganese concentrations exceeded the CL generally overlapped with locations that exceeded the CL for arsenic, indicating reducing conditions in groundwater has affected all three of these naturally occurring metals:
  - Of the 28 samples that exceeded the CL for iron in spring 2022, 27 samples (96%) also exceeded the CL for arsenic.
  - Of the 20 samples that exceeded the CL for manganese in spring 2022, 16 samples (80%) also exceeded the CL for arsenic.

Fall 2022 Sampling Event

- Of the 109 groundwater samples collected and analyzed for arsenic during the fall 2022 sampling event, 63 samples had concentrations exceeding the CL for arsenic and 46 samples had concentrations that either were not detected above the limit of detection or were detected below the CL:

  - Of the 46 samples that met the CL for arsenic, DO and ORP measurements indicate that 35 samples (76%) were collected from locations where the aquifer was oxidizing, seven samples (15%) were collected from locations screened in groundwater that was moderately reducing, and four samples (9%) were collected at locations with groundwater that was reducing.
  - In comparison, of the 63 samples that exceeded the CL for arsenic, samples were collected from locations with more strongly reducing geochemical conditions: one sample (2%) from groundwater under oxidizing conditions, 33 samples (52%) from moderately reducing conditions, and 29 samples (46%) where the aquifer was reducing.
  - Of the samples that met the CL for arsenic, the mean ORP value was 171.7 mV (median of 172.7 mV) and the mean DO concentration was 2.10 mg/L (median of 1.86 mg/L).
  - In comparison, samples that exceeded the CL for arsenic had a lower ORP and DO concentration: a mean ORP of -46.3 mV (median of -67.9 mV) and a mean DO concentration of 1.04 mg/L (median of 0.99 mg/L).
- Locations where iron and/or manganese concentrations exceeded the CL generally overlapped with locations that exceeded the CL for arsenic, indicating reducing conditions in groundwater has affected all three of these naturally occurring metals:
  - Of the 45 samples that exceeded the CL for iron in fall 2022, 43 samples (96%) also exceeded the CL for arsenic.
  - Of the 37 samples that exceeded the CL for manganese fall 2022, 32 samples (86%) also exceeded the CL for arsenic.

2.2.4 Quality Assurance/Quality Control

Eurofins was the primary contract laboratory used for the spring and fall 2022 LTM sampling events. Eurofins is compliant with the United States Department of Defense (DoD) and Department of Defense (DOE) Consolidated Quality Systems Manual for Environmental Laboratories, Version 5.3 (Quality Systems Manual; DoD and DOE 2019) under the DoD Environmental Laboratory Accreditation Program and holds current National Environmental Laboratory Accreditation Program accreditation for applicable analytical methods.

As part of the 2022 groundwater sampling events, quality assurance/QC samples were collected to confirm that the data quality objectives were met for the laboratory analysis. Field duplicate samples were collected during sampling events to evaluate field precision at the rate of 10% (1 per 10 samples). MS/MSD pairs were also submitted at a rate of 5% (1 per 20 samples) to evaluate matrix effects on analytical precision and accuracy.

Analytical results from the 2022 sampling events were reviewed and evaluated for data acceptability by Laboratory Data Consultants, Inc. of Carlsbad, California in accordance with the USEPA Region 1 Environmental Data Review Program Guidance (USEPA 2018), the QAPP (S-A JV 2020), and the DoD General Data Validation Guidelines (DoD 2019). The method requirements from the Quality Systems Manual (DoD and DOE 2019) and the USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846 (USEPA 2014) were also used as supplemental information.

Laboratory Data Consultants, Inc. of Carlsbad, California reviewed and updated the database with appropriate data qualifiers as needed. Laboratory analyses were confirmed to have been performed in general compliance with the precision, accuracy, representativeness, completeness, comparability, and sensitivity requirements listed in the QAPP (S-A JV 2020). Sample results that were qualified as estimated (UJ/J) due to QC exceedances are

usable with caution; no results were rejected. Analytical results reported for the 2022 LTM samples were deemed valid and usable for intended purposes. The data validation reports and a summary of quality control exceptions noted for the SHL 2022 LTM sampling data are presented in Appendix C.

2.3 Conclusions

The results of the spring monitoring event and the more comprehensive fall 2022 site-wide monitoring event continue to illustrate a general groundwater flow direction from the west/southwest to the north toward Nonacoicus Brook, with a deflection of groundwater flow to the north in the area west of the barrier wall near Red Cove at Plow Shop Pond. Concentrations of arsenic, iron, and manganese in groundwater continue to exceed CLs in various wells at SHL and in the NIA (Tables 6 and 7). Locations where dissolved metals (arsenic, iron, and manganese) concentrations exceed the CL are generally under more reducing geochemical conditions than locations where dissolved metals concentrations meet the CL.

The groundwater monitoring program will continue in accordance with the LTMMP Update and LTMMP Addendum (Sovereign 2015; KGS 2018, respectively) until a new Long-Term Monitoring and Maintenance Plan (LTMMP) is prepared. As mentioned in Section 2.2, one monitoring well along Sculley Road (SHM-07-03) was destroyed by Town of Ayer roadwork activities prior to the fall 2022 monitoring event. The Army is not planning to re-install this well at this time, as it has been below the CL for arsenic since installation and below laboratory limits of detection (LODs) in 12 of 16 historical sampling events.

The 2022 scope included the following additional work requested by USEPA in addition to what is included in the LTMMP Update and LTMMP Addendum:

- Continued collection of geochemical and hydrologic data from the nested piezometers (SHP 2016-1A/B through SHP 2016-5A/B) in spring and fall, until fall 2022.
- Continued collection of geochemical and hydrologic data for a minimum of 5 years (through 2022) for USEPA-added wells to the monitoring network (SHM-05-39A/B, SHM-99-31A/B).
- Continued collection of water level data from piezometers SHP-2017-01 and SHP-2017-02 located near the extraction wells in spring and fall, until fall 2022.
- Continued collection of geochemical and hydrologic data from bedrock wells SHP-2016-06A/B/C and SHP-2016-07A/B in spring and fall, until fall 2022.
- Continued collection of hydrologic data from wells SHM-10-11, N6-P1, and SHP-99-35X in spring and fall to provide more hydraulic control in the southern portion of the landfill through fall 2022.

An updated LTMMP will be prepared in 2023 and submitted to the USEPA and MassDEP. The Army will be conducting an assessment to confirm the effectiveness of the barrier wall installed adjacent to Red Cove in 2023. The results of the assessment will be considered as part of the LTMMP update.

3 Landfill Maintenance and Monitoring

In accordance with the LTMMP Update (Sovereign 2015), SHL was inspected, and routine maintenance was performed during 2022. All landfill maintenance and monitoring activities were completed by Sovereign.

3.1 Landfill Inspection

The annual inspection identifies and corrects problems pertaining to the effectiveness of the cap system, erosional controls, gas vents, and sampling points. The landfill inspection report with supporting photographs is presented in Appendix G. A summary of the report findings is provided below:

- The surface cover had no new depressions. No tree or shrub growth was observed on the landfill surface during the inspection. Small tree and shrub growth on the margins of the landfill were removed during the annual mowing event.
- An annual inspection of the landfill and adjacent areas was conducted on October 25, 2022. The overall condition of the landfill, utility berm, and culverts was found to be satisfactory. Vegetation atop the utility berm was mowed during the annual mowing event. The southern drainage swale exhibited large vegetative growth that was removed during annual mowing activities. Vegetation in the northern drainage swales was also removed during annual mowing activities. No new topographic depressions or significant erosion was observed.
- Gas vent GV-3 was observed to be leaning at a 15 to 20 angle but is still functional and appears to be in otherwise good condition (see photograph in Appendix G). The remaining landfill gas points (LGPs) and gas vents (Figure 11) were in good condition.
- Monitoring wells and piezometers located on the landfill cap or perimeter that are currently part of the LTM network were observed to be in good condition overall.
- The landfill access road was observed to be in good condition. Minor rutting with ponded water from a recent rain event was observed along the northern portion of the access road. Rutting appears to have worsened compared to previous years.
- Perimeter fencing was not installed historically along much of the western boundary of the landfill and along the southeastern boundary near the railroad tracks. The fence gates across roads that access the landfill are secured with chains and padlocks.
- Some wetland encroachment was observed in the swales located in the southern portion of the landfill. However, the individual areas of encroachment are small and confined to the swales.
- The recreational field located south of the access road in the middle of the southern half of the landfill appeared to be in good condition. There was no tire rutting observed between the field and the landfill access road.

Sovereign provided the following recommendations for 2023:

- Continue monitoring for settlement that creates depressions.
- Continue monitoring for tree and shrub growth on the surface cover. Remove tree/shrub growth as necessary.
- Continue monitoring the utility berm for negative impacts on the drainage patterns.

- Continue annual inspections and mowing of the landfill cap, utility berm, drainage swales, and culverts (including removal of tree and shrub growth).
- Continue to monitor GV-3 to ensure the angle of the vent does not worsen. Continue monitoring the condition of the remaining LGPs and monitoring wells.
- Continue monitoring for erosion and depressions/settlement within the landfill and repair, as necessary.
- Conduct routine checks of the recreational field to confirm the integrity of the landfill cover, gas vents, and monitoring wells in this area.
- Rutting observed along the northern portion of the landfill access road will be repaired and regraded in winter 2022-2023. Continue to monitor road condition and repair as needed.

3.2 Landfill Gas Monitoring

Sovereign completed annual sampling of landfill gas vents and LGPs (Figure 11) on October 27, 2022. Sampling activities were conducted in accordance with procedures described in the MassDEP Landfill Technical Guidance Manual, as revised May 1997 (MassDEP 1997):

- Landfill gas monitoring is conducted by first capping off the gas vents and connecting the handheld monitoring devices to the sample port on the cap for the initial readings.
- Following collection of the initial readings, an adjustable flow rate sampling pump is connected to the sample port on the cap. Two vent volumes are purged from the gas vents using the sampling pump, and the post-purge monitoring readings are collected with the handheld monitoring device.
- Each handheld monitoring device is equipped with an internal pump and is allowed to operate for approximately one minute before recording the monitoring data.

Landfill gas sampling was conducted with a multi-gas meter and landfill gas meter and included the following parameters: volatile organic compounds (VOCs), oxygen, hydrogen sulfide, lower explosive limit (LEL), carbon monoxide, carbon dioxide, and methane. Each parameter was measured and recorded twice (initial reading and post-purge reading). Gas monitoring results (Table G-1 and Table G-2) and gas probe construction details (Table G-3) are provided in Appendix G. Results appear to be generally consistent or lower than historical observations. The landfill gas monitoring results are summarized below:

- Field readings of barometric pressure were relatively stable and ranged from 29.56 to 29.87 inches of mercury. The background barometric pressure ranged from 29.56 to 29.87 inches mercury at the ATP from the start of the day to the end of the day.
- VOC detections ranged from 0.0 to 1.0 parts per million (ppm) in initial readings, and all locations were 0.0 ppm in post-purge readings. The highest initial readings of 1.0 ppm (gas probes LGP-09-01XB and LGP-09-02X) decreased to 0.0 ppm post-purge.
- Oxygen ranged from 0.0 to 20.9% in initial readings; all locations were 20.9% post-purge.
- Hydrogen sulfide remained at 0.0 ppm for all initial and post purge readings.
- The LEL ranged from 0.0 to 99% (initial) and 0.0 to 5.0% (post-purge).
- Carbon monoxide remained at 0.0 ppm for all initial and post purge readings.
- Carbon dioxide detections ranged from 0.0 to 15.5% (initial) and 0.0 to 0.7% (post-purge).

- Methane detections ranged from 0.0 to 11.4% in initial readings; all locations were 0.0% post-purge. The highest initial readings were detected at gas probe LGP-05-05X.

4 Arsenic Treatment Plant Operations, Maintenance, and Monitoring

The SHL ATP treated and discharged 25,256,825 gallons of groundwater between January 1 and December 31, 2022 (Table G-4 and Table G-5), bringing the cumulative treated volume total to approximately 374,303,475 gallons since system startup in 2006 (Table G-6). All ATP operations, maintenance, and monitoring in 2022 was conducted by Sovereign; data are presented in the following sections.

4.1 System Description

The ATP is designed to remove dissolved arsenic from extracted groundwater through co-precipitation with iron followed by microfiltration (MF). The ATP consists of the following components:

- Extraction system (extraction wells EW-01 and EW-04)
- Chlorine dioxide generation and addition in order to oxidize iron
- Coagulation via a contact tank with a direct drive batch tank mixer
- MF of the water to concentrate precipitated solids
- Solids removal via an inclined plate clarifier
- Bag filtration and discharge of the inclined plate clarifier decant water
- Polymer-aided flocculation of sludge using a filter bed roll-off (FBRO)
- Treated water discharge to the Devens publicly owned treatment works.

Historical monthly discharge totals and an operational summary of the monthly online hours, flow totals, and operating status during 2022 are presented in Appendix G.

4.1.1 System Efficiency and Routine Maintenance

During 2022, the treatment plant was operational approximately 88% of the total available hours during the calendar year (i.e., "uptime"), which is equal to the uptime in 2021 (Table G-4). When online, the average flow through the plant during the year was 54.73 gpm. The plant achieved an effective average extraction rate (i.e., the extraction rate calculated by dividing the volume pumped by the elapsed time during the year, not the actual online time) of 48.05 gpm in 2022 (compared to 47.11 gpm in 2021).

The FBRO was emptied routinely (every 1 to 2 weeks) in 2022 due to high sludge generation from inorganics (primarily iron) in the influent. This is consistent with historical FBRO maintenance. A total of 264.68 tons of sludge were removed in 2022 by Global Remediation Services, Inc. (Table G-7). The sludge removal process was optimized, which resulted in zero downtime attributable to FBRO operations for the ATP in 2022.

Non-operational time is associated with both routine and non-routine system maintenance, repairs, and upgrades (Section 4.1.2). The ATP MF system continues to require periodic clean-in-place (CIP) procedures to prevent long-term fouling of the filter membranes (Table G-8). The Army has continued to optimize system operations, and currently CIP events are conducted once per month. Extended CIP events are conducted only in situations when the level of filter fouling is greater than normal, most likely because of a non-optimal dosage concentration of chlorine dioxide. No extended CIP events were required in 2022.

4.1.2 Non-Routine System Maintenance, Repairs, and Upgrades

This section details major system non-routine maintenance activities encountered or implemented, along with system upgrades completed during 2022. Monthly shutdown and maintenance events, along with associated system downtimes, are presented in Table G-8. The non-routine maintenance activities are summarized below:

- January 3, 2022 – Microfilter Pump P1 was replaced due to leaking seals.
- February 2, 2022 – The chlorine dioxide flow control valve was replaced during a routine CIP event.
- April 16, 2022 – The system shut down due to a low-pressure alarm. The input/output card for Pump P1 was replaced and the system was restarted.
- April 17, 2022 – The system shut down due to a low-pressure alarm. It was determined that the air compressor was failing and required maintenance by the manufacturer. The air compressor was subsequently serviced on April 19, 2022, and the system was restarted.
- May 1, 2022 – The system shut down due to a low-pressure alarm from air compressor failure. A manufacturer representative determined that compressor valve assembly was clogged and subsequently replaced the multi-purpose valve and instrument block. The system was restarted on May 6, 2022, following compressor repair.
- May 17, 2022 – The system shut down due to failure of the polymer skid static mixer. The mixer was replaced and the system restarted on May 18, 2022.
- June 2, 2022 – The fire suppression panel was replaced due to failure of the existing panel.
- June 10, 2022 – The input/output card for the Pump 1 variable frequency drive on the microfilter skid was replaced due to normal wear.
- June 12, 2022 – The system shut down due to a low-pressure alarm from air compressor failure. The compressor was restarted on June 13, 2022; however, the air compressor failed again later that same day due to overheating and low pressure. On June 14, 2022, a manufacturer representative removed and cleaned the oil scavenge line and associated check valve and rewired the pressure switch. The system was subsequently restarted.
- June 24, 2022 – The system shut down due to a low-pressure alarm from air compressor failure. Upon evaluation, it was determined that the temperature switch had failed, and the oil cooler was completely clogged and unusable. As a result of systemic failures throughout the air compressor, the air compressor was taken out of service, and a new air compressor was installed on June 30, 2022.
- June 30, 2022 – The potable water solenoid valve failed and was subsequently replaced on July 5, 2022.
- July 12, 2022 – The chlorine dioxide skid was serviced, the eductor and inline mixer were cleaned, and the backup chlorine gas cylinder flow control valve was removed from service. The flow control valve was subsequently replaced on July 20, 2022.
- August 9, 2022 – The input/output card for the Pump 1 variable frequency drive on the microfilter skid was replaced due to normal wear.
- August 15, 2022 – Potable water service to the building was disrupted due to work on Sculley Road. Water service was restored on August 16, 2022, and the system was restarted.
- August 19, 2022 – The sodium chlorite feed check valve was replaced.
- August 26, 2022 – The sodium chlorite feed line was replaced.

- August 22, 2022 – The system shut down due to high effluent sump alarms. The effluent pumps were subsequently serviced on August 26, 2022.
- September 20, 2022 – A microfilter relay failed and was subsequently replaced on September 23, 2022, and the system was restarted.
- September 26, 2022 – A faulty chlorine gas regulator was replaced.
- October 5, 2022 – The impellor for Effluent Pump No. 1 was replaced during a CIP event to minimize downtime.
- October 13, 2022 – The impellor for Effluent Pump No. 2 was replaced. Effluent Pump No. 1 was able to maintain total system flow during this period, and as a result, the work was conducted with no additional downtime.
- October 25, 2022 – The system shut down due to basket strainer high pressure alarm. The basket strainer was subsequently inspected and cleaned on October 26, 2022, and the system was restarted.
- November 2, 2022 – The system shut down due to a failure of the sludge pump switch. The switch was subsequently repaired on November 3, 2022, and the system was restarted.
- November 28, 2022 – The system shut down to replace a leaking potable water backflow preventer. The potable water backflow preventor was replaced and the system was restarted.

4.2 Arsenic Treatment Plant Monitoring

This section describes the ATP influent and effluent sampling conducted in 2022 to monitor for arsenic and other parameters. Samples were analyzed by SGS Laboratories of Dayton, New Jersey. The associated laboratory analytical reports and data validation reports for the ATP monitoring conducted by Sovereign are included in Appendix B and Appendix C, respectively.

4.2.1 Influent

ATP influent was sampled for metals (arsenic, iron, and manganese), VOCs, and dissolved gases (methane and ethane), as described in the sections below.

4.2.1.1 Metals

The ATP system influent is sampled quarterly for metals (arsenic, iron, and manganese). Although influent inorganic sampling is not required by ATP Landfill Discharge Permit Number 020 (Massachusetts Development and Finance Agency [MassDevelopment] 2019) or by the LTMMP Update (Sovereign 2015), it is monitored to gauge system loading and to verify that a sufficient iron concentration is maintained to promote iron and arsenic co-precipitation and coagulation. The original system design recommended a minimum iron concentration of 40 mg/L. Current influent iron concentrations remain above this level (average of 51.0 mg/L in 2022). The ATP was designed with a ferric chloride addition system with the ability to add ferric chloride to the influent if deemed necessary based on results of influent inorganic sampling; this component of the system has not been needed and has been decommissioned.

Average concentrations for arsenic, iron, and manganese in extraction well EW-01 since 2006 are 2.01, 71.72, and 2.20 mg/L, respectively; compared to average concentrations of 1.49, 66.15, and 2.18 mg/L in 2022. Average concentrations for arsenic, iron, and manganese in extraction well EW-04 since 2006 are 2.82, 35.85, and

2.17 mg/L, respectively; compared to average concentrations of 3.60, 44.88, and 2.17 mg/L in 2022. Influent loading concentrations of iron, arsenic, and manganese are presented and graphically illustrated in Table G-9.

4.2.1.2 Volatile Organic Compounds and Dissolved Gases

In accordance with the LTMMP Update (Sovereign 2015), and as part of the landfill closure monitoring program, annual ATP influent sampling was conducted for VOCs and dissolved gases (methane and ethane) in September 2022. Results are documented in Table G-10 and summarized below:

- Methane was detected at concentrations of 2,120 µg/L (EW-01) and 1,060 µg/L (EW-04) in the sampled influent, compared to the 2021 sampling results of 1,990 µg/L (EW-01) and 1,490 µg/L (EW-04).
- Ethane was detected at concentrations of 0.68 µg/L (EW-01) and non-detect (EW-04), compared to the 2021 concentrations of 0.53 µg/L (EW-01) and non-detect (EW-04).
- Total VOC concentrations were 10.84 µg/L (EW-01) and 3.05 µg/L (EW-04). These low concentrations of VOCs are consistent with historical observations.

4.2.2 Effluent

The USACE is authorized to discharge treated groundwater from the ATP to the Devens municipal sewerage system in accordance with Landfill Discharge Permit Number 020 (MassDevelopment). The current permit, which mandates effluent sampling for arsenic and other select parameters on a monthly, quarterly, and/or annual basis and a maximum daily flow of 93,600 gallons per day (65 gpm), was last renewed on June 28, 2022, and is in effect until June 28, 2025 (MassDevelopment 2022). There were no changes made to the permit conditions. Effluent sampling results are included in Appendix G and summarized below:

- Arsenic samples were collected monthly, with results ranging from 1.6 to 26.3 µg/L. As shown in Table G-11, each sampling result was below the effluent limitation of 75 µg/L (Mass Development, 2022).
- Select metals (barium, manganese, and magnesium) and other parameters (chloride, nitrate, and sulfate) were sampled quarterly (March, June, September, and December 2022) (Table G-12). Sampling for these parameters is required by the permit, but no effluent limitations have been established.
- Select metals (chromium [total], cadmium, copper, lead, silver, selenium, and mercury) along with total toxic organics and total petroleum hydrocarbons were sampled on an annual basis in September 2022 (Table G-13). Total toxic organics are equal to the sum of total VOCs, semi-volatile organic compounds, pesticides, and polychlorinated biphenyls. Concentrations of all parameters were within permit-defined discharge limitations.

4.3 Arsenic Treatment Plant Optimization and Recommendations

The deployment of pressure transducers in the extraction wells and the MF module upgrades in January 2015 have allowed for further optimization of the ATP. The pressure transducers deployed in the extraction wells have eliminated the potential exposure of the well screen to air that is known to cause iron fouling. Thus, system downtime has been reduced and the system can now be controlled in a manner to optimize flow rates to best

meet hydrogeologic capture goals. The MF module upgrades have increased the total number of MF modules to 10 and have allowed for an increase in the average flow rate and output of the ATP.

No significant changes are proposed for the ATP operation and maintenance based on the data presented herein. However, based on the results of pilot testing performed in 2021, the Army is in the process of preparing a design for the installation of an alternate metals removal technology to replace the existing MF system, which will improve the performance and safety of the ATP. This work will include modifying the oxidant from chlorine dioxide to a less reactive compound (i.e., permanganate) and use of an inclined plate settler (e.g., a Lamella Gravity Settler).

The plant will continue to operate at a flow rate of approximately 50 gpm each month, with continued maintenance to include the following:

- The influent piping will be inspected annually and cleaned, if necessary, during scheduled CIP events. This will prevent the build-up of precipitate within the system that could restrict flow.
- System components will be regularly inspected and replaced before the end of their operational life. This will minimize operational downtime associated with equipment failure.

5 Land Use Controls

In accordance with the LUCIP (Sovereign 2014), the Army conducts annual monitoring and maintenance activities, which include ICs and affirmative measures.

5.1 Institutional Controls

The LUC area (Figure 4) is actively monitored, and any required changes to the area are updated in the LUCIP (Sovereign 2014), in consultation with and concurrence from the USEPA and MassDEP. Reports on the implementation and enforcement of the ICs are provided to the Town of Ayer and MassDEP, including any instances where groundwater extraction is observed.

A review of the ICs was conducted during 2022. The Town of Ayer completed a water main replacement project on Sculley Road in 2022; no other new construction activities or other changes were observed.

5.2 Affirmative Measures

Affirmative measures for the SHL LUCs include the following:

- An informational pamphlet with contact information is distributed annually to properties within the NIA and is included on the Town of Ayer Board of Health website (https://www.ayer.ma.us/board-health/pages/shepleys-hill-landfill-resources) under the title "Fort Devens SHL Factsheet Final_October 2022."
- A door-to-door survey is conducted every 5 years with at residences within the LUC area to provide the information pamphlet in person and general information on the groundwater moratorium. A survey was completed in 2019, with the next survey scheduled for 2024.
- A list of property owners and resident addresses within the LUC area is updated annually for implementation of the LUCIP actions noted; the LUCIP (Sovereign 2014) is distributed to appropriate parties.
- The Army meets with the Town of Ayer Board of Health annually or as needed if a change in the groundwater contamination distribution in the aquifer occurs.

Educational pamphlets were mailed to occupants of properties identified within the LUC area via the United States Postal Service in October 2022. The educational pamphlet was also provided to the Town of Ayer Board of Health on January 30, 2023, to post on its public website.

In summary, no deficiencies or deviations from the LUCs were noted; no corrective actions are required. The completed LUCIP checklist, list of properties/addresses within the LUC area, and educational pamphlet are included in Appendix H.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
D	The reported value is from a dilution.
M	Manual integrated compound.
U	Undetected at the Limit of Detection.

Metals

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J1	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
U	Undetected at the Limit of Detection.

General Chemistry

Qualifier	Qualifier Description
J	Estimated: The analyte was positively identified; the quantitation is an estimation

Receipt
The samples were received on 10/15/2022 9:20 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.5°C, 2.7°C and 4.7°C

HPLC/IC
Method 9056A_OF_28D_D5: The matrix spike duplicate (MSD) recoveries for analytical batch 680-747920 were outside control limits. Non-homogeneity is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Receipt
The samples were received on 10/20/2022 10:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 3.6°C and 4.0°C

HPLC/IC
Method 9056A_OF_28D_D5: The matrix spike (MS) recoveries for analytical batch 680-749279 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-747095 was outside control limits: (680-223686-A-5 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Receipt
The samples were received on 10/20/2022 10:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.4°C and 3.6°C

HPLC/IC
Method 9056A_OF_28D_D5: The matrix spike (MS) recovery for analytical batch 680-749750 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Narrative

Job Narrative
680-224848-2

Receipt
The samples were received on 11/5/2022 11:38 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.6°C

HPLC/IC
Method 9056A_OF_28D_D5: The matrix spike duplicate (MSD) recoveries for analytical batch 680-753235 were outside control limits. Non-homogeneity is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Sample and MS/MSD for SHM-10-04-FAL22 (680-224848-5) were re-analyzed outside of holding time for sulfate and chloride du to QC failures in the original analysis.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2320B: The sample duplicate precision for the following sample associated with analytical batch 680-751150 was outside control limits: (680-224848-B-3 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client:	Sovereign Consulting	**Job No**	JD37967
Site:	Shepley's Hill (SHL), Devens, MA	**Report Date**	1/18/2022 5:22:44 PM

On 01/10/2022, 1 Sample(s), 0 Trip Blank(s) and 0 Field Blank(s) were received at SGS North America Inc. at a maximum corrected temperature of 3.8 C. Samples were intact and chemically preserved, unless noted below. A SGS North America Inc. Job Number of JD37967 was assigned to the project. Laboratory sample ID, client sample ID and dates of sample collection are detailed in the report's Results Summary Section.

Specified quality control criteria were achieved for this job except as noted below. For more information, please refer to the analytical results and QC summary pages.

Compounds qualified as out of range in the continuing calibration summary report are acceptable as per method requirements when there is a high bias but the sample result is non-detect.

Metals Analysis By Method SW846 6020B

Matrix: AQ **Batch ID:** MP30757

- All samples were digested within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) JD37967-1MS, JD37967-1MSD, JD37967-1SDL were used as the QC samples for metals.
- RPD(s) for Serial Dilution for Arsenic are outside control limits for sample MP30757-SD1. Serial dilution indicates possible matrix interference.

SGS North America Inc. certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting the Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

SGS North America Inc. is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. Data release is authorized by SGS North America Inc indicated via signature on the report cover
