Executive Summary

This Remedial Investigation (RI) Report has been prepared by the Seres-Arcadis 8(a) JV, LLC (JV) on behalf of the United States Army Corps of Engineers (USACE) to document the remedial investigation activities performed at the Nike Anti-aircraft Missile Battery BU-51/52 (Nike Battery), located in Hamburg, Erie County, New York (Nike Battery; **Figure 1-1**). The RI was conducted in compliance with the Defense Environmental Restoration Program statute (10 United States Code 2701 et seq.), which requires that remedial investigation activities to evaluate contamination caused by Department of Defense (DoD) activities at Formerly Used Defense Sites (FUDS) be carried out subject to and consistent with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) as amended (42 USC § 9601 et seq.), and the National Oil and Hazardous Substances Pollution Contingency Plan. This RI Report is consistent with the United States Environmental Protection Agency (USEPA) Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA (USEPA 1988). All work was conducted in accordance with procedures developed in the Final Uniform Federal Policy for Quality Assurance Project Plan, Remedial Investigation, Nike Anti-aircraft Missile Battery BU-51/52 (Nike Battery) Launch Area, Hamburg, Erie County, New York (SERES-Arcadis JV, LLC [JV] 2020) (herein referred to as Final RI QAPP).

Objective

In accordance with the FUDS assignment, the RI was conducted only within the former Nike Battery Launch Area (**Figures 1-2, 1-3 and 1-4**). The overall goals of the RI were to:

- Gather sufficient information to assess and delineate the nature and extent of impacts (if present) in soil and groundwater from Department of Defense (DoD) activities in the Launch Area of the former Nike Battery.
- Collect data sufficient to evaluate potential risks to human health and the environment.
- Collect data sufficient to meet USACE and regulatory requirements and support remedial alternative decisions, if needed, for the former Nike Battery Launch Area.

The objective of the RI Report is to provide data sufficient to meet USACE and regulatory requirements and support remedial alternative decisions, if needed, for the former Nike Battery Launch Area or to justify a determination of either No DoD Action Indicated or No Further Action. This objective was met while meeting the requirements of the following guidance documents:

- Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA. EPA/540/G-89/004. OSWER Directive 9355.3-01. Interim Final (USEPA 1988)
- Engineer Regulation (ER) 200-3-1 – Environmental Quality FUDS Program Policy (USACE 2004a)

Remedial Investigation Field Work Summary

RI activities at the former Nike Battery Launch Area were conducted from May 19, 2020 to March 5, 2021, in accordance with the Final RI QAPP (JV 2020). The methods and results of the RI activities are included in this RI Report. Fieldwork included the following primary tasks to meet the objectives of the RI:

- Ecological habitat assessment;
- Downgradient residential potable well survey;
- Overburden and bedrock groundwater monitoring well installation with collection of surface / subsurface soil samples from monitoring well borings;

- Surface and reference soil sampling;
- Groundwater sampling;
- Hydraulic conductivity testing.

In conjunction with the RI field work, four historical monitoring wells located within the Nike Battery were decommissioned.

Habitat Assessment

A habitat assessment was conducted to document ecological habitat, identify potential ecological receptors, and evaluate the potential for ecological exposure to constituents in soil. The results from the habitat assessment were presented to the USACE in a memorandum, which was provided as Appendix B of the Remedial Investigation Field Report, Former Nike Anti-Aircraft Missile Battery, BU-51/52 Launch Area, Erie County, New York (JV 2021). The results indicate that only small areas (approximately ½-acre) of successional old field at the site perimeter provide potential habitat. The former Launch Area is actively used by the county and is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn. Lawn areas are not a natural cover type and provide limited wildlife habitat. On site habitat does not support abundant and diverse populations of wildlife, and potential exposure for populations of ecological receptors (plants, soil invertebrates, birds, and mammals) is limited.

Soil Data Collection

Surface and subsurface soil samples were collected during installation of 16 overburden wells (sample ID MW designation) (**Figure 3-1**). Soil samples were collected from the top of native material to the water table and analyzed for target analyte list (TAL) metals and hexavalent chromium, target compound list (TCL) volatile organic compounds (VOCs), TCL semi-volatile organic compounds (SVOCs), hydrazines, grain size, total organic carbon, and moisture content. Soil samples from overburden monitoring well borings were collected from the following depths:

- A: Surface samples were collected from the top 1 foot of native material.
- B: Depth of 1 to 3 feet below ground surface (bgs), or the 2-foot interval immediately below the surface soil sample depth.
- C: Highest indication of contamination or just above first water-bearing zone if no indication of contamination.

Surface soil samples (0 to 1 foot bgs) (sample ID SL designation) were collected from eight locations associated with historical and current use of the former Launch Area (e.g., drum storage areas, generator building/transformer pad, acid storage shed, former missile silos) (**Figure 3-2**). Based on the activities conducted at these locations, surface soil samples were analyzed for TAL metals, TCL VOCs, TCL SVOCs, and hydrazines, to evaluate the potential risks associated with surface soil exposure to site users.

Three of the surface soil samples (0 to 1 foot) collected in the vicinity of the former transformer pad were analyzed for polychlorinated biphenyls (PCBs).

Reference surface soil (0 to 1 foot bgs) and subsurface soil (1 to 3 feet bgs) samples (sample ID BH designation) were collected from 16 locations and analyzed for metals and polycyclic aromatic hydrocarbons (PAHs) to gather site-specific information on naturally occurring and/or anthropogenic background conditions. The reference sample data were compared to concentrations in samples from the former Launch Area. The Reference Area is immediately northeast of the former Launch Area and is currently used by the Town for recreational purposes.

Groundwater Data Collection

New overburden and bedrock monitoring wells were installed to evaluate the nature and extent of groundwater impacts (if present) and for evaluation of vertical and horizontal groundwater flow patterns (**Figure 3-1**). Two rounds of sampling were conducted: September 2020 and December 2020. During each event, water levels of monitoring wells were measured, and groundwater samples were collected for analysis of TAL metals, TCL VOCs, TCL SVOCs, and hardness.

In general, there was little difference in the depth to water in the overburden and bedrock wells, indicating that overburden and bedrock groundwater are hydrologically connected with an assumed slight downward gradient. However, there were some exceptions where bedrock wells were slow to recharge and had lower water levels (i.e., NHFLA-MW5BR). Groundwater level measurements collected during the September 2020 (**Figure 4-4**) and December 2020 (**Figure 4-5**) sampling events were used to generate groundwater contour maps. The direction of groundwater flow in the overburden wells is to the south and the direction of groundwater flow in the bedrock wells is to the southeast.

Slug tests in overburden wells were used to evaluate hydraulic conductivity (**Table 4-1**). The locations of slug tests were distributed across the investigation area to be representative of the site as a whole. Falling head and rising head tests were performed on each well in accordance with the Final RI QAPP (JV 2020). With the exception of well NHLA-MW16, the wells recovered quickly during testing, indicating relatively high hydraulic conductivity. Well NHLA-MW16 took an extended time to recover, indicating a lower relative hydraulic conductivity.

Residential Wells Survey

A desktop and windshield survey were conducted within a 1-mile radius of the site to evaluate the potential presence of water supply wells at the adjacent residences. The survey did not identify residential wells within the survey area.

Soil and Groundwater Data Evaluation

The former Launch Area is currently owned by the Town of Hamburg and is used by the Highway Department for office space, truck garage space, and storage of gravel piles and road salt. The current and foreseeable future land use for the former Launch Area is industrial. Soil analytical data were therefore evaluated against May 2021 USEPA Regional Screening Levels (RSLs) for industrial soil. The soil data were also compared to residential soil RSLs to evaluate an unlimited use/unrestricted exposure scenario, which generally is the level at which all human exposure pathways present an acceptable level of risk for all land uses. However, future residential use of the former Launch Area is not considered a realistic or reasonable scenario based on the current land use and ownership, proximity to the Hamburg Landfill, and presence of historic underground silos.

Groundwater analytical data were evaluated against May 2021 USEPA Tapwater RSLs. This is a conservative comparison given that groundwater at the former Launch Area is not currently used, and is unlikely to be used in the future, as a drinking water source. Potable water is supplied to the former Nike Battery areas and nearby residents by the Erie County Water Authority, which receives surface water from Lake Erie and the Niagara River.

As discussed below, the data collected during the RI field investigation did not reveal impacts associated with past DoD-related activities and confirmed that no revision was needed to the site boundary. Therefore, the data collected are sufficient to complete the RI without the need for additional investigation.

Soil

Only metals and PAHs were present in the soil samples at concentrations exceeding the USEPA industrial RSLs (**Tables 4-2a, 4-2b, 4-2c**; **Figures 4-6a, 4-6b, 4-7a, 4-7b**). Further, these compounds were ubiquitous throughout the investigation area and they were also detected in the reference soil samples (**Tables 4-3a, 4-3b**; **Figure 4-8**). These data, combined with the fact that there are no localized areas of relatively elevated concentrations, indicate that the site soils have not been impacted by DoD-related activities and that no additional investigation of soil is required.

Groundwater

In groundwater, VOCs, composed primarily of benzene and ethylbenzene, were detected at concentrations exceeding the USEPA Tapwater RSL at only three locations (**Table 4-4a**; **Figure 4-9a**). Based on their isolated nature and location/distance from former DoD activity areas, these concentrations are not indicative of a release to the environment associated with past DoD activities.

Concentrations of SVOCs in groundwater exceeding the USEPA Tapwater RSL were detected at five locations (**Table 4-4b**; **Figure 4-9b**). However, these concentrations were within an order of magnitude of the RSLs and, based on their isolated nature and location/distance from former DoD activity areas, are not indicative of a release to the environment associated with past DoD activities.

Numerous metals were detected in groundwater at concentrations greater than the USEPA Tapwater RSLs in both the total and dissolved samples (**Table 4-4c**; **Figure 4-9c**). However, the same metals were detected in locations upgradient from the DoD activity areas as well as downgradient from those locations. Many of these metals (i.e., iron, manganese, aluminum) are ubiquitous in groundwater throughout the region.

In addition, storage, handling, and use of highly soluble road salts by the Town of Hamburg's Highway Department on and adjacent to the former Launch Area appears to have impacted groundwater, resulting in elevated concentrations of sodium, potassium, calcium, and magnesium in groundwater that is characteristic of typical road salts (i.e., sodium chloride [NaCl], potassium chloride [KCl], calcium dichloride [$CaCl_2$], and magnesium chloride [$MgCl_2$]). These road salts, when introduced into the soil at high concentrations, will displace other metals sorbed to clays and other charged surfaces or bound to organic matter. The result is elevated levels in the soil of both the road salts and the metals mobilized by the road salts then leaching to the groundwater at levels above expected background. Sodium, the most common element of the road salt used, is present in the groundwater at levels as much as 100-times higher than expected for groundwater in this area (USGS OFR 2013-1095). Because the use of these road salts varies year-to-year, and the relative mobility of the metal ions varies based on their individual geochemical characteristics, the relationship between individual road salts to other metals present in the groundwater in the Launch Area is complex. Although the relationship between these metals is complex, there is a significant correlation between calcium from the road salt and manganese concentrations in groundwater, and magnesium from the road salt and manganese concentrations in groundwater. Based on the distribution of metals throughout the site, and given the use of the former Launch Area as a town maintenance facility for more than 50 years, the metals detected in groundwater are related to storage of road salt at the site and are not indicative of a release to the environment associated with past DoD activities.

Baseline Risk Assessment Results

A baseline risk assessment (BRA) was conducted for the former Launch Area consistent with the approach outlined in the RAWP (JV 2020). The BRA included both a human health risk assessment (HHRA) and a screening level ecological risk assessment (SLERA) and was performed using the soil and groundwater data collected during the RI. The risk assessments followed appropriate guidelines from the USEPA and USACE.

The objectives of the HHRA were to evaluate potential human health risks and provide a basis for deciding if remedial action is necessary to protect human health. Exposure scenarios based on the current and most likely future industrial land use (i.e., current/most likely future scenarios) included indoor commercial/industrial worker exposure to surface soil, outdoor maintenance worker exposure to surface soil, and construction/utility worker exposure to surface and subsurface soil and shallow (i.e., overburden) groundwater. The potential for vapor intrusion from overburden groundwater to indoor air of on-site buildings was also evaluated, and no volatile constituents in overburden groundwater were detected at concentrations greater than commercial vapor intrusion screening levels (VISLs) associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient (HQ) of 0.1 (USEPA 2021c). The potential for vapor intrusion from overburden groundwater to indoor air of off-site nearby residences was evaluated, and benzene in a single overburden well at the former Launch Area was detected at concentrations greater than residential VISLs (based on 1×10^{-6} cancer risk or 0.1 HQ). However, no further evaluation was conducted because only two of the ten benzene concentrations in the selected overburden monitoring wells exceeded the residential VISL, and the maximum detected concentration was twice the residential VISL based on 1×10^{-6} excess lifetime cancer risk (ELCR), indicating that the estimated residential cancer risk (2×10^{-6}) would be within the USEPA and NCP acceptable ELCR range of 1×10^{-6} to 1×10^{-4} (i.e., 1E-04 to 1E-06) (USEPA 1990). Although potable water is supplied to the former Nike Battery areas and nearby residents by the Erie County Water Authority, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. Therefore, a hypothetical future potable use scenario was evaluated for on-site commercial/industrial workers and off-site residents.

The HHRA results indicated that for all current/most likely future on-site exposure scenarios, non-cancer hazards are less than 1 and are therefore acceptable, and ELCRs are less than or within the acceptable risk range of 1×10^{-4} to 1×10^{-6} (**Exhibit 6-1**). For the hypothetical future potable use scenarios, non-cancer HIs exceed 1 and ELCRs are within (for the commercial/industrial worker) or exceed (for the resident) the risk range of 1×10^{-4} to 1×10^{-6}. The potential for cancer risk to an off-site resident from hypothetical future potable use of groundwater is from benzene and bis(2-ethylhexyl)phthalate. The potential for non-cancer hazard is predominantly due to benzene, bis(2-ethylhexyl)phthalate, and thallium in groundwater.

Benzene was detected in 8 of the 39 groundwater samples, at concentrations ranging from 0.33 to 210 micrograms per liter (µg/L), however the second highest concentration is 11 µg/L. Benzene concentrations exceeded the Tapwater RSL at three locations (MW-4, MW-5, and MW-9). Benzene was not detected (< 0.500 µg/L) in upgradient groundwater samples. The sporadic nature of the benzene detections in groundwater is not indicative of a widespread release. Benzene is widely distributed in the environment and can be released to soils through multiple sources including gasoline leaks (Agency of Toxic Substances and Disease Registry [ATSDR] 2007). Once in the environment, benzene is subject to volatilization, photooxidation (on the surface), and biodegradation (ATSDR 2007). Given the time (more than 50 years) since the DoD activities at the site and benzene's fate and transport characteristics, the presence of benzene in groundwater is likely not associated with historical DoD activities at the former Launch Area.

bis(2-Ethylhexyl)phthalate was infrequently detected in groundwater and a single concentration at one location (MW-4) exceeds the Tapwater RSL. bis(2-Ethylhexyl)phthalate was also detected in upgradient groundwater at an estimated concentration of 2.2 µg/L. A review of lab reports for a subset of the highest bis(2-

ethylhexyl)phthalate results in soil indicated results were biased high with potential for lab contamination. The USEPA (1989) notes that phthalate esters are considered common laboratory contaminants. Similarly, bis(2-ethylhexyl)phthalate is found in many consumer products, including tablecloths, shower curtains, furniture and automobile upholstery, garden hoses, floor tiles, sheathing for wire and cable, and food packaging materials (National Center for Biotechnology Information 2021). ATSDR (2007) reported an estimate that 92% of U.S. domestic supplies of bis(2-ethylhexyl)phthalate are released to landfills (USEPA 1981 as cited in ATSDR 2007). Similar to benzene, biodegradation is an important fate process for bis(2-ethylhexyl)phthalate in water and soil, albeit slower in soil (ATSDR 2007). Given the time (more than 50 years) since the DoD activities at the site, the multitude of potential sources, and the fate and transport characteristics of bis(2-ethylhexyl)phthalate, this contaminant is likely not associated with historical DoD activities.

Thallium was detected in half of the overburden and bedrock groundwater samples. However, concentrations in only two samples exceeded the background value of 0.82 µg/L. The HHRA likely overestimated the thallium exposure concentration because a maximum of 1.4 µg/L was used to evaluate the potable use scenario, and the mean of detected thallium concentrations is 0.32 µg/L. Thallium in the environment may be a result of coal use and/or emissions, and its previous use at the site has not been reported. Additionally, given the use of the former Launch Area as a town maintenance facility for more than 50 years, thallium is not likely attributable to historical DoD activities at the former Launch Area.

Although the habitat characterization identified the former Launch Area as highly disturbed with marginal habitat, a SLERA was performed to evaluate the likelihood of adverse ecological effects occurring as a result of exposure to constituents associated with the former Launch Area. Potential risks to ecological receptors were evaluated by comparing soil data from areas of the site with potential habitat to conservative ecotoxicological benchmarks. The SLERA results indicate that on site habitat does not support abundant and diverse populations of wildlife, and potential risk for populations of ecological receptors (plants, soil invertebrates, birds, and mammals) is limited.

Recommendations

The results from the HHRA indicate that no response action is required to be protective of human health. Similarly, the results from the SLERA indicate that the habitat at the former Launch Area is limited, and the potential for ecological exposure is expected to be low. Therefore, the findings of the RI support the conclusion that no further investigative or remedial actions are required for the former Nike Battery Launch Area.

1 Introduction

The Seres-Arcadis 8(a) Joint Venture (JV), LLC (hereafter referred to as the JV) has prepared this Remedial Investigation (RI) Report on behalf of the United States (U.S.) Army Corps of Engineers (USACE) to document the activities and results of a Comprehensive Environmental Response, Compensation, and Liability Act-(CERCLA-) compliant RI at the former Launch Area of the former Nike Anti-aircraft Missile Battery BU-51/52 (Nike Battery), a Formerly Used Defense Site (FUDS), located in Hamburg, Erie County, New York. The USACE oversees the FUDS program. The Nike Battery designated FUDS project number is D01MA002207. This RI Report has been prepared in accordance with the following:

- U.S. Environmental Protection Agency (USEPA) Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA (USEPA 1988);
- Engineer Regulation (ER) 200-3-1 – Environmental Quality FUDS Program Policy (USACE 2004).

RI field work was conducted in accordance with the field investigation procedures presented in the Final Uniform Federal Policy for Quality Assurance Project Plan, Remedial Investigation, Nike Anti-aircraft Missile Battery BU-51/52 (JV 2020; herein referred to as Final RI QAPP), with exceptions noted herein.

The JV performed this RI under Hazardous Toxic and Radioactive Waste (HTRW) Architect-Engineer Services Indefinite Delivery/Indefinite Quantity Contract No.: W912WJ-19-D-0004, Task Order (TO) W912WJ19F0123. This TO was issued and is being administered by USACE, New England District (CENAE) including overall project management, stakeholder coordination, and regional support. The work conducted under this TO falls under the Defense Environmental Restoration Program (DERP) – FUDS Program. In addition, 29 Code of Federal Regulations (CFR) 1910.120 applies to actions taken at this site. The Nike Battery environmental investigation activities were performed under the CERCLA as amended by the Superfund Amendments and Reauthorization Act and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) to the maximum extent practical and pursuant to ER 200-3-1, dated May 10, 2004.

1.1 Purpose

The overall goals of the RI were to:

- Gather sufficient information to assess and delineate the nature and extent of impacts (if present) in soil and groundwater from Department of Defense (DoD) activities in the Launch Area of the former Nike Battery.
- Collect data sufficient to evaluate potential risks to human health and the environment.
- Collect data sufficient to meet USACE and regulatory requirements and support remedial alternative decisions, if needed, for the former Nike Battery Launch Area.

1.2 Site Background

1.2.1 Site Location

The Nike Battery is located on Lakeview Road in Erie County, Hamburg, New York, approximately 5 miles southeast of Lake Erie (**Figure 1-1**). The layout of the Nike Battery is shown on **Figure 1-2**. The Town of Hamburg is the current owner of the Nike Battery (USACE 1991).

This RI Report focuses on the former Launch Area of the Nike Battery, which the Town of Hamburg's Highway Department currently uses for office space, truck garage space, and storage of gravel piles and road salt. In addition, the area was observed during the September 2020 site visit to be used for accumulation of household hazardous waste (i.e., paint cans) and electronic waste (i.e., televisions). The former Launch Area is bound on the north by Interstate 90; on the west by the Easement Area; on the east by residential areas; and on the south by residential areas, Lakeview Road, and Eighteen Mile Creek. The closest residential housing is located approximately 500 feet to the south on Lakeview Road. A closed and capped landfill, formerly operated by the Town, is located north of and adjacent to the former Launch Area.

Figure 1-3 provides historical site features of the former Launch Area from the period of DoD ownership. **Figure 1-4** provides current features of the Nike Battery under ownership of the Town of Hamburg. The former Launch Area is a FUDS-eligible HTRW project.

1.2.2 Historical Information

During the Cold War, the U.S. Army developed the Nike anti-aircraft missile to protect population centers and important industrial and military installations (Hamburg Historical Society 2019). Between December 1955 and May 1956, the DoD acquired approximately 57 acres by various deeds and condemnation proceedings and 95 acres in easements to develop the Nike Battery, which operated from 1956 until its closure in 1961 (USACE 1991). During that period, the former battery consisted of a Launch Area, a Control Area, and an Easement Area. The Launch Area contained the facilities and equipment required to assemble, test, and maintain the missiles and launchers. The approximately 150-acre former Nike Anti-aircraft Missile Battery BU-51/52 property was roughly rectangular in shape, trending southwest-to-northeast.

The former Launch Area contained a total of 60 Nike Ajax supersonic missiles, which were stored horizontally in six underground silos (also known as magazines; Hamburg Historical Society 2019). Based on historical information, typical Nike Ajax missile silos were up to approximately 20 feet deep; however, as noted below, the silos at this site could not be directly observed during this study as they had been filled with crushed asphalt by the Town of Hamburg. Above ground, there were four launchers per silo. The missiles were brought to the surface by an elevator and then attached, via a system of rails, to a launcher (Hamburg Historical Society 2019). The aboveground components of the silos have been demolished, and the subsurface elements of the silos were recently filled with asphalt road filings by the Town (Communication with Darren Smith, Town of Hamburg Deputy Highway Superintendent, September 10, 2019).

The Control Area contained the electronic equipment for target tracking, missile guidance, and missile fire control. The purpose of the Easement Area was to maintain line of sight distance between the Control Area and Launch Area. The Control Area and Easement Area are located northeast of the former Launch Area and are currently used as the Town of Hamburg's Lakeview Recreational Area including a playground, sledding hill, ball fields, and a BMX (bicycle off-road racing and trick riding) track. Neither the Control Area nor the Easement Area are FUDS-eligible.

The DoD also used a sewage treatment plant located on the southern side of North Creek Road (**Figure 1-3**). During the course of the RI, it was discovered that the treatment system is active and has been used by the Town of Hamburg since it was acquired from the DoD. As such, is not possible to distinguish impacts from the DoD versus the Town. The Town's beneficial re-use of the sewage treatment plant renders it ineligible under FUDS and the sewage treatment plant was not assessed in this RI (JV 2020).

On June 1, 1965, the DoD transferred the Nike Battery property to the General Services Administration (GSA; USACE 1991). In 1968, GSA conveyed the 57 acres to the Town of Hamburg, New York (USACE 1991).

A closed and capped landfill, constructed and formerly operated by the Town, is located adjacent to the former Launch Area. The Town of Hamburg began operating the Hamburg Landfill in 1970. The landfill is not FUDS-eligible because it was constructed and operated by the Town of Hamburg after the Nike Battery closure. The Hamburg Landfill is identified as Site 915097 in the State of New York's Inactive Hazardous Waste Site ('State Superfund') Program. The landfill was permitted "under New York Codes, Rules and Regulations Part 360 for trash, rubbish, construction and demolition (C&D) material, and other non-putrescible, non-industrial wastes" (New York State Department of Environmental Conservation [NYSDEC] 2017). Empty and partially empty drums may have been illegally dumped at the landfill, some of which contained potentially hazardous wastes (NUS Corporation 1987). The landfill was closed in 1984 and covered with approximately 2 feet of soil. According to NYSDEC, the landfill is not a health risk for residents because access is restricted; however, Town of Hamburg employees could be exposed to contaminated groundwater and soil if the landfill is disturbed. Improvements were made to the landfill cap in 2008 (GZA Environmental [GZA] 2018).

The Town of Hamburg police department uses the area formerly occupied by the enlisted men's barracks along the northwestern property boundary for the special weapons and tactics (SWAT) team activities, and as a firearm training center. This includes a small arms range with an earthen backstop berm (**Figure 1-4**). As shown on Figure 1-4, the wellhead from a former natural gas production well is still present in the eastern portion of the former Launch Area. This well is not active.

1.2.3 Previous Investigations

Previous investigations have been conducted at the former Launch Area, former Control Area, Easement Area, and Hamburg Landfill. However, because the focus of this RI is the former Launch Area, the discussion below is limited to previous investigations of this area and nearby residences along Lakeview Road.

1.2.3.1 1989 Confirmation Study and Contamination Evaluation

In 1988, Metcalf & Eddy (M&E) conducted an Inventory Phase Investigation for USACE, Kansas City District for the former Nike Battery (Launch Area only). The investigation included: 1) a site visit to collect background information and to determine sampling locations; 2) installation of four monitoring wells; 3) sampling and analysis of groundwater, soil, silo water, and tank oil to evaluate the potential for contamination at the Nike Battery; and 4) evaluation of physical and analytical data (M&E 1989).

Because no records of spills during operation and maintenance of the Nike BU-51/52 Site were found, the Contamination Study evaluated general disposal practices at Nike sites to determine which contaminants could potentially be attributed to Nike BU-51/52. The general disposal practices were compiled from documents that cited interviews with former Nike workers and from Nike Operations Manuals. In general, Nike sites handled, stored and disposed of missile fuels and components as well as used solvents, fuels, hydraulic fluids, and paint. Based on the known general disposal practices at Nike sites, M&E analyzed groundwater, silo water, and soil samples for volatile organic compounds (VOCs), total petroleum hydrocarbons (TPH), and total metals (M&E, 1989).

Methylene chloride and acetone were the only VOCs detected in the soil samples, but the presence of these compounds was not believed to be related to past DoD activities. Metals detected in soil included arsenic, barium,

cadmium, chromium, lead, and selenium. Arsenic and chromium exceeded industrial RSLs but were below the concentrations of metals reported in Concentrations of Selected Analytes in Rural New York State Surface Soils: A Summary Report on the Statewide Rural Surface Soil Survey (NYSDEC 2005). Cadmium, lead, and selenium were detected above Eco-SSLs, but below the concentrations of metals detected during the Statewide Rural Surface Soil Survey (NYSDEC 2005). Groundwater results were compared to USEPA Maximum Contaminant Levels (MCLs) and NYSDEC Class GA Groundwater Standards in force at the time of the M&E Study in 1989. Arsenic, cadmium, and lead exceeded the MCLs in groundwater and silo water samples.

The Contamination Evaluation (M&E 1989) noted that the potential for chromium and lead contamination at Nike sites is well documented. While chromium was not detected above reference criteria, it was detected in both groundwater and silo water. Chromium is a constituent of cleaning reagents that are used to remove corrosion from metal. Chromium and lead are both constituents of paint that was used on military installations. Lead is the primary constituent in battery electrolyte for storage batteries (M&E 1989).

The Contamination Evaluation also noted that past DoD activity may be responsible for the chromium and lead, but the source of the arsenic, barium, and cadmium was not clearly defined (M&E 1989).

1.2.3.2 1991 Inventory Project Report

In 1991, USACE New York District conducted a site survey of the Nike Battery to assess the presence of unsafe debris, hazardous waste impacts, and unexploded ordnance and completed an Inventory Project Report (INPR). The INPR determined that based on the historical DoD use, the Nike Battery was FUDS-eligible. The INPR recommended that an underground storage tank (UST) located at the site be properly abandoned, with soil excavation as necessary under New York State (NYS) Petroleum Bulk Storage Regulations, that monitoring wells previously installed by M&E for USACE be resampled to confirm the presence of metals in groundwater, and a risk assessment be performed. Specifically, the INPR Findings and Determination of Eligibility sheet proposed a public health assessment to determine the risk to public health from contamination at the site resulting from DoD activity. The INPR further recommended that the assessment should include resampling of groundwater and silo water to confirm elevated levels of metals, and address other potential sources of contamination (USACE 1991).

1.2.3.3 1999 NYSDEC UST Removal

In 1999, the NYSDEC opened spill number 987548 due to sheen observed in soil during excavation of two USTs from the Nike Battery by the Town of Hamburg. The Town removed a 550-gallon UST from the former Launch Area and an 8,000- to 9,000-gallon UST from the former Control Area (GZA 1999). Both USTs historically contained petroleum products, and petroleum-impacted soil from the excavation area was disposed off-site.

1.2.3.4 1999 Environmental Study, Nike Base/Hamburg Landfill

In 1999, the Town of Hamburg hired GZA to conduct a records search and media sampling at the former Nike Battery Launch, Control, and Easement Areas and the Hamburg Town Landfill. The results of their records search indicated four areas of concern:

- Former Launch Area, including the acid neutralizing pit; aboveground storage tanks (ASTs); USTs; septic system and leach field; and potential contamination in former missile silos.
- Easement Area: potential for oil, pesticides, and herbicide contamination

- Former Control Area: ASTs, USTs, septic system and leach field, and dry wells
- Inactive Landfill: Alleged illegal drum disposal in the 1970s, and burning of flammable, combustible, and hazardous material from the production of urethane foam in 1983.

GZA collected 36 surface soil, 18 subsurface soil, and 11 groundwater samples throughout the Nike Battery in two sampling rounds. In addition, surface water and sediment samples were collected from 14 locations and air samples from three locations (GZA 1999). Consistent with the 1989 results, arsenic and chromium in surface soil samples exceeded industrial RSLs but were below the concentrations of metals reported in the Statewide Rural Surface Soil Survey (NYSDEC 2005). Thallium was detected in one surface soil sample collected downgradient of the former Launch Area, and the thallium concentration exceeded the 2019 USEPA industrial soil Regional Screening Level (RSLs). Thallium was not detected at sufficient frequency to be included in the rural soil survey (NYSDEC 2005). Thallium was not detected in subsurface soil or groundwater. High concentrations of benzene and ethylbenzene were noted in a groundwater sample collected from GZA-MW-4 located downgradient of a suspected fuel tank (GZA 1999). High concentrations of cadmium, manganese, and total cyanide were noted in well ME-MW-2.

1.2.3.5 1999 Results of Groundwater Sampling of Neighboring Wells

In 1999, the New York State Department of Health (NYSDOH) sampled nine residential sumps and wells near the former Launch Area (NYSDOH 1999). Samples were analyzed for VOCs, semi-volatile organic compound (SVOCs), and metals. Benzene, toluene, ethylbenzene, and xylenes (BTEX) and metal concentrations were detected above regulatory limits or applicable screening levels at the Lakeview Road residences of Dr. Donald Hellert and Mr. Robert Martin, located immediately south of the site. Groundwater VOC concentrations were above regulatory limits or applicable screening levels at sample location BW-1. Groundwater metal concentrations were above regulatory limits or applicable screening levels at sample locations BW-1 (Robert Martin property) and DW-1 (Donald Hellert property).

1.2.3.6 1999 Soil and Groundwater Quality Investigations of Lakeview Properties

Based on the NYSDOH sampling results, Dr. Donald Hellert and Mr. Robert Martin hired Mr. Thomas Hellert, hydrogeologist, to investigate soil and water quality on their two Lakeview Road properties (Hellert 1999). Results of the groundwater analysis indicated the presence of ethylbenzene and xylenes, 2-butanone, and acetone at concentrations above NYSDEC Class GA criteria in groundwater. Metals detected in groundwater at concentrations above NYSDEC criteria included arsenic, beryllium, cadmium, chromium, lead, nickel, and zinc. The two surface soil samples exhibited arsenic, beryllium, cadmium, chromium, lead, nickel, and zinc concentrations above the NYSDEC criteria for soil.

1.2.3.7 2000 Site Investigation, Former Nike Battery BU-51/52

In 2000, Battelle conducted a site investigation (SI) at the former Launch Area for CENAE to determine the presence and magnitude of subsurface contamination and to look for evidence of southward migration of contaminants from the site. Battelle installed and sampled three soil borings at the former Launch Area and four monitoring wells at nearby residences on Lakeview Avenue. Samples were analyzed for metals, VOCs, and SVOCs. Soil samples were also analyzed for TPH (Battelle 2000a). Of the 15 metals detected in subsurface soil, only concentrations of arsenic, chromium, and thallium exceeded 2019 USEPA industrial soil RSLs. Concentrations of arsenic and thallium in soil samples from the former Launch Area were in the same order of

magnitude as those from nearby residences. Groundwater analytical results indicated that 15 of 23 metals were detected; however, arsenic and chromium (found in soil) were not among the detected metals in groundwater. Thallium concentrations in groundwater exceeded the 2019 USEPA Tapwater RSL but were less than the MCL. Barium was present at concentrations that exceeded the 2019 USEPA MCL in the groundwater samples from MW-4 (installed at a nearby residence; Battelle 2000a). Although barium is a component of tracer ammunition, it is not a component of munitions associated with Nike Anti-Aircraft Missiles. However, it is a component of numerous metals alloys and road salts/brines and, as noted in this report, both scrap metals and road salts are stored at the site by the Town of Hamburg Highway Department. Barium is also a component of fluorescent light bulbs, which may have been components of municipal waste placed in the landfill located at the site. Benzene was the only VOC present at concentrations that exceeded the MCL, with the highest concentration in GZA-MW-4 (Battelle 2000a).

Battelle concluded that the levels of contamination of subsurface soil and groundwater were low at the perimeter of the former Launch Area. They also concluded that hydrazine (a component of rocket fuel) was detected only in samples near the perimeter of the former Launch Area and not in residential soil. Battelle recommended completion of a screening level human health risk assessment (HHRA) to confirm the low likelihood of adverse impacts.

1.2.3.8 2000 Screening Level Human Health Risk Assessment

The HHRA performed by Battelle (2000b) evaluated potential risks to Lakeview Road residents south of the former Launch Area from exposure to DoD-related chemicals in soil, groundwater, and sump water. Results of five independent investigations previously conducted by the State of New York and independent entities were used for the public health risk assessment. Constituents of potential concern (COPCs) in soil included cadmium, nickel, thallium, zinc, hydrazine, and TPH. All volatile chemicals detected in soil, groundwater, and sump water were retained as COPCs for the vapor migration to indoor air evaluation; only the adult indoor air exposure through vapor intrusion was evaluated (e.g., inhalation of indoor air for children and shower inhalation were not evaluated). Total cancer risks for residential exposures to soil (dermal contact, incidental ingestion, and vegetable consumption) based on the maximum and average detected concentrations were less than the USEPA's acceptable risk range of 1×10^{-6} to 1×10^{-4}, and non-cancer hazard indices (HIs) were below 1. Inhalation risks and hazards for adult residential vapor intrusion exposure to volatile constituents in soil, groundwater, and sump water were also less than 1×10^{-6} and 1, respectively. The assessment concluded that the risks and hazards were within acceptable ranges, indicating that adverse health effects to residents near the former Launch Area were unlikely.

1.2.3.9 2003 Amendment to INPR

An amendment to the INPR, issued in October 2003, recommended a Potentially Responsible Party (PRP)/HTRW project to "investigate the use of the USTs at the property subsequent to DoD ownership…" (USACE 2003a). Subsequently, the USTs were removed from the former Control Area; all required cleanup was completed, and the HTRW project was closed.

1.2.3.10 2003 NYSDEC UST Removal

In 2003, four additional USTs were removed from the former Control Area (two 2,000-gallon USTs and two 4,000-gallon USTs) under NYSDEC spill number 0375052. Petroleum-impacted soils from the excavation area and the USTs were disposed off site (USACE 2003b).

1.2.3.11 2018 Records Review and Site Visit

In June 2018, Bluestone, CENAE, and Avatar Environmental, LLC (Avatar)] conducted a site visit at the former Nike Battery to collect information for development of a sampling/investigation plan for HTRW contamination that may or may not require removal/remedial action, with a goal to close the Site from DoD liability. The records review and site visit memorandum noted that the team visited the former Launch Area as well as a wetland mitigation pond, the former Control Area, and the Twin Ponds Area (Bluestone 2018)..

1.3 Report Organization

This RI Report is prepared consistent with Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA (USEPA 1988). Specifically, this report includes the following:

- **Section 1: Introduction** – presents the purpose of the project and report with a description of work authorization, an overview and history of the site being addressed, previous investigations, and organization of the report.
- **Section 2: Physical Characteristics** – discusses the general site characteristics, including climate, geology, hydrology, natural resources, and surface features.
- **Section 3: Remedial Investigation Field Work** – details the approach, methods, and procedures used to characterize potential contaminants.
- **Section 4: Remedial Investigation Results and Conceptual Site Model** – summarizes the results of the RI and presents the updated physical Conceptual Site Model (CSM).
- **Section 5: Nature and Extent of Contamination** – discusses the nature and extent and fate and transport of contaminants in the environment.
- **Section 6: Baseline Risk Assessment** – presents the human health and ecological exposure models and assesses potential human health and ecological risks.
- **Section 7: Summary of Results** – presents the RI summary and conclusions.
- **Section 8: References** – identifies references cited in the RI Report.

831 The following appendices supplement the results reported in this document:

- **Appendix A** **Habitat Assessment Photographs**
- **Appendix B** **Daily Field Reports**
- **Appendix C** **Data Validation Reports**
- **Appendix D** **Water Well Survey**
- **Appendix E** **Well Construction Logs**
- **Appendix F** **Well Decommissioning Reports**
- **Appendix G** **Well Development Logs, Sampling Logs, and Hydraulic Conductivity Graphs**
- **Appendix H** **Investigation Derived Waste Disposal**
- **Appendix I** **Risk Assessment Guidance for Superfund (RAGS) Part D Tables and ProUCL Output**
- **Appendix J** **Background Soil Data Evaluation: BTVs and Hypothesis Tests**

832

2 Physical Characteristics of the Site

This section presents a discussion of the physical characteristics of the former Nike Battery site, including the site climate, hydrology, and geology, along with site habitat, including habitat cover types and ecological resources. Cultural and archaeological resources are also presented along with current land use.

2.1 Climate

The site is located in Erie County, New York. Erie County is located on the eastern shore of Lake Erie and is characterized by moderately warm summers and bitterly cold winters. Cold winds in the winter typically prevail from the northwest in the Great Lakes region, producing dramatic lake-effect snowfalls on the southern and eastern shores of the Great Lakes. Total annual rainfall precipitation averages approximately 41 inches for Erie County. The average annual snowfall is approximately 92 inches, with the heaviest accumulations typically falling between December and March. In the warmer months of July and August, 79 degrees Fahrenheit (°F) is the normal high temperature. The colder months of January and February have a normal low temperature of 25°F (National Center for Environmental Information [formerly National Climatic Data Center] NCEI; 2021).

2.2 Current Land Use and Surface Features

The former Nike Battery is currently owned by the City of Hamburg and is publicly accessible. The current and foreseeable future land use for the former Launch Area located at the south end of the former Nike Battery is industrial. The former Launch Area is currently used by the Town of Hamburg's Highway Department for office space, truck garage space, and storage of gravel piles and road salt. The Town of Hamburg police department uses the area of the former enlisted men's barracks along the northwestern property boundary as a firearm training center (**Figure 1-4**). A sewage treatment facility, consisting of subsurface tanks and infiltration beds, is located to the south of the former Launch Area across Lakeview Road. The treatment system, which was once used by the DoD, is active and has been used since the Town acquired the property from the DoD.

Groundwater at the former Launch Area is not currently used, and is unlikely to be used in the future, as a drinking water source. Potable water is supplied to the former Nike Battery areas and nearby residents by the Erie County Water Authority, which receives surface water from Lake Erie and the Niagara River.

The former Launch Area is bounded on the north by Interstate 90; on the east by the Easement Area; on the west by residential areas; and on the south by residential areas, Lakeview Road, and Eighteen Mile Creek. The closest residential housing is located approximately 500 feet to the south on Lakeview Road. There are no state or federally designated wildlife refuges or recreational areas on or adjacent to the former Nike Battery Launch Area.

2.3 Site Hydrology

The former Launch Area is highly disturbed with little native vegetation. There is a small manmade drainage swale along the northwestern border of the former Launch Area that collects runoff during periods of heavy rainfall and snowmelt (**Figure 1-4**). The drainage swale extends approximately 450 feet into a small patch of phragmites/wetland area to the west of the silo area. The below-ground silos of the former Nike Battery are in an area currently used by the Town of Hamburg Highway Department for staging of materials. The silos have been

backfilled with asphalt millings; however, the concrete pads are still visible in some areas and the ground surface around some of the silos has collapsed/settled over time leaving open holes/depressions.

Surface water at the former Launch Area flows into a manmade drainage ditch that drains the perimeter of the former Town landfill, then traces the southwest and southeast sides of the silo area (**Figure 1-4**). This manmade ditch drains east to a second ditch that discharges to Eighteen Mile Creek, located 200 feet south of the former Launch Area boundary. Eighteen Mile Creek flows westward approximately 6 miles to Lake Erie (Foster 1999). Natural surface water drainage at the former Launch Area emanates from an area northeast of the landfill and flows along the western landfill boundary. All other surface water drainage is controlled by manmade ditches.

Other surface water features exist outside of the site boundary. The Highway Department constructed a bermed stormwater retention basin (referred to as a wetlands mitigation pond in the 2018 Records Review and Site Visit memorandum [Bluestone 2018]) approximately 800 feet northeast of the former Launch Area (**Figure 1-4**). State and federally regulated wetlands are present off site, and are shown on **Figure 2-1**. Much of the off-site areas north and upgradient of the former Launch Area are wetlands. The closest mapped wetlands are freshwater forested/shrub and freshwater emergent with two freshwater ponds located approximately 400 feet northwest and upgradient of the former Launch Area. The freshwater forested/shrub wetland category consists of woody wetlands, forested swamp, or shrub bogs. Freshwater emergent wetlands are described as herbaceous marsh, fen, swale, and wet meadow.

2.4 Site Geology and Hydrogeology

2.4.1 Geology

The former Launch Area is approximately 5 miles southeast of Lake Erie (**Figure 1-1**). The area surrounding the former Launch Area is characterized by a relatively flat land surface that slopes gently toward Lake Erie. Elevation at the site ranges from approximately 770 feet above mean sea level (amsl) to 755 feet amsl. Based on literature, native overburden materials in the area composed of interlaminated silt and clay derived from proglacial lake deposits (Rickard and Fischer 1970, Niagara Sheet). The proglacial lake sediments were deposited over shales of the Upper Devonian West Falls Group (Rickard and Fisher 1970). West Falls shale in the vicinity of the former Launch Area consists of two members: the Angola Member, which overlies the Rhinehart Member. Both members are described as a black and gray shale and light gray siltstone and sandstone with a thickness from 400 to 520 feet (LaSala 1968). The unit dips gently southward.

The RI field investigation showed that the overburden in the former Launch Area is composed primarily of fill materials (i.e., gravel, cinders, millings) combined with reworked native overburden materials. The thickness of the fill/disturbed overburden ranges from 2 to almost 10 feet, depending on the location. Below the fill, native silts and clays are found in some locations, all of which are underlain by weathered shale ranging from 2 to 8 feet in thickness. Competent bedrock is encountered generally within 12 to 17 feet bgs and is composed of gray to brown shale with frequent horizontal bedding plane fractures (locally) that decrease with depth. The shale is characterized by petroleum odors which are associated with naturally-occurring regional natural gas deposits.

2.4.2 Hydrogeology

Based on the results of previous investigations and those of the RI (discussed herein), groundwater at the former Launch Area ranges from approximately 4 to 16 feet below ground surface (bgs) (depending on surface topography) in the overburden and flows south and eastward from the former Launch Area toward Eighteen Mile Creek. Overburden groundwater is generally present at the weathered bedrock interface between the overburden materials and the competent shale bedrock. Based on hydraulic conductivity conducted during the RI, the average hydraulic conductivity of the overburden materials is on the order of 1×10^{-3} centimeters per second (cm/s), which is consistent with the fine sand or silt observed in the majority of the overburden well screen intervals. With one exception, which was caused by low recovery, the groundwater elevations in the paired overburden and bedrock monitoring wells installed during the RI were similar, indicating that the two units are hydraulically connected with little vertical flow between them. Based on previous investigations, and the RI results discussed herein, overburden and bedrock groundwater at the former Launch Area flow to the east and south toward Eighteen Mile Creek.

2.5 Natural Resources

A habitat assessment of the former Launch Area was conducted on May 19, 2020 to support the preparation of the screening level ecological risk assessment (SLERA; see **Section 6.2**). The purpose of the habitat characterization was to document ecological habitat, identify potential ecological receptors, and evaluate the potential for ecological exposure to site impacts. Natural communities were characterized using the New York Natural Heritage Program's (NHP's) Ecological Communities of New York State (Edinger et al. 2014). Representative photographs from the habitat assessment are included in **Appendix A**.

Observations from the habitat characterization verified that much of the area is covered with asphalt, concrete, and buildings, and these areas do not represent habitat for ecological receptors. The habitat cover types of the former Launch Area and adjacent areas were classified in accordance with the Ecological Communities of New York State (Edinger et al. 2014). The major cover types identified on site (and in the immediate vicinity) include residential/commercial/industrial, successional southern hardwood forest, successional old field, and emergent wetlands. The closest mapped wetlands are freshwater forested/shrub and freshwater emergent with two freshwater ponds located approximately 400 feet northwest and upgradient of the former Launch Area. Due to the proximity of human activities and the degree to which the area has been reworked, ecological receptors using these areas of the site are likely limited.

The manmade drainage ditches within the former Launch Area are relatively small (typically 1 to 2 feet wide), periodically maintained through mowing and cleanout, and expected to only intermittently contain surface water. Therefore, these drainage ditches are unlikely to support aquatic species such as fish. The manmade drainage ditches may support semi-aquatic invertebrates (e.g., frogs) on a seasonal basis; however, the habitat is relatively poor.

The habitat assessment identified a list of wildlife species observed or expected to occur. As expected, very few wildlife species were observed within the boundary of the former Launch Area due to the lack of habitat in most areas and high level of nearby human disturbance (e.g., the area east of the site is a recreational playing field maintained with regular mowing). In adjacent areas with potential habitat (e.g., forested areas north of the site boundaries), a variety of species or evidence (e.g., scat and/or tracks) thereof were observed, including birds (American robin, blue jay, Canada goose, mourning dove) and mammals (grey squirrel, raccoon, coyote, red fox).

Wildlife, such as the species observed, may occasionally traverse or forage onsite. No reptiles/amphibians were observed on site, which is expected given the lack of permanent surface water bodies within the former Launch Area. However, reptiles/amphibians (although not observed during the wildlife survey) may use the intermittent surface water in the manmade drainage ditches as seasonal habitat and may be occasionally present onsite.

A review of state and federally listed threatened and endangered species that may occur near or on the site indicated that the federally listed threatened northern long-eared bat may be present within Erie County, New York. Based on observations from the habitat assessment, habitat for the northern long-eared bat is not likely because forested habitat found to provide adequate summer roosting habitat is limited. In addition, nine migratory birds were identified under the Birds of Conservation Concern designation to potentially occur within Erie County seasonally. Of the nine listed, six are shore birds or raptors, which prefer habitat with more surface water features. There are no permanent surface water features on the site.

The additional three migratory bird species include bobolink, red-headed woodpecker, and wood thrush. The redheaded woodpecker and wood thrush prefer mature trees and forest in which to forage and breed, while the bobolink prefers hayfields and meadows. The site is characterized by mostly disturbed habitat and maintained mowed lawn; therefore, it is unlikely to find these species at the site due to a lack of suitable habitat. In addition to the federal database query, a New York State Natural Heritage Request was submitted on May 12, 2020. On June 12, 2020, the NHP responded that there were no records of rare or state-listed animals or plants or significant natural communities at the site or in its immediate vicinity. Given the overall lack of habitat across most of the former Launch Area, the presence of threatened and endangered species or critical habitat is not expected.

2.6 Cultural and Archaeological Resources

Previous investigations at the Nike Battery did not indicate evidence that culturally-sensitive sites are located within the area surrounding the former Launch Area and no indications of cultural or archeological resources were observed during the RI field activities.

3 Remedial Investigation Field Work

This section summarizes the field investigation activities conducted at the former Nike Battery Launch Area. All field activities were conducted in accordance with Final RI QAPP (JV 2020), except where exceptions are noted herein.

RI field activities began at the former Launch Area on July 27, 2020 and continued intermittently until March 5, 2021. Daily field reports with photographs detailing work completed (**Appendix B**) were provided to the USACE Project Manager for RI field activities conducted between July 27 and September 30, 2020. **Appendix B** also includes daily tailgate forms. **Exhibit 3-1** below summarizes the general timeframe of onsite activities. Specific field activities are discussed in the following sections.

Exhibit 3-1: Timeline of Field Activities

Field Activity	Schedule	Onsite Personnel
Mobilization and Utility Clearance	July 27 to 29, 2020	JV and New York Leak Detection
Monitoring Well Installation	August 10 to September 10, 2020	JV and Nothnagle Drilling USACE (August 18-20, 2020)
Well Decommissioning	September 4 and September 17, 2020	JV and Nothnagle Drilling
Soil Boring and Reference Sampling	September 11 to 17, 2020	JV and Nothnagle Drilling
First Groundwater Sampling Event	September 21 to 30, 2020	JV
Survey	October 26 to 30, 2020	JV and KHEOPS
Second Groundwater Sampling Event	December 14 to 18, 2020	JV
Slug Testing	March 3 to 5, 2021	JV

3.1 Overview of Sample Collection, Analysis, and Validation

In accordance with the Final RI QAPP (JV 2020), the RI field activities were intended to determine the nature and extent of impacts associated with the former Launch Area to support human health and ecological risk assessment.

Solvents, corrosion preventives, and petroleum, oil, and lubricants (POL) were commonly used during the operations of a typical Nike Missile Battery Launch Area. **Exhibit 3-2**, below, summarizes the potential sources of environmental contamination and associated classes of constituents based on historical DoD activities at the former Launch Area. As presented in the Final RI QAPP, Launch Area sampling locations were placed in potential historical DoD source areas.

Exhibit 3-2: Potential Sources and Classes of Constituents

Potential Source Products [1]	Potential Source Historical Infrastructure [2]	Associated Classes of Constituents
•Missile components •Liquid fuels •Oils (hydraulic & motor) •Chlorinated solvents •Missile starter fluid •Rocket propellants •Paint	•Missile assembly and test building •Drum storage area •Generator building •Acid storage shed •Acid fueling stations •Acid neutralization pits •Missile silos	•VOCs •SVOCs •Hydrazine •PCBs •Petroleum compounds •Metals

Notes:
1. Based on general historical disposal practices across Nike sites, as documented in historical interviews with former Nike workers and Nike operation manuals.
2. As identified by previous investigations and assessments.

As discussed below, as part of the RI field activities, discrete soil (surface and subsurface) and reference soil (surface and subsurface) samples were collected from predetermined locations selected to support a statistically valid sampling approach. Additionally, 21 monitoring wells were installed at the site, and groundwater samples were collected during two sampling events. **Figure 3-1** and **Figure 3-2** present the groundwater monitoring well and soil locations, respectively, from which samples were collected in the former Launch Area.

Surface soil, subsurface soil, and groundwater samples collected per the approved Final RI QAPP were sent to Katahdin Analytical Services of Scarborough, Maine (Katahdin) for the following analyses:

- VOCs by USEPA SW-846 Method 8260C;
- SVOCs by USEPA SW-846 Method 8270D;
- PAHs by USEPA SW-846 Method 8270D Selected Ion Monitoring (SIM)
- TAL metals by USEPA SW-846 Method 6010C/7471 (soil) and total and dissolved metals by USEPA SW-846 Method 6020/7470 (groundwater);
- Hydrazine by USEPA SW-846 Method 8315A;
- Hexavalent chromium by USEPA SW-846 Method 7196 or 7196A;
- Total organic carbon (TOC) by Lloyd Khan Method;
- Total solids by Method SM2540B;
- Hardness;
- Grain size by ASTM International (ASTM) D422;
- pH;
- Polychlorinated biphenyls (PCBs) by USEPA SW-846 Method 8082A.

Laboratory analytical methods were selected to meet the data quality objectives (DQOs) identified in the Final RI QAPP (JV 2020). The soil and groundwater sample analytical results are discussed in **Section 4.1**, and laboratory reports are available in the FUDS Chemical Database (FUDSChem) library. The JV provided data reporting elements for definitive data per Section I.13.4.2 of EM 200-1-3 and provided quality control (QC) of the various analytical tasks performed. An independent third-party firm conducted 100 percent data validation as specified in the Final RI QAPP. Data validation reports are provided in **Appendix C**.

The following field QC samples were collected in accordance with the Final RI QAPP Worksheet #20: Field QC Sample Quantities and Control Frequencies:

- Field duplicate samples (FD designation);
- Trip blank;
- Equipment blanks;
- Matrix spike (MS) samples;
- Matric spike duplicate (MSD) samples.

3.2 Ecological Habitat Assessment

An ecological habitat assessment was conducted at the site on May 19, 2020, to characterize habitat for the development of cover type maps and to conduct an ecological receptor survey.

The major cover types identified on site (and in the immediate vicinity) include residential/commercial/industrial, successional southern hardwood forest, successional old field (i.e., previously cleared land that is now undergoing the regrowth of vegetation), and emergent wetlands. The closest mapped wetlands are freshwater forested/shrub and freshwater emergent with two freshwater ponds located approximately 400 feet northwest and upgradient of the former Launch Area. Due to the proximity of human activities and the degree to which the area has been reworked, ecological receptors using these areas of the site are likely limited.

While on site, the field team also confirmed that there are no permanent on-site surface waters (including vernal pools) and verified that surface water and sediment sampling are not required for the RI. The drainage ditches within the former Launch Area are relatively small (typically 1 to 2 feet wide), periodically maintained through mowing and cleanout, and expected to only intermittently contain surface water. Therefore, these drainage ditches are unlikely to support aquatic species such as fish. The drainage ditches may support semi-aquatic species (e.g., frogs) on a seasonal basis; however, the habitat is relatively poor.

The habitat assessment identified a list of wildlife species observed or expected to occur. As expected, very few wildlife species were observed within the boundary of the former Launch Area due to the lack of habitat in most areas and high level of nearby human disturbance.

A review of state and federally listed threatened and endangered species that may occur near or on the site indicated that the federally listed threatened northern long-eared bat may be present within Erie County, New York. Based on observations from the habitat assessment, habitat for the northern long-eared bat is not likely because forested habitat found to provide adequate summer roosting habitat is limited. Given the overall lack of habitat across most of the former Launch Area, the presence of threatened and endangered species or critical habitat is not expected.

The results from the habitat assessment were presented to the USACE in a memorandum, which was provided as Appendix B of the Remedial Investigation Field Report, Former Nike Anti-Aircraft Missile Battery, BU-51/52 Launch Area, Erie County, New York (JV 2021). The results of the ecological habitat assessment are described in the SLERA (**Section 6.2**).

3.3 Residential Wells Survey

An online search of the NYSDEC Water Well Information website found 12 well records in the Town of Hamburg. None of the 12 wells were within 1-mile of the Nike Battery, which is outside the influence of groundwater discharging from the property. There were no former or current water supply wells found at the former Nike Battery site. As a note, the New York Department of Health website for water well guidance recommends a minimum separation distance between water wells and known contaminant sources between 25 to 300 feet plus additional 50% for shallow aquifer wells. The findings of the water well search are presented in **Appendix D**. In addition, a visual survey of the adjacent residential properties was conducted from publicly accessible areas (i.e., roadways) and/or from the Town of Hamburg property in August 2020. There were no visual indications of the presence of residential water wells noted during the survey.

3.4 Mobilization/Site Preparation

Between July 27 and 29, 2020, the JV escorted New York Leak Detection to perform utility clearance at proposed boring locations using the methods of ground-penetrating radar, tracing, and visual inspection of overhead utilities and surface utility infrastructure. New York Leak Detection marked out utilities within a 15-foot radius of all proposed subsurface sampling locations.

3.5 Monitoring Well Installation and Soil Sampling

3.5.1 Monitoring Well Installation

Between August 10 and September 10, 2020, 21 monitoring wells were installed by Nothnagle Drilling, Inc., with JV oversight including 16 overburden wells with bedrock wells co-located at five locations.

The 16 overburden monitoring wells were drilled using 6-inch-inner-diameter hollow-stem augers. Each well was logged by the field geologist in accordance with Unified Soil Classification System (USCS) methodologies. Identification of weathered bedrock was based on the presence of structure/bedding indicative of the source rock. Each well was screened from the bottom of the boring using 10 feet of 2-inch-inner-diameter, machine-slotted polyvinyl chloride (PVC) 0.010-inch screen and constructed in accordance with the procedures presented in the Final RI QAPP. The five bedrock wells drilled adjacent to five overburden wells were installed using HQ™ core barrel for the bedrock portion of the well down to the first water-bearing zone. Rock was characterized for geology and rock quality (i.e., rock quality designation [RQD]) and evaluated to quantify the magnitude of fractures. Bedrock monitoring wells were completed with screens because the competency of the shallow bedrock was unknown.

Air was monitored around the drilling area in accordance with the NYSDEC-required Community Air Monitoring Plan. The monitoring did not detect elevated readings of VOCs or particulates during drilling. Olivia Beaulieu of

USACE was present on site from August 18 through August 20, 2020 to observe the on-site activities. Monitoring well locations are presented on **Figure 3-1**.

The rationale for the monitoring well locations is provided in **Exhibit 3-3** below.

Exhibit 3-3: Rationale for Monitoring Well Locations

Downgradient of landfill

  - NHLA-MW16

Notes:

* indicates monitoring well NHLA-MW14 listed twice to present all rationale for location.

Monitoring wells were installed in accordance with the provisions of the Final RI QAPP, and as referenced therein, the USACE EM 1110-1-4000 Monitoring Well Design, Installation, & Documentation (1998), and QAPP Appendix E Standard Operating Procedure (SOP): Monitoring Well Installation.

Well construction boring logs are provided in **Appendix E**. **Table 3-1** provides a summary of monitoring well construction, including location coordinates, finished depths, screening intervals, and top of casing elevations.

3.5.2 Soil Sampling

During installation of the 16 overburden wells, a total of 43 soil samples (including field duplicate samples; MW designation) were collected using either a decontaminated stainless steel hand auger or split-spoon sampler and then transferred to a laboratory-supplied container.

In accordance with the Final RI QAPP and the requirements of the FUDSChem database, soil sample depths were designated in the sample name using the following nomenclature:

- A: Surface samples were collected from the top 1 foot of native material.
- B: Depth of 1 to 3 feet below surface soil sample depth.
- C: Highest indication of contamination or just above first water-bearing zone if no indication of contamination.

Subsurface soil sample depths are summarized in **Table 3-2**. Soil samples were collected, labeled, stored, and shipped to Katahdin for analysis.

As presented in the Final RI QAPP, soil samples collected during monitoring well installation were analyzed for the following parameters:

- Target Compound List (TCL) VOCs;
- TCL SVOCs;
- PAHs;
- PCBs (NHLA-MW11 only);
- Hydrazines;
- TAL metals;
- TOC;
- Grain size distribution;
- pH;
- Hexavalent chromium.

3.6 Surface and Reference Soil Sampling

In addition to soil samples collected during monitoring well installation, between September 11 and 17, 2020, surface soil samples were collected within the former Launch Area, and reference soil samples were collected within the Nike Battery but outside the former Launch Area.

3.6.1 Surface Soil Sampling

A total of 10 discrete surface samples (SL designation; eight parent and two field duplicate) were collected from the top 1 foot of native material (i.e., not composed of current ground cover such as gravel, asphalt, or cinders/mulch) from eight different locations to evaluate the potential risks to site users associated with surface soil exposure. The eight locations were chosen based on historical activities at the site, and included

boring/monitoring well locations and the former transformer area. **Exhibit 3-4** below summarizes the surface soil sample locations and the rationale for the locations of collection. Soil sampling locations are presented on **Figure 3-2**. Surface soil samples were collected, labeled, stored, and shipped to Katahdin for analysis in accordance with the procedures presented in the Final RI QAPP.

As presented in the Final RI QAPP, surface soil samples were analyzed for the following parameters:

- TCL VOCs;
- TCL SVOCs;
- PAHs;
- PCBs (NHLA-SL11A and NHLA-SL11B only);
- Hydrazines;
- TAL metals;
- TOC;
- Grain size distribution;
- pH;
- Hexavalent chromium.

Exhibit 3-4: Rationale for Former Launch Area Surface Soil Sampling Locations

Potential habitat area	
	• *Potential habitat area not covered by historical or proposed sample locations* • NHLA-SL31

3.6.2 Reference Soil Sampling

To evaluate naturally occurring and/or anthropogenic background conditions, 35 reference soil samples (BH designation) were collected from 16 predetermined locations. The use of, and rationale for, the collection of the reference samples was presented in Worksheets 11 (Section 11.1 #5 – Decision Rule) and 17 (Section 17.1), and Appendix C (Risk Assessment Work Plan) of the Final RI QAPP (JV 2020). Reference sample locations were selected in consultation with the USACE from within the former Nike complex (former Control/Easement Area), but outside of the former Launch Area, to provide soil that represents the regional soil types found within the former Launch Area. A more distant reference area was not selected because adjacent highways and dissimilar land uses would make the data less comparable to true site background conditions.

As noted above, the Reference Area is located in what was formerly the Control Area for the battery - immediately northeast of the former Launch Area. This area is now part of a recreational area redeveloped, and currently used, by the Town for walking trails and athletic fields. According to historic data on the Nike missile sites, Nike batteries typically had three operating areas: the Control Area, the Launch Area, and an Administration Area. The Administration Area was usually located within the Control Area. The Control Area and the Launch Area were constructed at least 1,000 yards apart, but were within sight of each other. The Control Area generally included equipment for target tracking and missile guidance. The Launch Area included facilities for assembly, testing, and missile maintenance and launching. Support facilities such as motor pools, generator buildings, guard dog kennels, and living quarters were also located in the Launch Area (Federation of American Scientists 2018). Therefore, given the lack of alternate locations, and since the Control Area did not support missile operation and maintenance facilities, this area was deemed to represent a usable reference data set for purposes of this RI. As discussed herein and presented in Appendix E, native soils observed in the reference samples were similar to those encountered in the former Launch Area.

The reference soil samples were analyzed for TAL metals, hexavalent chromium, and polycyclic aromatic hydrocarbons (PAHs). The site-specific reference soil data were gathered for comparison against sample concentrations in the former Launch Area and were used to calculate background threshold values (BTVs) as described in **Section 4.3.3**. A subset of samples was evaluated for grain size using ASTM Method D422 (without hydrometer). A top reference sample was collected from 0 to 1-foot bgs (Depth A designation) and a bottom sample was collected from 1 to 3 feet bgs (Depth B designation). Based on the lithology and characteristics of the subsurface materials encountered, the reference samples appeared to be representative of the site soils (i.e., generally described as silt and clay with some gravel).

Soil sampling locations are presented on **Figure 3-2**. Reference soil samples were collected, labeled, stored, and shipped to Katahdin for analysis in accordance with the procedures presented in the Final RI QAPP.

As presented in the Final RI QAPP, reference samples were analyzed for the following parameters:

- TAL metals;
- Hexavalent chromium;
- PAHs.

3.6.3 Well Decommissioning

From September 4 through September 17, 2020, Nothnagle Drilling, Inc. decommissioned four historical monitoring wells (GZA-MW-1, GZA-MW-2, GZA-MW-4, and ME-MW-3) in accordance with the NYSDEC CP-43:

Monitoring Well Decommissioning Policy (NYSDEC 2009). Each well was decommissioned by tremie-grouting from the bottom up using a cement-bentonite grout, then removing the surface casing and concrete pad. These were the only four of the seven historic monitoring wells located during site reconnaissance. The well decommissioning reports are included in **Appendix F**.

3.7 Survey

Between October 26 and 30, 2020, locations of monitoring wells and soil sampling locations were located by KHEOPS, a NYS Professional Surveyor control using the New York State Plane Coordinate West Zone and the North American Datum of 1983 for the horizontal datum and North American Vertical Datum of 1988 (NAVD 88) for the vertical datum. Monitoring well measuring point elevations were measured to the nearest 0.010-foot NAVD 88. KHEOPS also completed a boundary survey of the property based on the existing record information and deed for the property that the site occupies. Coordinates for monitoring wells are included in **Table 3-1**. The surveyed coordinates for the surface soil sample locations are summarized in **Table 3-3**. Relevant site features such as buildings were also included in the survey.

3.8 Groundwater Sampling

3.8.1 Development of Wells and First Groundwater Sampling Event (September 2020)

The 21 newly installed monitoring wells were developed before sampling using the methodology outlined in the USACE guidance document EM 1110-1-4000 Monitoring Well Design, Installation and Development (1998), as provided in the Final RI QAPP. This involved the use of alternating sequences of surging and pumping using a Waterra foot-valve pumping system, surge block, and submersible pump. Specific capacity and field parameter (pH, conductivity, and turbidity) measurements were used to gauge the progress of the development. The development water was containerized in drums and labelled pending waste characterization. Before sampling, it was confirmed that the volume of water purged during development of bedrock wells exceeded the volume of water lost during bedrock well installation.

Groundwater was allowed to equilibrate after well development, and between September 21 and 30, 2020, groundwater samples were collected from the 21 monitoring wells (**Figure 3-1**).

A low-flow purging/sampling method (using a flow-through cell, multimeter, and a peristaltic pump) was used to collect the groundwater samples. Water quality parameters, including temperature, conductivity, turbidity, pH, oxidation-reduction potential (ORP), salinity, and dissolved oxygen (DO), were measured during low-flow purging in accordance with the Final RI QAPP.

There were no odors, sheens, or other indications of contamination noted during the sampling.

Groundwater samples were collected directly into laboratory-supplied sample containers, labeled, stored, and shipped to Katahdin for analysis in general accordance with the procedures presented in the Final RI QAPP. High turbidity in samples clogged field filters; therefore, samples were filtered at the laboratory to remove suspended solids in preparation for the dissolved metals analyses. Deviation from sampling methods is discussed further in **Section 3.12.2.** Monitoring well development and sampling logs are presented in **Appendix G**.

As presented in the Final RI QAPP, groundwater samples were analyzed for the following parameters:

- VOCs by USEPA SW-846 Method 8260C;
- SVOCs by USEPA SW-846 Method 8270D;
- PAHs by USEPA SW-846 Method 8270D Selected Ion Monitoring (SIM);
- TAL total and dissolved metals by USEPA SW-846 Method 6020/7470;
- Hexavalent chromium by USEPA SW-846 Method 7196 or 7196A;
- Hardness.

3.8.2 Second Groundwater Sampling Event (December 2020)

A second groundwater sampling event was conducted between December 14 and 18, 2020. Water level measurements were recorded at all locations before groundwater sampling. Consistent with the first round of sampling, a low-flow purging/sampling method (using a flow-through cell, multimeter, and a peristaltic pump) was used to collect the samples. Water quality parameters, including temperature, conductivity, turbidity, pH, ORP, salinity, and DO, were measured during sampling.

There were no odors, sheens, or other indications of contamination noted during the sampling.

Groundwater samples from the second monitoring event were collected directly into laboratory-supplied sample containers, labeled, stored, and shipped to Katahdin for analysis in accordance with the procedures presented in the Final RI QAPP. Samples to be analyzed for dissolved metals were field filtered to remove suspended solids. Monitoring well sampling logs are presented in **Appendix G**.

3.9 Water Level Measurement

Before collection of groundwater samples during the first and second rounds of groundwater sampling, water levels in all wells were measured during the same day using a combination electronic water level and oil-water interface probe. Water level measurements are summarized in **Table 3-1**.

3.10 Hydraulic Conductivity Testing

Hydraulic conductivity testing was performed by slug testing conducted in five wells from March 3 through 5, 2021. In accordance with the Final RI QAPP (JV 2020), the testing was performed on the following overburden wells:

- NHLA-MW2;
- NHLA-MW6;
- NHLA-MW5OB;
- MHLA-MW-8;
- NHLA-MW16.

The wells are located across the former Launch Area with one well located in the Reference Area. In general, within the former Launch Area, NHLA-MW2 is on north side, NHLA-MW6 is in the central area, and NHLA-MW5OB is on the east side, MHLA-MW-8 is on the southwest side. NHLA-MW16 is located within the Reference

Area. Falling head and rising head tests were performed on each well in accordance with the Final RI QAPP (JV 2020). Each well was tested by adding a weighted, decontaminated, slug (a solid PVC pipe) to displace water into the formation. After the water level returned to static level, the slug was removed quickly, and the rising water levels were recorded (rising head test). For the falling head test portion, a slug was quickly added to the well and the falling water levels were recorded. A down-hole pressure transducer was used to measure the water levels.

3.11 Investigation-Derived Waste

Soil cuttings from all drilling locations were contained in steel 55-gallon drums, labeled, and staged at the facility at a location approved by Town of Hamburg Highway Department personnel. In addition, well development and purge groundwater from the September 2020 well development/sampling event was contained in steel 55-gallon drums, labeled, and staged at the same location.

Prior to the second groundwater sampling event, the drummed groundwater generated during well development and during the December 2020 sampling event were analyzed for waste characterization. The results of these characterization samples indicated that the purge water was non-hazardous and did not contain elevated concentrations of contaminants of concern. Based on these results, in accordance with the email approval received from the NYSDEC on December 14, 2020 (NYSDEC 2020), the drummed groundwater, along with the purge water from the second groundwater sampling, was discharged to the ground surface at a slow rate to vegetated areas away from monitoring wells. Representative samples from the drummed soil cuttings were also collected and submitted for laboratory analysis. The results of these characterization samples indicated that the soil cuttings were non-hazardous and did not contain elevated concentrations of contaminants of concern. The soil remaining after decanting the 34 groundwater drums was disposed off-site, along with 22 drums of soil cuttings from borings, at a permitted facility in accordance with federal, state, and local regulations. The soil and water waste characterization results, waste profile, and waste disposal manifest are included in **Appendix H**.

3.12 Deviations from the Final RI QAPP

RI field activities were completed in 2020 in accordance with the Final RI QAPP (JV 2020), except for the deviations described below. These sampling deviations from the Final RI QAPP had no impact on the usability of the data generated or on the investigation results because the final sampling dataset met project requirements as stated in the Final RI QAPP and the project completeness goal of 90 percent.

3.12.1 Samples Not Collected

The following samples were not collected:

- Location NHLA-MW17 was removed from the scope of work, as Rick Nowak of the Town of Hamburg Buildings and Grounds Department confirmed that the wastewater treatment plant (WWTP) has been in use by the Town since taking ownership of the property from the DoD. Therefore, it is not possible to distinguish whether potential impacts from the WWTP occurred during operation of the WWTP by the DoD or by the Town. Per the FUDS Program Policy, ER 200-3-1, Section 3-2.6.1, the Town's operation of the sewage treatment system for the past 61 years renders possible impacts from the sewage plant ineligible for evaluation under the FUDS program.

- Discretionary surface soil samples were not needed based on the results of the habitat assessment, which has been documented separately (Appendix B of the RI Field Report [JV 2021]).
- Surface samples (0 to 1-foot bgs) were not collected from locations NHLA-MW11A, -SL17, -SL18, -SL19, -SL20, -SL21, -SL22, -SL23, -SL24, and -SL30 due to the presence of asphalt and/or the absence of native material at these locations.

3.12.2 Monitoring Well Development

Specific capacity data could not be collected in most instances due to the inability to draw down the water level in the well. In addition, in most cases, well development volumes exceeded 40 well volumes with little to no change in turbidity levels, but with stabilization of all other parameters and no visible sediment in the well. Therefore, that supporting data was used to judge development success.

3.12.3 Deviations from Sampling Methodology

During the first groundwater sampling event, groundwater collected using low flow sampling methods from the monitoring wells was observed to have high suspended solids. The increased turbidity resulted in premature clogging of the 0.45 micron in-line filters used to filter groundwater for the dissolved metals analyses. Extra purging of each well in conjunction with using multiple in-line filters was not possible due to low recovery. As a result, the samples were collected in unpreserved sample containers and submitted to the laboratory for filtration and analysis. Proper filtration for dissolved metals analyses is necessary to avoid biased results associated with high turbidity. Turbidity levels were lower during the second groundwater sampling event and dissolved metals samples were collected using in-line filters per the QAPP.

3.13 Remedial Investigation Field Activities Documentation

During the RI field activities, site conditions and observations were noted in the field notebook and on the field forms. Copies of the Daily Field Reports with photographs and completed daily tailgate forms for RI field activities conducted between July 27 and September 30, 2020 are included in **Appendix B**.

4 Remedial Investigation Results

4.1 Geology

Subsurface geological features interpreted from the RI field investigation are summarized on **Figure 4-1** (cross-section locations), **Figure 4-2** (Cross-Section A-A'), and **Figure 4-3** (Cross-Section B-B'), and in the boring logs presented in **Appendix E**. As shown on **Figures 4-2** and **4-3**, the RI field investigation found that the overburden in the former Launch Area is composed primarily of fill materials combined with reworked native overburden materials consisting of silts and clays. The nature of the reworked native overburden materials was similar in the reference area soil borings (BH36 through BH51) to those encountered in the former Launch Area (where reworked native soils were present). The thickness of the fill/disturbed overburden ranges from 2 to almost 10 feet, depending on the location. Below the fill, native silts and clays are found in some locations, all of which are underlain by weathered shale ranging from 2 to 8 feet in thickness. Competent bedrock is encountered generally within 12 to 17 feet bgs and is composed of gray to brown shale with frequent horizontal bedding plane fractures (locally) that decrease with depth. The shale is characterized by petroleum odors which are associated with naturally-occurring regional natural gas deposits.

4.2 Hydrogeology

The water table at the former Launch Area ranges from approximately 4 to 16 feet bgs, depending on the surface topography, but is generally encountered within 10 feet of the ground surface across the majority of the site. As shown on **Figures 4-2** and **4-3**, as well as the well construction logs in **Appendix E**, the overburden monitoring wells are screened in the weathered bedrock, which reflects the field observation that groundwater is generally present at the weathered bedrock interface between the overburden materials and the competent shale bedrock. With the exception of bedrock monitoring well MW-05BR, groundwater was encountered in the bedrock groundwater monitoring wells within 10 feet of the competent bedrock interface. At MW-05BR groundwater was not encountered until approximately 25 feet below the competent bedrock. Groundwater at this location did not recharge significantly between the September and December 2020 sampling events. With the exception of MW-05BR, which exhibited very low recovery, the groundwater elevations in the paired overburden and bedrock monitoring wells installed during the RI were similar, indicating that the two units are hydraulically connected with little vertical flow between them.

4.2.1 Groundwater Flow

Figures 4-4 and **4-5** present potentiometric surface contours for the overburden and bedrock groundwater during the September 2020 and December 2020 groundwater monitoring events, respectively. As shown on these figures, groundwater in both the overburden and bedrock generally flows south and eastward from the former Launch Area toward Eighteen Mile Creek.

4.2.2 Hydraulic Conductivity and Travel Time

The results of the hydraulic conductivity testing are presented in **Table 4-1 and Appendix G**. As shown in the table, the average hydraulic conductivity of the overburden materials is on the order of $1x10^{-3}$ centimeters per second (cm/s), which is consistent with the fine sand or silt observed in the majority of the overburden well screen

intervals. Using this value, and a hydraulic gradient that ranges from approximately 0.010 foot per foot (ft/ft) to 0.003 ft/ft in the overburden, the average linear groundwater flow velocity in the overburden groundwater at the former Launch Area is approximately 12 to 40 feet per year (ft/y).

4.3 Sampling Results

The following sections provide a summary of the analytical results for RI groundwater and soil sampling conducted at the former Launch Area and presents the number of samples exceeding screening levels. Sample locations in the former Launch Area were selected to identify potential impacts from historical activities and current structures, and considered spatial location relative to the landfill and groundwater flow direction. Analytical data from reference soil samples are similarly screened and summarized below. Reference soil samples were collected from areas near the former Launch Area to evaluate potential naturally occurring and/or anthropogenic background conditions. The Reference Area was proximate to the site area to provide soil that represents the regional soil types found within the former Launch Area. The laboratory analytical reports for the 2020 RI samples are available in the FUDSChem library. Data validation reports for the 2020 data are provided in **Appendix C**. The 2020 dataset is considered usable and meets project DQOs with the minor exceptions summarized in **Appendix C**.

For human health, regulatory benchmarks and risk-based screening levels include the May 2021 USEPA RSLs for Residential Soil and May 2021 USEPA RSLs for Tapwater (USEPA 2021). The comparison to residential soil RSLs is conservative given that future residential use of the former Launch Area is not considered a realistic or reasonable scenario based on the current land use and ownership, proximity to the Hamburg Landfill, and presence of historic underground silos. Residential soil RSLs are considered to evaluate an unlimited use/unrestricted exposure scenario and to inform risk management decisions, if needed. Similarly, the comparison of groundwater data to Tapwater RSLs is conservative given that groundwater at the former Launch Area is not currently used, and is unlikely to be used in the future, as a drinking water source. The Tapwater RSLs are considered to inform risk management decisions, if needed. The RSLs protective at a cancer risk level of 1×10^{-6} or a non-cancer HQ of 0.1 were used. Data tables and figures presented in **Section 4** show the comparisons of detected concentrations to the human health screening values (i.e., the RSLs). The screening of site data against human health benchmarks is described in the following sections.

For ecological receptors, screening levels are based on the hierarchy of the USEPA (2007a) ecological soil screening levels (EcoSSLs), then USEPA Region IV soil ecological screening values (ESVs) (USEPA 2018), and then screening benchmarks from the Department of Energy Laboratories (Los Alamos National Laboratory [LANL] 2017). The surface and subsurface soil results were not initially screened with ecological screening criteria to evaluate nature and extent since only a subset of the soil sample locations represent areas of potential habitat. Instead, the soil data are screened for potential ecological risks in the SLERA (see **Section 6.2**).

4.3.1 Soil

Former Launch Area

A total of 53 soil samples (including field duplicate samples) were collected from various depths within the former Launch Area during the RI field activities: 43 surface/subsurface samples (sample ID MW designation) and 10 surface samples (sample ID SL designation).

In accordance with the Final RI QAPP (JV 2020) and the requirements of the FUDSChem database, soil sample depths were designated in the sample name using the following nomenclature:

- A: Surface samples were collected from the top 1 foot of native material.
- B: Depth of 1 to 3 feet bgs, or the 2-foot interval immediately below the surface soil sample depth.
- C: Highest indication of contamination or just above first water-bearing zone if no indication of contamination.

In the former Launch Area, soil samples were collected from the following depths:

- Depth A: 26 samples
- Depth B: 19 samples
- Depth C: eight samples.

Table 3-2 summarizes the actual sample collection depths for the soil samples.

Reference Area

A total of 35 soil samples (including field duplicate samples) (sample ID BH designation) were collected from various depths at 16 predetermined locations within the former Nike Battery, but outside the former Launch Area activities. The reference soil samples were collected from locations immediately northeast of the former Launch Area (see Section 3.6.2) in an area currently used for recreational purposes.

In the Reference Area, soil samples were collected from the following depths:

- Depth A: 17 samples,
- Depth B: 18 samples

Analytical results for soil samples collected in the former Launch Area are summarized in **Table 4-2a** (VOCs/PCBs), **Table 4-2b** (SVOCs), and **Table 4-2c** (metals). Analytical results for reference samples are summarized in **Table 4-3a** (metals) and **Table 4-3b** (PAHs). As described above, the soil sample analytical results were screened against 2021 USEPA residential and industrial RSLs.

Comparison to Risk-based Screening Levels

Exceedances of human health screening criteria for surface and subsurface soil in the former Launch Area (MW designation samples) are presented on **Figure 4-6a** (PAHs) and **Figure 4-6b** (metals). Exceedances of human health screening criteria for surface soil in the former Launch Area (SL designation samples) are presented on **Figure 4-7a** (PAHs) and **Figure 4-7b** (metals). Exceedances of human health screening criteria for reference surface soil are presented on **Figure 4-8** (metals).

The surface and subsurface soil results were not initially screened with ecological screening criteria to evaluate nature and extent since only a subset of the soil sample locations was identified as potential habitat. Consequently, the soil locations that represent potential habitat are included in the SLERA and the results of the soil data screened with ecological criteria are discussed in detail in **Section 6.2**.

4.3.1.1 Volatile Organic Compounds

Former Launch Area

In the 53 soil samples analyzed for 51 VOCs, 12 VOCs were detected in one or more samples. Five VOCs were detected in the Depth A samples, 11 VOCs were detected in the Depth B samples, and seven VOCs were detected in the Depth C samples. None of the VOC concentrations exceeded the USEPA residential or industrial RSLs.

Reference Area

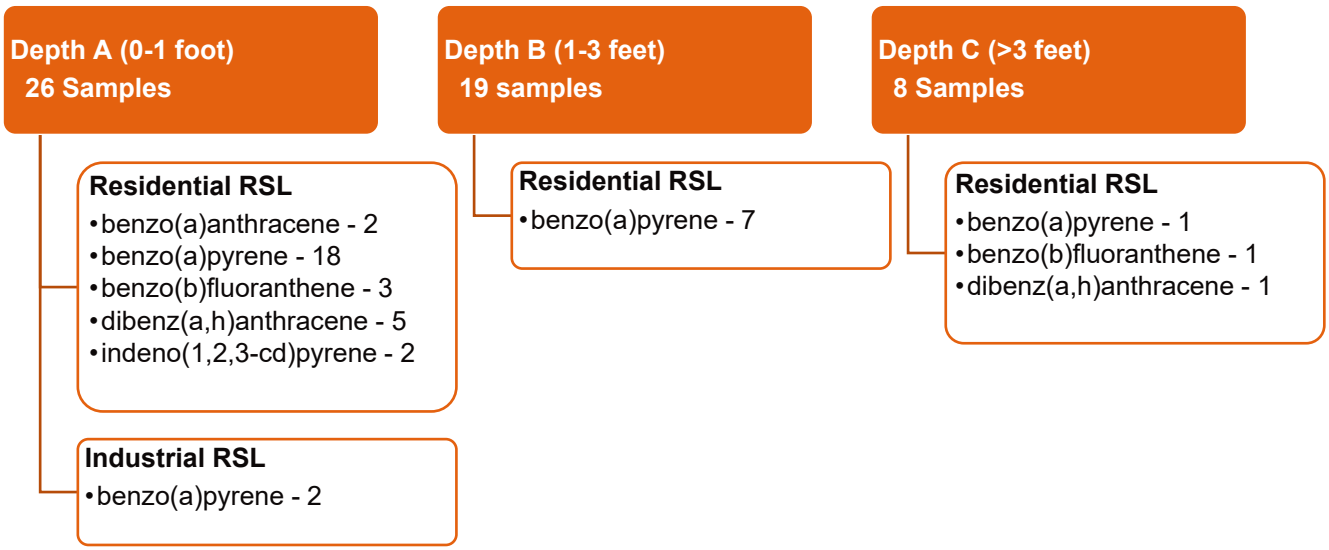
Reference soil samples were not analyzed for VOCs.

4.3.1.2 Semi-Volatile Organic Compounds and Polycyclic Aromatic Hydrocarbons

Former Launch Area

In the 53 soil samples analyzed for the list of 70 SVOC analytes, 24 SVOCs were detected in at least one sample, and 5 of the 24 SVOCs (all PAHs) exceeded screening criteria. **Exhibit 4-1** summarizes the number of samples with detected concentrations of PAHs that exceeded USEPA residential and/or industrial RSLs for the following sample depth intervals. **Figures 4-6a** and **4-7a** show concentrations of the PAHs at the locations with exceedances.

Exhibit 4-1: PAH RSL Exceedances in Former Launch Area Soil Samples



Reference Area

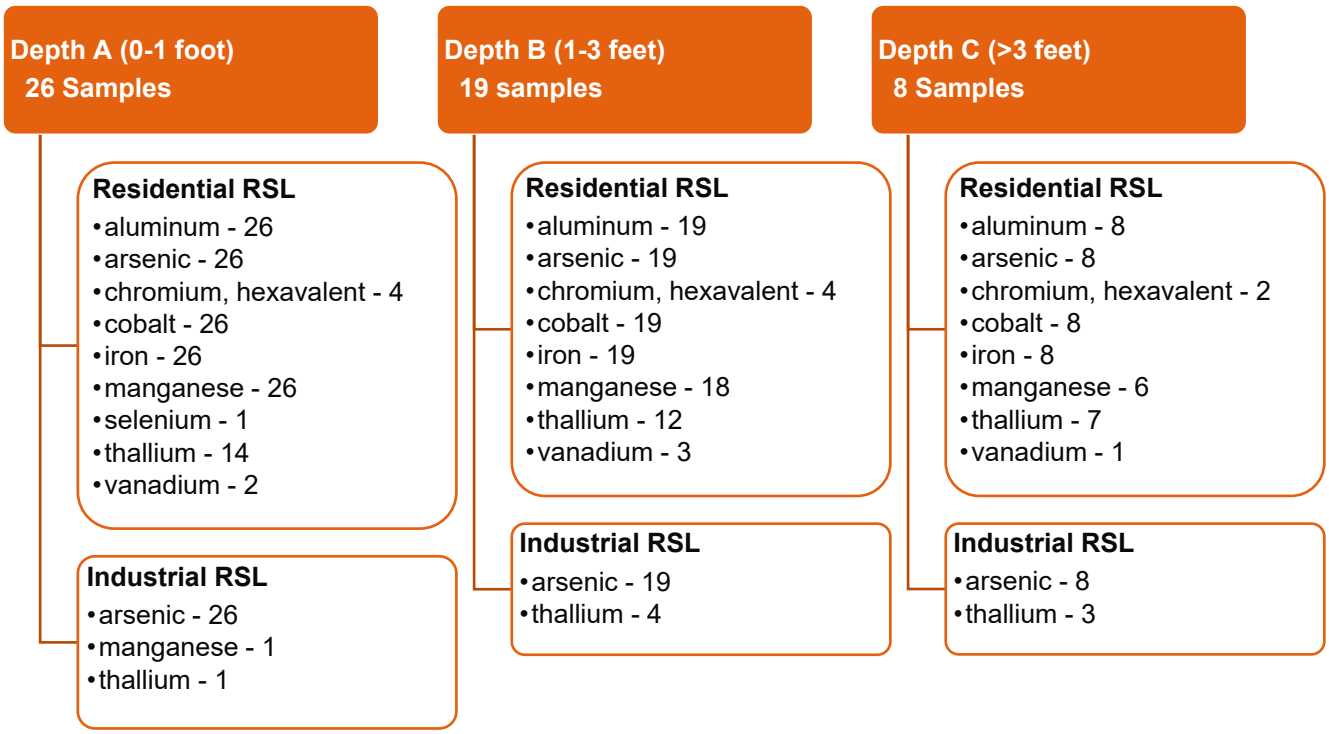
In the 35 reference soil samples analyzed for 17 PAHs, 15 PAHs were detected in at least one sample. Fourteen PAHs were detected in the Depth A samples, and 15 PAHs were detected in the Depth B samples. None of the Reference Area PAH concentrations exceeded the USEPA residential or industrial RSLs.

4.3.1.3 Metals

Former Launch Area

In the 53 soil samples analyzed for metals, 24 metals were detected in at least one sample. **Exhibit 4-2** summarizes the number of samples with detected concentrations of metals that exceeded USEPA residential and/or industrial RSLs for the following sample depth intervals. **Figures 4-6b** and **4-7b** show concentrations of the metals at the locations with exceedances.

Exhibit 4-2: Metals RSL Exceedances in Former Launch Area Soil Samples

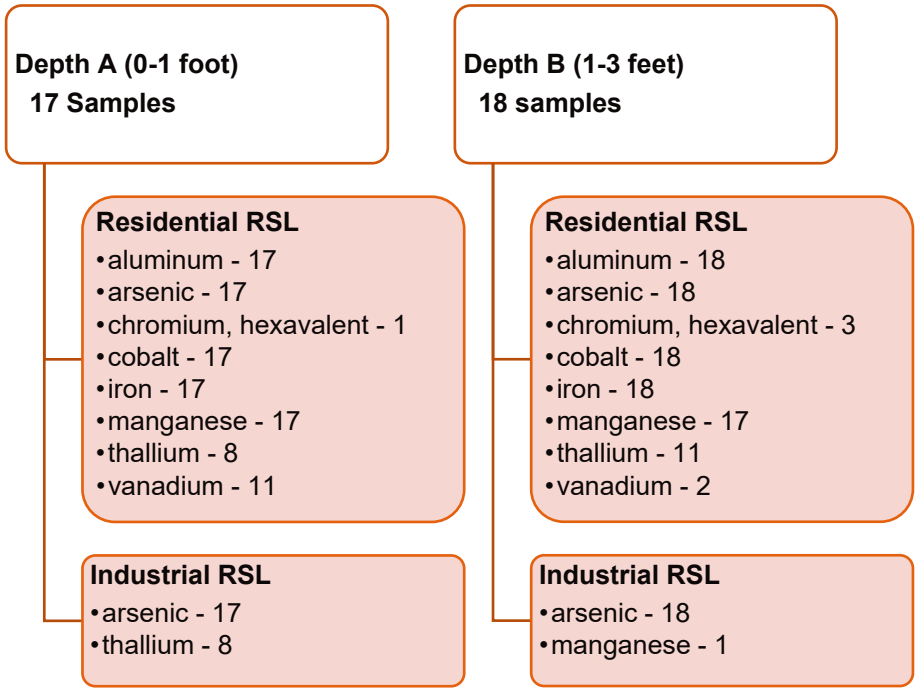


Reference Area

In the 35 reference soil samples from 16 locations analyzed for metals, 24 metals were detected in at least one sample. Concentrations of aluminum, cobalt, iron, and manganese exceeded residential RSLs at all 16 reference sample locations, and arsenic concentrations exceeded the industrial RSL at all locations. **Figure 4-8** shows concentrations of the metals that exceeded screening criteria at the reference locations.

Exhibit 4-3 summarizes the number of reference samples with detected concentrations of metals that exceeded USEPA residential and/or industrial RSLs for the 0 to 1 foot bgs and 1 to 3 feet bgs sample depth intervals. Different formatting (white header boxes and orange shading in boxes detailing exceedances) was used in the exhibit for reference soil data, to distinguish from the previous exhibit for the former Launch Area soil data.

Exhibit 4-3: Metals RSL Exceedances in Reference Soil Samples



4.3.1.4 Polychlorinated Biphenyls

Former Launch Area

Four soil samples collected from three locations in the vicinity of a former transformer pad were analyzed for seven PCB Aroclors. Two samples (parent and field duplicate) were collected from Depth A at one location and two samples were collected from Depth B at two locations. No PCB Aroclors were detected in any of the samples.

Reference Area

Reference soil samples were not analyzed for PCBs.

4.3.1.5 Hydrazines

Former Launch Area

In the 53 soil samples analyzed for hydrazines, hydrazine was not detected in 42 samples and results were rejected ("R" qualified) in 11 samples. Methyl hydrazine was not detected in 45 samples and results were rejected ("R" qualified) in eight samples. It should be noted that the "R" qualified data were initially "X" qualified which indicated significant quality control deficiencies in the laboratory analysis of the samples. As described in **Section 4.3.4.3,** the JV and USACE project team recommended that the "X" qualified data be rejected, and the qualifier changed to "R".

Reference Area

Reference soil samples were not analyzed for hydrazines.

4.3.2 Groundwater

A total of 46 groundwater samples (including field duplicate samples) were collected during two sampling events in September and December 2020 during the RI field activities. Samples collected from one upgradient well (MW-16) were used to approximate background conditions. The location of this well was selected as it was the most upgradient area accessible in the former Launch Area that would not also be downgradient of the Town landfill and/or immediately downgradient of the NYS Thruway.

Analytical results for groundwater samples are summarized in **Table 4-4a** (VOCs), **Table 4-4b** (SVOCs), and **Table 4-4c** (metals). Exceedances of the human health screening criteria for groundwater in the former Launch Area are presented on **Figure 4-9a** (VOCs), **Figure 4-9b** (SVOCs), and **Figure 4-9c** (metals).

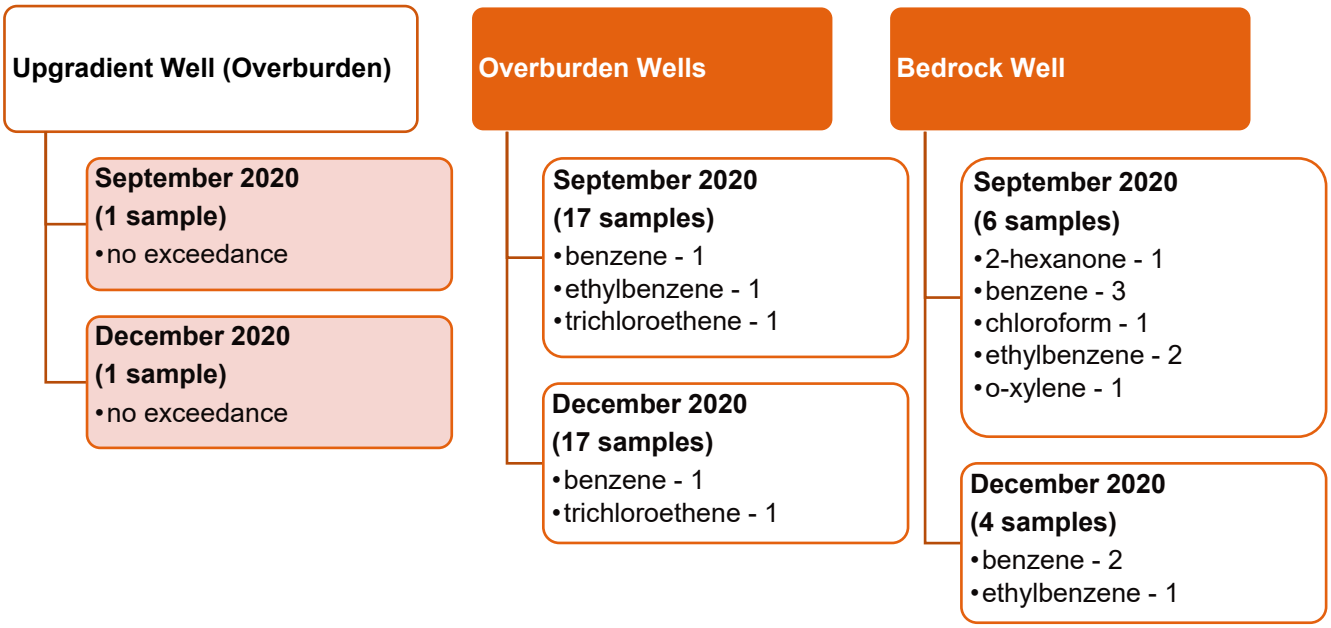
The laboratory analytical reports are available in the FUDSChem library. Data validation reports are provided in **Appendix C**.

4.3.2.1 Volatile Organic Compounds

In the 46 groundwater samples analyzed for 51 VOC constituents, 16 VOCs were detected in at least one groundwater sample during the September and/or December sampling events. **Figure 4-9a** shows locations with concentrations of VOCs exceeding USEPA Tapwater RSLs. No VOC concentrations exceeded the Tapwater RSLs in the upgradient well, MW-16.

Exhibit 4-4 below summarizes the number of samples with detected concentrations of VOCs exceeding the Tapwater RSLs by monitoring well type and sampling event. As shown in **Exhibit 4-4**, there was good agreement between the two sampling events in terms of the number and type of analytes that exceeded the applicable criteria. Different formatting (white header box and orange shading in boxes detailing exceedances) was used to show upgradient monitoring well data, to distinguish from the former Launch Area groundwater data.

Exhibit 4-4: Numbers of VOC Exceedances of Tapwater RSLs in Groundwater Samples

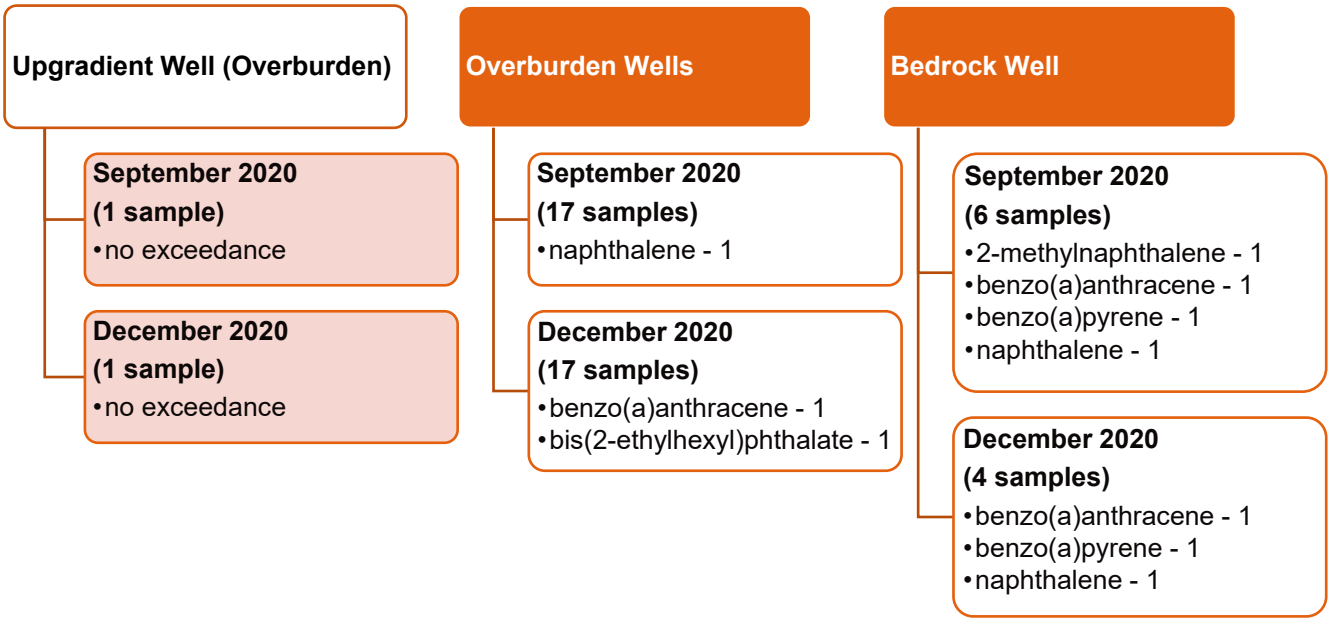


4.3.2.2 Semi-Volatile Organic Compounds

In the 46 groundwater samples analyzed for 68 SVOC constituents, 17 SVOCs were detected in at least one groundwater sample during the September and/or December sampling events. Sixteen of the 17 detected SVOCs were PAHs. **Figure 4-9b** shows locations with concentrations of SVOCs exceeding RSLs. No SVOC concentrations exceeded the RSLs in the upgradient well.

Exhibit 4-5 below summarizes the number of samples with detected concentrations of PAHs exceeding the USEPA Tapwater RSLs by monitoring well type and sampling event. Different formatting (white header box and orange shading in boxes detailing exceedances) was used to show upgradient monitoring well data, to distinguish from the former Launch Area groundwater data.

Exhibit 4-5: Numbers of SVOC Exceedances of Tapwater RSLs in Groundwater Samples



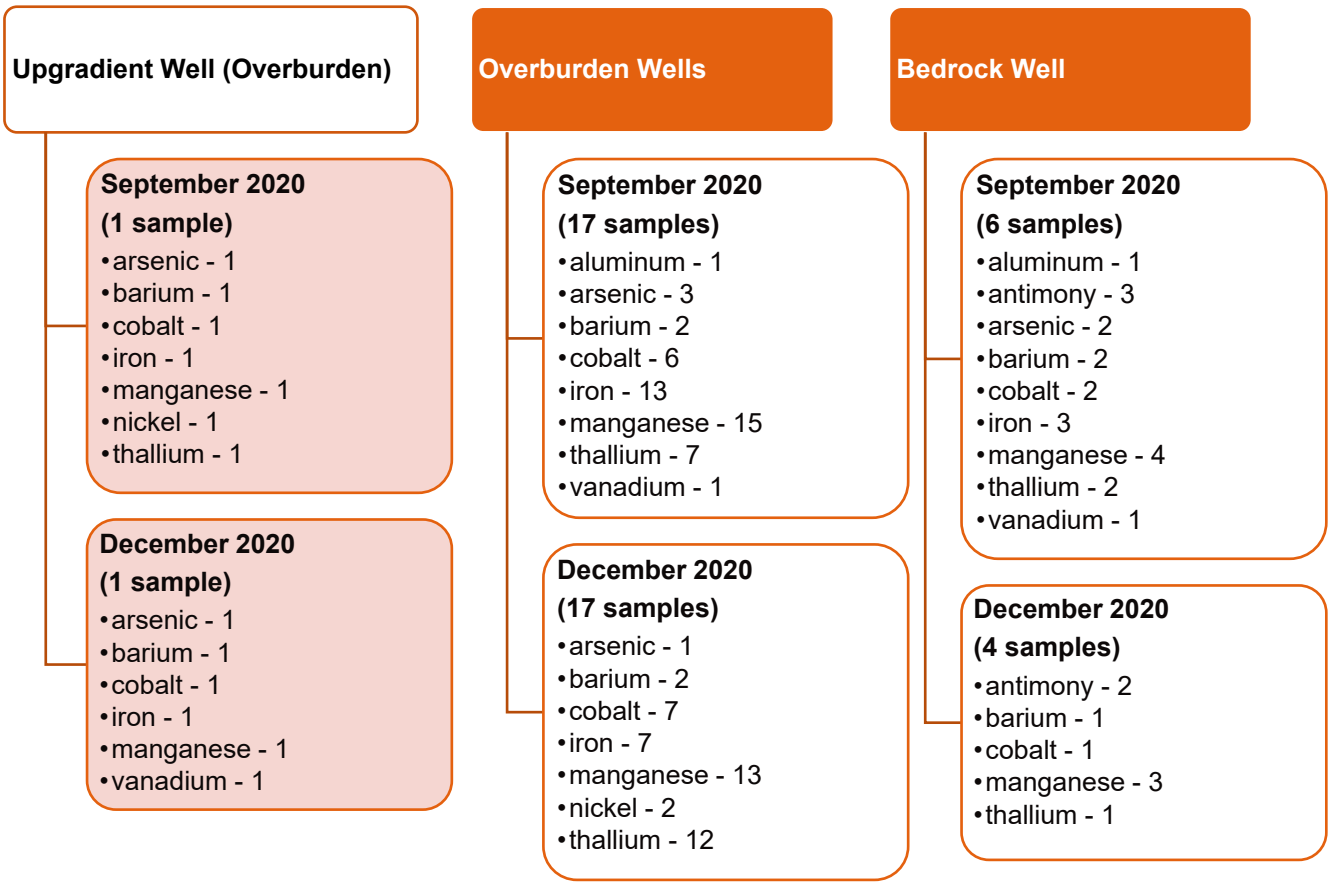
4.3.2.3 Metals

Total Metals

In the 46 groundwater samples analyzed for total metals, all 23 metals were detected in at least one sample collected during the September and/or December sampling events. In the upgradient well, 20 metals (total) were detected during the September and/or December sampling events. **Exhibit 4-6** below summarizes the numbers of samples with detected concentrations of total metals exceeding the USEPA Tapwater RSLs by monitoring well type and sampling event. Different formatting (white header box and orange shading in boxes detailing exceedances) was used to show upgradient monitoring well data, to distinguish from the former Launch Area groundwater data.

RSLs are not available for calcium, magnesium, potassium, and sodium. However, it was observed that concentrations of these metals (particularly sodium) were much higher than typical for freshwater groundwater. Sodium concentrations near 20 mg/L would be expected in background groundwater for this area (USGS OFR 2013-1095). Sodium concentrations ranged from 70.3 to 2,720 mg/L and were also elevated at the upgradient well location (268 to 315 mg/L). This finding can be explained by the storage of road salt/brines at the site, truck transport/loading/unloading of road salt by the Town of Hamburg's Highway Department, and the presence of an interstate highway (which is heavily salted during winter months) directly to the northwest.

Exhibit 4-6: Numbers of Total Metals Exceedances of Tapwater RSLs in Groundwater Samples

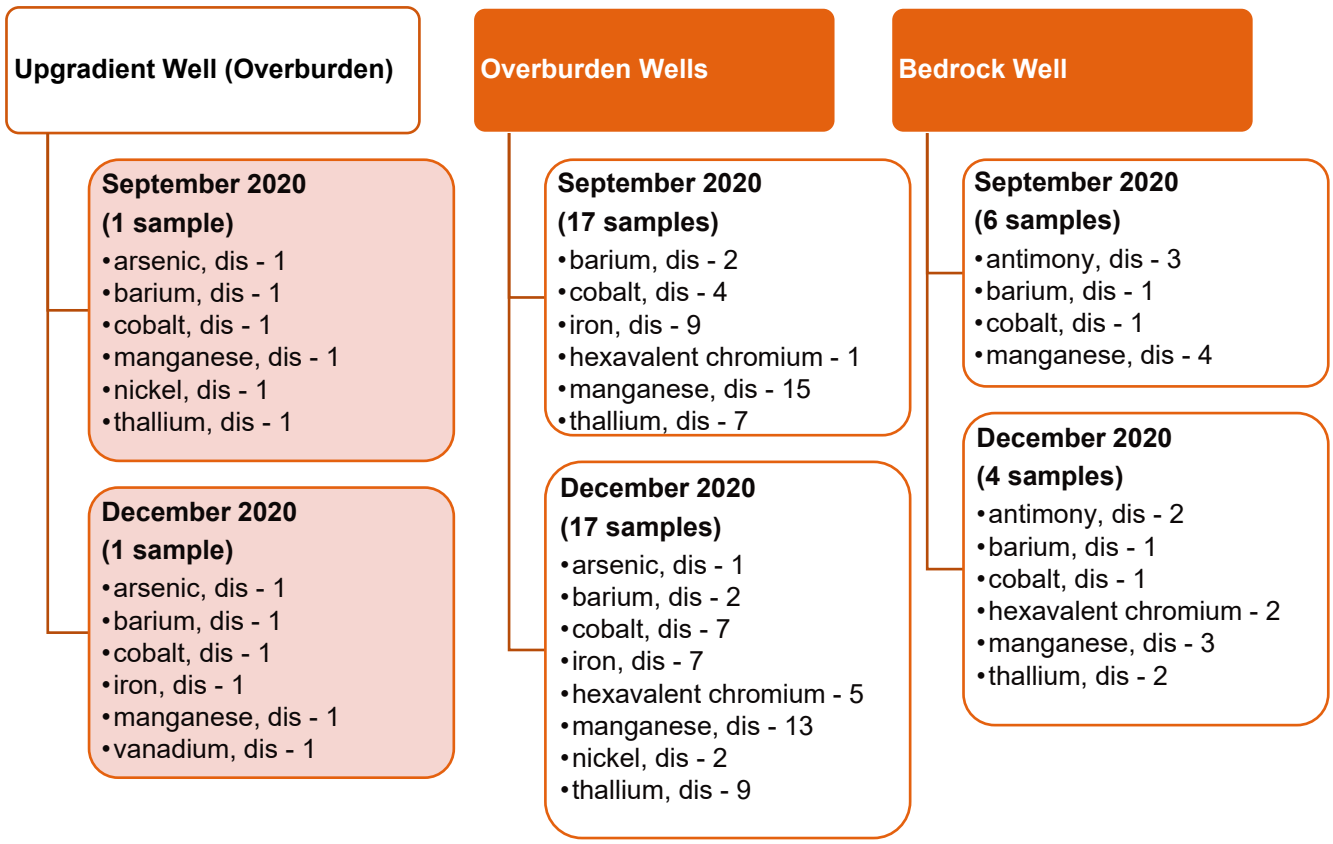


Dissolved Metals

In the 46 groundwater samples analyzed for 24 dissolved metals, 23 metals were detected in at least one sample collected during the September and/or December sampling events. In the upgradient well, 16 metals (dissolved) were detected during the September and/or December sampling events. **Exhibit 4-7** below summarizes the numbers of samples with detected concentrations of dissolved metals exceeding the USEPA Tapwater RSLs by monitoring well type and sampling event. Different formatting (white header box and orange shading in boxes detailing exceedances) was used to show upgradient monitoring well data, to distinguish from the former Launch

Area groundwater data. **Figure 4-9c** shows locations with concentrations of total and/or dissolved metals exceeding RSLs.

Exhibit 4-7: Numbers of Dissolved Metals Exceedances of Tapwater RSLs in Groundwater Samples



4.3.3 Background Threshold Values

The Reference Area (i.e., background) soil data were used to calculate site-specific BTVs. BTVs are typically represented by Upper Tolerance Limits (UTLs) calculated from a background dataset. For example, a 95/95 UTL indicates a value that contains 95% of the population with 95% confidence. The BTVs are used to aid in the identification of COPCs and inform the remedial decision process (see **Section 6**). The evaluation focused on metals and PAHs.

BTVs were derived using reference soil data from the 0 to 1 foot and 1 to 3 feet depth intervals and were developed for those constituents with a minimum of eight samples and five detections. If insufficient data were available to calculate UTLs, the BTV was approximated by the maximum detected concentration in the background dataset.

Prior to calculating BTVs, several exploratory data analysis steps were used to identify suspected outliers and determine goodness-of-fit (GOF) for each data set. Consistent with USEPA (2015) guidance, data were evaluated for fits to normal, lognormal, and gamma distributions at an alpha level (α) of 0.05 (95% significance level).

Optimal statistical tests, depending on the distribution and sample size, were applied using USEPA's (2015) ProUCL 5.1.002 software. The criteria for selecting the most reliable method of UTL calculation, in accordance with USEPA (2015), depends on sample size, degree of censoring, GOF results, and skewness (as determined by the standard deviation of the natural logarithm of the detections). The UTL was selected from among five possible methods: normal UTL, lognormal UTL, gamma UTL, KM UTL, or nonparametric UTL. If the UTL exceeded the maximum detected concentration, then the maximum was retained as the BTV for conservatism.

The detailed discussion on the BTVs is provided in **Appendix J**, along with the reference soil sample data, a table with suspected outliers, and BTVs for the 0 to 1 foot and 1 to 3 feet bgs depth intervals. The results of the BTV derivations for each soil depth horizon are also shown in **Table 4-5a** (0 to 1 foot bgs) and **Table 4-5b** (1 to 3 feet bgs). For comparison purposes, regional background levels for metals and PAHs in soil from the NYSDEC (2005) rural soil survey are provided in the tables. In general, the BTVs derived from the Reference Area soil data were found to be within an order of magnitude of the regional background levels.

4.3.4 Data Usability

4.3.4.1 Data Validation Procedures

Data validation criteria for the RI conducted at the former Launch Area were based on the quality objectives developed in the Final RI QAPP (JV 2020). Cadena, Incorporated (Inc.), a third party who was not associated with sample collection and analysis, interpretation of sample data, or any decision-making process for this project, validated the site data. Data were reviewed under Stage 2A guidelines. The analyses were validated using the following documents, as applicable to each analytical method:

- DoD Quality Systems Manual for Environmental Laboratories, Version 5.3 (2019a);
- DoD General Data Validation Guidelines, Revision 1 (2019b).

Before validation, field data were entered into FUDSChem throughout the sampling event and screened for errors. FUDSChem contains all tools necessary to review, qualify, and assess the quality of analytical data, as well as the tools to generate a presentation-quality data review report that displays these findings. As soon as a laboratory certifies a compliant Staged Electronic Data Deliverable (SEDD) 5.2 2a file into FUDSChem, Automated Data Review (ADR) is triggered and performs a data quality assessment based on the electronic QAPP. ADR checks the data for outliers and applies qualifiers based on the parameters set in the Final RI QAPP. Generally, for data validation, the validator will keep the chemistry results by sample delivery group (SDG), preliminary (Excel Format) report open in one window and use it, along with the lab report, to fill out the Data Review Checklist. If the validator finds a data point in the chemistry results by SDG preliminary (Excel Format) report that needs to be qualified, or that needs the qualifier removed or edited, the validator will update the qualifiers.

Sample results were subject to a Stage 2A data validation. Stage 2A data validation assesses data quality by comparing data collection, QC, and reporting parameters to the appropriate criteria (or limits) as specified in the Final RI QAPP, Contract Laboratory Program requirements, or by method-specific requirements.

4.3.4.2 Data Validation Results

Data validation reports are included in the FUDSChem library and are provided in **Appendix C**. Overall, the sample analyses were completed with quality assurance (QA)/QC protocols met. The "2020 former Launch Area" dataset is considered usable and meets project DQOs with the minor exceptions summarized below and provided with more detail in **Appendix C**.

- Analysis performed more than two times past the method-specified 24-hour holding times ("X" qualified):
  - Hexavalent chromium results in four groundwater samples and one equipment blank sample.
- Recoveries in the MS and/or MSD samples less than 30 percent ("X" qualified):
  - Antimony results in three soil samples and associated field duplicate samples.
  - Hexavalent chromium results in two soil samples and two groundwater samples.
- Recoveries in the MS and/or MSD samples less than 10 percent ("X" qualified):
  - 4-chloroaniline results in one soil sample and field duplicate sample.
  - Caprolactam result in two groundwater samples.
  - Hydrazine results in three soil samples.
  - Hydrazine and methyl hydrazine results in five soil samples and three associated field duplicate samples.
- Recovery in the laboratory control sample (LCS) less than 10 percent ("X" qualified):
  - Caprolactam results in three equipment blank samples.
  - 4-chloroaniline results in six soil samples.
  - Atrazine result in one soil sample.
  - 3,3'-dichlorobenzidine, 4-nitroaniline, atrazine, and N-nitrosodiphenylamine results in three soil samples.
  - 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, pentachlorophenol, and phenol results in three equipment blank samples.
  - 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in two groundwater samples and one equipment blank sample.
  - 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in six groundwater samples and one equipment blank sample.
  - 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2,4-dinitrotoluene, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, m-&p-cresols, hexachlorocyclopentadiene, pentachlorophenol, and phenol results in six groundwater samples and one equipment blank sample.
  - 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-methylphenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-chloro-3-

methylphenol, m-&p-cresols, pentachlorophenol, phenol, and 4-nitrophenol results in six groundwater samples, two field duplicate samples, and one equipment blank sample.

- The recoveries of one or more of the SVOC acid fraction surrogate compounds (i.e., 2,4,6-tribromophenol, phenol-6, and 2-fluorophenol) were less than 10 percent in 11 groundwater samples, two field duplicate samples, and 10 equipment blank samples. Samples were “X” qualified.

4.3.4.3 Data Uncertainty

The overall assessment of the field samples and QA/QC checks for the former Launch Area sampling dataset met project requirements and completeness goals. The completeness goal of 90 percent was met overall.

A total of 2,900 results for certain analyses and/or analytes were qualified as estimated (J qualifier) or estimated non-detect (UJ qualifier) out of 22,446 results for the “2020 former Launch Area” data. Sample results qualified as estimated (UJ, J) due to QC exceedances are usable with an understanding of the quality issues identified in the data validation report.

A total of 552 results for certain analyses and/or analytes in the “2020 former Launch Area” dataset were “X” qualified for the reasons previously described in **Section 4.3.4.2**. As stated in the DoD Data Validation Guidelines (2019b), “Sample results (including non-detects) qualified as X were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.” Therefore, the JV and USACE project team recommended that the 552 results that were X qualified be excluded from the “2020 former Launch Area” data set. These excluded data points are presented in Tables 4-2a, 4-2b, 4-2c, 4-3a, 4-3b, 4-4a, 4-4b, and 4-4c with R qualifiers. Despite the rejected data, the overall project DQOs were met.

For several of the target analytes, in soil and/or groundwater, the limits of detection were greater than the human health or ecological project action limits identified in the Final RI QAPP. This was primarily due to matrix interference in the samples and was limited to select metals and organics in soil and groundwater. The uncertainty associated with the elevated detection limits is further discussed in the uncertainty section of the BRA.

Based on the Stage 2A data validation, results that are not excluded are considered valid and usable.

5 Conceptual Site Model

This section presents the CSM for the former Launch Area of the Nike Battery that was developed based on the results of the RI. As provided in USEPA guidance, "A CSM is a comprehensive graphical and written summary of what is known or hypothesized about environmental contamination at a site and the relationships among key site information that are pertinent to decision-making. A CSM is a representation that evolves over the life cycle of site investigation and cleanup efforts. It provides a platform for evaluating the data gaps and related uncertainty associated with site history and operations; geology, hydrogeology and hydrology; contaminant sources, release mechanisms and fate and transport; potential receptors and exposure pathways." (USEPA 2021 Accessed at: https://clu-in.org/optimization/components_csm.cfm). Presented below are discussions on physical characteristics of the site, potential site constituents and sources, nature and extent of contaminants, and their fate and transport.

5.1 Physical Characteristics of the Site

After completion of the RI field work, key physical aspects of the site were evaluated to determine if assumptions changed based on the site observations and the results from the 2020 soil and groundwater sampling. Based on the results of the RI presented in the previous sections, the physical aspects of the CSM presented in the Final RI QAPP remain representative of the site. Most notably, this includes:

- The former Launch Area is used exclusively for commercial/industrial activities.
- Soil/overburden materials in the former Launch Area are predominantly composed of fill and reworked native materials. There was no visual or field-measured evidence of contamination (i.e., staining or odors) encountered in the overburden samples collected from the site.
- The groundwater table is located in the weathered bedrock layer at the interface between the overburden and competent bedrock.
- Bedrock is comprised of shale that is fractured along bedding planes at shallow depths and becomes more competent (i.e., less fractured) with depth.
- Overburden and bedrock groundwater can be considered a single, connected, unconfined flow system with groundwater flow toward 18 Mile Creek, which is the regional drainage feature. There was no visual or field-measured evidence of contamination (i.e., sheens or odors) observed in the groundwater samples collected from the site.
- Surface water flow is only present during precipitation/melting events and drains to wetland areas that also eventually discharge to 18 Mile Creek.

5.2 Identification and Nature and Extent of Contaminants

The results of the RI investigations indicate that the primary contaminants found in the former Launch Area soil and groundwater are PAHs and metals, with other SVOCs and VOCs found to a lesser extent in groundwater. These contaminants were detected in surface soil (0 to 1 foot bgs), subsurface soil (1 to 7 feet bgs), and overburden and bedrock groundwater samples at the site. As noted in **Section 2.5,** there is very limited ecological habitat at the former Launch Area; therefore, the following discussion of potential site constituents focuses on the comparison of detected concentrations to human health screening criteria. The surface and subsurface soil results were not initially screened with ecological screening criteria to evaluate nature and extent since only a subset of the soil sample locations was identified as potential habitat. The soil data from those areas that contain

potential habitat were compared to ecological screening benchmarks in the SLERA, and the results of the soil data screened with ecological criteria are discussed in detail in **Section 6.2**.

Soil data from the former Launch Area were also compared to reference soil data. These comparisons are presented in the HHRA (**Section 6.1**) and SLERA (**Section 6.2**). Constituents with maximum detected site concentrations less than BTVs calculated from the reference soil data were not included in the quantitative risk assessments (see **Sections 6.1.1** and **6.2.3**). Groundwater data from the former Launch Area were compared to upgradient monitoring well data. Constituents with maximum detected site concentrations less than the upgradient groundwater concentrations were not included in the quantitative HHRA (**Section 6.1.1**).

5.2.1 SVOCs/PAHS

Five PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene) were present at concentrations that exceeded residential soil RSLs, primarily in surface soil samples collected from the former Launch Area (**Table 4-2b**). These PAHs are classified as high molecular weight (HMW) PAHs. Benzo(a)pyrene was the most common exceedance spatially (including in soil at the upgradient location NHLA-MW16) and the only PAH present at a concentration that exceeded its industrial RSL. Approximately half of the benzo(a)pyrene exceedances in soil had concentrations below the regional background level (470 µg/kg; NYSDEC, 2005). As shown on **Figure 4-6a** and **Figure 4-7a**, the highest levels of PAHs were found in surface soil collected from 0 to 1 foot bgs at NHLA-MW14 and NHLA-MW15. NHLA-MW14 is associated with the drum and material storage historical activities area and is located along the east perimeter swales and downgradient of the site. NHLA-MW15 is located along east perimeter swales and proximal to the historical missile silos, now filled with asphalt pavement millings.

Concentrations of the PAHs in the former Launch Area soil samples are higher than concentrations of PAHs detected in Reference Area soil samples (**Table 4-3a**). For surficial soil (0 to 1 foot bgs), concentrations of five PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene) from the former Launch Area are statistically greater than the Reference Area samples. For subsurface soil (1 to 3 feet bgs), only two PAHs (benzo(a)pyrene, benzo(b)fluoranthene) from the former Launch Area are statistically greater than the Reference Area samples (see **Appendix J** Table J-5 for details).

In groundwater, 2-methylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, bis(2-ethylhexyl)phthalate, and naphthalene concentrations exceeded residential RSLs in several overburden and bedrock wells (NHLA-MW1OB, -MW4BR, -MW4OB, -MW5BR, -MW9BR, and -MW11) (see **Table 4-4b** and **Figure 4-9c**). The concentrations of these SVOCs were slightly above the residential RSL and, based on their isolated nature and location/distance from former DoD activity areas, do not indicate a release to the environment associated with past DoD activities. Two of the constituents (2-methylnaphthalene and naphthalene) are classified as low molecular weight (LMW) PAHs which are more soluble and volatile than HMW PAHs. The well with the greatest number of PAHs at concentrations above screening criteria was NHLA-MW5BR, which is located on the downgradient side of the site. There were no SVOC exceedances in the samples from the upgradient well NHLA-MW16. In addition, these compounds do not readily dissolve in groundwater and, when they do, their mobility is restricted by the presence of organic carbon, which is ubiquitous in the subsurface at the site due to the presence of fill materials in the overburden and natural petroleum compounds in the bedrock. Therefore, their presence at NHLA-MW5BR is not likely attributable to upgradient sources.

The distribution of the SVOCs/PAHs spatially and temporally suggests that there is no discernible trend in soil or groundwater, and that any impacts are likely localized. The shallow soils across the site indicate that PAHs may be present due in part to multiple non-DoD-related sources, such as petroleum residuals related to UST or AST leaks, fueling spills, asphalt used in road construction, tar, or from asphalt millings stored by the Town of

Hamburg in the missile silo vaults. The LMW PAHs in soil are present at substantially lower concentrations (below screening criteria) and smaller spatial distribution than those of the HMW PAHs. In groundwater, SVOC/PAH exceedances did not correlate with the SVOC/PAH soil results, illustrating the relatively low mobility of the HMW PAHs.

5.2.2 Metals

Various metals were detected in former Launch Area soils, Reference Area soils, and groundwater during the RI field investigations. In the Reference Area, eight metals (aluminum, arsenic, hexavalent chromium, cobalt, iron, manganese, thallium, and vanadium) were detected at concentrations above residential screening criteria in surface and subsurface soil depths at the site (**Table 4-3b**). The same metals, plus selenium (with 'J' qualifier), were detected in the former Launch Area at concentrations above residential screening criteria in surface and subsurface soils (**Table 4-2c**). Concentrations of only three of the eight metals (arsenic, manganese, and thallium) also exceeded their industrial RSLs in one or more samples from the Reference Area and the former Launch Area.

The concentrations of the metals in the former Launch Area and reference locations are similar. The results of the data collected from the former Launch Area and from the Reference Area suggest that metals concentrations in the former Launch Area are at local background levels, and that site soils have not been impacted by DoD-related activities. Aluminum, antimony, arsenic, cadmium, iron, nickel, and vanadium were detected in surface soil (0 to 1 foot bgs) at concentrations less than BTVs (see **Appendix I**, RAGS Part D Table 2.1). Although maximum detected concentrations of cobalt, selenium and thallium exceeded BTVs, their surface soil data sets were statistically different from (less than) the Reference Area data sets (see **Appendix J** Table J-5). For subsurface soil (1 to 3 feet bgs), concentrations of antimony, arsenic, cadmium, cobalt, copper, iron, manganese, nickel, selenium, vanadium, and zinc were less than BTVs (see **Appendix I**, RAGS Part D Table 2.2). Although maximum detected concentrations of aluminum, hexavalent chromium and thallium exceeded BTVs, their subsurface soil data sets were statistically different from (less than) the Reference Area data sets (see **Appendix J** Table J-5). In general, for the metals listed in **Exhibit 4-3**, the maximum concentrations detected in Reference Area soil samples are greater than the regional background levels (NYSDEC 2005).

Numerous metals were detected at concentrations greater than the USEPA Tapwater RSLs in both the total and dissolved samples **(Table 4-4c)**. However, the same metals were detected in locations upgradient from the DoD activity areas. In addition, many of these metals (i.e., iron, manganese, aluminum) are ubiquitous in groundwater throughout the region.

In addition, storage, handling and use of highly soluble road salts by the Town of Hamburg's Highway Department on and adjacent to the former Launch Area appears to have impacted groundwater, resulting in elevated sodium, potassium, calcium, and magnesium in groundwater that is characteristic of sodium chloride (NaCl), potassium chloride (KCl), calcium dichloride ($CaCl_2$), and magnesium chloride ($MgCl_2$) road salts. These road salts, when introduced in the soils at high concentrations, will displace other metals sorbed to clays and other charged surfaces or bound to organic matter. The result is elevated levels of both the road salts and metals in the soils mobilized by the road salts to the groundwater at levels above expected background. Sodium, the most common element of the road salts used, is present in the groundwater at levels as much as 100-times higher than expected for groundwater in this area (USGS OFR 2013-1095). Because the use of these salts varies year-to-year, and relative mobility of the metal ions varies based on their individual geochemical characteristics, the relationship between individual road salts to other metals present in the groundwater is complex. Although the relationship between these metals is complex, there is a significant correlation between calcium from the road salt and manganese, and magnesium from the road salt and manganese concentrations in groundwater. Based on

the distribution of metals throughout the site and given the use of the former Launch Area as a town maintenance facility for more than 50 years, the metals detected in groundwater are indicative of releases related to road salt storage onsite and are not indicative of a release to the environment associated with past DoD activities.

5.2.3 VOCs

VOCs were detected in groundwater at concentrations above screening criteria **(Table 4-4a)**; no VOCs in soil exceeded screening criteria **(Table 4-2a)**. Concentrations of 2-hexanone, benzene, ethylbenzene, xylene, and trichloroethene (TCE) in groundwater exceeded USEPA Tapwater RSLs in overburden (NHLA-MW4OB, -MW5OB, and -MW9OB) and bedrock wells (NHLA-MW4BR, -MW5BR, and -MW9BR).

The presence of benzene, ethylbenzene, and xylene may be due to historical releases or naturally-occurring petroleum deposits that exist in the area. These compounds are very water soluble, resulting in high mobility. When released to water, VOCs are unlikely to adsorb to sediment or suspended solids; thus, they are less likely to persist in the environment. Given that the site has been used as a highway maintenance facility for more than 50 years, it is likely that the presence of these compounds is not associated with DoD activities.

TCE concentrations exceeded the RSL of 0.28 micrograms per liter (µg/L) in two overburden wells (NHLA-MW4OB in September at 0.37 J µg/L and the field duplicate for NHLA-MW9OB in December at 0.410 µg/L) but were below detection limit in their respective bedrock well pair. It should be noted that the detection in NHLA-MW4OB is a 'J' laboratory qualifier, indicating that it is an estimated value; and TCE was not detected in the parent sample of NHLA-MW9OB. These concentrations were slightly above the residential RSL and, based on their isolated nature and location/distance from former DoD activity areas, do not indicate a release to the environment associated with past DoD activities.

No VOCs were found in soil at concentrations above screening criteria.

5.3 Fate and Transport

Contaminant transport refers to migration mechanisms away from the source area. Contaminant fate refers to the expected final state that an element, compound, or group of compounds will achieve following release (and transport) to the environment. Understanding the fate and transport in the environment is important in evaluating the potential hazards to human health and the environment.

5.3.1 General

The primary environmental media for contaminants at the former Launch Area are surface and subsurface soil and groundwater. There are no permanent surface water features or aquatic habitat on the site, therefore surface water and sediment were not considered environmental media of concern. The contaminants identified in the former Launch Area at concentrations exceeding the applicable human health RSLs are PAHs and metals in soil and VOCs, SVOCs, and metals in groundwater.

Besides metals, which are naturally occurring elements in soil, the most prevalent compounds present in soil in the former Launch Area at concentrations exceeding USEPA residential or industrial RSLs are PAHs. These compounds were ubiquitous throughout the investigation area, and they were also detected in reference soil samples. In addition, there are no localized areas of relatively elevated concentrations, indicating that the impacts to site soils are not from DoD-related activities.

In groundwater, the metals, VOCs, and SVOCs detected at concentrations greater than the USEPA Tapwater RSLs also likely do not indicate a release to the environment associated with past DoD activities. The metals concentrations upgradient of DoD activity areas are similar to concentrations from downgradient locations. VOC and SVOC exceedances are isolated and are not co-located with former DoD activity areas.

5.3.2 Potential Sources and Routes of Migration

The primary potential sources for contaminants at the former Launch Area are the missile silos and support facilities. Historic releases may have occurred to soil and/or paved surfaces, resulting in contaminants present in surface soil. Contaminants at the site are subject to various transport or migration mechanisms including wind dispersion/wind erosion, surface runoff and surface water flow, and infiltration/dissolution. Migration pathways may include air, water, soil, and the interfaces between the phases of the contaminant (i.e., solid, liquid, or gas), as well as biological uptake. Migration of constituents from impacted media (primary, secondary, and tertiary source media) to exposure media (media to which human and ecological receptors may be exposed) can involve a variety of release mechanisms and transport routes. The exposure routes applicable to the former Launch Area are described in the sections below.

5.3.2.1 Soil-to-Groundwater

The primary mechanism of contaminant transport from the secondary source (i.e., surface soil/vadose zone) to groundwater is through dissolution and transport of constituents via infiltration from precipitation or snowmelt. The average depth to groundwater in the former Launch Area is less than 10 feet bgs (**Table 3-1**). The short transport pathway through the vadose zone increases the likelihood of contaminants in the soils/vadose zone to reach groundwater.

The following can facilitate or impede contaminant transport to groundwater:

- Soil pH;
- Organic and clay content in the soil;
- ORP;
- Sorption properties of the constituent;
- Constituent solubility.

The storage and truck transport of road salt by the Town of Hamburg's Highway Department has resulted in the distribution of salts across the soil surface at the former Launch Area. This is particularly true of sodium (the most common road salt is sodium chloride) and is evident by the very high sodium concentrations in groundwater. Once dispersed to soil, the salt cations will displace naturally occurring metals (e.g., cobalt, manganese, and vanadium) that are sorbed to exchangeable sites on the soils (clays and iron oxyhydroxide precipitates) and organic matter due to the high ionic strength of the sodium chloride solutions. The distribution of these cations will depend on the amounts of road salt stored at the site, and when and how long the material was stored. An additional source of sodium to area-wide groundwater is the application of road salt on the interstate highway northwest and generally upgradient of the former Launch Area. This results in naturally-occurring metals in soil becoming mobilized in groundwater and could explain concentrations greater than the RSLs, including at the upgradient well location, MW-16.

5.3.2.2 Overland Flow

Overland flow via surface runoff and surface water flow is a secondary release mechanism. Stormwater can erode exposed soil particles during precipitation events. This is influenced by site topography, amount and rate of precipitation, soil particle size/density, cohesion of soil, and vegetation cover. Vegetation limits the surface area of soil subject to erosion by stormwater runoff. The former Launch Area is highly disturbed with little vegetation and has significant coverage by impervious surfaces. The area is generally flat with a small manmade drainage swale along the southeastern border of the former Launch Area that may collect runoff during periods of heavy rainfall and snowmelt. Surface runoff and overland flow may impact tertiary sources (i.e., surface water and sediment), but these media are not expected to be impacted given the relatively flat topography of the site and the small size of the manmade drainage ditches.

5.3.2.3 Migration with Groundwater

Migration in groundwater occurs primarily through advection. Advection is the movement of a chemical with groundwater flow. Aquifer characteristics, such as hydraulic conductivity, pH, dissolved and total organic matter content, clay and cation exchange capacity of the aquifer matrix, ORP and dissolved oxygen, other dissolved constituents, and ionic strength of the groundwater, significantly influence mobility in the surficial aquifer. Constituent properties, including sorption, solubility, precipitation and co-precipitation reactions, and biotic and abiotic degradation, also influence mobility in the surficial aquifer. Based on water levels collected in September 2020, the direction of groundwater flow in the overburden and bedrock groundwater is to the southeast.

Based on site use and the groundwater geochemistry, there is strong evidence that the storage/transport/use of road salt is principally responsible for the levels of metals observed in groundwater. The dissolution and migration of road salt (particularly sodium chloride) originating at the site is obvious, in that the greatest total sodium concentrations (883 to 2,720 mg/L) are from overburden monitoring wells (MW-3, MW-4OB, MW-5OB, and MW-6) immediately downgradient of the existing salt barn. The highest cobalt (16.3 µg/L) and manganese (5,440 µg/L) concentrations were also observed in groundwater from MW-3. Relatively elevated metals concentrations were also found in wells (MW-2, MW-11, and MW-12) adjacent to the salt barn or near/downgradient of truck transport pathways.

5.3.2.4 Erosion and Wind Dispersion

Aerial migration of particulates from surface soil via wind erosion and dispersion may occur as a secondary release mechanism for areas of the former Launch Area with exposed soil. The potential for this transport mechanism is reduced at the site due to the covering by buildings, asphalt, and gravel for most areas. Moist or vegetated areas will also be less subject to erosion and wind dispersion.

5.3.2.5 Adsorption and Biological Uptake

Adsorption of contaminants from soil into terrestrial vegetation and soil organisms may occur as a tertiary release mechanism. Additionally, biological uptake may occur for birds and mammals foraging at the site. However, these release mechanisms are expected to be limited at the former Launch Area. As discussed in **Section 6.2**, only small areas (approximately ½-acre) of successional old field at the site perimeter provide potential habitat. The former Launch Area is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn. Lawn areas are not a natural cover type and provide limited wildlife habitat.

6 Baseline Risk Assessment

This section presents the baseline risk assessment (BRA) for the former Launch Area at the Nike Battery. The BRA consists of a HHRA (**Section 6.1**) and a SLERA (**Section 6.2**), which followed appropriate guidelines from the USEPA and USACE (e.g., EM 200-1-4 Volumes I and II).

6.1 Human Health Risk Assessment

The objectives of the HHRA were to:

- Evaluate potential human health risks, currently and in the future, in the absence of any major action to control or mitigate potential contamination (i.e., baseline risks).
- Assist in determining the need for and extent of (if any) soil and groundwater remediation.
- Provide a basis for deciding if remedial action is necessary to protect human health.

The HHRA followed guidance outlined in the USEPA's Risk Assessment Guidance for Superfund (RAGS), Volume I, Human Health Evaluation Manual, Part A (USEPA 1989), Part D (USEPA 2001), Part E (USEPA 2004), and Part F (USEPA 2009), which is consistent with USACE guidance EM 200-1-4, Risk Assessment Handbook – Volume I: Human Health Evaluation (USACE 1999). The HHRA is presented in a series of tables that follow the RAGS Part D (USEPA 2001) format (see **Appendix I**).

The HHRA followed the four-step process typically used to assess potential human health risks. These steps are summarized below and further described in the following sections.

- Data Evaluation – Evaluate relevant soil and groundwater data to determine data usability and select COPCs.
- Exposure Assessment – Identify actual and/or potential constituent release and transport mechanisms and potentially exposed human populations and possible exposure pathways, determine COPC concentrations at potential points of human exposure, and estimate human exposures to COPCs.
- Toxicity Assessment – Summarize toxicity information for each COPC.
- Risk Characterization – Estimate the likelihood and magnitude of adverse health effects in the form of excess lifetime cancer risks and non-cancer hazards. Discuss sources of uncertainty in the HHRA.

6.1.1 Data Evaluation

The data evaluation focuses on the compilation of usable analytical data and the selection of COPCs in soil and groundwater. The HHRA was conducted using soil and groundwater data collected during the RI. Surface soil, subsurface soil, and groundwater samples from the former Launch Area and site-specific reference sample data from adjacent areas on the Nike Battery were collected as described in the Final RI QAPP and in **Section 4**.

Surface soil data for the HHRA was defined as all samples from 0 to 1 foot bgs. Subsurface soil samples were samples from unsaturated soils at 1 foot bgs to the water table or 10 feet, whichever was first. The RI soil data from the former Launch Area included 22 surface soil (plus four field duplicate) samples and 23 unsaturated subsurface soil (plus three field duplicate) samples. Sample NHFLA-SL11B-A-SEP2020 from 0 to 2 feet bgs was included in both the surface soil and subsurface soil data sets. Two samples from 15 to 17 feet bgs were not included in the HHRA. All soil samples were analyzed for TCL VOCs, TCL SVOCs, TAL metals and hexavalent chromium. Three of the surface soil (plus one field duplicate) samples were also analyzed for PCBs.

The RI groundwater data from the former Launch Area included two rounds of samples from each of 19 monitoring wells (15 overburden and four bedrock wells) and one groundwater sample from a fifth bedrock well (NHFLA-MW5BR-SEP2020). All groundwater samples were analyzed for TCL VOCs, TCL SVOCs, TAL metals, and hexavalent chromium. Field measurements indicated the depth to shallow groundwater ranges from approximately 4 to 10 feet bgs and suggests hydrogeologic communication between the overburden and bedrock groundwater units. Therefore, all groundwater data were initially evaluated as a single aquifer (i.e., data from overburden and bedrock monitoring wells were combined) to identify COPCs for the potable use scenario. Groundwater data from only the overburden wells were used to identify COPCs for a construction/utility worker exposure scenario and the vapor intrusion pathway.

Following sample collection and analysis, the laboratory analytical data were validated in accordance with procedures outlined in the Final RI QAPP. Data validation reports are included in **Appendix C**. Generally, data characteristics used to satisfy the QA/QC requirements included precision, accuracy, representativeness, comparability, detection limit verification, and blank contamination elimination or qualification. Based on review of the data validation reports, the majority of the soil and groundwater data is of acceptable quality overall but subject to the data validator's qualifying remarks (e.g., J [estimated] qualifiers). Some sample results were qualified "X" by the data validator, indicating the sample results were affected by serious deficiencies and exclusion of the data was recommended. These results were reviewed by the JV and USACE project team and were considered unusable ("R" used as the final qualifier); therefore, "X" qualified results were not used in this HHRA. Data qualified as estimated were used as detected values, the same as unqualified data.

In summarizing the analytical data and calculating exposure point concentrations (EPCs) for the HHRA, results of parent and field duplicate samples were combined as follows:

- If a constituent was detected in both the parent and corresponding duplicate sample, the analytical results were averaged.
- If a constituent was detected in only one of the two samples, the detected concentration was used.
- If a constituent was not detected in either sample, the limits of detection were averaged.

To focus the HHRA on those constituents that, if contacted, have the greatest potential to pose human health risks, the list of detected constituents was narrowed to a final list of COPCs according to the following screening process:

- Essential nutrients (i.e., calcium, magnesium, potassium, and sodium) were categorically eliminated as COPCs. Additionally, although elevated concentrations of these essential nutrients were observed in groundwater samples from the former Launch Area and in the upgradient MW-16, the presence of these constituents in groundwater is not related to historical DoD-related activities and is likely due to storage of road salt and brine at the site (see **Appendix I**, RAGS Part D Table 2.3).
- Detected constituent concentrations in soil were compared to the USEPA residential soil RSLs (USEPA 2021a) in RAGS Part D Tables 2.1 and 2.2 (see **Appendix I**). While the current and foreseeable future use of the former Launch Area is industrial, residential soil RSLs were used to inform risk management decisions, if needed. The RSLs are protective of resident (adult and child) exposures via incidental ingestion, dermal contact, and inhalation. RSLs associated with a cancer risk of 1×10^{-6} or a non-cancer HQ of 0.1 were used to account for cumulative risk from exposure to multiple constituents. Constituents in soil with maximum concentrations greater than the residential soil RSLs were identified as COPCs.

- Detected metals and PAH concentrations in soil were also compared to BTVs calculated using the site-specific reference sample data (see **Tables 4-5a and 4-5b** and **Appendix J**). Metals and PAHs detected at concentrations greater than the residential soil RSLs but less than BTVs were eliminated from further quantitative evaluation (USACE 2011).
- For the metals and PAHs with maximum concentrations greater than the residential soil RSLs and BTVs, box plots and two-sample hypothesis tests were used to compare site data to reference soil data sets (see **Appendix J**). Metals and PAHs for which hypothesis testing indicated the site data set was less than or equal to the reference soil data set were eliminated from further quantitative risk evaluation (USACE 2011).
- Detected constituent concentrations in groundwater were compared to the USEPA Tapwater RSLs (USEPA 2021a) in RAGS Part D Tables 2.3 and 2.4 (see **Appendix I**). While groundwater is not currently used for drinking water, the potable use scenario was evaluated to inform risk management decisions, if needed. The Tapwater RSLs are protective of chronic residential exposures to chemicals in groundwater via ingestion, dermal contact, and inhalation (of volatile chemicals only) exposure routes. RSLs associated with a cancer risk of 1×10^{-6} or a non-cancer HQ of 0.1 were used to account for cumulative risk from exposure to multiple constituents. Constituents in groundwater with maximum concentrations greater than the Tapwater RSLs were identified as COPCs.
- Detected metals concentrations in groundwater were also compared to maximum concentrations in the upgradient monitoring well, MW-16. Metals detected at concentrations greater than the Tapwater RSLs but less than concentrations in MW-16 were eliminated from further quantitative evaluation (USACE 2011). Following this approach, concentrations of arsenic, cobalt, iron, manganese, and vanadium may be considered consistent with naturally occurring and/or anthropogenic conditions in groundwater and were eliminated as COPCs (RAGS Part D Tables 2.3 and 2.4).
- To evaluate the potential vapor intrusion pathway from shallow groundwater, volatile chemical analytical data from shallow (i.e., overburden) groundwater samples were compared to the USEPA Vapor Intrusion Screening Levels (VISLs; USEPA 2021b) in RAGS Part D Tables 2.5 and 2.6 (see **Appendix I**). VISLs associated with a cancer risk of 1×10^{-6} or a non-cancer HQ of 0.1 were used. A site-specific groundwater temperature based on the average of field measurements in the overburden wells with volatile chemical detections was used to adjust the Henry's Law Constant in the USEPA's groundwater VISL calculator. Volatile chemicals in shallow groundwater samples at detected concentrations greater than the VISLs were identified as COPCs for the vapor intrusion pathway.

The soil and groundwater data summaries and selection of COPCs are presented in RAGS Part D Tables 2.1 through 2.6 (see **Appendix I**). The RAGS Part D Table 2 series is organized to include the following components: range of detected concentrations, data qualifiers, location of maximum detected concentration, frequency of detection (FOD), range of detection limits, concentration used for screening, screening toxicity value, COPC flag, and the rationale for elimination or selection of a constituent as a COPC.

The surface soil COPCs shown in RAGS Part D Table 2.1 are:

- PAHs – benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene.
- Metals – hexavalent chromium and manganese.

The subsurface soil COPCs shown in RAGS Part D Table 2.2 are:

- PAHs – benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene.

The groundwater COPCs shown in RAGS Part D Table 2.3 (potable use scenario) and RAGS Part D Table 2.4 (construction / utility worker exposure scenario) included VOCs, SVOCs, and metals. RAGS Part D Table 2.5 shows that no volatile constituents in shallow (i.e., overburden) groundwater from the former Launch Area exceeded USEPA VISLs (USEPA 2021b) for a commercial scenario.

RAGS Part D Table 2.6 includes groundwater data from only the overburden wells (MW-5OB, -7OB, -13, -14, and -15) located near the southern site boundary, in the direction of groundwater flow away from the site and toward the nearest residential properties on Lakeview Road. The volatile constituent concentrations in these wells were conservatively compared to the USEPA VISLs (USEPA 2021b) for a residential scenario, as a possible indication of potential future residential exposure via vapor intrusion from shallow groundwater. As shown in RAGS Part D Table 2.6, benzene was the only constituent detected in the selected wells at a concentration above residential VISLs. Benzene was detected in only three of the ten samples in the selected overburden wells, in only three of the 30 total overburden groundwater samples (see RAGS Part D Table 2.4), and in eight of the 39 groundwater samples collected during the RI (see RAGS Part D Table 2.3). The sporadic nature of the benzene detections in groundwater is not indicative of a widespread release. Two concentrations (5.1 J µg/L and 2.8 µg/L, both in MW-5OB) in the selected overburden wells exceeded the residential VISL of 2.25 µg/L. Considering that the VISL for benzene is based on a target cancer risk of 1×10^{-6}, the two concentrations from the same well barely exceed the screening level, and benzene is the only volatile constituent with an exceedance for this pathway, it can be inferred that the estimated residential cancer risk (i.e., 2E-06) would be within acceptable levels. Benzene is widely distributed in the environment and can be released to soils through multiple sources including gasoline leaks (ATSDR 2007). Once in the environment, benzene is subject to volatilization, photooxidation (on the surface), and biodegradation (ATSDR 2007). Given the time (more than 50 years) since the DoD activities at the site and the fate and transport characteristics of benzene, its presence in groundwater is likely not associated with historical DoD activities. Based on these considerations and the fact that the former Launch Area is not used and is not likely to be redeveloped for residential use, no further evaluation of the residential vapor intrusion pathway was performed.

6.1.2 Exposure Assessment

The objective of the exposure assessment section of an HHRA is to estimate the type and magnitude of human exposure to constituents at or originating from a site. This was accomplished by establishing assumptions about the potential for human exposure (e.g., exposed populations, exposure pathways, exposure frequency), calculating representative EPCs for each COPC, and modeling human exposure in the form of daily intakes (termed dermally absorbed dose [DAD] for dermal contact exposure) or inhalation exposure concentrations (ECs). These estimates of exposure were combined in the risk characterization with constituent-specific toxicity values to calculate incremental lifetime cancer risks and non-cancer hazards.

6.1.2.1 Current and Future Land Uses

The current and foreseeable future land use for the former Launch Area is industrial. The property is owned by the Town of Hamburg and used by the Highway Department for storage, office space, and maintenance. The Town of Hamburg police department uses the area of the former enlisted men's barracks along the southwestern property boundary as a police and firearm training center. A small arms range with an earthen backstop berm is located in the northwestern corner of the former Launch Area adjacent to the landfill.

The former Launch Area is zoned for residential-agricultural use (Town of Hamburg 2018). Residential properties are located approximately 500 feet south of the former Launch Area along Lakeview Road. However, future residential use of the former Launch Area is not considered a realistic or reasonable scenario based on the

current land use and ownership, proximity to the Hamburg Landfill, and presence of the underground silos. Per a conversation with the Town Engineer on November 21, 2019, redevelopment of the former Launch Area for future residential use is highly unlikely and is not part of the Town's plans (Personal communication with Mike Quinn 2019).

The former Control Area and Easement Area at the Nike Battery are northeast of the former Launch Area and are currently used as the Town of Hamburg's Lakeview Recreational Area, consisting of a playground, sledding hill, ball fields, and a BMX track. The former Control Area and Easement Area are not the subject of current investigations.

6.1.2.2 Potential Receptors and Exposure Pathways

Based on the current and most likely future land use, potential human receptors include on-site commercial/industrial indoor workers, on-site outdoor maintenance workers, on-site construction/utility workers, and off-site residents.

RAGS Part D Table 1 (see **Appendix I**) presents the exposure scenarios and receptor populations that were evaluated for the former Launch Area. The scenario time frame, source medium, exposure medium, exposure point, receptor population, receptor age, exposure route, type of analysis, and rationale for selection or exclusion of an exposure pathway are provided.

Generally, human exposure to COPCs in soil may occur through incidental ingestion, dermal contact, and inhalation (particulates and volatile constituents). Under the current and most likely future land use, direct exposure to COPCs in groundwater may occur through incidental ingestion, dermal contact, and inhalation (volatiles) if shallow groundwater is encountered during site excavation. Indirect exposure to volatile constituents in shallow groundwater could occur through inhalation of indoor air if an occupied building overlies affected groundwater.

Groundwater at the former Launch Area is not used as a drinking water source. Potable water is supplied to the former Nike Battery areas and nearby residents by the Erie County Water Authority, which receives surface water from Lake Erie and the Niagara River. Therefore, use of groundwater as drinking water is currently an incomplete exposure pathway. However, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. While, unlikely, there is the potential for groundwater to be used as drinking water by on-site commercial/industrial indoor workers and off-site nearby residents in the future. Therefore, these groundwater exposure pathways are potentially complete under hypothetical future exposure scenarios.

Based on a preliminary search of public databases containing well records (see **Appendix D**) and considering what is currently known about surrounding land uses (which are primarily residential), irrigation wells and industrial wells were not identified. There are no restrictions that would limit future use of the surficial aquifer for irrigation or industrial purposes. However, evaluation of the potable use scenario is considered protective of potential exposures via irrigation or industrial wells. Therefore, use of groundwater for irrigation or as industrial process water was not identified as a potential exposure scenario to be evaluated in the HHRA.

A graphical representation of complete or potentially complete exposure pathways for each receptor population is presented in the human health CSM (**Figure 6-1**). A complete exposure pathway includes a source, an exposure medium, an exposure route, and a receptor (USACE 2012). If any one of these elements is missing, the pathway is considered incomplete. A pathway is potentially complete when data are insufficient to conclude a pathway is complete (e.g., there is currently not an exposure point [drinking water well], or sampling has not been performed to confirm constituents are present in the assumed exposure medium [indoor and outdoor air]).

The HHRA evaluated the following complete or potentially complete exposure pathways:

On Site

- Current/most likely future on-site indoor commercial/industrial workers may be exposed to COPCs in indoor dust derived from surface soil via incidental ingestion and inhalation of wind-blown fugitive dust and volatiles.
- Current/most likely future on-site indoor commercial/industrial workers could be exposed to volatile COPCs present in underlying groundwater that migrates from shallow groundwater to indoor air of on-site buildings. However, as discussed in **Section 6.1.1**, no volatile constituents in overburden groundwater exceeded USEPA VISLs (USEPA 2021b) for a commercial scenario. Therefore, no further evaluation of the on-site commercial/industrial vapor intrusion pathway was performed.
- Under a hypothetical future scenario, on-site indoor commercial/industrial workers could be exposed to COPCs in groundwater via ingestion of groundwater used as potable water, dermal contact while washing hands, and inhalation of volatiles released to indoor air during potable use of groundwater. Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source.
- Current/most likely future on-site outdoor maintenance workers may be exposed to COPCs in surface soil via incidental ingestion, dermal contact, and inhalation of wind-blown fugitive dust and volatiles.
- Current/most likely future on-site construction/utility workers may be exposed to COPCs in combined surface and subsurface soil via incidental ingestion, dermal contact, and inhalation of volatiles and dust during excavation.
- Given the shallow depth to groundwater, current/most likely future on-site construction/utility workers may be exposed to COPCs in groundwater via incidental ingestion, dermal contact, and inhalation of volatiles in shallow groundwater that infiltrates the bottom of an excavation.

Off Site

- Current/most likely future off-site residents could be exposed to volatile COPCs (if present in underlying groundwater) that migrate from shallow groundwater to indoor air of nearby residences. **Section 6.1.1** discussed that benzene is the only constituent that was detected at a concentration above residential VISLs in the overburden wells nearest to existing residential properties. However, benzene concentrations in two samples from the same well only slightly exceeded the residential VISL based on a target cancer risk of 1×10^{-6}. The sporadic nature of the benzene detections in groundwater is not indicative of a widespread release. Given the use of the former Launch Area as a town maintenance facility for more than 50 years, the presence of benzene in groundwater is not likely attributable to historical DoD activities. Based on these considerations and the fact that the former Launch Area is not used and is not likely to be redeveloped for residential use, no further evaluation of the residential vapor intrusion pathway was performed.
- Under a hypothetical future scenario, off-site residents may be exposed to COPCs in groundwater via ingestion of groundwater used as potable water, dermal contact while washing hands and showering, and inhalation of volatile compounds released to indoor air during household use of groundwater (e.g., clothes washing). Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source.

6.1.2.3 Exposure Point Concentrations

To determine the constituent concentrations to which an individual might be exposed over many years, representative EPCs were calculated from the useable soil and groundwater data. The USEPA (1992, 1989) recommends that the arithmetic average concentration of the data be used for evaluating long-term exposure and that, because of the uncertainty associated with estimating the true average concentration at a site, the 95 percent (%) upper confidence limit (UCL) on the arithmetic average be used as the EPC. The 95% UCL concentration provides reasonable confidence that the true average will not be underestimated. The USEPA also indicates that, where there is a question about the distribution of the data, a statistical test should be used to identify the best distributional assumption for the dataset (USEPA 1992b).

The ProUCL® 5.1.002 (ProUCL) program developed by the USEPA's Technology Support Center for Monitoring and Site Characterization was used to test the distributional assumptions and calculate 95% UCL concentrations for the soil COPCs. When entering the soil data into ProUCL, if a COPC was not detected in a sample, the sample reporting limit was entered as a proxy concentration, and the sample result was coded as non-detect. ProUCL contains rigorous parametric and non-parametric statistical methods that can be used on full or uncensored datasets and on datasets with below detection limit observations (also called left-censored datasets). Depending on the distribution and 95% UCL estimation method, ProUCL will use only detected data or will incorporate detection limits.

The USEPA (2015) indicates that statistical estimates of EPCs may not be reliable for small datasets, or for those with only a few detected values (e.g., fewer than four to six). Generally, for soil datasets with fewer than eight samples or fewer than five detected values, the maximum detected concentration was used as the EPC. Where the 95% UCL concentration calculated by ProUCL is greater than the maximum detected concentration, the maximum detected concentration was retained as the EPC. **Appendix I** contains the ProUCL output for the soil COPCs.

Given that only two samples are available from each well, the maximum detected concentration for each COPC across all monitoring wells (excluding the upgradient monitoring well, MW-16) was used as the groundwater EPC. This approach is consistent with USEPA Office of Solid Waste and Emergency Response (OSWER) Directive 9283.1-42 (USEPA 2014a). The hydrogeological investigation demonstrated that the overburden and bedrock groundwater are in communication; therefore, a single EPC was used for each COPC to represent the aquifer (i.e., combined overburden and bedrock groundwater) and evaluate the potable use scenario. Field measurements indicated the depth to shallow groundwater ranges from approximately 4 to 10 feet bgs. The maximum detected concentration for each COPC across only the overburden wells (excluding MW-16) was used to evaluate the potential exposure of construction/utility workers to constituents in shallow groundwater.

EPCs for other media (i.e., outdoor and indoor air) were derived from numerical relationships between the chemical's concentration in soil or groundwater and the other medium based on chemical-specific properties and site-specific parameters (e.g., climatic conditions and soil type). Worksheets 4-1 through 4-4 in **Appendix I** provide the details of these calculations.

EPCs for particulates in outdoor air were estimated by multiplying the EPCs for the COPCs in soil by a particulate emission factor (PEF). The PEF is based on simplified soil-to-air transmission relationships described in Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA 2002). The USEPA has derived a default PEF due to wind under passive conditions that is used to calculate the RSLs (USEPA 2021a). This default PEF (1.36E+09 m^3/kg) was used to estimate COPC concentrations in outdoor air for the on-site indoor commercial/industrial worker and on-site outdoor maintenance worker. A site-specific PEF was calculated for the on-site construction/utility worker using the equation for a construction scenario, available in

USEPA 2002. USEPA default values were used except for the Q/C variable presented in the site-specific PEF equation (Equation E-18; USEPA 2002), which is based on the local climate and size of the site.

EPCs for volatile COPCs in outdoor air were estimated by multiplying the EPCs for the COPCs in soil by chemical-specific volatilization factors (VFs) based on equations in USEPA 2002. Site-specific VFs were calculated using soil parameter (e.g., soil porosity) values specific to the predominant soil type encountered during the RI at the former Launch Area (Equation 4-8; USEPA 2002). Sub-chronic VFs were calculated for on-site construction/utility workers, for which the assumed exposure duration is 1 year (Equation 5-14; USEPA 2002).

EPCs for volatile COPCs in the outdoor air of an excavation were estimated by multiplying the EPCs for the COPCs in groundwater by a VF based on equations available in the Virginia Unified Risk Model (Virginia Department of Environmental Quality [VDEQ] 2019).

Finally, to evaluate inhalation of volatile COPCs that could be released to indoor air during potable use of the groundwater, EPCs for volatile COPCs in groundwater were multiplied by the VF (0.5 L/m^3) used to calculate the Tapwater RSLs (USEPA 2021a).

6.1.2.4 Estimates of Constituent Intake/Exposure

Estimates of chemical intake and exposure were developed to portray reasonable maximum exposure (RME) under current and future exposure scenarios. The RME scenario considers the highest exposure that might reasonably be expected to occur; one that is well above the average case of exposure but within the range of possibility. Use of RME parameter values to model baseline human health risks is a conservative approach, in that it yields upper bound cancer risk and non-cancer hazard estimates (USEPA 1989).

The RME parameters and the intake, exposure, and dose equations used to estimate human exposure are consistent with USEPA (1989, 2002, 2004, 2009, 2011, and 2014b) guidance and presented in the RAGS Part D Table 4 series in **Appendix I**. For commercial/industrial workers, outdoor maintenance workers, and residents, chronic exposures were estimated. For construction/utility workers, where the exposure duration is assumed to be 1 year, sub-chronic exposures were estimated.

6.1.3 Toxicity Assessment

The toxicity assessment (or dose-response assessment) section of an HHRA characterizes the relationship between the magnitude of exposure and the potential for an adverse health effect to occur. Toxicity assessment involves determining whether exposure to a constituent can increase the incidence of adverse health effects and characterizing the nature and strength of the evidence of causation. The toxicity information is then quantitatively evaluated, and the relationship between the dose of constituent received and the incidence of adverse health effects in the exposed population is evaluated.

6.1.3.1 Sources of Toxicity Data

The USEPA and other regulatory agencies have assessed the toxicity of numerous chemicals, and the guidance they provide was used in this HHRA. These include reference doses (RfDs) and reference concentrations (RfCs) for the evaluation of non-carcinogenic health effects from chronic and sub-chronic exposure to chemicals and cancer potency slope factors (CSFs) and unit risk factors (URFs) for evaluating incremental cancer risk from lifetime exposure to chemicals (i.e., excess lifetime cancer risks [ELCRs]).

Sources of toxicological information and toxicity values, in order of preference consistent with USEPA (2003) guidance, included:

- Tier 1 - Integrated Risk Information System (IRIS; USEPA 2021d). IRIS is an internet database containing current information on human health effects that may result from exposure to chemicals in the environment and has received internal and external scientific review.
- Tier 2 - Provisional Peer-Reviewed Toxicity Values (PPRTVs; USEPA 2021e). PPRTVs were developed by the USEPA Office of Research and Development/National Center for Environmental Assessment/Superfund Health Risk Technical Support Center and are available as chemical-specific issue papers.
- Tier 3 - Additional sources of toxicity information, including but not limited to the California Environmental Protection Agency (CalEPA) Office of Environmental Health Hazard Assessment's chronic reference exposure levels and cancer potency values, the ATSDR minimal risk levels, and toxicity values published in the USEPA Health Effects Assessment Summary Tables (HEAST) (USEPA 1997a).

6.1.3.2 Adverse, Non-cancer Health Effects

The NCP (USEPA 1990) indicates that acceptable exposure levels for chemicals with non-cancer health effects should represent concentration levels to which the human population, including sensitive subpopulations (e.g., the elderly, young children), may be exposed without adverse health effects during a lifetime or part of a lifetime, incorporating an adequate margin of safety. The potential for non-cancer health effects associated with oral and dermal exposures is evaluated by comparing an estimated chemical intake or DAD over a specified period with an RfD derived for a similar exposure period. The RfD is an estimate of a daily exposure level for the human population, including sensitive subpopulations, that is likely to be without an appreciable risk of deleterious effects during a lifetime. Therefore, the ratio of the intake or DAD to the RfD, termed the hazard quotient (HQ), assumes a level of exposure (i.e., the RfD) below which it is unlikely for even sensitive subpopulations to experience adverse health effects.

The potential for non-cancer health effects associated with inhalation exposures is evaluated by comparing COPC concentrations in air (i.e., ECs) to RfCs derived for a similar exposure period (USEPA 2009). HQs were estimated by calculating the ratio of the EC to the RfC.

The USEPA has indicated that RfDs and RfCs are based on the assumption that thresholds exist for certain toxic effects and that they often carry uncertainty spanning perhaps an order of magnitude. Chronic RfDs and RfCs were specifically developed to be protective of long-term exposure to a chemical. For construction/utility workers, whose exposure is assumed to occur over a 1-year period, sub-chronic RfDs and RfCs were used where available from the USEPA RSL Subchronic Tables. Chronic RfDs and RfCs were used as conservative approximations where sub-chronic values were not available.

The RfDs and RfCs for the characterization of potential chronic and sub-chronic non-cancer health effects via oral and inhalation exposures are presented in RAGS Part D Tables 5.1 and 5.2 (see **Appendix I**), respectively, along with the primary target organ, the combined uncertainty and modifying factors used in the derivation of the RfD and RfC, and the source of the RfD and RfC. Generally, order-of-magnitude (i.e., in increments of 10) uncertainty factors reflect the various types of toxicological data (e.g., a laboratory animal study extrapolated to the human condition) used to estimate the RfDs and RfCs. Modifying factors, which can range from greater than zero to 10, reflect qualitative professional judgment regarding scientific uncertainties (e.g., the completeness of the overall database) not covered by the uncertainty factor. Application of the uncertainty and modifying factors is intended to result in RfDs and RfCs that are protective of human health.

RfDs are not available to evaluate dermal exposure. In their absence, oral RfDs were used and adjusted following USEPA (2004) guidance to reflect absorbed dose. Dermal RfDs were calculated by multiplying oral RfDs by gastrointestinal absorption efficiency factors. This allows for comparison between exposures estimated as absorbed doses and toxicity values expressed as absorbed doses. The oral-to-dermal adjustment factors and the adjusted RfDs are presented in RAGS Part D Table 5.1 (see **Appendix I**).

6.1.3.3 Excess Lifetime Cancer Risks

Regardless of the mechanism of effect, risk evaluation methods employed by the USEPA generally derive from the hypothesis that thresholds for cancer induction by carcinogens do not exist, and that the dose-response relationship is linear at low doses. Based on this hypothesis, USEPA has derived estimates of incremental cancer risk from lifetime exposure to potential carcinogens. This is accomplished by establishing the carcinogenic potency of the chemical through critical evaluation of the various test data and fitting dose-response data to a low-dose extrapolation model. The CSF, which describes the dose-response relationship at low doses, is expressed as a function of intake (i.e., $[mg/kg\text{-}day]^{-1}$).

ELCRs from oral and dermal exposures are estimated by multiplying an estimated daily intake or DAD prorated over 70 years by the CSF. The resulting risk estimate is expressed as a unitless probability (e.g., 2×10^{-5} or 2 in 100,000) of an individual developing cancer. The unitless probability represents the incremental (or increased) lifetime cancer risk associated with the estimated exposure above the background risk of developing cancer. This linear equation is valid only at low risk levels (i.e., below estimated risks of 0.01). According to the USEPA (1989), this approach does not necessarily provide a realistic prediction of risk. The true value of the risk at trace ambient concentrations is unknown and may be as low as zero.

To evaluate inhalation exposures, inhalation unit risks (IURs) that relate cancer potency to a chemical concentration in air were used instead of CSFs (USEPA 2009). ELCRs from inhalation exposure were estimated by multiplying the EC by the URF.

Oral CSFs and IURs are presented in RAGS Part D Table 6.1 and Table 6.2, respectively, in **Appendix I**. The USEPA weight-of-evidence classification under the 1986 Guidelines for Carcinogen Risk Assessment (USEPA 1986) or cancer guideline description under USEPA's revised carcinogen risk assessment guidelines (USEPA 2005c) for carcinogenicity and the source of slope factors or unit risk factors are also presented in RAGS Part D Tables 6.1 and 6.2 (see **Appendix I**).

The USEPA indicates that early-life exposure to carcinogenic chemicals with a mutagenic mode of action can result in a greater contribution to cancers appearing later in life (USEPA 2005d). To account for this, age-dependent adjustment factors (ADAFs) were applied to the oral CSFs and IURs for carcinogenic COPCs with a mutagenic mode of action (e.g., benzo(a)pyrene). The USEPA (2005d) recommends a ten-fold adjustment for exposure during 0 and 2 years of age, a three-fold adjustment for exposures between 2 and less than 16 years of age, and no adjustment for exposures for individuals 16 years and older. For the current/future resident child, an ADAF of 10 was applied to the cancer toxicity values to evaluate exposure from the ages 0 to 2 (ED = 2 years), and an ADAF of 3 was applied to evaluate exposure from the ages of 2 to 6 (ED = 4 years).

As with RfDs, the USEPA has not derived CSFs to evaluate dermal exposure. In their absence, CSFs for oral exposure were used and adjusted per USEPA guidance to reflect absorbed dose. Dermal CSFs were calculated by dividing the oral CSFs by gastrointestinal absorption efficiency factors. This allows for risk estimation based on exposures estimated as absorbed doses and CSFs expressed as absorbed doses. The oral-to-dermal adjustment factors and the adjusted CSFs are presented in RAGS Part D Table 6.1 (see **Appendix I**).

6.1.3.4 Chemical Mixtures

USEPA guidance was also used to evaluate the overall potential for non-cancer health effects and ELCRs from exposure to multiple chemicals. For the evaluation of non-cancer health effects, USEPA guidance assumes that sub-threshold exposures to several chemicals at the same time could result in an adverse health effect. The sum of the HQs (for individual chemicals, exposure routes, exposure pathways, or potentially exposed populations) is termed the HI. Generally, HIs are only used in the evaluation of a mixture of chemicals that induce the same effect by the same mechanism of action. In this HHRA, the HIs of a mixture of chemicals that can have different effects were used as a screening-level approach, as recommended by the USEPA (1989). This approach may overestimate the likelihood of adverse, non-cancer health effects. Therefore, for HIs greater than 1 from the mixture, toxic organ-specific HIs were calculated based on the toxicological endpoint used to derive the RfD.

For the evaluation of carcinogenic risks, USEPA guidance indicates that the individual risks associated with exposure to each chemical can be summed. This approach was used in this HHRA and assumes dose-additivity consistent with the Guidelines for the Health Risk Assessment of Chemical Mixtures (USEPA 1986) and Supplementary Guidance for Conducting Human Health Risk Assessment for Chemical Mixtures (USEPA 2000) and independence of action by the chemicals involved (i.e., that there are no synergistic or antagonistic chemical interactions and that all chemicals produce the same effect: cancer).

6.1.4 Risk Characterization

The risk characterization section of an HHRA involves combining exposure estimates with toxicity information to generate ELCRs and non-cancer hazards for each human exposure scenario evaluated in the HHRA. In this section, the non-cancer hazards and ELCRs are presented and discussed. Additionally, sources of uncertainty in this HHRA are documented and discussed.

6.1.4.1 Non-cancer Hazards

The potential for non-cancer health effects associated with constituent exposure was evaluated by calculating the ratio of an estimated intake or EC over a specified period with a chemical-specific RfD or RfC derived for a similar exposure period. The RfD or RfC is an estimate of a daily exposure level for the human population, including sensitive subpopulations, that is likely to be without an appreciable risk of deleterious effects during a lifetime. The non-cancer HQ therefore assumes a level of exposure below which it is unlikely for even sensitive subpopulations to experience adverse health effects. The total individual HQs were summed for each exposure pathway and scenario to yield HIs representative of the potential for adverse, non-cancer health effects from cumulative exposure. For the non-cancer assessment, exposure scenarios with an HI greater than 1 (i.e., 1E+00) are of potential concern. Where HIs from the mixture of chemicals were greater than 1, toxic organ-specific HIs were calculated based on the toxicological endpoint used to derive the RfD.

RAGS Part D Tables 7.1 through 7.6 in **Appendix I** present the calculation of non-cancer hazards for each receptor and exposure pathway. RAGS Part D Tables 9.1 through 9.6 (in **Appendix I**) summarize the non-cancer HQs by COPC (across all exposure routes), and RAGS Part D Tables 10.1 through 10.6 (in **Appendix I**, if applicable) include only the predominant contributors (if any) to the non-cancer HIs greater than 1.

Current/Future On-site Indoor Commercial/Industrial Workers

RAGS Part D Tables 7.1 and 9.1 show the non-cancer HQs for the current/future on-site indoor commercial/industrial worker exposure to surface soil (0 to 1 feet bgs). The receptor total HI for this exposure pathway is 0.02 and is below the acceptable level of 1.

Current/Future On-site Outdoor Maintenance Workers

RAGS Part D Tables 7.2 and 9.2 show the non-cancer HQs for the current/future on-site outdoor maintenance worker exposure to surface soil (0 to 1 feet bgs). The receptor total HI for this exposure pathway is 0.04 and is below the acceptable level of 1.

Current/Future On-site Construction/Utility Workers

RAGS Part D Table 7.3 shows the non-cancer HQs for the current/future on-site construction/utility worker exposure to surface soil and subsurface soil (0 to 10 feet bgs). The receptor total HI for this exposure pathway is 0.06 and is below the acceptable level of 1.

RAGS Part D Table 7.4 shows the non-cancer HQs for the current/future on-site construction/utility worker exposure to shallow (i.e., overburden) groundwater. The receptor total HI for this exposure pathway is 0.8 and is below the acceptable level of 1.

The combined RAGS Part D Table 9.3 and 9.4 shows the combined HI for the current/future on-site construction/utility worker exposure to both soil and groundwater is 0.8 and is below the acceptable level of 1.

Hypothetical Future On-site Indoor Commercial/Industrial Workers

RAGS Part D Table 7.5 shows the non-cancer HQs for the hypothetical future on-site indoor commercial/industrial worker exposure to groundwater used for potable purposes. Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. The receptor total HI for this hypothetical future exposure pathway is 3. The predominant contributor to the potential non-cancer hazard was thallium.

The combined RAGS Part D Table 9.1 and 9.5 (and combined Table 10.1 and 10.5) shows the combined HI for the hypothetical future on-site indoor commercial/industrial worker exposure to both soil and groundwater is also 3. The only target organ-specific HI greater than 1 was for dermal/skin effects (HI = 2, predominantly from ingestion of thallium in groundwater).

RAGS Part D Table 2.3 shows thallium was detected in 20 of 39 groundwater samples. However, concentrations in only two samples exceeded the background value of 0.82 µg/L. The HHRA likely overestimated the thallium exposure concentration since a maximum of 1.4 µg/L was used to evaluate the potable use scenario, and the mean of detected thallium concentrations is 0.32 µg/L. Thallium in the environment may be a result of coal use and/or emissions, and its previous use at the site has not been reported. Additionally, given the use of the former Launch Area as a town maintenance facility for more than 50 years, thallium is not likely attributable to historical DoD activities at the former Launch Area.

Hypothetical Future Off-site Residents

RAGS Part D Tables 7.6, 9.6, and 10.6 show the non-cancer HQs for the hypothetical future off-site residential exposure to groundwater used for potable purposes. Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. The receptor total HI for this hypothetical future exposure pathway is 20. The predominant contributors to the potential non-cancer hazard were benzene, bis(2-ethylhexyl)phthalate, and thallium. Target organ-specific HIs greater than 1 were calculated for dermal/skin effects (HI = 7, predominantly from ingestion of thallium), immune system effects (HI = 6, predominantly from ingestion and inhalation of benzene) and liver effects (HI = 5, predominantly from dermal contact with bis[2-ethylhexyl]phthalate).

As discussed above, thallium was detected in 20 of 39 groundwater samples, however concentrations in only two samples exceeded the background value of 0.82 µg/L. The HHRA likely overestimated the thallium exposure

concentration since a maximum of 1.4 µg/L was used, and the mean of detected thallium concentrations was 0.32 µg/L. Thallium in the environment may be a result of coal use and/or emissions, and its previous use at the site has not been reported. bis(2-Ethylhexyl)phthalate is a common laboratory contaminant and is likely an artifact of sample analysis. A review of lab reports for a subset of the highest bis(2-ethylhexyl)phthalate results in soil indicated results were biased high with potential for lab contamination. Additionally, bis(2-ethylhexyl)phthalate was detected in only 4 of the 39 groundwater samples (at concentrations ranging from 1.9 to 28 µg/L), and a single detected concentration (28 µg/L in NHFLA-MW4OB-DEC2020) exceeded the Tapwater RSL of 5.6 µg/L. bis(2-Ethylhexyl)phthalate was also detected in one of the two upgradient groundwater samples at an estimated concentration of 2.2 µg/L. Benzene was detected in 8 of the 39 groundwater samples, at concentrations ranging from 0.33 to 210 µg/L, however the second highest concentration was 11 µg/L. Benzene concentrations exceeded the Tapwater RSL at three locations (MW-4, MW-5, and MW-9). Benzene was not detected (< 0.500 µg/L) in upgradient groundwater samples. The sporadic nature of the benzene detections is not indicative of a widespread release. Finally, given the use of the former Launch Area as a town maintenance facility for more than 50 years, the presence of these constituents in groundwater is not likely attributable to historical DoD activities at the former Launch Area.

6.1.4.2 Excess Lifetime Cancer Risks

Individual ELCRs are expressed as unitless probabilities of a person developing cancer. The total individual (i.e., COPC-specific) ELCRs were summed for each exposure pathway and scenario to arrive at an estimate of the potential for cancer risk from cumulative exposure. For known or suspected carcinogens, the NCP established that acceptable exposure levels are generally concentration levels that represent an incremental upper-bound lifetime cancer risk in the range from 1×10^{-4} (i.e., 1E-04 or 1 in 10,000) to 1×10^{-6} (i.e., 1E-06 or 1 in 1,000,000) or less (USEPA 1990). The ELCRs estimated for each exposure scenario are therefore compared to this risk range established by the NCP.

RAGS Part D Tables 7.1 through 7.6 in **Appendix I** present the calculation of ELCRs for each receptor and exposure pathway. RAGS Part D Tables 9.1 through 9.6 (in **Appendix I**) summarize the ELCRs by COPC (across all exposure routes), and RAGS Part D Tables 10.1 through 10.6 (in **Appendix I**, if applicable) include only the predominant contributors to the total ELCRs greater than 1E-04.

Current/Future On-site Indoor Commercial/Industrial Workers

RAGS Part D Tables 7.1 and 9.1 show the cancer risks for the current/future on-site indoor commercial/industrial worker exposure to surface soil (0 to 1 feet bgs). The total ELCR for this exposure pathway is 6E-07 and is below the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

Current/Future On-site Outdoor Maintenance Workers

RAGS Part D Tables 7.2 and 9.2 show the cancer risks for the current/future on-site outdoor maintenance worker exposure to surface soil (0 to 1 feet bgs). The total ELCR for this exposure pathway is 2E-06 and is within the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

Current/Future On-site Construction/Utility Workers

RAGS Part D Tables 7.3 shows the cancer risks for the current/future on-site construction/utility worker exposure to surface soil and subsurface soil (0 to 10 feet bgs). The total ELCR for this exposure pathway is 5E-08 and is below the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

RAGS Part D Tables 7.4 shows the cancer risks for the current/future on-site construction/utility worker exposure to shallow (i.e., overburden) groundwater. The total ELCR for this exposure pathway is 3E-06 and is within the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

The combined RAGS Part D Table 9.3 and 9.4 shows the total ELCR for the current/future on-site construction/utility worker exposure to both soil and groundwater is 3E-06 and is within the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

Hypothetical Future On-site Indoor Commercial/Industrial Workers

RAGS Part D Table 7.5 shows the cancer risks for the hypothetical future on-site indoor commercial/industrial worker exposure to groundwater used for potable purposes. Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. The total ELCR for this hypothetical future exposure pathway is 7E-05, which is within the acceptable risk range of 1×10^{-4} to 1×10^{-6}.

The combined RAGS Part D Table 9.1 and 9.5 (and combined Table 10.1 and 10.5) shows the total ELCR for the hypothetical future on-site indoor commercial/industrial worker exposure to both soil and groundwater is also 7E-05.

Hypothetical Future Off-site Residents

RAGS Part D Tables 7.6, 9.6, and 10.6 show the cancer risks for the hypothetical future off-site residential exposure to groundwater used for potable purposes. Although this exposure pathway is currently incomplete, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. The total ELCR for this hypothetical future exposure pathway is 1E-03. The predominant contributors to the potential cancer risk were benzene and bis(2-ethylhexyl)phthalate.

As discussed above, bis(2-ethylhexyl)phthalate is a common laboratory contaminant and is likely an artifact of sample analysis. Additionally, bis(2-ethylhexyl)phthalate was detected in only 4 of the 39 groundwater samples (at concentrations ranging from 1.9 to 28 µg/L), and a single detected concentration (28 µg/L in NHFLA-MW4OB-DEC2020) exceeded the Tapwater RSL of 5.6 µg/L. bis(2-Ethylhexyl)phthalate was also detected in one of the two upgradient groundwater samples at an estimated concentration of 2.2 µg/L. Benzene was detected in 8 of the 39 groundwater samples, at concentrations ranging from 0.33 to 210 µg/L, however the second highest concentration was 11 µg/L. Benzene concentrations exceeded the Tapwater RSL at three locations (MW-4, MW-5, and MW-9). Benzene was not detected (< 0.500 µg/L) in upgradient groundwater samples. The sporadic nature of the benzene detections is not indicative of a widespread release. Finally, given the use of the former Launch Area as a town maintenance facility for more than 50 years, the presence of these constituents in groundwater is not likely attributable to historical DoD activities at the former Launch Area.

6.1.5 HHRA Summary and Conclusions

This HHRA evaluated potential risks to human health associated with the former Launch Area. The HHRA relied on soil and groundwater data collected during the RI.

Exposure scenarios based on the current and most likely future industrial land use (i.e., current/most likely future scenarios) included indoor commercial/industrial worker exposure to surface soil, outdoor maintenance worker exposure to surface soil, and construction/utility worker exposure to surface and subsurface soil and shallow (i.e., overburden) groundwater. The potential for vapor intrusion from overburden groundwater to indoor air of on-site buildings was also evaluated, and no volatile constituents in overburden groundwater were detected at concentrations greater than commercial VISLs associated with a cancer risk of 1×10^{-6} or a non-cancer HQ of 0.1.

The potential for vapor intrusion from overburden groundwater to indoor air of off-site nearby residences was evaluated, and benzene in a single overburden well at the former Launch Area was detected at concentrations greater than residential VISLs (based on 1×10^{-6} cancer risk or 0.1 HQ). However, no further evaluation was conducted because only two of the ten benzene concentrations in the selected overburden monitoring wells exceeded the residential VISL, and the maximum detected concentration was twice the residential VISL based on 1×10^{-6} indicating the estimated residential cancer risk (2E-06) would be within acceptable levels. Although potable water is supplied to the former Nike Battery areas and nearby residents by the Erie County Water Authority, there are no restrictions that would limit future use of the surficial aquifer as a drinking water source. Therefore, a hypothetical future potable use scenario was evaluated for on-site commercial/industrial workers and off-site residents.

Exhibit 6-1 summarizes the cancer risks and non-cancer hazard indices for each exposure scenario (i.e., human receptor and exposure pathway) evaluated in the HHRA.

Exhibit 6-1: Summary of Excess Lifetime Cancer Risks and Non-cancer Hazard Indices

Scenario Timeframe	Receptor Population	Exposure Medium	Excess Lifetime Cancer Risk	Noncancer Hazard Index
Current / Most Likely Future	Indoor Commercial/Industrial Worker	Surface Soil (0 to 1-foot bgs)	6E-07	2E-02
	Outdoor Maintenance Worker	Surface Soil (0 to 1-foot bgs)	2E-06	4E-02
	Construction/Utility Worker	Surface and Subsurface Soil (0 to 10 feet bgs)	5E-08	6E-02
		Shallow Groundwater	3E-06	8E-01
Hypothetical Future	Indoor Commercial/Industrial Worker	Overburden and Bedrock Groundwater (Potable Use)	7E-05	3E+00
	Off-site Resident	Overburden and Bedrock Groundwater (Potable Use)	1E-03	2E+01

Based on the assumptions regarding the potential for human exposure and constituent toxicity used in the HHRA:

- Receptor-total HIs were less than 1 and ELCRs were less than or within the acceptable risk range of 1×10^{-4} to 1×10^{-6} (i.e., 1E-04 to 1E-06) for all current/most likely future on-site worker exposure scenarios.
- The total HI for the hypothetical future on-site commercial/industrial potable use exposure pathway was 3 and for the hypothetical future off-site residential potable use exposure pathway was 20. The predominant contributor to the potential commercial/industrial non-cancer hazard was thallium. The predominant contributors to the residential non-cancer hazard were benzene, bis(2-ethylhexyl)phthalate, and thallium.
- The ELCR for the hypothetical future on-site commercial/industrial potable use exposure pathway was 7E-05 and for the hypothetical future off-site residential potable use exposure pathway was 1E-03. ELCRs greater than 1E-04 were estimated for benzene and bis(2-ethylhexyl)phthalate.

Benzene was detected in 8 of the 39 groundwater samples, at concentrations ranging from 0.33 to 210 µg/L, however the second highest concentration was 11 µg/L. Benzene concentrations exceeded the Tapwater RSL at three locations (MW-4, MW-5, and MW-9). Benzene was not detected (< 0.500 µg/L) in upgradient groundwater samples. The sporadic nature of the benzene detections in groundwater is not indicative of a widespread release. bis(2-Ethylhexyl)phthalate was infrequently detected (4 of 39 samples) in groundwater, and a single detected concentration exceeded the Tapwater RSL of 5.6 µg/L. bis(2-Ethylhexyl)phthalate was also detected in upgradient groundwater at an estimated concentration of 2.2 µg/L. Additionally, bis(2-ethylhexyl)phthalate is a common

laboratory contaminant and is likely an artifact of sample analysis. Thallium was detected in half the overburden and bedrock groundwater samples, however concentrations in only two samples exceeded the background value of 0.82 µg/L. The HHRA likely overestimated the thallium exposure concentration since a maximum of 1.4 µg/L was used to evaluate the potable use scenario and the mean of detected thallium concentrations was 0.32 µg/L. Thallium in the environment may be a result of coal use and/or emissions, and its previous use at the site has not been reported. Additionally, the groundwater metals data evaluation offers strong evidence to support that groundwater conditions reflect impacts of a more recent origin (e.g., from the storage/transport/use of road salt at the site). Given the use of the former Launch Area as a town maintenance facility for more than 50 years, the presence of these constituents in groundwater is not likely attributable to historical DoD activities.

6.2 Screening Level Ecological Risk Assessment

This SLERA evaluates potential ecological risk at the former Launch Area. The SLERA process included habitat characterization, identification of ecological receptors and potentially complete exposure pathways, and selection of constituents of potential ecological concern (COPECs). The SLERA then evaluated potential risks to ecological receptors by comparing site data for each COPEC to ecotoxicological benchmarks to identify ecological constituents of concern (COCs). The SLERA results will inform the RI process and support potential remedial decisions.

6.2.1 Screening-Level Ecological Risk Assessment Approach

The SLERA followed the process detailed within the approved RAWP (JV 2020) and is consistent with the technical guidance from USEPA (1997b) Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments and USACE (2010) Environmental Quality – Risk Assessment Handbook, Volume II: Environmental Evaluation.

The USEPA ecological risk assessment guidance describes an eight-step process with several scientific management/decision points (SMDPs). This SLERA comprises Steps 1, 2 and 3a of the process. Step 1 (Screening-Level Problem Formulation and Ecological Effects Evaluation) and Step 2 (Screening-Level Preliminary Exposure Estimate and Risk Calculation) are the initial SLERA in which analytes that are unlikely to pose ecological risks are eliminated from further consideration. Step 3a consists of refinement screening where less conservative assumptions are considered to further evaluate the potential for ecological risk. The SLERA concludes with an SMDP determining whether contaminants from the site pose an ecological threat. If there are sufficient data to determine that ecological risks are negligible, the ecological risk assessment is completed at this step with a finding of negligible risk.

As part of the SLERA process (Step 1), a habitat assessment of the former Launch Area was conducted. The habitat assessment included documentation of cover types on site and in the site vicinity. The habitat assessment also included a wildlife survey to document potential ecological resources. Information from the U.S. Fish and Wildlife Service (USFWS) and New York NHP was also reviewed to determine the potential occurrence of threatened and endangered species or critical habitats. Information from the habitat assessment was used in the SLERA to evaluate the potential for ecological exposure to constituents in on-site media.

The SLERA also includes Step 2 of the ecological risk assessment (ERA) process, which is the screening-level exposure estimate and risk calculation. The SLERA identified ecological COCs by comparing the maximum detected concentrations to the lowest of the screening benchmarks. Ecological COC selection also considers background concentrations and FOD. Subsequently, the SLERA refinement (Step 3a) includes a comparison of

arithmetic mean concentrations to benchmarks to further evaluate the potential for population-level ecological risks from exposure across the site.

The COCs were evaluated in the SLERA process to identify the potential for ecological risk to various receptor groups (i.e., plants, soil invertebrates, birds, and mammals). The SLERA estimated risk by comparing COC concentrations with conservative ecotoxicological screening values for each group of ecological receptors. The data used in the screening included only those data from the former Launch Area that represent potential habitat for ecological receptors (see **Section 6.2.3.1**). Much of the former Launch Area is developed by the Town of Hamburg Highway Department and consists of buildings, parking lots, storage areas, and roads. Ecological exposure to soil in these areas is not possible; therefore, data from gravel areas were not considered in the SLERA.

The data representative of potential habitat areas were compared to ecotoxicological benchmarks as a conservative assessment of potential ecological risks. These benchmarks represent generic non-site-specific screening values available from USEPA and other sources. The SLERA conservatively compared the maximum detected concentrations to the screening benchmarks to estimate an HQ, which was calculated as the ratio of the detected concentration to the screening benchmark. The SLERA uses maximum detected concentrations in the initial screen (instead of the 95% UCL) to be consistent with the SLERA process flow chart (**Figure 6-2a**) and reflects the conservative nature of the SLERA.

Consistent with the SLERA process flow chart (**Figure 6-2b**), this SLERA also included a SLERA refinement step (Step 3a). This SLERA refinement step supported the SMDP and aided in the determination of whether: 1) risks to ecological receptors are negligible and no further assessment is warranted; 2) potential risks are still indicated and a more detailed baseline ecological risk assessment (BERA) is required; or 3) insufficient information to determine if risk is acceptable or not and a BERA is required.

6.2.2 Screening Level Problem Formulation

This section represents the screening level problem formulation for the SLERA. The problem formulation describes the physical attributes of the former Launch Area, characterizes ecological habitat, and identifies potential ecological receptors and exposure pathways. The problem formulation used this information to develop the ecological CSM for the former Launch Area.

6.2.2.1 Site Description

The former Launch Area is bound on the north by Interstate 90; on the west by the Easement Area; on the east by residential areas; and on the south by residential areas, Lakeview Road, and Eighteen Mile Creek. A closed and capped landfill, formerly operated by the Town, is located north of and adjacent to the former Launch Area. As described in **Section 2.2**, the former Launch Area is currently used by the Town of Hamburg's Highway Department for office space, truck garage space, a lay-down yard, and storage of gravel piles and road salt. Conditions of the former Launch Area reflect the active usage, and most of the area consists of asphalt, concrete, buildings, and maintained mowed field. There are no vernal pools or permanent surface waters on site.

6.2.2.2 Ecological Characterization

A habitat assessment of the former Launch Area was conducted on May 19, 2020. The purpose of the habitat characterization was to document ecological habitat, identify potential ecological receptors, and evaluate the potential for ecological exposure to site COPECs. Natural communities were characterized using the New York NHP's Ecological Communities of New York State (Edinger et al. 2014). Representative photographs from the habitat assessment are included in **Appendix A**.

The former Launch Area lies within the Eighteen Mile Creek watershed and is within the greater Lake Erie drainage basin. Observations from the habitat characterization verified that much of the area is covered with asphalt, concrete, and buildings, and these areas do not represent habitat for ecological receptors. Observations also indicated that the manmade drainage ditches on site are ephemeral and relatively small (approximately 2 feet wide and 6 inches deep) and do not provide significant habitat for aquatic ecological receptors. For example, reptiles/amphibians were not observed during the habitat assessment.

The major cover types identified on site (and in the immediate vicinity) are depicted on **Figure 6-3** and described below.

- Residential/Commercial/Industrial: Most of the site and surrounding land use is residential and commercial and classified as a terrestrial cultural system. Terrestrial cultural systems are communities that are created, maintained, or modified by human activities to such an extent that the composition of the substrate and the resident communities are substantially altered from those that existed before human influence (Edinger et al. 2014). This cover type comprises several subsystems including buildings (classified as urban or rural structures), community parks and residential grounds (classified as mowed lawn with trees and mowed lawn subsystems), residential gardens, and roadside borders (classified as mowed roadside pathway and herbicide-sprayed roadside/pathway subsystems). This cover type also includes commercial or industrial buildings (classified as urban or rural structure exterior subsystem), as well as vacant lots, railroads and paved or unpaved roads/paths, which may include parking lots. Most of the site proper fits this site classification. The residential/commercial/industrial areas provide limited habitat for ecological receptors.
- Successional Southern Hardwood Forest: The successional southern hardwood forest cover type is a more natural cover type characterized as having more than 60 percent coverage by trees. This cover type is a mixed forest on land that has been previously cleared of trees. This cover type exists outside of the site boundary in two areas: north of the Hamburg Landfill and south of the former Launch Area. The forested areas (which do not occur within the site boundaries) likely provide habitat for a diverse group of ecological resources.
- Successional Old Field: This cover type includes ground cover that is predominantly herbaceous with scattered shrubs and has less than 25 percent coverage by trees. This land is composed of previously cleared land that is now undergoing the regrowth of vegetation, primarily dominated by forbs and grasses. The successional old field does not occur on site except along the western and northern site boundaries, where the cover type occurs along the eastern portion of the site (on top of the Hamburg Landfill) and north of the former Launch Area. The successional old field areas provide habitat for a diverse group of ecological resources.
- Wetlands: The NYSDEC Environmental Resource Mapper does not identify any regulated wetlands on site (https://gisservices.dec.ny.gov/gis/erm/ ; **Figure 6-4**). However, a small (less than 1 acre) depression of the maintained mowed field along the east side of the site has been colonized by wetland-type vegetation (e.g., bulrush). Although the area supports wetland vegetation, it is not high-quality habitat because the field is periodically mowed. Wetland vegetation also occurs immediately southwest of the site boundary. Given their small size and periodic mowing, these areas provide minimal habitat for ecological resources.

- Surface Waters: Manmade drainage ditches exist in several areas of the site. These ditches are ephemeral and contain water seasonally. Other surface water bodies in the vicinity of the former Launch Area include the mitigation pond (approximately 0.5 mile north of the site), the twin pond area (approximately 1 mile north of the site), and Eighteen Mile Creek (approximately 1 mile southeast of the site). Complete transport mechanisms for site-related constituents to reach these areas have not been identified, and they were not evaluated in the SLERA.

During the habitat assessment, the field team recorded observed plant species for each cover type. A list of observed plant species (and species expected to occur) is provided in **Table 6-1**. The observed and typical plants include various species of herbaceous plants (e.g., dandelion, goldenrod, thistle, grasses), shrubs (e.g., dogwood, pussy willow, honeysuckle), and trees (e.g., black cherry, cottonwood).

The habitat assessment also included recording the presence of potential ecological receptors (e.g., birds, mammals) based on direct visual observation, calls, tracks, scat, and nesting/denning sites. A list of wildlife species observed (or expected to occur) is presented in **Table 6-2**. As expected, very few wildlife species were observed within the boundary of the former Launch Area due to the lack of habitat in most areas and high level of human disturbance. In adjacent areas with potential habitat (e.g., forested and field areas adjacent to site boundaries), a variety of species or evidence (e.g., scat and/or tracks) thereof was observed, including birds (e.g., American robin, blue jay, Canada goose, mourning dove) and mammals (e.g., grey squirrel, raccoon, coyote, red fox). No reptiles/amphibians were observed on site, which is expected given the lack of permanent surface water bodies within the former Launch Area.

6.2.2.3 Threatened and Endangered Species

A review of state and federally listed threatened and endangered species that may occur near or on site was conducted using the USFWS Integrated Planning and Consultation (IPaC) online resource tool (https://ecos.fws.gov/ipac/location/index). According to the USFWS, the federally listed threatened northern long-eared bat may be present within Erie County, New York; although no critical habitat was identified for this location from the IPaC information (USFWS 2019). Based on the ecological characterization performed during the habitat assessment, habitat for the northern long-eared bat is not likely based on the small area of forested habitat found to provide adequate summer roosting habitat.

Nine species of migratory birds were identified under the Birds of Conservation Concern designation to potentially occur within Erie County seasonally. Of the nine, six of them are shore birds or raptors, which prefer habitat with more surface water features. There are no permanent or colonized surface water features on the site. The additional three migratory bird species include bobolink, red-headed woodpecker, and wood thrush. The redheaded woodpecker and wood thrush prefer mature trees and forest in which to forage and breed, while the bobolink prefers hayfields and meadows. The site is characterized by mostly disturbed habitat and maintained mowed lawn; therefore, it is unlikely to find these species at the site due to a lack of suitable habitat.

In addition to the federal database query, a New York State Natural Heritage Request was submitted on May 12, 2020. On June 12, 2020, the NHP responded that there are no records of rare or state-listed animals, plants, or significant natural communities at the site or in its immediate vicinity.

Given the overall lack of habitat across most of the former Launch Area, the presence of threatened and endangered species or critical habitat is not expected.

6.2.2.4 Ecological Receptors and Exposure Pathways

This section identifies exposure pathways and potential receptors that may be exposed to COPECs in environmental media. Potential ecological receptors can be exposed directly (e.g., incidental soil ingestion or direct contact) or indirectly through the food web (e.g., dietary ingestion). An exposure pathway includes the following elements: 1) constituent source; 2) release mechanism to the environment; 3) transport medium; 4) receptor contact at the exposure point; and 5) exposure route. An exposure pathway may be classified as complete or potentially complete if all five elements are present. If an element is missing, the exposure pathway is considered incomplete and is generally excluded from evaluation.

Important features that need to be considered when evaluating whether an exposure pathway is complete include the COPEC concentrations in different media and their respective locations, the physical and chemical properties of the COPECs, and the locations of environmentally sensitive areas. Additional considerations (especially for this site) are the overall habitat quality and lack of ecological receptors across much of the site.

Potential ecological receptors and exposure pathways are identified in the schematic ecological CSM diagram (**Figure 6-5**). The diagram details the primary source of contamination and illustrates how chemicals at the original point of release may move in the environment (as described in **Section 5 – Conceptual Site Model**). The CSM also identifies ecological receptors and potential exposure pathways (e.g., ingestion of contaminants in soil or food, direct contact with contaminated media). For wildlife (i.e., birds and mammals), oral exposures were predominantly considered. Potential risks from substances via inhalation or dermal exposures are typically not quantified for wildlife because of the lack of acceptable methodology to quantify exposure.

The source area (historical releases to soil in the former Launch Area) forms the basis for the ecological CSM, and soil is the primary exposure medium for ecological receptors. Sampling activities described previously in this RI Report include the investigation of surface and subsurface soil and groundwater. Surface water and sediment samples were not collected because there are no permanent on-site surface water bodies. The sampling included a broad list of target analytes including VOCs, SVOCs (including PAHs), metals, PCBs, and pesticides/herbicides.

Much of the site is comprised primarily of landscaped and maintained grass areas. Such highly disturbed landscaped/maintained areas are not typically considered potential habitat; however, for this site the degree and timing of landscape maintenance activities are not well understood and these areas (which are typically excluded from the evaluation of ecological risks) were included in the SLERA as a conservative assumption. As such, surface soil was identified as a potential exposure medium for ecological receptors, but in a very limited capacity due to poor habitat and the small size of the total habitat (less than 1 acre). A similar rationale was considered applicable for excluding potential ecological exposure related to subsurface soil.

Surface water and sediment are not potential exposure media based on the lack of surface water habitat present at the former Launch Area. Groundwater is also not a potential exposure medium since the depth to groundwater (approximately 4 to 7 feet bgs) and lack of surface expressions (e.g., seeps) preclude exposure.

As mentioned previously, only small areas (approximately ½-acre) of successional old field at the site perimeter provide potential habitat (see **Figure 6-3**). The former Launch Area is actively used by the county and is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn. Lawn areas are not a natural cover type and provide limited wildlife habitat. On site habitat does not support abundant and diverse populations of wildlife. Regardless, as a conservative approach, the SLERA assumes some portions of the site may present potential for exposure to ecological receptors, primarily through exposure to COPECs in soil. Potential exposure routes associated with surface soil include direct contact, ingestion, and food-web transfer. Inhalation or dermal exposures are typically not evaluated for wildlife because of the lack of acceptable methodology to quantify exposure.

Soil COPECs exhibit varying degrees of potential for exposure depending on chemical-specific parameters; however, the following potentially complete receptors and exposure pathways were identified:

- Plants – Plants are an important part of the ecological community because they prevent soil erosion and provide cover and food for invertebrate and vertebrate species. Direct contact with COPECs in soil is a potentially complete exposure pathway for plants.
- Soil Invertebrates – Soil invertebrates play an important role for soil aeration and provide food for wildlife. Direct contact and ingestion of COPECs in soil is a potentially complete exposure pathway for soil invertebrates.
- Birds and Mammals – Birds and mammals of several species from various feeding guilds are an important part of a healthy ecosystem. Incidental ingestion of COPECs in soil during foraging or grooming and food-web transfer (for bioaccumulative COPECs) are potentially complete exposure pathways for birds and mammals. The specific species identified to represent various types of feeding guilds for birds and mammals are as follows:
  - Herbivorous birds and mammals – mourning dove and meadow vole.
  - Invertivorous birds and mammals – American robin and short-tailed shrew.
  - Omnivorous birds and mammals – common crow and raccoon.
  - Carnivorous birds and mammals – red-tailed hawk and red fox.

Although most of the former Launch Area contains no habitat for ecological receptors, surface soil data for the limited areas of the site that contain potential habitat were evaluated for potential risks to plants, soil invertebrates, and birds and mammals. Although threatened and endangered species were not identified as potential ecological receptors (see **Section 6.2.2.3**), either on the former Launch Area or its immediate vicinity, the potential for ecological risk to protected species is at a minimum conducted at the community or population level.

6.2.2.5 Identification of Assessment and Measurement Endpoints

Ecological risk assessment typically relies on the identification of assessment and measurement endpoints to establish the framework for evaluating potential risk. Assessment endpoints are statements of characteristics or attributes of the environment that are to be protected (USEPA 1997b). Assessment endpoints generally cannot be measured directly; therefore, measurement endpoints are identified to provide measures of potential adverse effects. **Exhibit 6-1** below summarizes assessment and measurement endpoints.

Exhibit 6-2: Assessment Endpoints and Measurement Endpoints

Assessment Endpoints	Measurement Endpoints[1]
Abundance and diversity of plant community	Compare soil data to conservative benchmarks for plants
	Observations of stressed vegetation
Abundance and diversity of soil invertebrate community	Compare soil data to conservative benchmarks for soil invertebrates
Sustainability (defined by survival, growth, and reproduction) of bird and mammal populations[2]	Compare soil data to conservative benchmarks for birds/mammals

Note:
1. The measurement endpoints evaluate soil data (0 to 1 ft) from areas of the former Launch Area that represent potential habitat for ecological receptors. Soil data representative of manmade features of the site (e.g., areas of asphalt and gravel) are excluded in the assessment.
2. Inclusive of herbivorous, invertivorous, omnivorous, and carnivorous bird and mammal receptors.

The measurement endpoints described above were largely based on comparison of soil COPEC concentrations to medium-specific ecotoxicological benchmarks derived from the literature. These benchmarks are not site-specific and typically incorporate uncertainty in a precautionary manner, making their use in the SLERA relatively conservative. Based on the results of the SLERA (and subsequent steps of the SLERA refinement), if supplemental measurement endpoints and more site-specific studies are required (e.g., toxicity testing, tissue sampling and analysis), these types of studies would be proposed in a BERA (if necessary).

6.2.3 Screening-Level Effects Evaluation

The screening-level effects evaluation included the following three components: 1) identification of COPECs in environmental media (limited to surface soil for the former Launch Area); 2) exposure assessment to identify potential levels of ecological exposure to COPECs in relevant media; and 3) effects assessment that identified relevant ecotoxicological screening benchmarks. These components are conducted in a sequential manner that first identifies which analytes can be eliminated from further ecological evaluation, and then proceeds with identifying the potential ecological exposure and possible adverse effects that may be related to the remaining analytes (i.e., ecological COCs).

6.2.3.1 Identification of Potential Ecological Constituents of Concern

As described in **Section 4.3.1**, the RI soil data from the former Launch Area included analytical results for metals, VOCs, SVOCs (including PAHs), and PCBs. Sampling and analysis summaries for the current RI investigation are presented in **Section 4**. Analytical results are available in the FUDSChem database and data validation reports are included in **Appendix C**.

A subset of the available soil data was used to evaluate potential ecological risk. The RI soil samples were collected to characterize site conditions, and the sample locations reflect the predominant disturbance and commercial/industrial land usage (see **Section 6.2.2.2** for habitat description). Of the 24 soil samples collected on site, 19 were collected from maintained lawn and 3 were collected from gravel (areas that provide little to no habitat), since those are the most predominant cover types. Only two soil samples were collected from successional old field areas because the coverage of these areas on site is very small. As previously described, for this site the degree and timing of landscape maintenance activities are not well understood. Therefore, data from the landscaped/maintained areas (which are typically excluded from the evaluation of ecological risks) were included in the SLERA as a conservative assumption. Data from gravel area samples were excluded.

The soil sample locations used in the SLERA are presented in **Table 6-3** and on **Figure 6-4**. The soil data from 0 to 1 foot from these locations were used to characterize potential exposure and identify ecological COCs. The soil data considered in the SLERA are presented in **Table 6-4**. COCs were selected based on the process identified in the SLERA flow chart (**Figures 6-2a**) and incorporated several decision points on **Figure 6-2a**.

Specifically, a constituent is identified as an ecological COC if the following applies (along with the decision point):

- Constituent is potentially related to former DoD activity (D8).
- Sufficient quality and quantity of data exist (D9).
- Concentrations exceed background (D12).
- Constituent was detected at a frequency >10 percent (D14).
- Maximum detected concentration exceeded conservative benchmarks (D20, D21, D22).

For purposes of this SLERA, it was assumed that each of the target analytes (metals, VOCs, SVOCs, PCBs) are potentially related to former DoD activities (see D8 on **Figure 6-2a**). This is a conservative assumption, given that

sources of contaminants from DoD activities (e.g., solvents, corrosion preventives, and petroleum, oil, and lubricants) are currently used at the site by the Town of Hamburg Highway Department. Also, these constituents have many anthropogenic origins. Finally, the occurrence of metals and PAHs is often widespread and naturally occurring.

In terms of whether a sufficient quality and quantity of data exist (see D9 on **Figure 6-2a**), the DQOs established as part of the Final RI QAPP (JV 2020) include the collection of sufficient data to characterize ecological risks and support remedial decision-making purposes. Surface water and sediment data were not collected since there are no permanent surface waters on site. Potential exposure to surface soil is the most relevant pathway for ecological receptors. A total of 20 soil sample locations were used to characterize potential ecological risk. Therefore, this DQO has been achieved. Also, the soil data were validated to assure the quality of the data. As described in **Section 6.1.1**, results qualified "X" were reviewed by project chemists and subsequently rejected; therefore, "X" qualified results were not used in this SLERA. Data qualified as estimated were used as detected values, the same as unqualified data. Also, for duplicates, if both the parent and duplicate were detected or if both were not detected then the results were averaged; if either the parent or duplicate was detected and the other was not detected, the detected result was selected. Non-detects were evaluated at one-half of the detection limit for any evaluation of central tendency in the risk evaluation.

To determine whether the concentrations exceed background (see D12 on **Figure 6-2a**), the maximum detected concentrations were compared to the BTVs calculated in **Appendix J**. Maximum detected concentrations rather than a measure of central tendency (e.g., arithmetic mean) were compared to BTVs as a conservative approach since the maximums are the single highest detected concentrations in the site data set. The comparison of surface soil data to background is included as part of the ecological COC identification in **Table 6-5**.

The evaluation of FOD (see D14 on **Figure 6-2a**) is also included in **Table 6-5** and shows that most of the VOCs and SVOCs and all PCB Aroclors were not detected in any of the surface soil samples included in the SLERA. Therefore, these constituents were not identified as ecological COCs.

The final step in identifying COCs is the comparison of site data to conservative ecological benchmarks for soil (see D20, D21, and D22 on **Figure 6-2a**). The plant, soil invertebrate, bird, and mammal benchmarks were selected based on the following hierarchy:

- USEPA (2007a) EcoSSLs
- USEPA (2018) Region 4 Ecological Soil Screening Values
- LANL (2017) screening benchmarks.

USEPA EcoSSLs for PAHs are available for soil invertebrates and mammals, and were developed for total LMW PAHs and total HMW PAHs. LMW PAHs have fewer than four benzene rings, and HMW PAHs have four or more benzene rings (USEPA 2007a). The soil data for individual PAHs were therefore summed to calculate total LMW PAH concentrations and total HMW PAH concentrations. The total LMW PAH concentrations and total HMW PAH concentrations are presented in **Table 6-4** and **Table 6-5**.

Constituents were identified as an ecological COC if their maximum detection concentration exceeded the BTV (if available) and at least one benchmark (plant, soil invertebrate, bird, or mammal) and had a FOD of at least 10%. If a constituent did not have an available benchmark and had a FOD of at least 10%, it was identified as an ecological COC. Constituents where the maximum detected concentration exceeded the BTV and/or benchmark with a FOD less than 10% and no apparent clustering of detected concentrations were not identified as COCs. Calcium, magnesium, potassium, and sodium are essential nutrients and were not identified as COCs.

The soil data evaluation (**Table 6-5**) identified the following 10 metals, total HMW PAHs, and 13 individual SVOCs as ecological COCs:

- Metals: barium, chromium (including hexavalent chromium), cobalt, copper, lead, manganese, mercury, selenium, thallium, and zinc.
- SVOCs: total HMW PAHs, atrazine, bis(2-ethylhexyl)phthalate, acenaphthene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, indeno(1,2,3-cd)pyrene, and pyrene.

VOCs and PCBs were not identified as ecological COCs.

Each of the identified COCs was carried forward in the ecological risk screening process for further evaluation.

6.2.3.2 Exposure Assessment

Exposure for ecological receptors at the former Launch Area is limited to soil. For bioaccumulative COCs (e.g., lead, mercury, select PAHs) potential exposure for upper trophic level receptors may also occur via uptake in the food chain. As a conservative assumption, the initial evaluation of ecological risk was based on maximum detected concentrations in soil. Subsequent evaluations (in the SLERA refinement) evaluated the data based on arithmetic mean concentrations and considered background exceedance of the screening benchmarks.

6.2.3.3 Effects Assessment

The ecological effects assessment describes the potential adverse effects to ecological receptors associated with the ecological COCs. The effects assessment identifies ecological benchmarks for evaluation of direct contact for lower trophic level organisms (plants and soil invertebrates) and for direct ingestion and dietary intake for upper trophic level organisms (birds and mammals). The soil benchmarks included plant benchmarks (**Table 6-6**), soil invertebrate benchmarks (**Table 6-7**), bird benchmarks (**Table 6-8**) and mammal benchmarks (**Table 6-9**). As described in **Section 6.2.3.1** for ecological COC selection, sources in the preferred order were USEPA (2007a) EcoSSLs, then USEPA Region 4 Ecological Soil Screening Values (USEPA 2018), then screening benchmarks from LANL (2017).

These conservative benchmarks are risk-based screening concentrations that represent concentrations below which adverse effects will not likely occur. The soil benchmarks were from sources that incorporate specific approaches in the methods to derive a concentration that is protective of ecological receptors. In accordance with the conservative nature of the SLERA process, the soil benchmarks selected are sufficiently conservative to protect organisms at the community level. These conservative benchmarks were not intended to serve as levels that will trigger specific actions if exceeded. The exceedance of a conservative benchmark is not confirmation that an adverse ecological effect has occurred. The potential for an adverse ecological effect (and need for additional evaluation) would depend on the relevancy of the benchmark and the magnitude and frequency of exceedance.

6.2.4 Risk Characterization

Risk characterization combines site-related exposure estimates (described in the exposure assessment) and ecotoxicological effects data (described in the effects assessment) to estimate the likelihood of adverse effects. The risk characterization was conducted by comparing exposure concentrations to conservative ecotoxicological benchmarks, and the resulting value was identified as an HQ. HQs were calculated using the following equation:

$$HQ = \frac{Soil\ Concentration}{Ecotoxicological\ Benchmark}$$

An HQ less than or equal to 1.0 indicates that the potential for adverse effects to ecological receptors is absent or minimal, and additional evaluation is not necessary. An HQ greater than 1.0 indicates that a potential for adverse effects to ecological receptors may exist, and that additional evaluation of potential risks is necessary. The HQ value also indicates the magnitude of the exceedance. For example, if the HQ is less than 10, then the detected concentration is less than 10 times the benchmark, and if the HQ is greater than 10, then the value is greater than 10 times the benchmark. It is important to note that HQs greater than 1.0 developed as part of this SLERA should not be used as a definitive indication of the presence of ecological risk. Instead, HQs are meant to serve as an order-of-magnitude indicator for potential risk.

The risk characterization for each receptor group also includes a SLERA refinement step (Step 3a). While the SLERA evaluated the data based on a point-by-point comparison and relied on the maximum detected concentration to assess exceedances, the SLERA refinement step calculated HQs based on arithmetic mean concentrations. Arithmetic mean HQs were calculated to evaluate average level of exceedances for habitat across the site, recognizing that many ecological receptors are mobile and would not be exposed to site conditions in only the area of the maximum detected concentration. Mean HQs greater than 1.0 for birds and mammals were further refined by incorporating adjustment factors that considered the range in potential values for parameters used to quantify risk. The specific details of the HQ adjustment factors are presented in Sections 6.2.4.3 and 6.2.4.4 and the footnotes to **Table 6-8** and **Table 6-9**.

The SLERA refinement step also considered BTV exceedance of the screening benchmarks by calculating BTV HQs. The BTV HQs were used to identify whether general background conditions exceed the benchmark, further placing the site HQs into perspective. The site HQs are not directly compared with background HQs because they are based on different statistical estimates of soil COC concentrations. Specifically, the SLERA refinement site HQs were calculated using arithmetic mean concentrations while the BTV HQs were based on upper end estimates of reference soil concentrations (e.g., UTLs). However, these refinement steps serve to place the exceedance of conservative screening benchmarks into perspective. The SLERA refinement step also considers the fact that most of the former Launch Area does not provide habitat for ecological receptors, and potential for ecological exposure is expected to be minimal.

6.2.4.1 Risks to Plants

Potential risks to the terrestrial plant community were evaluated by comparing surface soil data to plant ecotoxicological benchmarks (**Table 6-6**). The HQs >1.0 based on maximum detected concentrations included eight metals (barium = 1.2, hexavalent chromium = 5.7, cobalt = 1.9, manganese = 7.9, mercury = 1.3, selenium = 123, thallium = 38, zinc = 3.9) and one SVOC (acenaphthene = 1.8). The highest maximum HQ (123) occurred for selenium. All other ecological COCs had maximum concentrations below their applicable plant benchmark, or a plant benchmark was not available (**Table 6-6**).

Given the conservatism of the generic plant benchmarks used in the risk characterization, a SLERA refinement step was used to place these HQs >1.0 into perspective in terms of actual ecological risk to the abundance and diversity of plant populations. The SLERA refinement step included the evaluation of HQs based on arithmetic mean COC concentrations for site samples (**Table 6-6**). The only mean HQs >1.0 were for hexavalent chromium (HQ=1.1), manganese (HQ=3.5), selenium (HQ=8.6), and thallium (HQ=10).

An additional refinement was to evaluate background conditions by comparing BTVs to the conservative benchmarks (**Table 6-6**). BTV HQs are not directly comparable to site HQs because the site HQs were based on arithmetic mean concentrations while BTV HQs were based on UTLs. Regardless, the BTV HQs (calculated from reference locations) were > 1.0 for hexavalent chromium, manganese, selenium, and thallium (in addition to barium, cobalt, and zinc), indicating benchmark exceedances for reference locations. Therefore, it is concluded

from this line of evidence that site concentrations of select metals (and SVOCs) do not present an unacceptable risk for population-level effects for plants.

A secondary line of evidence for evaluating risks to plants was observations of the plant community during the habitat assessment. Although quantitative studies of plant abundance and diversity of site cover types were not conducted, signs of stressed vegetation (e.g., yellow or wilted leaves, stunted growth) or areas devoid of vegetation that may be related to COCs in soil were documented, if present. As expected, human usage of the site has impacted the vegetation in most of the site proper through placement of gravel/asphalt, mowing, and other intrusive activities. More remote and natural areas (e.g., around the perimeter of the site) did not exhibit signs of phytotoxicity that may be related to soil COCs.

Collectively, site conditions do not indicate an unacceptable level of risk to plants.

6.2.4.2 Risks to Soil Invertebrates

Potential risks to the soil invertebrate community were evaluated by a direct comparison of surface soil data to the invertebrate ecotoxicological benchmarks (**Table 6-7**). The HQs >1.0 based on maximum detected concentrations included five metals (hexavalent chromium = 5.9, manganese = 3.8, mercury = 7.5, selenium = 16, zinc = 5.3) and total HMW PAHs (HQ=5.6). All other metal and SVOC HQs were <1.0. The highest maximum HQ (16) occurred for selenium. All other ecological COCs had maximum concentrations below their applicable soil invertebrate benchmark, or a soil invertebrate benchmark was not available (**Table 6-7**).

Again, a SLERA refinement step was used to place these HQs >1.0 into perspective in terms of actual ecological risk to the abundance and diversity of soil invertebrate populations. The SLERA refinement step included the evaluation of HQs based on arithmetic mean COC concentrations for site samples (**Table 6-7**). The mean HQs >1.0 were for hexavalent chromium (HQ=1.2), manganese (HQ=1.7), mercury (HQ=1.3), selenium (HQ=1.1) and zinc (HQ=1.4).

An additional refinement was to evaluate background conditions by comparing BTVs to the conservative benchmarks (**Table 6-7**). BTV HQs are not directly comparable to site HQs because the site HQs were based on arithmetic mean concentrations while BTV HQs were based on UTLs. Regardless, the BTV HQs (calculated from reference locations) were > 1.0 for hexavalent chromium, manganese, mercury, and zinc, indicating benchmark exceedances for reference locations. Therefore, it is concluded from this line of evidence that site concentrations of select metals (and SVOCs) do not present an unacceptable risk for population-level effects to soil invertebrates.

6.2.4.3 Risks to Birds

Birds may utilize the portions of the site that provide habitat. The specific avian species identified to represent various types of feeding guilds include herbivores (e.g., mourning dove), invertivores (e.g., American robin), omnivores (e.g., common crow) and carnivores (e.g., red-tailed hawk).

Potential risks to birds were evaluated by a direct comparison of surface soil data to the avian ecotoxicological benchmarks (**Table 6-8**). The HQs >1.0 based on maximum detected concentrations included six metals (chromium = 2.1, copper = 2.5, lead = 6.7, mercury = 29, selenium = 53, zinc = 14) and two SVOCs (bis[2-ethylhexyl]phthalate = 290, benzo(a)anthracene = 12). The highest maximum HQ for birds (290) occurred for bis(2-ethylhexyl)phthalate. All other ecological COCs had maximum concentrations below their applicable avian benchmark, or an avian benchmark was not available (**Table 6-8**).

The SLERA refinement step was used to place these HQs >1.0 into perspective in terms of actual ecological risk to the sustainability of bird populations. The SLERA refinement step included the evaluation of HQs based on arithmetic mean COC concentrations for site samples (**Table 6-8**). The mean HQs >1.0 were for lead (HQ=2.7), mercury (HQ=5.0), selenium (HQ=3.7), zinc (HQ=3.5), bis(2-ethylhexyl)phthalate (HQ=74), and benzo(a)anthracene (HQ=1.1). Mean HQs were further refined by incorporating adjustment factors that considered the range in potential values for parameters used to quantify risk. The screening benchmarks are based on conservative assumptions regarding food ingestion rate and area use factor. For example, the avian EcoSSLs were calculated assuming an upper end estimate of food ingestion rate for the American woodcock (USEPA 2007b). Use of a species-specific mean food ingestion rate from the EcoSSL supporting documentation (USEPA 2007b) would reduce the HQ values by a factor of 0.7 (see adjustment factor calculation details in the footnotes to **Table 6-8**). Additionally, an estimate of the median home range for an American woodcock is 72 acres (USEPA 1993), while the potential habitat at the former Launch Area is limited to less than a couple non-contiguous acres of vegetation along portions of the site perimeter. Rather than reducing mean HQs by a factor of 0.03 (equivalent to 2 acres divided by 72 acres), a more conservative area use factor of less than 1 (i.e.,, 0.5) was used to represent potential exposure for avian receptors. Finally, an adjustment factor of 0.1 is used to reflect an assumed approximate order of magnitude difference between a no observed adverse effect level (NOAEL) and an actual effect level (e.g., a lowest observed adverse effect level [LOAEL]) (USEPA 1997b). Use of these adjustment factors of 0.7 for food ingestion rate, 0.5 area use factor, and 0.1 to reflect actual effect levels results in refined HQs <1.0 for all ecological COCs except bis(2-ethylhexyl)phthalate (HQ=2.6) (**Table 6-8**). However, a review of data validation reports for the J qualified bis(2-ethylhexyl)phthalate results in the SLERA soil data set indicated results were biased high with potential for lab contamination. This is indicated by LCS recoveries above the acceptance limits and method blank contamination (e.g., method blank results for bis(2-ethylhexyl)phthalate ranged from 100 to 4,600 mg/kg compared to the qualified sample results ranging from 370 to 5,600 mg/kg). Also, bis(2-ethylhexyl)phthalate is found in many consumer products, including tablecloths, shower curtains, furniture and automobile upholstery, garden hoses, floor tiles, sheathing for wire and cable, and food packaging materials (National Center for Biotechnology Information 2021). ATSDR (2007) reported an estimate that 92% of U.S. domestic supplies of bis(2-ethylhexyl)phthalate are released to landfills (USEPA 1981 as cited in ATSDR 2007). Given the use of the former Launch Area as a town maintenance facility for more than 50 years, bis(2-ethylhexyl)phthalate is not likely attributable to historical DoD activities.

An additional refinement was to evaluate background conditions by comparing BTVs to the conservative benchmarks (**Table 6-8**). The bird HQs based on BTVs for copper (HQ=1.3), lead (HQ=3.5), mercury (HQ=12), selenium (2.0), and zinc (HQ=5.5) were also >1.0. Reference soil data were only analyzed for metals and PAHs, and therefore a BTV was not calculated for bis(2-ethylhexyl)phthalate. The fact that some of the BTV HQs were greater than the mean HQs is a function of the different statistical estimates of soil COC concentrations (i.e., BTVs were based on upper end estimates of reference soil concentrations). The conclusion from this line of evidence is that site concentrations of select metals (and SVOCs) do not present an unacceptable risk for population-level effects to birds.

6.2.4.4 Risks to Mammals

Mammals may utilize the portions of the site that provide habitat. The specific mammalian species identified to represent various types of feeding guilds include herbivores (e.g., meadow vole), invertivores (e.g., short-tailed shrew), omnivores (e.g., raccoon) and carnivores (e.g., red fox).

Potential risks to mammals were evaluated by a direct comparison of surface soil data to the mammalian ecotoxicological benchmarks (**Table 6-9**). The HQs >1.0 based on maximum detected concentrations included six metals (chromium = 1.6, copper = 1.4, lead = 1.3, selenium = 101, thallium = 4.5, zinc = 8.0), total HMW PAHs

(HQ=92), and one additional SVOC (bis(2-ethylhexyl)phthalate = 10). The highest maximum HQ for mammals (101) occurred for selenium. All other ecological COCs had maximum concentrations below their applicable mammalian benchmark, or a mammalian benchmark was not available (**Table 6-9**).

The SLERA refinement step was used to place these HQs >1.0 into perspective in terms of actual ecological risk to the sustainability of mammal populations. The SLERA refinement step included the evaluation of HQs based on arithmetic mean COC concentrations for site samples (**Table 6-9**). The mean HQs >1.0 were for selenium (HQ=7.1), thallium (HQ=1.2), zinc (HQ=2.1), bis(2-ethylhexyl)phthalate (HQ=2.5), and total HMW PAHs (HQ=8.4). Mean HQs were further refined by incorporating adjustment factors that considered the range in potential values for parameters used to quantify risk. The screening benchmarks are based on conservative assumptions regarding food ingestion rate and area use factor. For example, the mammalian EcoSSLs were calculated assuming an upper end estimate of food ingestion rate for the short-tailed shrew (USEPA 2007b). Use of a species-specific mean food ingestion rate from the EcoSSL supporting documentation (USEPA 2007b) reduces the HQ values by a factor of 0.8 (see adjustment factor calculation details in the footnotes to **Table 6-9**). Additionally, an adjustment factor of 0.1 reflects an assumed approximate order of magnitude difference between a NOAEL and LOAEL (USEPA 1997b). Use of these adjustment factors of 0.8 for food ingestion rate and 0.1 results in refined HQs <1.0 for all ecological COCs (**Table 6-9**).

An additional refinement was to evaluate background conditions by comparing BTVs to the conservative benchmarks (**Table 6-9**). The mammal HQs based on BTVs for selenium (HQ=3.7), thallium (HQ=2.7), and zinc (HQ=3.2) were also >1.0. The fact that some of the BTV HQs were greater than the mean HQs is a function of the different statistical estimates of soil COC concentrations (i.e., BTVs were based on upper end estimates of reference soil concentrations). The conclusion from this line of evidence is that site concentrations of select metals (and SVOCs) do not present an unacceptable risk for population-level effects to mammals.

6.2.5 SLERA Summary and Conclusions

This SLERA evaluated potential risks to environmental receptors associated with the former Launch Area and was developed as part of an RI site characterization conducted in 2020. Information collected during the RI indicates that the site contains minimal habitat. The former Launch Area is actively used by the county and is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn, which is not a natural cover type and provides limited wildlife habitat. The RI soil samples were collected to characterize site conditions, and the sample locations reflect the predominant disturbance and commercial/industrial land usage. Only two soil samples were collected from habitat areas (i.e., successional old field areas) since the coverage of these areas on site is very small. The highly disturbed landscaped/maintained areas would typically be excluded from the SLERA because they are not considered potential habitat. However, since the degree and timing of landscape maintenance activities are not well understood, data from maintained lawn areas were conservatively included in the SLERA.

During the habitat assessment, the field team recorded observed plant species for each cover type. The observed and typical plants include various species of herbaceous plants, shrubs, and trees. The habitat assessment also included recording the presence and/or evidence of ecological receptors. Very few wildlife species were observed within the boundary of the former Launch Area due to the lack of habitat in most areas and high level of human disturbance (**Section 2.5**). In adjacent areas with potential habitat (e.g., forested areas north of the site boundaries), a variety of species, or evidence (e.g., scat and/or tracks) thereof, were observed including birds and/or mammals that may occasionally traverse or forage onsite. Given the overall lack of habitat across most of the former Launch Area, the presence of threatened and endangered species or critical habitat is not expected.

This SLERA evaluated risks for several receptor groups including plants, soil invertebrates, and wildlife (i.e., birds and mammals). Conclusions from the risk evaluation for each environmental receptor group are presented below.

- Plants - Risk to terrestrial plants is low based on the limited frequency and magnitude of benchmark exceedances and the lack of observed stress or phytotoxicity to plant communities at the site. The plant HQs >1.0 based on mean site concentrations were for hexavalent chromium (HQ=1.1), manganese (HQ=3.5), selenium (HQ=8.6), and thallium (HQ=10). The HQs based on BTVs for each of these metals were also >1.0 indicating background concentrations also exceed the benchmarks.
- Soil Invertebrates - Risk to soil invertebrates is low based on the limited frequency and magnitude of benchmark exceedances. The soil invertebrate HQs >1.0 based on mean site concentrations were for hexavalent chromium (HQ=1.2), manganese (HQ=1.7), mercury (HQ=1.3), selenium (HQ=1.1) and zinc (HQ=1.4). The HQs based on BTVs for hexavalent chromium, manganese, mercury and zinc were also >1.0, indicating background concentrations also exceed the benchmarks.
- Birds - Risk to birds is low based on the limited frequency and magnitude of benchmark exceedances. The bird HQs >1.0 based on mean site concentrations were for lead (HQ=2.7), mercury (HQ=5.0), selenium (HQ=3.7), zinc (HQ=3.5), bis(2-ethylhexyl)phthalate (HQ=74), and benzo(a)anthracene (HQ=1.1). Refined bird HQs were <1.0 for all ecological COCs except bis(2-ethylhexyl)phthalate (HQ=2.6). However, a review of data validation reports for the J qualified bis(2-ethylhexyl)phthalate results in the SLERA soil data set indicated results were biased high with potential for lab contamination. This is indicated by LCS recoveries above the acceptance limits and method blank contamination. Also, bis(2-ethylhexyl)phthalate is found in many consumer products (National Center for Biotechnology Information 2021), and an estimated 92% of U.S. domestic supplies of bis(2-ethylhexyl)phthalate are released to landfills (USEPA 1981 as cited in ATSDR 2007). Given the use of the former Launch Area as a town maintenance facility for more than 50 years, bis(2-ethylhexyl)phthalate is not likely attributable to historical DoD activities.
- Mammals - Risk to mammals is low based on the limited frequency and magnitude of benchmark exceedances. The mammal HQs >1 based on mean site concentrations were for selenium (HQ=7.1), thallium (HQ=1.2), zinc (HQ=2.1), bis(2-ethylhexyl)phthalate (HQ=2.5), and total HMW PAHs (HQ=8.4). Refined mammal HQs were <1.0 for all ecological COCs.

The SLERA results indicate only small areas (approximately ½-acre) of successional old field at the site perimeter provide potential habitat. The former Launch Area is actively used by the county and is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn, which is not a natural cover type and provides limited wildlife habitat. On site habitat does not support abundant and diverse populations of wildlife, and there is no unacceptable risk for ecological receptors (plants, soil invertebrates, birds, and mammals).

6.3 Discussion of Uncertainty

Risk assessment involves the integration of complex analyses of constituent concentrations in the environment, the fate and transport of constituents in the environment, the potential for human and ecological exposure, and constituent-specific potency and/or toxicity. Some uncertainties are associated with each component in this process. Uncertainty in a risk assessment is typically accounted for by identifying the sources of uncertainty and characterizing whether the risk estimates may be over-predicted or under-predicted.

6.3.1 Environmental Sampling and Analysis

This risk assessment was based on the soil and groundwater data collected during the recent RI conducted in 2020 and 2021. Fieldwork, sample analysis, and data evaluation were performed in such a way as to minimize the potential for uncertainty in data quality and usability. Fieldwork and laboratory analysis of samples were performed in accordance with procedures outlined in the Final RI QAPP (JV 2020).

6.3.1.1 Field Sampling and Risk Assessment Data Sets

As discussed in the Final RI QAPP (JV 2020), the sampling approach and rationale were developed mainly based on historical site usage and the identified need for vertical and horizontal delineation of environmental impacts from potential source areas. A combination of judgmental (e.g., biased to the former transformer pad or drainage swales) and random (e.g., evenly spaced over the area covering the former missile silos or grass-covered areas where human or ecological exposure could occur) sampling approaches were used to characterize the site. Overall, the field investigation methods increased the likelihood of revealing potential impacts due to historical DoD use of the former Launch Area and thereby minimized the potential for under-estimating human health and ecological risks.

In terms of ecological risk, the former Launch Area is highly disturbed and covered with asphalt, gravel, and buildings. Other areas of the former Launch Area are maintained lawn, which is not a natural cover type and provides limited wildlife habitat. On site habitat is limited to small areas (less than a couple acres in total) of vegetation along portions of the site perimeter. The RI soil samples reflect the predominant disturbance and commercial/industrial land usage. Although soil data from highly disturbed landscaped/maintained areas would typically be excluded from the SLERA, for the former Launch Area these data were conservatively included since the degree and timing of landscape maintenance activities are not well understood. Given the number of samples and the limited habitat present at the site, the soil data set included in the SLERA provided adequate spatial coverage for evaluating potential ecological risks.

For the HHRA, metals concentrations in groundwater were compared to maximum concentrations in two samples from the upgradient monitoring well, MW-16. Metals detected at concentrations greater than the Tapwater RSLs but less than concentrations in MW-16 were eliminated from further quantitative evaluation (USACE 2011). Following this approach, arsenic, cobalt, iron, manganese, and vanadium were eliminated as COPCs. However, two samples from a single upgradient well were used to approximate background conditions. This contributes uncertainty due to the limited number of upgradient samples (i.e., less than 8 samples which would be considered statistically defensible). Therefore, as an additional line of evidence to support that these metals are consistent with naturally occurring and/or anthropogenic background conditions, geochemical relationships between aluminum and iron and the select metals in groundwater (arsenic, cobalt, manganese, and vanadium) were explored. Due to high concentrations of salts (sodium and calcium) in groundwater samples from the site (including MW-16), geochemical relationships between sodium and calcium and the select metals in groundwater were also explored. High concentrations of salt cations can displace other naturally occurring metals sorbed to soil, thereby mobilizing the metals in groundwater and masking relationships with aluminum and iron. The prevalence of non-detect results for aluminum and arsenic precluded further evaluation of relationships with other metals. There appeared to be a strong correlation between calcium (from road salts) and manganese, and magnesium (from road salts) and manganese concentrations in groundwater. There was a slight correlation between iron and manganese, sodium and manganese, and magnesium and cobalt in groundwater. Overall, the geochemical evaluation does not offer a clear line of evidence supporting that the select metals in groundwater are naturally occurring. However, this is to be expected given the complex relationship between when and where different road salts (sodium, potassium, calcium, and magnesium chloride) were used or stored on the site over

the past 50-years, along with other factors including variation in soil types, stormwater runoff paths, and truck transport pathways. However, the principal reason there is not a strong correlation is the salt cations, such as sodium, will displace other metal ions in the soils up to a certain concentration, above which, additional ions are not displaced. Once a certain sodium concentration is reached, the metals ions that were displaced are capped/do not increase. Based on the distribution of metals throughout the site and given what is known about the current and historical site use, the metals detected in groundwater are likely related to use of the site as a town maintenance facility for the past 50 years and do not indicate a release to the environment associated with past DoD activities. Therefore, this site-specific geochemical data evaluation supports that the uncertainty introduced by placement of a single upgradient monitoring well is negligible and does not have a material effect on the HHRA conclusions.

6.3.1.2 Analytical Results Evaluation

The analytical data were validated in accordance with the DoD Quality Systems Manual for Environmental Laboratories, Version 5.3 (2019a) and the DoD General Data Validation Guidelines, Revision 1 (2019b). A total of 43 soil and 286 groundwater sample results in the HHRA data sets were qualified “X” by the data validator, indicating the sample results were affected by serious deficiencies and exclusion of the data was recommended. As discussed in **Section 4.3.4.3**, these data were reviewed by the project chemists, who recommended that “X” qualified data be changed to R qualified (rejected). As such, the R qualified data were not included in the HHRA or SLERA.

The analytical results for hydrazine, methylhydrazine, 3,3-dichlorobenzidine, 4-chloroaniline, 3-nitroaniline, atrazine, n-nitrosodiphenylmine, antimony, and hexavalent chromium in some soil samples were rejected. However, these rejected results are not likely to have a material impact on the overall conclusions of the HHRA or SLERA, for the following reasons:

- Hydrazine and methylhydrazine results were rejected in up to nine soil samples (inclusive of duplicates); however, these constituents were not detected in the remaining soil samples and were not detected in groundwater.
- 3,3-Dichlorobenzidine, 4-chloroaniline, 3-nitroaniline, atrazine, and n-nitrosodiphenylmine results were rejected in up to nine soil samples (inclusive of duplicates). Only atrazine was detected in three of 21 surface soil samples and one of 19 subsurface soil samples. The rejected atrazine result was within the range of concentrations detected in the remaining samples. The detected atrazine concentrations were above the ecological screening level but less than the residential RSL. None of these SVOCs were detected in groundwater.
- Antimony results were rejected in three site and two reference soil samples (inclusive of duplicates), and hexavalent chromium results were rejected in two reference soil samples; however, the rejected results were within the range of concentrations detected in the remaining soil samples. Therefore, these rejected results are not likely to have impacted the overall conclusions of the HHRA or SLERA.

The analytical results for dissolved hexavalent chromium, phenolic compounds, hexachlorocyclopentadiene, and caprolactam in some groundwater samples were rejected. However, these rejected results are not likely to have a material impact on the overall conclusions of the HHRA, for the following reasons:

- Dissolved hexavalent chromium was detected at estimated concentrations in seven of 46 samples (inclusive of duplicates) and was rejected in six of 46 samples. While it is possible that dissolved hexavalent chromium was present in one or more of the samples with rejected results at concentrations below the limit of detection (LOD), exposure to detected hexavalent chromium was evaluated in the HHRA.

- Of the phenolic compounds with rejected results, only phenol was detected in one of 23 groundwater samples; this detected concentration was less than the Tapwater RSL. Of the other phenolic compounds, several rejected results were greater than the Tapwater RSL (i.e., 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol). However, these compounds were not detected in other groundwater samples, nor were they detected in soil, and they are not likely to be associated with historical DoD activities.
- Hexachlorocyclopentadiene was rejected in six groundwater samples and was not detected in any other groundwater samples or in any soil samples, albeit at detection limits greater than the human health screening values. However, hexachlorocyclopentadiene is not considered a site-related constituent.
- Caprolactam was rejected in two groundwater samples, and the rejected results were below the Tapwater RSL. Caprolactam was detected in one of 22 soil samples at a concentration several orders of magnitude less than the residential RSL. Caprolactam is an organic compound used in the manufacture of synthetic fibers and is not likely associated with historical DoD activities. Therefore, the rejected caprolactam results in groundwater do not impact the overall conclusions of the HHRA.

6.3.1.3 Evaluation of Detection Limits

The analytical detection limits for constituents in soil were compared to human health risk-based screening levels. The COPC selection tables in **Appendix I** showed the detection limits (i.e., LODs) were sufficiently low. The maximum LODs for all detected chemicals except hexavalent chromium and thallium were below the residential RSLs. Based on review of the sample-specific results and laboratory-supplied detection limits (i.e., [limit of quantitation [LOQ], LOD, and detection limit [DL]) presented in the Final RI QAPP (JV 2020), although the LOQ (0.4 mg/kg) for hexavalent chromium was greater than the residential RSL (0.3 mg/kg), the LOD (0.24 mg/kg) and DL (0.12 mg/kg) were below it. A few samples may have had non-detect results with elevated LODs (above the RSL) due to matrix interference; however, there is 99% confidence that hexavalent chromium was not present at a concentration above the DL, because if it had been present, it would have been reported as a detect and qualified as estimated (“J”). Hexavalent chromium was detected in six of 22 soil samples, therefore exposure to this constituent was evaluated in the HHRA. For thallium, the residential RSL (0.078 mg/kg) based on a non-cancer HQ of 0.1 was below the LOQ (1.5 mg/kg), LOD (0.5 mg/kg) and DL (0.087 mg/kg). However, the LOD and DL are below the residential RSL based on a non-cancer HQ of 1. Additionally, thallium was detected in 12 of 22 soil samples; therefore, exposure to thallium was evaluated in the HHRA. LODs for the non-detect analytes in soil were also below the residential RSLs except for a few SVOCs, and in these cases, the LODs were below the residential RSLs based on a non-cancer HQ of 1 or target cancer risk of 1E-05. Non-detect results that had LODs greater than human health screening levels in a select few samples do not have a material effect on the conclusions of the HHRA.

For groundwater, several non-detect VOCs and SVOCs had LODs greater than the Tapwater RSLs. However, groundwater is not currently used and is unlikely to be used in the future, as a source of potable water on the site or in the immediate vicinity. As discussed previously, detected concentrations of VOCs and SVOCs were not co-located with former DoD activity areas, and do not indicate a release to the environment associated with past DoD activities. Additionally, given the use of the former Launch Area as a town maintenance facility for more than 50 years, it is unlikely that these non-detected VOCs/SVOCs would be present at concentrations above the Tapwater RSLs (but below the detection limits) and would be attributable to historical DoD activities.

Soil LODs were below the ecological screening benchmarks presented in the SLERA, with the exception of select samples with LODs greater than one or more screening benchmark for metals (antimony, cadmium, hexavalent chromium, mercury, selenium, thallium) and SVOCs (bis(2-ethylhexyl)phthalate, carbazole, dibenzofuran). Based

on review of the sample-specific results and laboratory-supplied detection limits (i.e., LOQ, LOD, and DL) presented in the Final RI QAPP (JV 2020), although the LOQs for cadmium and hexavalent chromium were greater than the lowest available ecological benchmarks, the LODs and DLs were below them. Although LOQs and LODs for antimony, mercury, selenium, and dibenzofuran were above the ecological benchmarks, the DLs were below them. A few samples may have had non-detect results with elevated LODs (above the benchmarks) due to matrix interference; however, there is 99% confidence that these constituents were not present at concentrations above the DLs, because if they had been present, they would have been reported as detects and qualified as estimated ("J"). For thallium, bis(2-ethylhexyl)phthalate and carbazole, the lowest available ecological benchmarks were greater than the LOQs, LODs, and DLs. However, these constituents were detected in at least one soil sample and were therefore evaluated in the SLERA. The presence of these constituents in soil is not likely attributable to historical DoD activities. Therefore, the benchmark exceedance of select LODs does not indicate data quality issues and does not affect data usability for the SLERA.

6.3.1.4 Historical Sample Results

Historical soil and groundwater data collected during site investigations conducted more than 20 years ago were not used in this BRA. Based on a comparison of these older data to the human health screening levels used in this BRA, hydrazine, PAHs, and metals would be COPCs in soil. These same constituents were detected in the RI soil samples but were not selected as COPCs based on comparisons to the residential RSLs or reference sample data. The 2020 RI sample data were considered more representative of the site and supported the premise that current constituent concentrations in soil are below levels of concern. Based on review of the historical groundwater data, VOCs (primarily BTEX constituents), SVOCs (PAHs and bis[2-ethylhexylphthalate], and metals were the COPCs in groundwater. These chemicals were detected in the RI groundwater samples and generally within the same range of concentrations as the historical data. Therefore, exclusion of the historical groundwater data from the BRA would not likely affect the BRA conclusions and was preferred given the age of samples.

6.3.2 Exposure Assessment

An underlying assumption in the HHRA is that potential human receptors could be exposed to the maximum detected concentrations in soil and groundwater. Use of the maximum concentration to identify soil and groundwater COPCs and to calculate risks from exposure to groundwater is a health-protective approach that over-states the potential for exposure. The 95% UCL concentrations were used in the soil risk calculations because they are a more realistic estimate of exposure that considers the non-random patterns of human use of the former Launch Area.

Potential human exposure scenarios were developed based on site-specific information, USEPA guidance documents, and professional judgment. The use of residential soil RSLs to identify human health COPCs is conservative since future residential use of the former Launch Area is not a realistic or reasonable scenario based on the current land use and ownership, proximity to the Hamburg Landfill, and presence of historic underground silos. Residential soil RSLs were used to evaluate an unlimited use/unrestricted exposure scenario and to inform risk management decisions, if needed. Similarly, while groundwater is not currently used and is unlikely to be used in the future for drinking water, the potable use scenario was evaluated to inform risk management decisions, if needed. The exposure scenario with little likelihood of ever occurring is the vapor intrusion pathway for volatile constituents that could potentially migrate from shallow groundwater to indoor air through cracks in building foundations. Benzene was the only volatile chemical that was detected in shallow groundwater at a concentration above the USEPA VISLs for residential air, and it was detected in only three of the 30 total overburden groundwater samples collected during the RI. Due to this localized impact, it is unlikely that a receptor

would be exposed to indoor air concentrations at the maximum concentration from one sample, leading to an overestimation of vapor intrusion risks.

Maximum concentrations were used in the SLERA to identify ecological COCs and calculate screening-level HQs. This is a conservative approach that over-states the potential for ecological exposure. Use of the arithmetic mean concentrations in the SLERA refinement is a more realistic estimate of exposure that considers the spatial distribution of contaminant concentrations and the transient nature of most wildlife receptors. The ecological exposure assumptions are also conservative since the SLERA included surface soil data from disturbed areas such as maintained fields that are not naturally occurring habitat and provide limited cover and foraging potential for wildlife.

While aspects of the exposure assessment methodology can result in over-estimates or under-estimates of human and ecological exposure, exposure was probably overestimated, overall, for the potentially exposed populations evaluated.

6.3.3 Risk-Based Screening Levels and Toxicity Values

There is some uncertainty associated with the risk-based screening levels and toxicity values used in the HHRA. However, screening levels and toxicity values are designed to be health-protective. Human health risk-based screening levels are typically derived using parameters representative of reasonable maximum exposure and peer-reviewed toxicity values. In most cases, the toxicity values are derived by extrapolating from laboratory animal data to humans. Uncertainty factors are applied to avoid under-estimating the potential for adverse human health effects.

Selected soil ESVs are also intentionally conservative. The benchmarks considered in this SLERA were from sources that incorporate specific approaches in the methods used to derive a concentration that is protective of ecological receptors. For example, Oak Ridge National Laboratory (ORNL) documents (Efroymson et al. 1997a; 1997b; 1997c) were used to derive soil benchmarks presented in the USEPA (1997b) guidance. The ORNL authors readily acknowledge that there is uncertainty associated with their derivation methodology. This uncertainty is because most studies used to derive the benchmarks were laboratory-controlled dose studies that artificially increase the bioavailability so that a response can be detected. However, in accordance with the conservative nature of the SLERA process, the authors also acknowledge that the soil benchmarks selected are sufficiently conservative to protect organisms at the community level (Efroymson et al. 1997a).

Finally, several constituents do not have human health risk-based screening levels, or ecological benchmarks for any receptor categories (i.e., plants, soil invertebrates, birds or mammals). For human health, the only constituents with no screening levels available are calcium, magnesium, potassium, and sodium, which are essential nutrients that were categorically eliminated as COPCs (see **Appendix I**, RAGS Part D Table 2s). Besides these same four essential nutrients, the only additional constituents with no ecological benchmarks available are aluminum, iron, atrazine, and caprolactam. Aluminum and iron were not identified as ecological COCs because maximum detected concentrations were below the BTVs. Atrazine and caprolactam were both infrequently detected (3/20 and 1/20, respectively) in the soil samples included in the SLERA. Atrazine is an herbicide and caprolactam is an organic compound used in the manufacture of synthetic fibers. The presence of these organic compounds in soil is not likely associated with past DoD activities at the former Launch Area. Therefore, the lack of screening levels or ecological benchmarks is unlikely to have a material effect on the risk assessment conclusions.

Overall, the potential for human health and ecological risk was likely over-stated in the HHRA and SLERA.

7 Summary of Results

This section summarizes the significant results obtained and the conclusions reached as a result of the RI activities conducted at the Launch Area of the former Nike Battery. Only the most significant findings are presented in this section and are reproduced directly or abstracted from information contained in this report. The overall goal of the RI was to determine the nature and extent of contaminants in soil and groundwater at the former Launch Area and subsequently to determine the potential hazards and risks posed to human health and the environment. As a result of the characterization conducted at the former Launch Area, the objectives of the RI have been met.

7.1 RI Summary

Field activities for the RI at the Launch Area of the former Nike Battery were conducted between May 19, 2020 and March 5, 2021. Tasks performed included collection of soil and groundwater samples for site characterization and to support remedial decision making.

7.1.1 RI Fieldwork Summary

During the RI field activities, 43 soil samples (including field duplicate samples) were collected within the former Launch Area during installation of 16 overburden wells (sample ID MW designation) from the top of native material to the water table and analyzed for TAL metals, hexavalent chromium, TCL VOCs, TCL SVOCs, hydrazines, grain size, TOC, and moisture content.

A total of 10 surface soil samples (sample ID SL designation) were collected from eight additional locations within the former Launch Area and analyzed for TAL metals, TCL VOCs, TCL SVOCs, and hydrazines.

Three of the surface soil samples collected in the vicinity of the former transformer pad were analyzed for PCBs.

A total of 35 reference soil samples (including field duplicate samples) were collected from the surface (0 to 1 foot bgs) and subsurface (1 to 3 feet bgs) at 16 locations within the Nike Battery but outside the former Launch Area (sample ID BH designation) and analyzed for metals and PAHs.

Sixteen new overburden and five paired bedrock monitoring wells were installed to evaluate the nature and extent of any groundwater impacts and for delineation of groundwater flow. Two rounds of sampling were conducted: one in September 2020 and a second round in December 2020. During each event, water levels of monitoring wells were documented, and groundwater samples were analyzed for TAL metals, TCL VOCs, TCL SVOCs, and hardness.

Groundwater level measurements collected during the September 2020 and December 2020 sampling events were used to generate groundwater contour maps. The direction of groundwater flow in the overburden wells is to the south, and the direction of groundwater flow in the bedrock wells is to the south and east.

Slug tests in overburden wells were used to evaluate hydraulic conductivity. The locations of slug tests were distributed across the investigation area to be representative of the site as a whole. Except for well NHLA-MW16, the wells recovered quickly during testing, indicating relatively high hydraulic conductivity. Well NHLA-MW16 took an extended time to recover, indicating a lower relative hydraulic conductivity.

7.1.2 Nature and Extent of Contamination

The results of the RI investigations indicate that the primary contaminants found in the former Launch Area soil and groundwater are PAHs and metals, with other SVOCs and VOCs found to a lesser extent in groundwater.

The distribution of the SVOCs/PAHs spatially and temporally suggest no discernible trend in soil or groundwater, and any contamination is likely localized. The concentrations identified in shallow soils across the site indicate that PAHs are likely present due in part to multiple non-DoD-related sources, such as petroleum residuals related to UST or AST leaks, fueling spills, asphalt used in road construction, roofing tar, or from asphalt millings stored by the Town of Hamburg in the missile silo vaults. In groundwater, SVOC/PAH exceedances did not correlate with the SVOC/PAH soil results.

Generally, the metal levels in soils in the former Launch Area are similar to those in samples collected from reference locations, suggesting that their presence is at background levels. Soil data from the former Launch Area were compared to reference soil data. Constituents with maximum detected site concentrations less than BTVs calculated from the reference soil data were not included in the quantitative risk assessments (see **Sections 6.1.1** and **6.2.3**). Groundwater data from the former Launch Area were compared to upgradient monitoring well data. Constituents with maximum detected site concentrations less than the upgradient groundwater concentrations were not included in the quantitative HHRA (**Section 6.1.1**).

Based on these data, no DoD-related contaminant source areas, past or existing, were identified during the RI. In addition, although not the focus of this RI, there were also no non-DoD-related source areas identified during the RI.

7.1.3 Baseline Risk Assessment Conclusions

The BRA was completed based on the RI soil and groundwater data, and included both an HHRA and a SLERA (and SLERA refinement).

The HHRA results indicated that for all current/most likely future on-site exposure scenarios, non-cancer hazards are less than 1 and are therefore acceptable, and ELCRs are less than or within the acceptable risk range of 1×10^{-4} to 1×10^{-6} (i.e., 1E-04 to 1E-06) established by the NCP. For the hypothetical future potable use scenarios, non-cancer HIs exceed 1 and ELCRs are within (for the commercial/industrial worker) or exceed (for the resident) the risk range of 1×10^{-4} to 1×10^{-6}. The potential for cancer risk to an off-site resident from hypothetical future potable use of groundwater is from benzene and bis(2-ethylhexyl)phthalate. The potential for non-cancer hazard is predominantly due to benzene, bis(2-ethylhexyl)phthalate, and thallium in groundwater.

Benzene was detected in 8 of the 39 groundwater samples, at concentrations ranging from 0.33 to 210 µg/L, however the second highest concentration was 11 µg/L. Benzene concentrations exceeded the Tapwater RSL at three locations (MW-4, MW-5, and MW-9). Benzene was not detected (< 0.500 µg/L) in upgradient groundwater samples. The sporadic nature of the benzene detections in groundwater is not indicative of a widespread release. bis(2-Ethylhexyl)phthalate was infrequently detected (4 of 39 samples) in groundwater, and a single detected concentration exceeded the Tapwater RSL of 5.6 µg/L. bis(2-Ethylhexyl)phthalate was also detected in upgradient groundwater at an estimated concentration of 2.2 µg/L. Additionally, bis(2-ethylhexyl)phthalate is a common laboratory contaminant and is likely an artifact of sample analysis. Thallium was detected in half the overburden and bedrock groundwater samples, however concentrations in only two samples exceeded the background value of 0.82 µg/L. The HHRA likely overestimated the thallium exposure concentration because a maximum of 1.4 µg/L was used to evaluate the potable use scenario and the mean of detected thallium concentrations was 0.32 µg/L. Thallium in the environment may be a result of coal use and/or emissions, and its previous use at the site has not

been reported. Additionally, the groundwater metals data evaluation offers strong evidence to support that groundwater conditions reflect impacts of a more recent origin (e.g., from the storage/transport/use of road salt at the site). Given the use of the former Launch Area as a town maintenance facility for more than 50 years, the presence of these constituents in groundwater is not likely attributable to historical DoD activities.

The SLERA results indicate that only small areas (approximately ½-acre) of successional old field at the site perimeter provide potential habitat. The former Launch Area is actively used by the county and is largely covered with gravel, asphalt, or buildings and ecological exposure to soil in these areas is not possible. Similarly, other areas of the former Launch Area are maintained lawn. Lawn areas are not a natural cover type and provide limited wildlife habitat. On site habitat does not support abundant and diverse populations of wildlife. Additionally, based on the limited frequency and magnitude of benchmark exceedances, risk to terrestrial plants, soil invertebrates, birds, and mammals is low. Considered as a whole, limited quality habitat and the benchmark screening results indicate no unacceptable risk for ecological receptors (plants, soil invertebrates, birds, and mammals).

7.2 Recommendations

The purpose of the RI at the Launch Area of the former Nike Battery was to conduct an on-site investigation and gather sufficient data to characterize the nature and extent of DoD impacts (if present). The primary goal of the RI was to collect the appropriate amount of information to determine if there are site conditions that may pose unacceptable hazards or risks to human health and the environment arising from DoD-related contaminants. The data collection and risk assessments will be used to support remedial decisions, if needed, or to justify a determination of either No DoD Action Indicated or No Further Action.

In soil collected from the former Nike Battery Launch Area, metals and PAHs were detected at concentrations above the screening levels. In groundwater collected from the former Nike Battery Launch Area, metals, PAHs, and VOCs were detected at concentrations above the screening levels. Given the use of the former Launch Area as a town maintenance facility for more than 50 years, these contaminants cannot be linked conclusively to past DoD activities at the site and are not indicative of a DoD-related release to the environment.

The human health and SLERA evaluations concluded that there is no unacceptable DoD-related risk to human health under current and likely foreseeable future uses and to ecological receptors at the former Nike Battery Launch Area. Therefore, the findings of the RI support a No Further Action Proposed Plan.

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-xylenes.

Detected concentrations are bolded.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

USEPA = United States Environmental Protection Agency

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-xylenes.

Detected concentrations are bolded.

Acronymns and Abbreviations:

-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/kg = micrograms per kilogram.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
USEPA = United States Environmental Protection Agency

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-xylenes.

Detected concentrations are bolded.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

USEPA = United States Environmental Protection Agency

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-xylenes.

Detected concentrations are bolded.

Acronymns and Abbreviations:

-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/kg = micrograms per kilogram.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
USEPA = United States Environmental Protection Agency

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Pyrene	129-00-0	180,000	2,300,000	µg/kg	**1100**	**390**	**1200**	**140**	**110**

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

ng/g = nanograms per gram.

µg/kg = micrograms per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for chromium III.

5. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/g = micrograms per gram.
mg/kg = milligrams per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

4. Screening level is for chromium III.

5. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Acronymns and Abbreviations:

-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/g = micrograms per gram.
mg/kg = milligrams per kilogram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface interval (generally 1 to 3 ft bgs).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

Detected concentrations are bolded.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/g = micrograms per gram.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

USEPA = United States Environmental Protection Agency

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface interval (generally 1 to 3 ft bgs).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

6. Screening level is for chromium III.

7. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

pH	ARC-pH	--	--	pH units	--	--	--	--	--	--	--	--

Notes:

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface inte ft bgs).

2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

3. Screening levels are the USEPA RSLs for residential or industrial soil. The RSLs are concentrations associa risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

6. Screening level is for chromium III.

7. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

References

USEPA. 2021. Regional Screening Level (RSL) Summary Table. May 2021. Available at: https://semspub.epa.gov/work/HQ/400750.pdf.

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

ft = feet.

ft bgs = feet below ground surface.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/g = micrograms per gram.

mg/kg = milligrams per kilogram.

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-xylenes.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-xylenes.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-xylenes.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-xylenes.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
R = The data validator flagged the data with "X" qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable ("R" qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated valu
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated valu
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated valu
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated valu
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for m-cresol.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
LOD = limit of detection.
RSL = Regional Screening Level.
µg/L = micrograms per liter.
mg/L = milligrams per liter.
Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated valu
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.
The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for chromium III.

4. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/L = micrograms per liter.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for chromium III.

4. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/L = micrograms per liter.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Notes:

1. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".

2. Screening levels are the USEPA RSLs for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

3. Screening level is for chromium III.

4. Screening level is for mercuric chloride.

Detected concentrations are bolded.

Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

Acronymns and Abbreviations:

-- = not available or not analyzed.

CASRN = Chemical Abstracts Service Registry Number.

LOD = limit of detection.

RSL = Regional Screening Level.

µg/L = micrograms per liter.

Qualifier Definitions:

U = The analyte was not detected and was reported as less than the LOD.

J = The reported result was an estimated value.

UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.

R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples. The project team performed data usability assessment and recommended these data to be rejected/ are not usable (“R” qualifiers).

Abbreviations:

95/95 UTL = one-sided 95 percent upper confidence limit for the 95th percentile
BTV = background threshold value
FOD = frequency of detection
ft bgs = feet below ground surface
G = gamma
KM = Kaplan-Meier
Ln = lognormal
mg/kg = milligrams per kilogram
N = normal
NP = nonparametric
Perc. = percentile
-- = insufficient data for calculating statistics
Max (a) = insufficient data for calculating UTL; BTV is based on the maximum
Max (b) = 95UTL is greater than the maximum; BTV is based on the maximum
UTL = upper tolerance limit
µg/kg = micrograms per kilogram
WH = Wilson Hilferty

Notes:

1 Statistics are provided for full datasets. Potential statistical outliers identified in the dataset are presented in Table J-2.

2 Distribution assessed by goodness-of-fit tests based on detected values only conducted using ProUCL 5.1.002 at a 95% confidence level (α = 0.05).
Distribution for BTV selected according to the following hierarchy: normal > gamma > lognormal > nonparametric.

3 UTLs only calculated for analytes with at least 8 total observations and 5 detected observations (USEPA, 2015).

4 For nonparametric UTLs, the achieved minimum coverage with 95% confidence is provided (USEPA 2009, Table 17-4).

5 Final BTV selected in accordance with decision tree presented in Table J-3.
Notes indicate basis for BTV: UTL = 95/95 UTL; Max = maximum detected concentration; ND = BTV not defined because FOD=0%.
Values less than 10 are reported to 2 significant figures. Values greater than 10 are reported to 3 significant figures.

6 New York State soil background are 95th percentiles and maximums for source-distant samples collected as part of rural soil survey (NYSDEC, 2005).
< # = value is non-detect and value shown is method detection limit.
*Actual detected value; other non-detected readings had higher values.
***Actual non-detected value; other detected readings had lower values.

Notes:
1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).
2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".
3. Low molecular weight (LMW) polycyclic aromatic hydrocarbons (PAHs) are composed of fewer than four benzene rings (USEPA 2007a).
4. High molecular weight (HMW) polycyclic aromatic hydrocarbons (PAHs) are composed of four or more benzene rings (USEPA 2007a).
5. Data qualified as estimated ("J") were used as detected values, the same as unqualified data. Also, for duplicates, if both the parent and duplicate were detected or if both were not detected then the results were averaged; if either the parent or duplicate was detected and the other was not detected, the detected result was used.

Detected concentrations are bolded.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
ng/g = nanograms per gram.
µg/g = micrograms per gram.
µg/kg = micrograms per kilogram.
mg/kg = milligrams per kilogram.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.

Notes:
1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs), "B" to designate first subsurface interval (generally 1 to 3 ft bgs), and "C" to designate second subsurface interval (various depths).
2. Normal samples are indicated with "N" and field duplicate samples are indicated with "FD".
3. Low molecular weight (LMW) polycyclic aromatic hydrocarbons (PAHs) are composed of fewer than four benzene rings (USEPA 2007a).
4. High molecular weight (HMW) polycyclic aromatic hydrocarbons (PAHs) are composed of four or more benzene rings (USEPA 2007a).
5. Data qualified as estimated ("J") were used as detected values, the same as unqualified data. Also, for duplicates, if both the parent and duplicate were detected or if both were not detected then the results were averaged; if either the parent or duplicate was detected and the other was not detected, the detected result was used.

Detected concentrations are bolded.

Acronymns and Abbreviations:
-- = not available or not analyzed.
CASRN = Chemical Abstracts Service Registry Number.
ft = feet.
ft bgs = feet below ground surface.
LOD = limit of detection.
ng/g = nanograms per gram.
µg/g = micrograms per gram.
µg/kg = micrograms per kilogram.
mg/kg = milligrams per kilogram.

Qualifier Definitions:
U = The analyte was not detected and was reported as less than the LOD.
J = The reported result was an estimated value.
UJ = The analyte was not detected and was reported as less than the LOD as an estimated value.
R = The data validator flagged the data with “X” qualifiers due to significant QC deficiencies in the laboratory analysis of the samples.

Table 6-5
Identification of Potential Ecological Constituents of Concern
Former Nike BU 51/52 Launch Area Remedial Investigation
Hamburg, NY

Notes
1. The soil data considered in the screening level ecological risk assessment and included in the summary statistics are presented in Table 6-4 Summary of Soil Data Considered in SLERA.
2. The plant, soil invertebrate, bird, and mammal benchmarks were selected based on the following hierarchy: USEPA EcoSSLs if available (2007), USEPA Region 4 Ecological Soil Screening Levels if available (2018), and Department of Energy Laboratories i.e., Los Alamos National Laboratory (2017) if available.
3. Ecological COCs are constituents with a maximum detection that exceeds the BTV (if available) and at least one benchmark (plant, soil invertebrate, bird, or mammal) and has a FOD of at least 10%. If a constituent does not have an available benchmark and has a FOD of at least 10%, it was identified as an ecological COC. Calcium, magnesium, potassium, and sodium are essential nutrients and were not identified as ecological COCs.
4. Low molecular weight (LMW) polycyclic aromatic hydrocarbons (PAHs) are composed of fewer than four benzene rings (USEPA 2007a).
5. High molecular weight (HMW) PAHs are composed of four or more benzene rings (USEPA 2007a).

Acronyms and Abbreviations:
% = percent
-- = not available
BTV = background threshold value
CASRN = Chemical Abstracts Service Registry Number
COC = constituent of concern
FOD = frequency of detection
mg/kg = milligrams per kilogram

Notes
1. Ecological COCs are constituents with a maximum detection that exceeds the BTV, the plant benchmark, and has a FOD of at least 10%.
2. The soil data considered in the screening level ecological risk assessment and included in the summary statistics are presented in Table 6-4 Summary of Soil Data Considered in SLERA.
3. The plant benchmarks were selected based on the following hierarchy: USEPA EcoSSLs if available (2007), USEPA Region 4 Ecological Soil Screening Levels if available (2018), and Department of Energy Laboratories i.e., Los Alamos National Laboratory (2017) if available.
4. The maximum HQs were calculated as the maximum concentration for each COC divided by the applicable plant benchmark. Maximum HQs greater than 1.0 are bolded.
5. The arithmetic mean HQs were calculated as the mean concentration for each COC divided by the applicable plant benchmark. Mean HQs greater than 1.0 are bolded.
6. The BTV HQs were calculated as the BTV for each COC divided by the applicable plant benchmark. BTV HQs equal to or greater than 1 are bolded.
7. High molecular weight (HMW) polycyclic aromatic hydrocarbons (PAHs) are composed of four or more benzene rings (USEPA 2007a).

Acronyms and Abbreviations:
-- = not available
< = less than
% = percent
BTV = background threshold value
COC = constituent of concern
FOD = frequency of detection
HQ = hazard quotient
mg/kg = milligrams per kilogram

Total HMW PAHs[8]	20 / 20	100	--	--	101	--	9.2	--	--	--	--	

Notes

1. Ecological COCs are constituents with a maximum detection that exceeds the BTV, the bird benchmark, and has a FOD of at least 10%.
2. The soil data considered in the screening level ecological risk assessment and included in the summary statistics are presented in Table 6-4 Summary of Soil Data Considered in SLERA.
3. The bird benchmarks were selected based on the following hierarchy: USEPA EcoSSLs if available (2007), USEPA Region 4 Ecological Soil Screening Levels if available (2018), and Department of Energy Laboratories i.e., Los Alamos National Laboratory (2017) if available.
4. The maximum HQs were calculated as the maximum concentration for each COC divided by the applicable bird benchmark. Maximum HQs greater than 1.0 are bolded.
5. The mean HQs were calculated as the arithmetic mean concentration for each COC divided by the applicable bird benchmark. Mean HQs greater than 1.0 are bolded.
6. Refined HQs were calculated by adjusting the mean HQ using the following factors (see calculation details in tables below References):
   a. An adjustment factor of 0.7 to account for the difference between high-end estimate and mean food intake rate for the American woodcock (USEPA 2007b).
   b. An area use factor of 0.5 to account for the lack of habitat (<2 non-contiguous acres) at the former Launch Area compared to the foraging area for American woodcock (USEPA 1993); and
   c. An adjustment factor of 0.1 to reflect an assumed approximate order of magnitude difference between a NOAEL and LOAEL (USEPA 1997b).
7. The BTV HQs were calculated as the BTV for each COC divided by the applicable bird benchmark. BTV HQs equal to or greater than 1 are bolded.
8. High molecular weight (HMW) polycyclic aromatic hydrocarbons (PAHs) are composed of four or more benzene rings (USEPA 2007).
9. As described in Section 6.2.4.3, data validation reports for a subset of the highest bis(2-ethylhexyl)phthalate results were biased high with potential for lab contamination. This is indicated by laboratory control sample recoveries above the acceptance limits and method blank contamination (e.g., method blank results for bis(2-ethylhexyl)phthalate ranged from 100 to 4,600 mg/kg compared to the qualified sample results ranging from 370 to 5,600 mg/kg).

Acronyms and Abbreviations:
-- = not available
< = less than
% = percent
BTV = background threshold value
COC = constituent of concern
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect level
mg/kg = milligrams per kilogram
NOAEL = no observed adverse effect level

Derivation of HQ adjustment factor (0.7) based on food intake rates for American woodcock

High-end point estimate used to develop EcoSSL	0.214	kg dw / kg BW / day	EcoSSL Attachment 4-1, Table 1 (USEPA 2007b).
Mean intake rate used to develop adjustment factor	0.1415	kg dw / kg BW / day	Mean of mean food intake rates (0.160, 0.123) provided in EcoSSL Attachment 4-1, Table 1 (USEPA 2007b).
Ratio of mean to high-end point estimate	0.7	unitless	Equivalent to 0.1415 kg dw / kg BW / day divided by 0.214 kg dw / kg BW / day

Derivation of HQ adjustment factor (0.5) based on available habitat relative to home range for American woodcock

Median home range for American woodcock	72	acres (equivalent to 29 hectares)	Mean of median home range (3.1, 73.6, 10.5 hectares) for American woodcock in Pennsylvania/mixed forests with shrubs and fields, provided in Wildlife Exposure Factors Handbook, Vol. I (USEPA 1993).
Potential habitat available at former Launch Area	2	acres	
Ratio of available habitat to median home range	0.03	unitless	Actual calculated value is 0.03; conservative higher estimate of ratio (0.5) was used.

Soil Screening Criteria		
Polycyclic Aromatic Hydrocarbons (µg/kg)	Residential RSL [2]	Industrial RSL [2]
Benzo(a)anthracene	1100	21000
Benzo(a)pyrene	110	2100
Benzo(b)fluoranthene	1100	21000
Dibenz(a,h)anthracene	110	2100
Indeno(1,2,3-cd)pyrene	1100	21000

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface interval (generally 1 to 3 ft bgs).

2. Screening levels are the United States Environmental Protection Agency (USEPA) regional screening levels (RSLs) for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Soil Screening Criteria		
Inorganics (mg/kg)	Residential RSL [2]	Industrial RSL [2]
Aluminum	7,700	110,000
Arsenic	0.68	3
Chromium, Hexavalent	0.3	6.3
Cobalt	2.3	35
Iron	5,500	82,000
Manganese	180	2,600
Selenium	39	580
Thallium	0.078	1.2
Vanadium	39	580

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface interval (generally 1 to 3 ft bgs).

2. Screening levels are the United States Environmental Protection Agency (USEPA) regional screening levels (RSLs) for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Soil Screening Criteria		
Inorganics (mg/kg)	Residential RSL [2]	Industrial RSL [2]
Aluminum	7,700	110,000
Arsenic	0.68	3
Chromium, Hexavalent	0.3	6.3
Cobalt	2.3	35
Iron	5,500	82,000
Manganese	180	2,600
Thallium	0.078	1.2
Vanadium	39	580

1. Sample IDs contain "A" to designate surface interval (0 to 1 ft bgs) and "B" to designate first subsurface interval (generally 1 to 3 ft bgs).

2. Screening levels are the United States Environmental Protection Agency (USEPA) regional screening levels (RSLs) for residential or industrial soil. The RSLs are concentrations associated with a cancer risk of 1×10^{-6} or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.

Detected concentrations are bolded.

Detected concentrations that exceed residential RSLs are bolded and shaded yellow.

Detected concentrations that exceed industrial RSLs are bolded and shaded orange.

Nickel	39
Thallium	0.02
Vanadium	8.6
Screening levels are the May 2021 United States Environmental Protection Agency (USEPA) regional screening levels (RSLs) for tapwater. The RSLs are concentrations associated with a cancer risk of 1×10-6 or a non-cancer hazard quotient of 0.1 to account for exposure to multiple constituents.	
Detected concentrations are bolded.	
Detected concentrations exceeding the tapwater RSLs are bolded and shaded yellow.

NIKE BU 51/52 HAMBURG, NY DAILY SUMMARY

DATE: Wednesday 7/29/2020

ONSITE RESOURCES

- JV - Jeff Brayer (Arcadis)
- New York Leak Detection – Nick Stari

WORK COMPLETED

- Checked in with Hamburg Range Master, Highway Department and provided status update to Rick Nowak of Buildings and Grounds Department
- Completed H&S tailgate meeting
- NYLD marked out utilities near pond and athletic fields for the background sampling locations.
- All proposed sampling locations have utilities marked out within a 15 foot radius of each location.

PLANNED ACTIVITIES

- Figures will be updated with field verified drainage pathway and sampling locations.
- JV and Nothnagle drilling will be onsite August 10, 2020 to begin monitoring well installation and collection of soil samples.

Please let us know if you have any comments or require any additional information.

NIKE BU 51/52 HAMBURG, NY DAILY SUMMARY

DATE: Tuesday 7/28/2020

ONSITE RESOURCES

- JV - Jeff Brayer (Arcadis)
- New York Leak Detection – Nick Stari

WORK COMPLETED

- Checked in with Hamburg Range Master, Highway Department and provided status update to Rick Nowak of Buildings and Grounds Department
- Completed H&S tailgate meeting
- JV staked and flagged background sample locations near pond and athletic fields
- NYLD marked out utilities near the transporter pad, north of gun range, missile assembly and testing building, and all other locations within the former Nike Launch Area.

WORK PLANNED FOR 7/29/2020

- NYLD will continue marking utilities for background locations near athletic fields and pond area

Please let us know if you have any comments or require any additional information.

Nathan Mullens, SERES

Date:
August 3, 2020

FUDS Project Number:
C02NY0079

Subject:
Nike BU 51/52 – Hamburg, NY - Field Investigation Summary (July 27, 2020 – July 31, 2020)

---

1. Onsite Personnel

- Onsite July 27, 2020 – July 29, 2020
    - JV - Jeff Brayer (Arcadis) and New York Leak Detection – Nick Stari
- Offsite July 30, 2020 – July 31, 2020

2. Completed Activities

- All sampling locations were staked. New York Leak Detection marked out utilities within a 15 foot radius of proposed sampling locations.
- Utility clearance lines of evidence include ground penetrating radar, tracing, site walk with Rick Nowak of Buildings and Grounds to discuss Town knowledge of utilities, reconnaissance and visual inspection of overhead utilities and surface utility infrastructure, and 811 Dig Safely New York. In areas of congested utilities, Nothnagle Drilling, Inc. will also hand clear.

3. Items Discussed

- JV will refresh utility mark outs weekly as needed in high traffic areas.
- An employee of the Town Highway Department indicated that although the missile silos were filled with asphalt millings, underground areas may not have been backfilled. Void spaces may be encountered during drilling. If encountered, drill locations may be adjusted, as necessary.
- Installation of the monitoring well and sample collection at location 17 has been postponed until additional information regarding Town use of the wastewater treatment plant (WWTP) has been obtained. Reconnaissance during utility mark-out observed a leach field with active sanitary infrastructure in the vicinity of location 17. The 2019 Bluestone Remedial Investigation Work Plan indicates that "The former Sewage Treatment Plant was used by DoD. According to an internal USACE memo dated 27 March 2000, the Town of Hamburg never used this facility. Information regarding the abandonment or demolition of the Sewage Treatment Facility was not found among the historical documents." However, the Buildings and Grounds Department confirmed that some of the Town buildings connect to this system, and that the Buildings and Grounds Department managed the system through circa 2016, at which time the Highway Department began managing the system. Management includes pumping of solids from the 20,000-30,000 gallon tank and onsite treatment of leachate with chlorine prior to discharge to 18 Mile Creek.

4. Health and Safety

- Checked in with Hamburg Highway Department and Buildings and Grounds Department daily.
- Completed H&S tailgate meetings daily prior to onsite activities.
- Met with Jason Koelle – NFTA Police – Range Master
  - Discussed gun range use and access to points behind and next to the range.
  - Range will be in use for target practice every day for the next three weeks, but when not in use, the red flag will be lowered signifying that the range is clear for access.

5. Planned Activities

- JV will reach out to the Town for additional information regarding when the Town began use of the WWTP. JV will discuss any additional findings with USACE to confirm that location 17 should be removed from the scope of work.
- JV will generate a sample tracking spreadsheet to be included with future weekly summaries.
- Drilling and sample collection is scheduled to begin on August 10, 2020.

Subject:
Nike BU 51/52 – Hamburg, NY - Field Investigation Summary (August 3, 2020 – August 7, 2020)

---

1. Onsite Personnel

- None

2. Completed Activities

- Onsite activities were not completed this week.

3. Items Discussed

- JV confirmed with the Buildings and Grounds Department that the Town has used the WWTP since taking ownership of the property from DOD. Sample location 17 is removed from the scope of work.

4. Health and Safety

- Accident Prevention Plan was finalized.

5. Planned Activities

- Nothnagle and JV mobilize to site on August 10, 2020. Drilling begins August 11, 2020.

Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/11/2020)

ONSITE DATE Tuesday 8/11/2020

ONSITE RESOURCES

- 7:30 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 18:15 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)
- 15:00 – 18:15 JV – Kate Clubine (Arcadis)

COMPLETED ACTIVITIES

- Checked in with Town of Hamburg Buildings and Grounds Department (Pat Ryan and Rick Nowak)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Installed bedrock monitoring well MW9BR. Photographs below.
    - Visual, PID, or olfactory impacts were not observed.
    - Containerized soil cuttings and labeled drum.

MW9BR (Bedrock Well)	
Top of fractured bedrock	10’ bgs
Top of competent bedrock (shale)	14’ bgs
Water level	3.3’ bgs
First water bearing zone	14-15’ bgs
Second water bearing zone	20-24’ bgs
2” 10 slot screen (8’ of screen)	16-24’ bgs
Sand	14’-16’ bgs
Bentonite Seal	12-14’ bgs
Grout	2-12’ bgs

PLANNED ACTIVITIES FOR 8/12/2020

- Drilling will begin on MW7BR (bedrock well).

PHOTOGRAPHS

Filter pack sand being placed around the screen.

Bentonite pellet seal being placed above the filter pack sand.

Rig setting up to install MW9BR

TGM + *project number plus date as follows: xxxxxxxx.xxxx.xxxxx - dd/mm/year*

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: JV Hanbury Nike Base Launch Area		**Project Location:** Hanbury Highway	
Date: 8-11-20	**Time:** 7:30	**Conducted by:** J. Brewer	**Signature/Title:**
Client: ACOE		**Client Contact:** ACOE	**Subcontractor companies:** Nothing to Drill

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Walk the drill site
2 Check for utilities
3 Check Rig/Equipment
4 Transport Augers
5 Start Augering
6 Retrieving Samples

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations [X] If there are none, write "None" here: _____

If yes, describe them here: Highway Department operation in Laydown Yard

How will they be controlled? Use Trucks + Cones to mark and block work areas

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
[ ] Not applicable		[ ] Working at Height		[ ] Confined Space	
[ ] Energy Isolation (LOTO)		[X] Excavation/Trenching	Utility Checklist	[ ] Hot Work	
[ ] Mechanical Lifting Ops		[X] Overhead & Buried Utilities	811 GPR	[ ] Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

[ ] Incidents from day before to review?	[ ] Lessons learned from the day before?	[ ] Topics from Corp H&S to cover?
[ ] Any corrective actions from yesterday?	[ ] Will any work deviate from plan?	[ ] Any Stop Work Interventions yesterday?
[ ] JLAs or procedures are available?	[ ] Field teams to "dirty" JLAs, as needed?	[ ] If deviations, notify PM & client
[X] Staff has appropriate PPE?	[X] Staff knows Emergency Plan (EAP)?	[X] All equipment checked & OK?
		[X] Staff knows gathering points?

Comments: 1st Day Drilling, Familiarize Crew w/ E-Stops on Rig + Test ARCADIS Truck

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [ ] Lessons learned and best practices learned today: None
- [ ] Incidents that occurred today: None
- [ ] Any Stop Work interventions today? None
- [ ] Corrective/Preventive Actions needed for future work: None
- [ ] Any other H&S issues: None

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/12/2020)

ONSITE DATE Wednesday 8/12/2020

ONSITE RESOURCES
- 7:30 – 15:30 Nothnagle – Jeremiah Leatherstich and Steve Loranty
- 7:30 – 18:30 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Refreshed utility mark outs and locations stakes.
- Began installation of MW7BR (bedrock well).
  - Petroleum like odor observed in well casing at 12.5' bgs (head space) with a PID reading of 116 ppm.
    - No sheen or staining was observed in the soil cuttings.
    - Weathered bedrock is present at 12.5' bgs, and elevated PID readings were not observed above the weathered bedrock. It is possible that the elevated reading naturally occurs due to local rock formation exhibiting petroleum like odors and formation gas; however, this observation will be further evaluated next week during installation of MW7OB (overburden well).
  - A portion of the borehole from approximately 14-17' bgs of highly fractured rock collapsed after hole was reamed from NQ to HQ diameter. A 3" split spoon was used to clear borehole prior to setting well. Borehole remained open while placing filter sand pack and bentonite seal
  - Based on the observed cuttings and confirmation split spoons, highly weathered shale is present from 12-14' bgs, and this interval was dry. Competent bedrock was encountered at 14' bgs and the first water-bearing zone was encountered from 14 to 15' bgs. To provide for monitoring of the 14-15' bgs zone, while sealing the bedrock from the overburden/weathered bedrock, the well screen was installed short of the highly weathered shale interval, and the sand pack was installed to 2 feet above the screen to capture the shallow zone. This well construction allowed us to monitor this zone while being able to seal the bedrock from the overburden/ weathered rock.

MW7BR (Bedrock Well)	
Top of fractured bedrock	12' bgs
Top of competent bedrock (shale)	14' bgs
Water level	2-3' bgs
First water bearing zone	14-15' bgs
Second water bearing zone	20-24' bgs
2" 10 slot screen (8' of screen)	16-24' bgs
Sand	14'-16' bgs
Bentonite Seal	12-14' bgs
Grout (completed 8/13/2020)	2-12' bgs

DAILY FIELD REPORT - Wednesday 8/12/2020
Nike BU 51/52 – Hamburg, NY

PLANNED ACTIVITIES FOR 8/13/2020

- Complete grouting of MW7BR.
- Begin installation of MW4BR.

PHOTOGRAPHS

Rig set up at MW7BR.

Bentonite pellet seal being placed above the filter pack sand.

MW7BR 12-12.5 bgs. Elevated PID at 12.5' bgs.

MW7BR 14-16' bgs cave in. Top of competent rock is heavily fractured.

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: JV Former Nike BU 51/52 Landfill Area			**Project Location:** Larch Area
Date: 6-12-2020	**Time:** 7:45	**Conducted by:** J. Brayton	**Signature/Title:**
Client:		**Client Contact:**	**Subcontractor companies:** Nebraska Drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Top off MW9BR
2 Down augers
3 Set up Rig on MW7BR
4 Advance Augers
5 Split spoon some
6 Core back

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: Pressures, Heavy Augers

How will they be controlled? Stand clear of area (work area)

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☒ Overhead & Buried Utilities	811, GR	☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Any Stop Work Interventions yesterday?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ If deviations, notify PM & client
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ All equipment checked & OK?
☐ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ Staff knows gathering points?

☐ Topics from Corp H&S to cover?

Comments: _____

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/13/2020)

ONSITE DATE Thursday 8/13/2020

ONSITE RESOURCES
- 7:30 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 18:00 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed grouting at MW7BR and MW9BR and installed 4' stick-up protective casings at both wells.
- Began installation of MW4BR (bedrock well).
  - The well was dry during drilling until top of competent rock was penetrated at 15' bgs, and then water rose to 6' bgs. While coring the water bearing zones were observed at:
    - 15'-17' bgs– approximately 50 gallons of water lost while drilling
    - 21.3'-25' bgs – approximately 70 gallons of water gained while drilling
  - Petroleum like odor observed in well casing at 21.7' bgs (head space) with a PID reading of 35 ppm.
    - No sheen or staining was observed in the soil cuttings.
    - It is possible that the elevated reading naturally occurs due to local rock formation exhibiting petroleum like odors and formation gas; however, this observation will be further evaluated next week during installation of MW4OB (overburden well).
  - Reamed borehole from NQ to HQ diameter to set well. Grouted with tremie pipe and installed 4' stick-up protective casing.
  - Competent bedrock was encountered at 15' bgs and the first water-bearing zone was encountered from 15 to 17' bgs. To provide for monitoring of the 15-17' bgs zone, while sealing the bedrock from the overburden/weathered bedrock, the well screen was installed short of the top of shallow interval, and the sand pack was installed to 2 feet above the screen to capture the shallow zone. This well construction allowed us to monitor this zone while being able to seal the bedrock from the overburden/ weathered rock.

MW4BR (Bedrock Well)	
Top of competent bedrock (shale)	15' bgs
Water level	6' bgs
First water bearing zone	15-17' bgs
Second water bearing zone	21.3'-25' bgs
2" 10 slot screen (8' of screen)	17-25' bgs
Sand	15'-17' bgs
Bentonite Seal	13'-15' bgs
Grout	2-13' bgs

PLANNED ACTIVITIES FOR 8/14/2020

- Top off grout below protective casings at MW4BR, MW7BR and MW9BR
- Begin installation of MW5BR.

PHOTOGRAPHS

Rig setting up to install MW4BR

Hollow stem auguring at MW4BR

Bentonite pellet seal being placed above the filter pack sand.

Borehole grouting above bentonite pellet seal using a tremie pipe.

Additional photographs of core will be included in weekly summary report.

C02NY0079

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/14/2020)

ONSITE DATE Friday 8/14/2020

ONSITE RESOURCES
- 7:30 – 17:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 19:00 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Began installation of MW5BR (bedrock well).
  - Petroleum like odor observed in well casing at interface of competent rock (19'bgs) and through length of core with a PID reading of 3.8 ppm.
    - No sheen or staining was observed in the soil cuttings.
    - It is possible that the elevated reading naturally occurs due to local rock formation exhibiting petroleum like odors and formation gas; however, this observation will be further evaluated next week during installation of MW5OB (overburden well).
  - Top of fractured bedrock was encountered at 9.5' bgs, with first water bearing zone observed at 17.5' bgs in overburden and top of competent rock (shale) at 19' bgs. Coring was completed from 19' to 34' bgs.
    - Water loss did not occur during coring, and a second water bearing zone was not observed in this depth interval. Minimal fractures were observed.
    - The borehole was pumped down and allowed to recharge to 4' over 25 minutes. The water was observed infiltrating at interface of overburden and top of bedrock by way of spotlight down borehole.
    - It is suspected that recharge is not coming from bedrock fractures but rather from overburden with water running down the borehole indicating recharge. A hybrid water table may be present.
    - The borehole was left open to recharge to static. The drill rig was secured onsite with caution tape.
- The following measurements were obtained:

Bedrock Well	Water Level		Total Depth	
	TOC	BGS	TOC	BGS
MW4BR	5.66'	2.47'	28.4'	25.15'
MW7BR	5.93'	2.75'	27.21'	24.02'
MW9BR	9.31'	6.46'	26.35'	23.55'

PLANNED ACTIVITIES FOR 8/17/2020
- Measure water level recharge and core from 34-39' bgs to determine if second water bearing zone is present.
- Contact Pete Dienes of Hamburg Police Department to coordinate range access for installation of MW1BR.

PHOTOGRAPHS

Hollow stem auguring at MW5BR

Rock coring at MW5BR

Bailing water out of borehole to confirm recharging capabilities of competent bedrock at MW5BR.

MW5BR drilling site with restricted access. Includes labeled non-hazardous investigation derived waste drums for soil cuttings and groundwater.

Additional photographs of core will be included in weekly summary report.

- JV (SERES): 8/11/2020 – 8/14/2020
- Nothnagle: 8/10/2020 – 8/14/2020

Completed Activities

- Installation of bedrock monitoring wells MW9BR, MW7BR, and MW4BR are complete. Photographs of the cores of MW9BR, MW7BR, and MW4BR are attached to this summary. Installation of MW5BR began on 8/14/2020 and is anticipated to be completed on 8/17/2020.
- A round of water levels was collected on 8/14/2020.

Items Discussed

- Location 17 has been removed from the scope work per the USACE PM. It was confirmed by Rick Nowak of the Town of Hamburg Buildings and Grounds Department that the wastewater treatment plant (WWTP) has been in use by the Town since taking ownership of the property from the Department of Defense. Therefore, it is not possible to distinguish whether potential impacts from the WWTP occurred during the period the WWTP was operated by the Department of Defense or was operated by the Town.

Health and Safety

- Checked in with Town of Hamburg Buildings and Grounds daily.
- Completed H&S tailgate meetings daily prior to onsite activities.
- Zero Lost-Time Accidents

Planned Activities

- JV is currently coordinating with the Town of Hamburg Police Department to schedule access to locations MW1BR and MW1OB, which are located near the small arms range. The range will not be in use on Friday 8/21/2020 and potentially one additional day the between 8/18/2020 and 8/20/2020. The JV will install these two wells during one of these times.
- Olivia Beaulieu of USACE will be onsite 8/18/2020 through 8/20/2020 to oversee fieldwork.
- Overburden well installation and soil sampling will begin 8/18/2020. A sample tracking spreadsheet will be included with future weekly summaries.
- H&S audit by JV using Accident Prevention Plan forms planned for Tuesday 8/18/2020.

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/17/2020)

ONSITE DATE Monday 8/17/2020

ONSITE RESOURCES
- 7:30 – 15:00 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 18:00 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Continued installation of MW5BR (bedrock well) from 34'-39' bgs.
  - Petroleum like odor observed in length of core with a PID reading of 2.7 ppm.
    - No sheen or staining was observed in the soil cuttings.
    - It is possible that the elevated reading naturally occurs due to local rock formation exhibiting petroleum like odors and formation gas; however, this observation will be further evaluated next week during installation of MW5OB (overburden well).
  - 15 gallons of water gained at 36.4' bgs. Recirculation water changed color from grey to brown, indicating a possible mud seam.
  - Measured static water level at 2.75' bgs following recharge over weekend. Water was observed at 17.5' bgs when overburden was drilled on Friday 8/14/2020.
  - Grouted with tremie pipe and installed 4' stick-up protective casing.

MW5BR (Bedrock Well)	
Top of competent bedrock (shale)	19' bgs
Water level	2.75'
First water bearing zone	17.5' bgs (in weathered bedrock)
Second water bearing zone	36.4' bgs
2" 10 slot screen (10' of screen)	29'-39' bgs
Sand	27'-29' bgs
Bentonite Seal	25-27' bgs
Grout	2-25' bgs

PLANNED ACTIVITIES FOR 8/18/2020
- Perform subsurface soil sampling and installation of MW9OB and MW7OB (overburden wells).
- Meet Town of Hamburg Buildings and Grounds crew at the range to assist moving the telephone pole that is blocking access to MW1BR and MW1BO location.

PLANNED ACTIVITIES FOR 8/19/2020

- Drill MW1BR on Wednesday.

PHOTOGRAPHS

Additional rock coring at MW5BR (34-39' bgs)

Bedrock core extraction at MW5BR

Adding bentonite chips to MW5BR

MW5BR with protective stick-up casing.

Additional photographs of core will be included in weekly summary report.

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: Hornby NIKE BU 51/52			**Project Location:** Hornby Highway Dept
Date: 8-17-20	**Time:** 7:30	**Conducted by:** J. Brazel	**Signature/Title:**
Client: ACOE		**Client Contact:** ACOE JV	**Subcontractor companies:** Nothnagle Drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 CONTINUE DRILLING @ MW5BR
2 SET WELL @ MW5BR
3 MOBILIZE @ OVERBURDEN WELL
4 WASTE HANDLING
5 DECON/HOUSEKEEPING
6

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: NONE

If yes, describe them here: _____

How will they be controlled? _____

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☒ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☒ Overhead & Buried Utilities	811 GPR	☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Topics from Corp H&S to cover?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ Any Stop Work Interventions yesterday?
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☒ If deviations, notify PM & client
☐ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ All equipment checked & OK?
		☐ Staff knows gathering points?

Comments: DRILLING ADDITIONAL 5' BGS @ MW5BR TO VERIFY WATER IN BEDROCK (34-39' BGS)

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☒ Gravity (i.e., ladder, scaffold, trips) (L M H) — SLIPS, TRIPS, FALLS	☒ Motion (i.e., traffic, moving water) (L M H) — DEPT Highway Vehicles	☒ Mechanical (i.e., augers, motors) (L M H) — AUGERS

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500

In	Out
In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB**, I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

ONSITE DATE Tuesday 8/18/2020

ONSITE RESOURCES

- 7:30 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 16:30 – USACE – Olivia Beaulieu
- 7:30 – 19:30 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)
- 14:00 – 18:30 JV – Kate Clubine (Arcadis)

COMPLETED ACTIVITIES

- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Audit completed by Kate Clubine. Findings include:
  - Added contact name and phone number to drum labels.
  - Created drum inventory to track waste generation (to be included in future weekly summaries).
  - Housekeeping and PPE in good order. Added general COVID best management practices to daily tailgate moving forward.
  - Documentation in good order.
  - Sampling and decon practices in good order.
- Completed installation of MW5OB (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW5OB-A-AUG2020	0-1’ bgs
NHFLA-MW5OB-B-AUG2020	1-3’ bgs
NHFLA-MW5OB-C-AUG2020	15-17’ bgs

  - No sheen or staining was observed in the soil cuttings. PID reading of 6.8 ppm at 10’ bgs. Septic-like odor of unknown origin encountered in vicinity of bottom of overburden.
  - Spoon refusal encountered at 17’ bgs. At 17.5’, water was observed via spotlight entering bore hole at base of augers. Auger refusal encountered at 18.75’ bgs (bottom of overburden).

MW5OB (Overburden Well)	
Top of competent bedrock (shale)	19’ bgs
Water level	Dry until bedrock reached, water level to be taken 8/19/2020
First water bearing zone	17.5’ bgs (in weathered bedrock)
2” 10 slot screen (10’ of screen)	8.5’-18.5’ bgs
Sand	6.5’-8.5’ bgs
Bentonite Seal	4.5’-6.5’’ bgs
Grout	2’-4.5’ bgs

PLANNED ACTIVITIES FOR 8/19/2020

- Perform installation of MW1BR (bedrock well).

PLANNED ACTIVITIES FOR 8/20/2020

- Perform subsurface soil sampling and installation of MW9OB and MW7OB (overburden wells).

PLANNED ACTIVITIES FOR 8/21/2020

- Perform subsurface soil sampling and installation of MW1OB (overburden well).

- 7:30 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 16:00 USACE – Olivia Beaulieu
- 7:30 – 19:00 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Began installation of MW1OB (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW1OB-A-AUG2020	0-1’ bgs
NHFLA-MW1OB-B-AUG2020	1-3’ bgs
NHFLA-MW1OB-C-AUG2020	5-7’ bgs

  - No sheen or staining was observed in the soil cuttings. PID reading of 0.1 ppm.
  - Fill material (silt and clay, concrete, slag, asphalt, organics) from grass surface to 7’ bgs.
  - Spoon refusal encountered at 7.5’ bgs. At 7.5’, water was observed via spotlight entering bore hole at base of augers. Auger refusal encountered at 12.5’ bgs (bottom of overburden).

MW1OB (Overburden Well)	
Top of weathered, fractured bedrock	7’ bgs
Top of competent bedrock (shale)	12.5’ bgs
Water level	Dry until 7.5’ bgs, water level to be taken 8/20/2020
First water bearing zone	7.5’ bgs (in weathered bedrock)
2” 10 slot screen (7’ of screen)	5.5’-12.5’ bgs
Sand	4.5’-5.5’ bgs
Bentonite Seal	2.5’-4.5’’ bgs
Grout	0’-2.5’ bgs

- Began installation of MW1BR (bedrock well)
  - Augered to 11’ bgs, advanced roller bit to competent rock at 12’ bgs, cored from 12’-22’ bgs
    - Recovery: 90.4%, RQD: 45%
    - 30 Gallons water loss during coring from 12-17’ (Intensely fractured, slightly weathered)
    - Pumped roughly 30 gallons from the bore hole down to 11.8’ bgs. Water went from very turbid to clear and cold, which suggests water is from bedrock formation since cutting water would be warm and turbid

MW1BR (Bedrock Well)	
Top of weathered, fractured bedrock	7’ bgs
Top of competent bedrock (shale)	12.5’ bgs
Water level	7.5’ bgs (just after drilling)
First water bearing zone	12.5 – 17’ bgs (heavily fractured zone)
2” 10 slot screen (8’ of screen)	14’-22’ bgs
Sand	13’-14’ bgs
Bentonite Seal	11’-13’’ bgs
Grout	2’-11’ bgs

PLANNED ACTIVITIES FOR 8/20/2020

- Perform subsurface soil sampling and installation of MW9OB and MW7OB (overburden wells).

PHOTOGRAPHS

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [X] Lessons learned and best practices learned today: Stand Get attention of driller before approaching Rig

Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/20/2020)

ONSITE DATE Thursday 8/20/2020

ONSITE RESOURCES

- 7:00 – 16:15 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 16:15 – USACE – Olivia Beaulieu
- 7:30 – 19:30 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES

- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW9OB (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW9OB-A-AUG2020	0-0.4’ bgs (See Note 1)
NHFLA-MW9OB-B-AUG2020	1.4-3’ bgs (See Note 2)

  - Note 1: The monitoring well location MW9OB did not contain native material to collect for an ecological sample. The sample NHFLA-MW9OB-A-AUG2020 was collected 1.5’ north of the MW9OB monitoring well location.
  - Note 2: “Recent fill” consisting of concrete and asphalt from was observed from 0.4-1.4’ bgs. Top of weathered bedrock at was observed at 3’ bgs. The sample NHFLA-MW9OB-B-AUG2020 was collected below the “recent fill” and above the weathered bedrock.
  - No sheen or staining was observed in the soil cuttings. PID reading of 1.8 ppm 5-6’ bgs in shale.
  - Spoon refusal was encountered at 5’ bgs. Auger refusal was encountered at 11’ bgs.
  - Red rust staining observed at first water bearing zone a 5’ bgs.

MW9OB (Overburden Well)	
Overburden	0-3’ bgs
Weathered bedrock	3-11’ bgs
Top of competent bedrock (shale)	11’ bgs
First water bearing zone	5’ bgs
2” 10 slot screen (7’ of screen)	4-11’ bgs
Sand	3-4’bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

- Completed installation of MW7OB (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW7OB-A-AUG2020	0-0.5’ bgs (See Note 3)
NHFLA-MW7OB-B-AUG2020	1.2-3’ bgs
NHFLA-MW7OB-C-AUG2020	3-5’ bgs

- Note 3: “Recent fill” consisting of concrete, slag and grass was observed from 0.5-1.2’ bgs. The sample NHFLA-MW7OB-A-AUG2020 was collected from 0-0.5’ bgs.
- No sheen or staining was observed in the soil cuttings.
- Spoon refusal was encountered at 7’ bgs. Auger refusal was encountered at 11’ bgs.
- Red rust staining observed at first water bearing zone a 5’ bgs.

MW7OB (Overburden Well)	
Overburden	0-5’ bgs
Weathered bedrock	5-11’ bgs
Top of competent bedrock (shale)	11’ bgs
First water bearing zone	5’ bgs
2” 10 slot screen (7’ of screen)	4-11’ bgs
Sand	3-4’bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

PLANNED ACTIVITIES FOR 8/21/2020 - Perform installation of MW16.

Top Left - Drill rig setting up at MW9OB

Top Right - Sample collection at MW9OB

Bottom Left - Bentonite seal application at MW7OB

Bottom Right - Well completion at MW7OB with protective stickup casing. Includes labeled nonhazardous investigation derived waste drum for soil cuttings.

Additional photographs of core will be included in weekly summary report.

ARCADIS

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: NIKE Hamburg BU 51/52		**Project Location:** Hamburg Highway Dept	
Date: 8-20-20	**Time:** 7:30	**Conducted by:** J. Bruder	**Signature/Title:** Geologist
Client: ACOE		**Client Contact:** ACOE	**Subcontractor companies:**

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Split Spoon Sample
2 Augering
3 - Decon Augers
4 - Set well
5 Sampling
6

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations [X] If there are none, write "None" here:

If yes, describe them here:

How will they be controlled?

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
[ ] Not applicable		[ ] Working at Height		[ ] Confined Space	
[ ] Energy Isolation (LOTO)		[X] Excavation/Trenching	811 GAR	[ ] Hot Work	
[ ] Mechanical Lifting Ops		[X] Overhead & Buried Utilities	811 GAR	[ ] Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

[ ] Incidents from day before to review?	[ ] Lessons learned from the day before?	[ ] Topics from Corp H&S to cover?
[X] Any corrective actions from yesterday?	[ ] Will any work deviate from plan?	[ ] Any Stop Work Interventions yesterday?
[ ] JLAs or procedures are available?	[ ] Field teams to "dirty" JLAs, as needed?	[ ] If deviations, notify PM & client
[X] Staff has appropriate PPE?	[ ] Staff knows Emergency Plan (EAP)?	[X] All equipment checked & OK?
		[X] Staff knows gathering points?

Comments: Keep a clean work area - Organization of equipment

Recognize the hazards (check all that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

[X] Gravity (i.e., ladder, scaffold, trips) (L (M) H) Slip, Trip, Falls w/that	[X] Motion (i.e., traffic, moving water) (L (M) H) Yard traffic	[X] Mechanical (i.e., augers, motors) (L (M) H) Augers, SS, hammer
[X] Electrical (i.e., utilities, lightning) (L M H) Overhead	[X] Pressure (i.e., gas cylinders, wells) (L M H) Hydraulic	[X] Environment (i.e., heat, cold, ice) (L (M) H) Sunny

ONSITE DATE Friday 8/21/2020

ONSITE RESOURCES
- 7:00 – 15:00 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 19:30 JV – Jeff Brayer (Arcadis) and Michael Cliggett (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW16 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW16-A-AUG2020	0.5-1' bgs (See note 1)
NHFLA-MW16-B-AUG2020	1-3' bgs (See note 2)
NHFLA-MW16-C-AUG2020	15-17' bgs (See note 3)

  - Note 1: Organics (vegetation) were observed from 0-.5 bgs. The surface sample was collected from 0.5-1' bgs, which consisted of silt and fine/medium gravel.
  - Note 2: Fill (concrete, slag, glass, gravel, wood chips) was observed from 1' to 14.5' bgs.
  - Note 3: Native materials were observed from 14.5 – 17' bgs.
  - No sheen or staining was observed in the soil cuttings. PID reading of 2 ppm in wood chips at 14' bgs
  - There was no recovery from 9-11' bgs. The spoon was clean and empty upon retrieval. Due to concrete present above and below the 9-11' bgs interval, the rig may have drilled through a void space in concrete blocks.
  - Spoon refusal was encountered at 21' bgs. Competent bedrock was not located within the 0-21' bgs interval.
  - Red rust staining observed at first water bearing zone a 17' bgs.

MW16 (Overburden Well)	
Overburden	0-17' bgs
Weathered bedrock	17'-21' bgs
Top of competent bedrock	Not present at 21' bgs (end of boring)
First water bearing zone	17' bgs
2" 10 slot screen (10' of screen)	11-21' bgs
Sand	9-11' bgs
Bentonite Seal	7-9' bgs
Grout	0-7' bgs

- Performed water level measurements

Well	Water Level	Depth to Bottom
MW1BR	2.94' bgs	21.61' bgs
MW1OB	2.86' bgs	11.68' bgs
MW5BR	0.65' bgs	37.8' bgs (soft bottom)
MW5OB	2.48' bgs	17.98' bgs
MW7BR	3.81' bgs	24.32 ' bgs
MW7OB	3.78' bgs	10.81' bgs
MW9BR	3.43' bgs	23.16' bgs
MW9OB	2.62' bgs	11.09' bgs

PLANNED ACTIVITIES FOR 8/24/2020 - Perform installation of MW10.

PHOTOGRAPHS

Drill rig setting up to perform split-spoon sampling at MW16.

PVC screen/riser installation at MW16.

Well completion at MW16 with protective stickup casing. Labeled nonhazardous drum containing soil cuttings.

Equipment blank sample collection from shovel used to collect surface sample at MW16.

.

Additional photographs of core will be included in weekly summary report.

Subject:

Nike BU 51/52 – Hamburg, NY – Weekly Field Summary (August 17, 2020 – August 21, 2020)

Onsite Personnel (See Daily Field Report for Individual Names and Times Onsite)

- JV (Arcadis/SERES): 8/17/2020 – 8/21/2020
- Nothnagle: 8/17/2020 – 8/21/2020
- USACE: 8/18/2020 – 8/20/2020

Completed Activities

- Installation of bedrock monitoring well MW1BR and overburden wells MW1OB, MW5OB, MW7OB, MW9OB, and MW16.
- A QAPP audit was completed on 8/18/2020.
- A round of water levels was collected on 8/21/2020.

Items Discussed

- On 8/17/2020, USACE and JV held a call to discuss the background sample locations presented in the QAPP. Due to the amount of land development and the presence of the Interstate 90 and lack of undeveloped land for a more suitable area for background sampling, the samples collected from the areas around the mitigation pond and athletic fields will be called 'reference' samples instead of 'background' samples. It was also agreed that, since the intent of the sampling is also for COPC screening, the data from these sample locations would be compared to published NYSDEC statewide background values for metals and PAHs. Care will be taken in the field to identify layers of fill or re-worked soil and avoid these intervals in the sampling if possible. The area surrounding each sample background/reference location will also be inspected for the presence of pressure treated lumber and asphalt.

Health and Safety

- Checked in with Town of Hamburg Buildings and Grounds daily.
- Completed H&S tailgate meetings daily prior to onsite activities.
- H&S Audit added COVID discussion to daily H&S tailgate meetings.
- Zero Lost-Time Accidents

Planned Activities

- Overburden well installation and soil sampling will continue the week of 8/24/2020.

Samples Collected August 17, 2020 – August 21, 2020

Nathan Mullens, SERES

SERES-ARCADIS JV, LLC
669 Marina Drive, Suite B-7
Charleston, South Carolina 29492

FUDS Project Number:
C02NY0079

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/24/2020)

ONSITE DATE Monday 8/24/2020

ONSITE RESOURCES
- 7:00 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 19:30 JV – Jeff Brayer (Arcadis)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW2 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW2-A-AUG2020	0-1′ bgs (See note 1)
NHFLA-MW2-B-AUG2020	1-3’ bgs (See note 2)

- Note 1: Silt and gravel in 0-1’ bgs.
- Note 2: Silt and clay with decomposed shale in 1-3’ bgs. Yellow rust like staining in fractures.
- Spoon refusal was encountered at 4.5’ bgs. Auger refusal was not encountered at end of boring at 12’ bgs.
- No sheen observed in the soil cuttings. PID reading of 226 ppm over top of augers with a petroleum/bituminous/asphalt like odor. PID reading of 0.0 ppm in breathing space.

MW2 (Overburden Well)	
Overburden	0-4.5’ bgs
Weathered bedrock	4.5’-12’ bgs
Top of competent bedrock	Not present at 12’ bgs (end of boring)
Water Level	5’ bgs
First water bearing zone	10-12’ bgs
2” 10 slot screen (8’ of screen)	4-12’ bgs
Sand	3-4’ bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

PLANNED ACTIVITIES FOR 8/24/2020 - Perform installation of MW10.

PHOTOGRAPHS

Drill rig setting up at MW10

Auguring to below ground surface at MW10

Split-spoon sample collected from MW10

Bentonite seal application at MW10

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: Hamburg NTKE Bu 51/52			**Project Location:** Hamburg Highway Dept
Date: 8-24-2020	**Time:** 7:30	**Conducted by:** J. Brayer	**Signature/Title:**
Client: ACOE		**Client Contact:** ACOE	**Subcontractor companies:** Northpeak Drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Mobilize rig to site
2 Decon augers
3 Split Spoon Sample
4 Soil Sample
5 Set well
6

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: _____

How will they be controlled? _____

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☒ Excavation/Trenching	811/GPR	☐ Hot Work	
☐ Mechanical Lifting Ops		☒ Overhead & Buried Utilities	811 GPR	☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Topics from Corp H&S to cover?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ Any Stop Work Interventions yesterday?
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ If deviations, notify PM & client
☒ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ All equipment checked & OK?
		☐ Staff knows gathering points?

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☒ Gravity (i.e., ladder, scaffold, trips) (L M H) uneven ground, Rocks	☒ Motion (i.e., traffic, moving water) (L M H) Mowers	☒ Mechanical (i.e., augers, motors) (L M H) Augers, Drill Rigs
☒ Electrical (i.e., utilities, lightning) (L M H) None - All overhead - Not seen	☒ Pressure (i.e., gas cylinders, wells) (L M H) Hydraulic	☒ Environment (i.e., heat, cold, ice) (L M H) Hot Humid
☒ Chemical (i.e., fuel, acid, paint) (L M H) Bentonite	☒ Biological (i.e., ticks, poison ivy) (L M H) Ticks, Mosquitos	☒ Radiation (i.e., alpha, sun, laser) (L M H) Sun - wear sun screen
☒ Sound (i.e., machinery, generators) (L M H) Loud drilling, EE Something	☐ Personal (i.e. alone, night, not fit) (L M H)	☐ Driving (i.e. car, ATV, boat, dozer) (L M H)

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

[X] **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - *(See statements below)*

[ ] Elimination	[ ] Substitution	[ ] Isolation
[ ] Engineering controls	[ ] Administrative controls	[X] Monitoring

Avery Vail / NDT /	AV 7:30	3:30 AV	AV
Steve Lowery / DOI /	SL 0730	3:35 SL	SL

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500

Visitor Name/Co - not involved in work

In	Out
In	Out
In	Out
In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [ ] Lessons learned and best practices learned today: _____
- [ ] Incidents that occurred today: _____
- [ ] Any Stop Work interventions today? _____
- [ ] Corrective/Preventive Actions needed for future work: _____
- [ ] Any other H&S issues: _____

Keep H&S 1st in all things

- 7:30 – 18:30 JV – Chris Lo (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW15 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW15-A-AUG2020	0-1’ bgs (See note 1)
NHFLA-MW15-B-AUG2020	1-3’ bgs (See note 2)
NHFLA-MW15-C-AUG2020	3-4.4’ bgs (See note 3)
NHFLA-DUP1-AUG2020	0-1' bgs MW15
NHFLA-MS1-AUG2020	0-1' bgs MW15
NHFLA-MSD1-AUG2020	0-1' bgs MW15
NHFLA-DUP1-AUG2020	1-3' bgs MW15
NHFLA-MS-AUG2020	1-3' bgs MW15
NHFLA-MSD2-AUG2020	1-3' bgs MW15

  - Note 1: Silt and gravel with some slag in 0-1’ bgs.
  - Note 2: Silt and clay with some shale and slag in 1-3’ bgs.
  - Note 3: Silt and clay with some shale in 3-4.4’ bgs.
  - Spoon refusal was encountered at 5’ bgs. Auger refusal was encountered at 11’ bgs.
  - No sheen, odor or elevate PID readings observed in the soil cuttings.
  - Well was dry until bottom of boring was reached.

MW15 (Overburden Well)	
Overburden	0-4.4’ bgs
Shale	4.4 -5’ bgs
Weathered bedrock	5 – 11 ’ bgs
Top of competent bedrock	11’ bgs
First water bearing zone	11’ bgs
2” 10 slot screen (7’ of screen)	4-11’ bgs
Sand	3-4’ bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

- Completed installation of MW6 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW6-A-AUG2020	0-1' bgs (See note 1)
NHFLA-MW6-B-AUG2020	1-3' bgs (See note 2)

  - Note 1: Silt and gravel with trace slag in 0-1' bgs.
  - Note 2: Silt and clay with some laminated shale in 1-3' bgs. Yellow rust staining in shale laminations in shoe (bottom of split spoon).
  - Very Fractured and very weathered shale from 3-4' bgs. No sheen or staining observed; however, a petroleum like odor with a PID reading of 16 ppm was observed in soil cuttings.
  - Spoon refusal was encountered at 4' bgs. Auger refusal was not at encountered at 11' bgs.
  - Well was dry until bottom of boring was reached. Well was left to recharge overnight and on 8/27/2020 the water level at 3' bgs,

MW6 (Overburden Well)	
Overburden	0-4.4' bgs
Shale	4.4 -5' bgs
Weathered bedrock	5 – 11 ' bgs
Top of competent bedrock	Not present at 11' bgs (end of boring)
First water bearing zone	fractured bedrock zone
2" 10 slot screen (7' of screen)	4-11' bgs
Sand	3-4' bgs
Bentonite Seal	2-3' bgs
Grout	0-2' bgs

PLANNED ACTIVITIES FOR 8/27/2020 - Perform installation of MW13.

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500

In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**, and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (8/27/2020)

ONSITE DATE Thursday 8/27/2020

ONSITE RESOURCES
- 7:00 – 14:00 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 15:45 JV – Jeff Brayer (Arcadis)
- 7:30 – 15:30 JV – Chris Lo (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW13 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW13-A-AUG2020	0-1’ bgs
NHFLA-MW13-B-AUG2020	1-3’ bgs
NHFLA-MW13-C-AUG2020	3.5-5.5’ bgs

  - Spoon refusal was encountered at 7’ bgs. Auger refusal was not encountered at 11’ bgs.
  - No sheen, odor or elevated PID readings observed in the soil cuttings.
  - A tar-like substance was observed from 3-3.3’ bgs.

MW13 (Overburden Well)	
Overburden	0-4.4’ bgs
Weathered bedrock	5.5-11’ bgs
Top of competent bedrock	Not present at 11’ bgs (end of boring)
First water bearing zone	7’ bgs
2” 10 slot screen (7’ of screen)	4-11’ bgs
Sand	3-4’ bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

PLANNED ACTIVITIES FOR 8/28/2020
- Mobilize Bobcat to the site and transport drums to central staging area behind the salt barn
- Arcadis to train SERES on well development.
- Nothnagle to finish setting concrete around wells.

PHOTOGRAPHS

Split-spoon sample retrieval at MW13

Fractured bedrock in split-spoon sample

Filter pack installation (#00 silica) at MW13

Well completion at MW13 with protective stick-up casing. Includes labeled non-hazardous investigation derived waste drum for soil cuttings.

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: NHE Hamburg Bu 51/52		**Project Location:** Hamburg Highway Dept	
Date: 8-27-20	**Time:** 7:30	**Conducted by:** J. Brazier	**Signature/Title:**
Client: ACOE	**Client Contact:** ACOE	**Subcontractor companies:** Nothnagle Drilling Inc	

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Mobilize Rig
2 Split-spoon Boring
3 Soil Sampling
4 Set well
5 Decon Augers
6 Collect Gw Samples

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: Police Shooting Range is active - Can't approach when Red flag is flying

How will they be controlled? Communication w/ Shooting Range master

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☐ Overhead & Buried Utilities		☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☒ Lessons learned from the day before?	☐ Topics from Corp H&S to cover?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ Any Stop Work Interventions yesterday?
☒ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☒ If deviations, notify PM & client
☒ Staff has appropriate PPE?	☒ Staff knows Emergency Plan (EAP)?	☒ All equipment checked & OK?
		☒ Staff knows gathering points?

Comments: 30/30 Thunder/Lightning Risk

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category

☒ Gravity (i.e., ladder, scaffold, trips) (L (M) H) Wet Grass, Trip Hazards	☐ Motion (i.e., traffic, moving water) (L M H) unexpected movement/Hand	☒ Mechanical (i.e., augers, motors) (L (M) H) Augers, spears
☒ Electrical (i.e., utilities, lightning) (L M H) Overhead Power	☒ Pressure (i.e., gas cylinders, wells) (L M H) Ht Hands	☒ Environment (i.e., heat, cold, ice) (L (M) H) Warm-Humid Severe T-Storms
☒ Chemical (i.e., fuel, acid, paint) (L M H) Bentonite	☒ Biological (i.e., ticks, poison ivy) (L (M) H) Mosquitoes,	☒ Radiation (i.e., alpha, sun, laser) (L M H) Sun-Wear Sun Screen

Nike BU 51/52 – Hamburg, NY – Weekly Field Summary (August 24, 2020 – August 28, 2020)

Onsite Personnel (See Daily Field Report for Individual Names and Times Onsite)

- JV (Arcadis): 8/24/2020 – 8/27/2020
- JV (SERES): 8/25/2020 – 8/28/2020
- Nothnagle: 8/24/2020 – 8/28/2020

Completed Activities

- Installation of overburden wells MW2, MW6, MW10, MW13, and MW16 with associated soil samples.
- Began well development of MW7, MW9, MW10.

Items Discussed

- QAPP will be finalized by 9/11/2020.
- Chain of custody with lab signature will be uploaded within 5 days of sampling.

Health and Safety

- Checked in with Town of Hamburg Buildings and Grounds daily.
- Completed H&S tailgate meetings daily prior to onsite activities.
- Zero Lost-Time Accidents
- SERES followed New York State Travel Advisory Protocol and worked independently until negative COVID test was received.

Planned Activities

- Overburden well installation and soil sampling will continue the week of 8/31/2020.
- Well development will continue the week of 8/31/2020.

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (9/1/2020)

ONSITE DATE Tuesday 9/1/2020

ONSITE RESOURCES
- 7:00 – 15:30 Nothnagle – Avery Wall and Steve Loranty
- 7:30 – 19:30 JV – Jeff Brayer (Arcadis), Chris Lo (SERES)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Completed installation of MW8 (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-MW8-A-SEP2020	0-1’ bgs
NHFLA-MW8-B-SEP2020	1-3’ bgs
NHFLA-DUP5-SEP2020	1-3’ bgs

  - Spoon refusal was encountered at 5’ bgs. Auger refusal was not encountered at end of boring at 11’ bgs.
  - No sheen, discoloration or elevated PID readings observed in the soil cuttings.

MW8 (Overburden Well)	
Overburden	0-5’ bgs
Weathered bedrock	5-11’ bgs
Top of competent bedrock	Not present at 11’ bgs (end of boring)
First water bearing zone	8-11’ bgs
2” 10 slot screen (7’ of screen)	4-11’ bgs
Sand	3-4’ bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

- Completed installation of MW4OB (overburden well)
  - Soil and QC samples submitted to laboratory.

NHFLA-4OB-A-SEP2020	0-1’ bgs
NHFLA-4OB-B-SEP2020	1-3’ bgs

  - Spoon refusal was encountered at 3’ bgs. Auger refusal was not encountered at end of boring at 12.5’ bgs.
  - No sheen, discoloration or elevated PID readings observed in the soil cuttings.

MW4OB (Overburden Well)	
Overburden	0-3’ bgs
Weathered bedrock	3-12.5’ bgs
Top of competent bedrock	Not present at 12.5’ bgs (end of boring)
First water bearing zone	11-12’ bgs
2” 10 slot screen (7’ of screen)	4.5-12.5’ bgs
Sand	3-4.5’ bgs
Bentonite Seal	2-3’ bgs
Grout	0-2’ bgs

PLANNED ACTIVITIES FOR 9/2/2020 - Perform installation of MW14

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: NIKE Base Bu 31/32			**Project Location:** Hornburg Hwy Depot
Date: 9-1-20	**Time:** 7:30	**Conducted by:** J. Bayer	**Signature/Title:**
Client: ACOE		**Client Contact:** ACOE	**Subcontractor companies:** Nothnagle Drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 Mobilize Rig to Boring 3 Soil Sample 5 Pack Samples
2 Set up Sampling Ext 4 Decon augers 6

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations [X] If there are none, write "None" here:

If yes, describe them here: Gun Range was not active - Gauge wells

How will they be controlled?

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
[ ] Not applicable		[ ] Working at Height		[ ] Confined Space	
[ ] Energy Isolation (LOTO)		[X] Excavation/Trenching	E/U LOA	[ ] Hot Work	
[ ] Mechanical Lifting Ops		[X] Overhead & Buried Utilities	E/U LOA	[ ] Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

[ ] Incidents from day before to review?	[ ] Lessons learned from the day before?	[X] Topics from Corp H&S to cover? Covid-19
[ ] Any corrective actions from yesterday?	[ ] Will any work deviate from plan?	[ ] Any Stop Work Interventions yesterday?
[ ] JLAs or procedures are available?	[ ] Field teams to "dirty" JLAs, as needed?	[ ] If deviations, notify PM & client
[X] Staff has appropriate PPE?	[X] Staff knows Emergency Plan (EAP)?	[X] All equipment checked & OK?
		[X] Staff knows gathering points?

Comments:

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

[X] Gravity (i.e., ladder, scaffold, trips) (L (M) H) Slips, Trips, Falls	[X] Motion (i.e., traffic, moving water) (L (M) H) Moving Equipment	[X] Mechanical (i.e., augers, motors) (L (M) H) Augers, split spoons
[X] Electrical (i.e., utilities, lightning) (L M H) No overhead	[X] Pressure (i.e., gas cylinders, wells) (L M H) Hydraulic	[X] Environment (i.e., heat, cold, ice) (L (M) H) Hot, Humid
[X] Chemical (i.e., fuel, acid, paint) (L M H) Hydraulic	[X] Biological (i.e., ticks, poison ivy) (L M H) Mosquitos	[X] Radiation (i.e., alpha, sun, laser) (L (M) H) Sun - Sun Screen
[X] Sound (i.e., machinery, generators) (L M H) Split spoons	[ ] Personal (i.e. alone, night, not fit) (L M H)	[X] Driving (i.e. car, ATV, boat, dozer) (L M H) Driving on site

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

- [X] **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - (*See statements below*)
- [ ] Elimination
- [ ] Engineering controls
- [X] General PPE Usage
- [X] Personal Hygiene
- [ ] Emergency Action Plan (EAP)
- [ ] JLA to be developed/used ***(specify)***
- [ ] Substitution
- [ ] Administrative controls
- [X] Hearing Conservation *For Phys*
- [ ] Exposure Guidelines
- [ ] Fall Protection
- [ ] LPO conducted ***(specify job/JLA)***
- [ ] Isolation
- [X] Monitoring *PID*
- [ ] Respiratory Protection
- [X] Decon Procedures *Alconox DI*
- [ ] Work Zones/Site Control
- [ ] Traffic Control
- [ ] Other ***(specify)***

Signature and Certification Section - Site Staff and Visitors

Name/Company/Signature	Initial & Sign in Time	Initial & Sign out Time	I have read and understand the HASP
Jeff Bates / ARCADIS /	JB 7:30	JB 18:30	JB
Steve Lorentz / NDI /	SL 7:30	SL 3:30	SC
Avery Wall / NDI /	AW 7:30	AW 3:30	AW
Christian Lo / Seres /	CL 8:00	CL 18:00	CL

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500

Visitor Name/Co - not involved in work

In	Out
In	Out
In	Out
In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [X] Lessons learned and best practices learned today: *Stand to the left or right of Augers When retracting*
- [ ] Incidents that occurred today: _____
- [ ] Any Stop Work interventions today? _____
- [ ] Corrective/Preventive Actions needed for future work: _____
- [ ] Any other H&S issues: *COVED - Avoid busy time at Store*

Keep H&S 1st in all things

- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Decommissioned wells GZA-MW-1, GZA-MW-2, and GZA-MW-4
    - Could not decommission ME-MW-3 due to the presence of a large bees nest. Decommissioning will be performed after removal of nest by exterminator.
- Began development of newly installed monitoring wells.

PLANNED ACTIVITIES FOR 9/8/2020 – Conduct surface and subsurface soil sampling, continue monitoring well development, set bollards around monitoring wells.

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: NIKE BOSE BU 5152			**Project Location:** Hanburg Hwy Dept
Date: 9-4-2020	**Time:** 7:30	**Conducted by:**	**Signature/Title:**
Client:		**Client Contact:**	**Subcontractor companies:** Noth Nagle drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 MOBOLIZE RIG 3 Closing Wells 5 _____

2 _____ 4 _____ 6 _____

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: GUN RANGE WAS NOT ACTIVE. - George Wells

How will they be controlled? _____

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☐ Overhead & Buried Utilities		☐ Other permit	

Discuss following questions (for some review previous day's post activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Topics from Corp H&S to cover?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ Any Stop Work Interventions yesterday? COVID-19
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ If deviations, notify PM & client
☒ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ All equipment checked & OK?
		☐ Staff knows gathering points?

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☒ Gravity (i.e., ladder, scaffold, trips) (L (M) H) Slips, trips, FALLS	☐ Motion (i.e., traffic, moving water) (L M H)	☐ Mechanical (i.e., augers, motors) (L M H)
☐ Electrical (i.e., utilities, lightning) (L M H)	☑ Pressure (i.e., gas cylinders, wells) (L M H) Hydraulic	☒ Environment (i.e., heat, cold, ice) (L M H) Nice 67°
☒ Chemical (i.e., fuel, acid, paint) (L M H) Hydraulic	☒ Biological (i.e., ticks, poison ivy) (L M (H)) BEES	☒ Radiation (i.e., alpha, sun, laser) (L M H) Sunscreen
☐ Sound (i.e., machinery, generators) (L M H)	☐ Personal (i.e. alone, night, not fit) (L M H)	☒ Driving (i.e. car, ATV, boat, dozer) (L M H) Driving on site

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Nike BU 51/52 – Hamburg, NY – Weekly Field Summary (August 31, 2020 – September 4, 2020)

Onsite Personnel (See Daily Field Report for Individual Names and Times Onsite)

- JV (Arcadis/SERES): 8/31/2020 – 9/4/2020
- Nothnagle: 8/31/2020 – 9/4/2020

Completed Activities

- Installation of overburden wells MW3, MW8, MW4OB, MW14, MW11, and MW12 with associated soil samples.
- Decommissioned wells GZA-MW1, GZA-MW2, and GZA-MW4.
- Continued development of newly installed monitoring wells.

Items Discussed

- Chain of custody with lab signatures will be uploaded within 5 days of sampling.

Health and Safety

- Checked in with Town of Hamburg Buildings and Grounds daily.
- Completed H&S tailgate meetings daily prior to onsite activities.
- Zero Lost-Time Accidents

Planned Activities

- Surface and subsurface soil samples will be collected from on-site and reference locations during the week of 9/7/2020.
- Well development will continue during the week of 9/7/2020.

Samples Collected **August 31, 2020 – September 4, 2020**

ONSITE RESOURCES
- 8:00 – 16:00 Nothnagle – Avery Wall, Jeff Schwake
- 7:30 – 18:00 JV – Jeff Brayer (Arcadis)

COMPLETED ACTIVITIES
- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting prior to onsite activities. See attached form.
- Installed bollards around wells.
- Reference and QC samples submitted to laboratory. No sheen, discoloration or elevated PID readings observed. Silt and clay observed from 0-2.2' bgs fractured and weathered shale from 2.2-3' bgs at locations BH46.

NHFLA-BH46-A-SEP2020	0-1' bgs
NHFLA-BH46-B-SEP2020	1-3' bgs
NHFLA-DUP6-SEP2020	0-1' bgs
NHFLA-MS4-SEP2020	0-1' bgs
NHFLA-MSD4-A-SEP2020	0-1' bgs
NHFLA-EB14-SEP2020	Equipment blank
NHFLA-TB16-SEP2020	Trip Blank

- Completed well development at MW7OB, MW10, and MW13.

PLANNED ACTIVITIES FOR 9/11/2020 – Continue sampling at reference locations.

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: ACOE MRKE Hockey Rink 5/1/52			**Project Location:** 2720 Lakeview Rd Lakeview
Date: 9-10-20	**Time:** 7:30	**Conducted by:** T. Baker	**Signature/Title:** Biologist
Client: ACOE		**Client Contact:**	**Subcontractor companies:** Northgate Drilling

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1. Set Bollards (Drilling)
2. Mixing Concrete
3. Sample Surface Soil
4. Mobilize Rig
5. Painting Bollards
6. _____

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations: [X]

If there are none, write "None" here: _____

If yes, describe them here: Mixing Concrete for Well Bollards

How will they be controlled? Mix so that fine dust is minimized and wear upwind

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
[ ] Not applicable		[ ] Working at Height		[ ] Confined Space	
[ ] Energy Isolation (LOTO)		[X] Excavation/Trenching	811 EAP	[ ] Hot Work	
[ ] Mechanical Lifting Ops		[ ] Overhead & Buried Utilities	811 EAP	[ ] Other permit	

Discuss following questions (for some review previous day's past activities). **Check if yes :**

[ ] Incidents from day before to review?	[ ] Lessons learned from the day before?	[ ] Any Stop Work Interventions yesterday?
[ ] Any corrective actions from yesterday?	[ ] Will any work deviate from plan?	[ ] If deviations, notify PM & client
[ ] JLAs or procedures are available?	[ ] Field teams to "dirty" JLAs, as needed?	[X] All equipment checked & OK?
[X] Staff has appropriate PPE?	[X] Staff knows Emergency Plan (EAP)?	[ ] Staff knows gathering points?

[X] Topics from Corp H&S to cover? Cold

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

[X] Gravity (i.e., ladder, scaffold, trips) (L M H): Wet boots, Slips, Trips, Mobilizing Rig	[X] Motion (i.e., traffic, moving water) (L M H)	[X] Mechanical (i.e., augers, motors) (L M H): Split spoons, Augers/Bits
[X] Electrical (i.e., utilities, lightning) (L M H): Buried & Above Overhead	[X] Pressure (i.e., gas cylinders, wells) (L M H): Artesian	[X] Environment (i.e., heat, cold, ice) (L M H): Cold temp
[X] Chemical (i.e., fuel, acid, paint) (L M H): Benzene - Hydrocarbons	[X] Biological (i.e., ticks, poison ivy) (L M H): Mosquitos, Ticks	[X] Radiation (i.e., alpha, sun, laser) (L M H): Sun - Sunburn
[X] Sound (i.e., machinery, generators) (L M H): Driving Split spoons	[X] Personal (i.e. alone, night, not fit) (L M H): Worn and not fit	[X] Driving (i.e. car, ATV, boat, dozer) (L M H): Driving on Site

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

[X] **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - *See statements below*)		
[ ] Elimination	[ ] Substitution	[ ] Isolation
[ ] Engineering controls	[ ] Administrative controls	[X] Monitoring
[X] General PPE Usage	[X] Hearing Conservation	[ ] Respiratory Protection
[X] Personal Hygiene	[ ] Exposure Guidelines	[X] Decon Procedures
[ ] Emergency Action Plan (EAP)	[ ] Fall Protection	[X] Work Zones/Site Control
[ ] JLA to be developed/used *(specify)*	[ ] LPO conducted *(specify job/JLA)*	[ ] Traffic Control
[ ]	[ ]	[ ] Other *(specify)*
[ ]	[ ]	[ ]

Signature and Certification Section - Site Staff and Visitors

Name/Company/Signature	Initial & Sign in Time	Initial & Sign out Time	I have read and understand the HASP
Jeff Bratt / ARCADIS /	JB 730	JB 1240	JB
Jeff Schaal / ARCADIS /	JS 800	JS 1000	JS
ARCADIS /	AV 800	AV 1400	AV

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3644.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3644 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9556 and Corp H&S at 1.720.344.3500.

Visitor Name/Co - not involved in work

	In	Out
	In	Out
	In	Out
	In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**, and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [X] Lessons learned and best practices learned today: Don't over ~~complicate~~ Expect when opening spaces
- [ ] Incidents that occurred today:
- [ ] Any Stop Work interventions today?
- [ ] Corrective/Preventive Actions needed for future work:
- [ ] Any other H&S issues:

Keep H&S 1st in all things

[ ] Any corrective actions from yesterday?	[ ] Will any work deviate from plan?	[ ] Any Stop Work Interventions yesterday?
[ ] JLAs or procedures are available?	[ ] Field teams to "dirty" JLAs, as needed?	[ ] If deviations, notify PM & client
[X] Staff has appropriate PPE?	[X] Staff knows Emergency Plan (EAP)?	[X] All equipment checked & OK?
		[X] Staff knows gathering points?

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

- [X] Gravity (i.e., ladder, scaffold, trips) (L M H): Wet Soil, uneven terrain
- [X] Motion (i.e., traffic, moving water) (L M H): Unexpected Movement of Tool
- [X] Mechanical (i.e., augers, moving): SS Sampler/Auto Hammer
- [X] Electrical (i.e., utilities, lightning) (L M H): Buried
- [X] Pressure (i.e., gas cylinders, wells) (L M H): Hydraulic
- [X] Environment (i.e., heat, cold, ice) (L M H): Cool Temp
- [X] Chemical (i.e., fuel, acid, paint) (L M H): Bentonite
- [X] Biological (i.e., ticks, poison ivy) (L M H): Poison IVY, Mosquitos
- [X] Radiation (i.e., alpha, sun, laser) (L M H): Sun-wear Sunscreen
- [X] Sound (i.e., machinery, generators) (L M H): Loud Drill SI Safety
- [X] Personal (i.e. slips, sight, not fit) (L M H): Aft New Worker Orientation
- [X] Driving (i.e. car, ATV, boat, dozer) (L M H): Daily on Site

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JLAs, and other control processes. Discuss and document any additional control processes.

- [x] **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - (See statements below)
- [ ] Elimination
- [ ] Engineering controls
- [x] General PPE Usage
- [x] Personal Hygiene
- [ ] Emergency Action Plan (EAP)
- [ ] JLA to be developed/used (specify)
- [ ] Substitution
- [ ] Administrative controls

Kate Osborne	KC 11:30	18:30	KC

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.800.455.6155 and then notify the field supervisor who will, in turn, notify Corp H&S at 1.720.344.3844.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify Corp H&S at 1.720.344.3844 and then Corp Legal at 1.720.344.3756.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify Corp Legal at 1.678.373.9596 and Corp H&S at 1.720.344.3500

Visitor Name/Co - not involved in work

In	Out

I will **STOP** the job any time anyone is concerned or uncertain about health & safety or if anyone identifies hazard or additional mitigation not recorded in the site project, job or task hazard assessment.

I will **be** alert to any changes in personnel, conditions the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB,** I will perform **TRACK**, and then amend the hazard assessments or HASP as needed.

I will **not assist** a subcontractor or other party with work unless it is absolutely necessary and then only I have done TRACK and I have thoroughly controlled hazard.

Post Daily Activities Review - Review at end of day or before next day's work. (Check those applicable and explain:)

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: Hanby Lake Dr 51/52			Project Location: 2700 Lakeview Rd Lake Hamilton AR
Date: 9-16-20	Time: 7:30	Conducted by: J. Bahl	Signature/Title:
Client: ACOE		Client Contact: ACOE	Subcontractor companies: Worthington Bridge Inc

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1. Unloading trailer
2. Mobilizing to Jobsite
3. Soil Sampling
4. Processing Samples
5. Hand Clearing
6. Painting Bollards

Other Hazardous Activities - Check the box if there are any other ARCADIS, Client or other party activities that may pose hazards to ARCADIS operations ☐ If there are none, write "None" here: _____

If yes, describe them here: Poison Ivy

How will they be controlled? Pre-Dispose Clean, Wash after w/ Tecnu

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☐ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☒ Excavation/Trenching	OH Locate	☐ Hot Work	
☐ Mechanical Lifting Ops		☒ Overhead & Buried Utilities	OH Locate	☐ Other permit	

Discuss following questions (for some review previous day's past activities). **Check if yes:**

☒ Topics from Corp H&S to cover? Covid-19

☐ Incidents from day before to review?	☐ Lessons learned from the day befors?	☐ Any Stop Work Interventions yesterday?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ If deviations, notify PM & client
☐ JLAs or procedures are available?	☐ Field teams to "dirty" JLAs, as needed?	☐ All equipment checked & OK?
☒ Staff has appropriate PPE?	☒ Staff knows Emergency Plan (EAP)?	☐ Staff knows gathering points?

Comments: Maintain 6ft Separation or Wear a mask

Recognize the hazards (check all those that are discussed) (Examples are provided) and **A**ssess the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☒ Gravity (i.e., ladder, scaffold, trips) (L M H): Slip, trips, falls	☒ Motion (i.e., traffic, moving water) (L M H): Unmarked manmade	☒ Mechanical (i.e., augers, mowers) (L M H): SS Samples
☒ Electrical (i.e., utilities, lightning) (L M H): Buried - Marked	☒ Pressure (i.e., gas cylinders, wells) (L M H): Hydraulic	☒ Environment (i.e., heat, cold, ice) (L M H): Cool mornings
☒ Chemical (i.e., fuel, acid, paint) (L M H): Bentonite, Paint	☒ Biological (i.e., ticks, poison ivy) (L M H): Poison IVY!!	☒ Radiation (i.e., alpha, sun, laser) (L M H): Wear Sun Screen
☒ Sound (i.e., machinery, generators) (L M H): Drill Steer Sampling	☒ Personal (i.e., slips, right, not fit) (L M H): Lifting	☒ Driving (i.e. car, ATV, boat, dozer) (L M H): Watch for truck traffic

Continue TRACK Process on Page 2

I will **STOP** the job any time anyone is concerned or uncertain about health & safety or if anyone identifies hazard or additional mitigation not recorded in the site project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions the work site or hazards not covered by the original hazard assessments.

If it is necessary to **STOP THE JOB**, I will perform **TRACK**, and then amend the hazard assessments o HASP as needed.

I will not assist a subcontractor or other party with t work unless it is absolutely necessary and then only I have done TRACK and I have thoroughly controlle hazard.

Subject:
Nike BU 51/52 – Hamburg, NY – Daily Field Report (9/25/2020)

ONSITE DATE Friday 9/25/2020

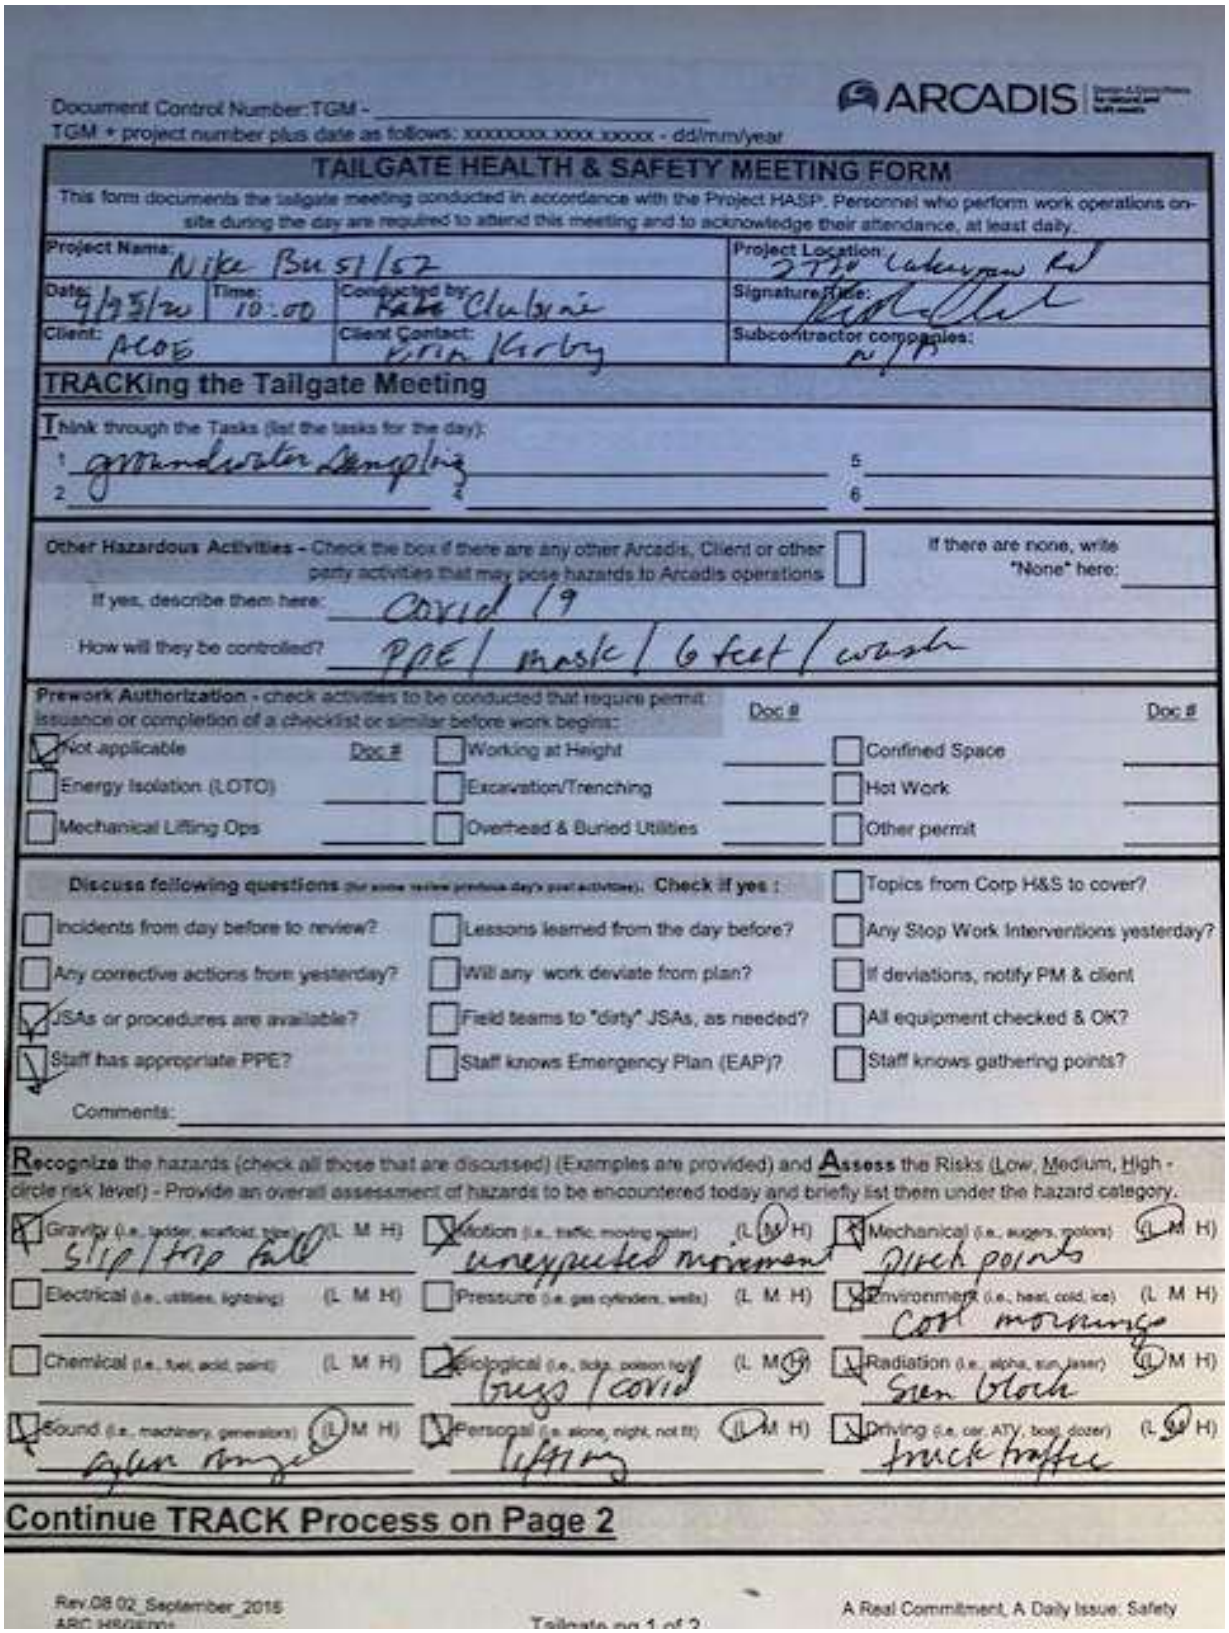
ONSITE RESOURCES

- 10:00 – 18:00 JV – Kim Stilson, Josh Duquette, Kate Clubine (Arcadis)

COMPLETED ACTIVITIES

- Checked in with Town of Hamburg Buildings and Grounds Department (Rick Nowak and Pat Ryan)
- Completed H&S tailgate meeting and site tour prior to onsite activities. See attached form.
- Sampled the following wells:
  - NHFLA-MW8-SEP2020
  - NHFLA-MW15-SEP2020
  - NHFLA-MW9OB-SEP2020
  - NHFLA-MW14-SEP2020
  - NHFLA-MW11-SEP2020
  - NHFLA-MW9BR-SEP2020
  - NHFLA-EB21-SEP2020
  - NHFLA-TB26-SEP2020
  - NHFLA-TB27-SEP2020

PLANNED ACTIVITIES FOR 9/29/2020 – Continue sampling.



Document Control Number: TGM - _____
TGM + project number plus date as follows: xxxxxxxx.xxxx.xxxxx - dd/mm/year

ARCADIS

TAILGATE HEALTH & SAFETY MEETING FORM

This form documents the tailgate meeting conducted in accordance with the Project HASP. Personnel who perform work operations on-site during the day are required to attend this meeting and to acknowledge their attendance, at least daily.

Project Name: Nike Bu 51/52		Project Location: 2770 Lakeview Rd	
Date: 9/25/20	Time: 10:00	Conducted by: Kate Clubine	Signature: Kate Clubine
Client: ALOE		Client Contact: Erin Kirby	Subcontractor companies: N/A

TRACKing the Tailgate Meeting

Think through the Tasks (list the tasks for the day):

1 groundwater sampling
2
3
4
5
6

Other Hazardous Activities – Check the box if there are any other Arcadis, Client or other party activities that may pose hazards to Arcadis operations ☐ If there are none, write "None" here: _____

If yes, describe them here: covid 19

How will they be controlled? PPE / mask / 6 feet / wash

Prework Authorization - check activities to be conducted that require permit issuance or completion of a checklist or similar before work begins:

	Doc #		Doc #		Doc #
☒ Not applicable		☐ Working at Height		☐ Confined Space	
☐ Energy Isolation (LOTO)		☐ Excavation/Trenching		☐ Hot Work	
☐ Mechanical Lifting Ops		☐ Overhead & Buried Utilities		☐ Other permit	

Discuss following questions (for crew review previous day's past activities). **Check if yes :**

☐ Incidents from day before to review?	☐ Lessons learned from the day before?	☐ Topics from Corp H&S to cover?
☐ Any corrective actions from yesterday?	☐ Will any work deviate from plan?	☐ Any Stop Work Interventions yesterday?
☑ JSAs or procedures are available?	☐ Field teams to "dirty" JSAs, as needed?	☐ If deviations, notify PM & client
☑ Staff has appropriate PPE?	☐ Staff knows Emergency Plan (EAP)?	☐ All equipment checked & OK?
		☐ Staff knows gathering points?

Comments: _____

Recognize the hazards (check all those that are discussed) (Examples are provided) and **Assess** the Risks (Low, Medium, High - circle risk level) - Provide an overall assessment of hazards to be encountered today and briefly list them under the hazard category.

☒ Gravity (i.e., ladder, scaffold, trips) slip / trip fall (L M H)	☒ Motion (i.e., traffic, moving water) unexpected movement (L M H)	☒ Mechanical (i.e., augers, rotors) pinch points (L M H)
☐ Electrical (i.e., utilities, lightning) (L M H)	☐ Pressure (i.e. gas cylinders, wells) (L M H)	☒ Environment (i.e., heat, cold, ice) cool mornings (L M H)
☐ Chemical (i.e., fuel, acid, paint) (L M H)	☒ Biological (i.e., ticks, poison ivy) bugs / covid (L M H)	☒ Radiation (i.e., alpha, sun, laser) sun block (L M H)
☒ Sound (i.e., machinery, generators) (L M H)	☒ Personal (i.e. alone, night, not fit) (L M H)	☒ Driving (i.e. car, ATV, boat, dozer) truck traffic (L M H)

Continue TRACK Process on Page 2

TAILGATE HEALTH & SAFETY MEETING FORM - Pg. 2

Control the hazards (Check all and discuss those methods to control the hazards that will be implemented for the day): Review the HASP, applicable JSAs, and other control processes. Discuss and document any additional control processes.

- [x] **STOP WORK AUTHORITY** (Must be addressed in every Tailgate meeting - *(See statements below)*
- [ ] Elimination
- [ ] Engineering controls
- [x] General PPE Usage
- [x] Personal Hygiene
- [ ] Emergency Action Plan (EAP)
- [ ] JSA to be developed/used *(specify)*
- [ ] Substitution
- [ ] Administrative controls
- [ ] Hearing Conservation
- [ ] Exposure Guidelines
- [ ] Fall Protection
- [ ] TIP conducted *(specify job/JSA)*
- [ ] Isolation
- [ ] Monitoring
- [ ] Respiratory Protection
- [x] Decon Procedures
- [ ] Work Zones/Site Control
- [ ] Traffic Control
- [ ] Other *(specify)*

Signature and Certification Section - Site Staff and Visitors

Name/Company/Signature	Initial & Sign in Time	Initial & Sign out Time	I have read and understand the HASP
Josh Duquette / Arcadis /	1000	1800	JP
Kyle Stifler / Arcadis	1000 KS	1800	KS
Kate Claborn / Arcadis	10:00	18:00	KC

Important Information and Numbers

All site staff should arrive fit for work. If not, they should report to the supervisor any restrictions or concerns.

In the event of an injury, employees will call WorkCare at 1.888-449-7787 and then notify the field supervisor who will then notify the Project or Task Manager.

In the event of a motor vehicle accident, employees will notify the field supervisor who will then notify the Project or Task Manager.

In the event of a utility strike or other damage to property of a client or 3rd party, employees will immediately notify the field supervisor, who will then immediately notify the Project or Task Manager.

Visitor Name/Co - not involved in work

In	Out
In	Out
In	Out
In	Out

I will STOP the job any time anyone is concerned or uncertain about health & safety or if anyone identifies a hazard or additional mitigation not recorded in the site, project, job or task hazard assessment.

I will be alert to any changes in personnel, conditions at the work site or hazards not covered by the original hazard assessments.

If it is necessary to STOP THE JOB, I will perform TRACK; and then amend the hazard assessments or the HASP as needed.

I will not assist a subcontractor or other party with their work unless it is absolutely necessary and then only after I have done TRACK and I have thoroughly controlled the hazard.

Post Daily Activities Review - Review at end of day or before next day's work (Check those applicable and explain:)

- [ ] Lessons learned and best practices learned today:
- [ ] Incidents that occurred today:
- [ ] Any Stop Work interventions today?
- [ ] Corrective/Preventive Actions needed for future work:
- [ ] Any other H&S Issues:

A Real Commitment, A Daily Issue: Safety

Appendix C

Data Validation Reports

APPENDIX C - DATA VALIDATION

SUMMARY

The former Nike Anti-aircraft Missile Battery BU-51/52 Launch Area Remedial Investigation dataset is considered usable and meets project DQOs with the following exceptions:

- The hexavalent chromium results in groundwater samples NHFLA-MW11-SEP2020, NHFLA-MW15-SEP2020, NHFLA-MW8-SEP2020, NHFLA-MW9BR, SEP2020, and NHFLA-MW9OB-SEP2020 and equipment blank sample NHFLA-EB21-SEP2020 were assigned "X" qualifiers because the analysis was performed more than two times past the method-specified 24-hour holding times (analysis performed greater than 66 hours from sample collection). The hexavalent chromium results in these samples are not usable and should be rejected.
- The antimony results in soil samples NHFLA-BH46-A-SEP2020, NHFLA-SL11A-A-SEP2020, and NHFLA-SL29-A-SEP2020, and the associated field duplicate samples NHFLA-DUP6-SEP2020 and NHFLA-DUP7-SEP2020 were assigned "X" qualifiers because the recoveries of antimony in the MS and/or MSD samples were less than 30 percent. The antimony results in these samples are not usable and should be rejected.
- The hexavalent chromium results in soil samples NHFLA-BH46-A-SEP2020 and NHFLA-BH38-A-SEP2020 and groundwater samples NHFLA-MW2-SEP2020 and NHFLA-MW8-SEP2020 were assigned "X" qualifiers because the recoveries of hexavalent chromium in the MS and/or MSD samples were less than 30 percent. The hexavalent chromium results in these sample are not usable and should be rejected.
- The 4-chloroaniline results in soil sample NHFLA-SL11A-A-SEP2020 and field duplicate sample NHFLA-DUP7-SEP2020 were assigned "X" qualifiers because the recovery of 4-chloroaniline in the MS and MSD samples were less than 10 precent. The 4-chloroaniline results in these samples are not usable and should be rejected.
- The caprolactam result in groundwater samples NHFLA-MW2-SEP2020 and NHFLA-MW5OB-SEP2020 were assigned "X" qualifiers because the recoveries of caprolactam in the MS samples were less than 10 percent. The caprolactam results in these samples are not usable and should be rejected.
- The hydrazine results in soil samples NHFLA-MW16-A-AUG2020, NHFLA-MW11-B-SEP2020, and NHFLA-SL28-A-SEP2020 were assigned "X" qualifiers because the recoveries of hydrazine in the MS and MSD samples were less than 10 percent. The hydrazine results in these samples are not usable and should be rejected.
- The hydrazine and methyl hydrazine results in soil samples NHFLA-MW-15-A-AUG2020, NHFLA-MW-15-B-AUG2020, NHFLA-MW3-B-AUG2020, NHFLA-MW8-A-SEP2020, and NHFLA-SL29-A-SEP2020, and the associated field duplicate samples NHFLA-DUP1-AUG2020, NHFLA-DUP2-AUG2020, and NHFLA-DUP4-AUG2020 were assigned "X" qualifiers because the recoveries of hydrazine and methyl hydrazine in the MS and MSD samples were less than 10 percent. The hydrazine and methyl hydrazine results in these samples are not usable and should be rejected.

- The caprolactam results in equipment blank samples NHFLA-EB1-AUG2020, NHFLA-EB2-AUG2020, and NHFLA-EB7-AUG2020 were assigned "X" qualifiers because the recovery of caprolactam in the LCS sample was less than 10 percent. The caprolactam result in these samples are not usable and should be rejected.
- The 4-chloroaniline results in soil samples NHFLA-MW5OB-A-AUG2020, NHFLA-MW5OB-B-AUG2020, NHFLA-MW5OB-C-AUG2020, NHFLA-MW1OB-A-AUG2020, NHFLA-MW1OB-B-AUG2020, and NHFLA-MW1OB-C-AUG2020 were assigned "X" qualifiers because the recovery of 4-chloroaniline in the LCS sample was less than 10 percent. The 4-chloroaniline results in these samples are not usable and should be rejected.
- The atrazine result in soil sample NHFLA-SL11A-A-SEP2020 was assigned an "X" qualifier because the recovery in the LCS sample was less than 10 percent. The atrazine result in this sample is not usable and should be rejected.
- The 3,3'-dichlorobenzidine, 4-nitroaniline, atrazine, and N-nitrosodiphenylamine results in soil samples NHFLA-MW11-B-SEP2020, NHFLA-MW11-C-SEP2020, and NHFLA-MW-12-B-SEP2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The 3,3'-dichlorobenzidine, 4-nitroaniline, atrazine, and N-nitrosodiphenylamine results in these samples are not usable and should be rejected.
- The 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, pentachlorophenol, and phenol results in equipment blank samples NHFLA-EB-15-2-SEP2020, NHFLA-EB17-SEP2020, and NHFLA-EB18-SEP2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, pentachlorophenol, and phenol results in the samples are not usable and should be rejected.
- The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in groundwater samples NHFLA-MW2-SEP2020 and NHFLA-MW5OB-SEP2020, field duplicate sample NHFLA-DUP11-SEP2020, and equipment blank sample NHFLA-EB19-SEP2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in the samples are not usable and should be rejected.
- The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in groundwater samples NHFLA-MW10-DEC2020, NHFLA-MW11-DEC2020, NHFLA-MW12-DEC2020, NHFLA-MW16-DEC2020, NHFLA-MW2-DEC2020, and NHFLA-MW3-DEC2020 and equipment blank sample NHFLA-EB23-DEC2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dinitrophenol,

4,6-dinitro-2-methylphenol, 4-nitrophenol, and pentachlorophenol results in the samples are not usable and should be rejected.

- The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2,4-dinitrotoluene, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, m-&p-cresols, hexachlorocyclopentadiene, pentachlorophenol, and phenol results in groundwater samples NHFLA-MW14-DEC2020 NHFLA-MW-1BR-DEC2020, NHFLA-MW-1OB-DEC2020NHFLA-MW4BR-DEC2020 , NHFLA-MW4OB-DEC 2020, and NHFLA-5OB-DEC2020, and equipment blank sample NHFLA-EB24-DEC2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2,4-dinitrotoluene, 2-chlorophenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-nitrophenol, m-&p-cresols, hexachlorocyclopentadiene, pentachlorophenol, and phenol results in the samples are not usable and should be rejected.
- The 2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-methylphenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-chloro-3-methylphenol, m-&p-cresols, pentachlorophenol, phenol, and 4-nitrophenol results in groundwater samples NHFLA-MW15-DEC2020, NHFLA-MW7BR-DEC2020, NHFLA-MW7OB-DEC2020, NHFLA-MW8-DEC2020NHFLA-MW9BR-DEC2020, and NHFLA-MW9OB-DEC2020, field duplicate samples NHFLA-DUP14-DEC2020 and NHFLA-DUP15-DEC2020, and equipment blank sample NHFLA-EB25-DEC2020 were assigned "X" qualifiers because the recoveries in the LCS sample were less than 10 percent. The2,3,4,6-tetrachlorophenol, 2,4,5-trichlorophenol, 2,4,6-trichlorophenol, 2,4-dichlorophenol, 2,4-dinitrophenol, 2-chlorophenol, 2-methylphenol, 2-nitrophenol, 4,6-dinitro-2-methylphenol, 4-chloro-3-methylphenol, m-&p-cresols, pentachlorophenol, phenol, and 4-nitrophenol results in the samples are not usable and should be rejected.
- The recoveries of one or more of the SVOC acid fraction surrogate compounds (i.e., 2,4,6-tribromophenol, phenol-6, and 2-fluorophenol) were less than 10 percent in groundwater samples NHFLA-MW4OB-SEP2020, NHFLA-MW7OB-SEP2020, NHFLA-MW12-DEC2020, NHFLA-MW16-DEC2020, NHFLA-MW15-DEC2020, NHFLA-MW7BR-DEC2020, NHFLA-MW7OB-DEC2020, NHFLA-MW8-DEC2020, NHFLA-MW9BR-DEC2020, NHFLA-MW9OB-DEC2020, and NHFLA-MW13-DEC2020, field duplicate samples NHFLA-DUP14-DEC2020, and NHFLA-DUP15-DEC2020, and equipment blank samples NHFLA-EB1-AUG2020, NHFLA-EB2-AUG2020, NHFLA-EB3-AUG2020, NHFLA-EB11-SEP2020, NHFLA-EB12-SEP2020, NHFLA-EB17-SEP2020, NHFLA-EB15-SEP2020, NHFLA-EB23-DEC2020, NHFLA-EB24-DEC2020, and NHFLA-EB25-DEC2020. The results for all acid fraction SVOCs in the samples were qualified "X" and are not usable; the results should be rejected.

Date Submitted:	January 13, 2021

Field Sample ID	Lab Sample ID	Matrix	Type/Type Code	M8315A
NHFLA-SL29-A-SEP2020	410-15140-1	Solid	Field Sample/N	X
NHFLA-EB18-SEP2020	410-15140-2	Water	Equipment Blank/EB	X

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Eurofins Lancaster Laboratories Environmental, LLC, Lancaster, PA and were reported under sample delivery group (SDG) 410-15140-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 6 results (100.00%) out of the 6 results (sample and field QC samples) reported are qualified based on review and 2 results (33.33%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

January 13, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method M8315A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-SL29-A-SEP2020 (MS)/ 410-15140-1MS	Hydrazine	1.104	54 - 128	10 - 128	percent	J/X	M	
NHFLA-SL29-A-SEP2020 (MS)/ 410-15140-1MS	Methyl hydrazine	1.356	29 - 187	10 - 187	percent	J/X	M	
NHFLA-SL29-A-SEP2020 (MS)/ 410-15140-1MS	1,1-Dimethylhydrazine	35.97	86 - 124	10 - 124	percent	J/UJ	M	
NHFLA-SL29-A-SEP2020 (SD)/ 410-15140-1MSD	Hydrazine	1.141	54 - 128	10 - 128	percent	J/X	M	
NHFLA-SL29-A-SEP2020 (SD)/ 410-15140-1MSD	Methyl hydrazine	1.483	29 - 187	10 - 187	percent	J/X	M	
NHFLA-SL29-A-SEP2020 (SD)/ 410-15140-1MSD	1,1-Dimethylhydrazine	41.41	86 - 124	10 - 124	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for M8315A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-SL29-A-SEP2020	N	1,1-Dimethylhydrazine	0.130	0.100 U H FL	0.100 UJ		ng/g	M
NHFLA-SL29-A-SEP2020	N	Hydrazine	0.130	0.0500 U H FL	0.0500 X		ng/g	M
NHFLA-SL29-A-SEP2020	N	Methyl hydrazine	0.130	0.100 U H FL	0.100 X		ng/g	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method M8315A, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-SL29-A-SEP2020 (N)/ 410-15140-1		12.36	< 3	< 6	days	J/X	H1	Test Exceeds UCL
NHFLA-SL29-A-SEP2020 (N)/ 410-15140-1MS		12.36	< 3	< 6	days	J/X	H1	Test Exceeds UCL
NHFLA-SL29-A-SEP2020 (N)/ 410-15140-1MSD		12.36	< 3	< 6	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Table of All Qualified Results

Test Method: M8315A Extraction Method: NONE

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Anomalies Count

Test/Extraction Method/Leach	Field Samples Outside of Compliance	Analytes Outside of Compliance
M8315A/NONE/NONE	1	3

Anomalies are cases where the reported RL exceeds that specified in the governing project document.

Reporting Anomalies

Test Leach	FieldSample ID	Type	Dilution	Analyte	Result	DL	LOD	LOQ/RL	Project RL	Units
M8315A/NONE/NONE	NHFLA-EB18-SEP2020	EB	1	1,1-Dimethylhydrazine	0.630 UJ	0.310	0.630	1.00	0.8	ug/L
M8315A/NONE/NONE	NHFLA-EB18-SEP2020	EB	1	Hydrazine	0.500 UJ	0.130	0.500	0.630	0.5	ug/L
M8315A/NONE/NONE	NHFLA-EB18-SEP2020	EB	1	Methyl Hydrazine	0.630 UJ	0.310	0.630	1.00	0.8	ug/L

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
H1	Test Hold Time
H2	Prep Hold Time
M	MS Recovery
TR	Trace Level Detect

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: M8315A (Determination of Hydrazine, Monomethylhydrazine, and 1,1- Dimethylhydrazine in Aqueous and Soil Samples by LC/MS/MS)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?		•		Water sample -002 (equipment blank) was prepped outside of the 10 day project criteria (12 days actual) so all sample -002 results qualified estimated with UJ/H2 flags/reason codes. H1 qualifiers removed for soil sample since it was prepped and analyzed within project criteria for soil.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Sample -001 MS/MSD recoveries biased low for all target analytes with hydrazine and monomethylhydrazine below reject criteria. Sample -001 results for hydrazine/monomethylhydrazine qualified rejected with X/M flags/reason codes and 11-dimethylhydrazine qualified estimated with UJ/M.
Was the MS/MSD RPD within project acceptance limits?	•			
Were surrogate recoveries within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?	•			Sample -001 hydrazine and monomethylhydrazine based on MS recovery low bias.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Eurofins Lancaster Laboratories Environmental, LLC, Lancaster, PA and were reported under sample delivery group (SDG) 410-13919-1_52_2a_FUDSChem. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Field Duplicate RPD
- Lab Blank
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Test Hold Time

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 2 results (13.33%) out of the 15 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method M8315A, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MS5-SEP2020 (MS)/ 410-13919-1MS	Hydrazine	36.88	54 - 128	10 - 128	percent	J/UJ	M	
NHFLA-MSD5-SEP2020 (SD)/ 410-13919-1MSD	Hydrazine	31.00	54 - 128	10 - 128	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for M8315A

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-DUP7-SEP2020	FD	Hydrazine	0.130	0.0500 U	0.0500 UJ		ng/g	M
NHFLA-SL11A-A-SEP2020	N	Hydrazine	0.130	0.0500 U FL	0.0500 UJ		ng/g	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method M8315A, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-DUP7-SEP2020 (FD)/ 410-13919-2		5.480	< 3	< 6	days	J/UJ	H1	Test Exceeds UWL
NHFLA-SL11A-A-SEP2020 (N)/ 410-13919-1		5.460	< 3	< 6	days	J/UJ	H1	Test Exceeds UWL
NHFLA-SL11B-A-SEP2020 (N)/ 410-13919-4		5.410	< 3	< 6	days	J/UJ	H1	Test Exceeds UWL
NHFLA-SL25-A-SEP2020 (N)/ 410-13919-3		5.440	< 3	< 6	days	J/UJ	H1	Test Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Table of All Qualified Results

Test Method: M8315A	Extraction Method: NONE							
FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-DUP7-SEP2020	FD	Hydrazine	0.130	0.0500 U	0.0500 UJ		ng/g	M
NHFLA-SL11A-A-SEP2020	N	Hydrazine	0.130	0.0500 U FL	0.0500 UJ		ng/g	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method M8315A

FieldSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
NHFLA-DUP7-SEP2020	FD	1,1-Dimethylhydrazine	0.130	0.100 U	0.100 UJ	0.100 U	
NHFLA-DUP7-SEP2020	FD	Hydrazine	0.130	0.0500 U	0.0500 UJ	0.0500 UJ	M

Determination of Hydrazine, Monomethylhydrazine, and 1,1-Dimethylhydrazine in Aqueous and Soil Samples by LC/MS/MS (M8315A/NONE)	**Recovery Limit**	**RPD Limit**	**MS Percent Recovery**	**MSD Percent Recovery**	**RPD**		
1,1-Dimethylhydrazine (ng/g)	86-124	30	105	105	0.635	0.130 U	0.130 U
Hydrazine (ng/g)	54-128	30	36.9	31.0	17.3	0.130 UJ	-
Methyl hydrazine (ng/g)	29-187	30	94.0	94.0	0.00	0.130 U	-

Notes:
Shaded cells identify any compounds that were outside the acceptable MS/MSD recovery limit.
Bold = Bolded result indicates positively identified compounds in the parent sample

µg/L = micrograms per liter
%R = percent recovery
ID = Identification
MS = Matrix Spike
MSD = Matrix Spike Duplicate
NA = Not Applicable
RPD = Relative Percent Difference
U = Compound was not detected and was reported at the limit of quantitation (LOQ).
VOC = volatile organic compound

UJ = The analyte was analyzed for, but was not detected. The reported LOQ is approximate.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Reason Code Definitions

Code	Definition
H1	Test Hold Time
M	MS Recovery

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: M8315A (Determination of Hydrazine, Monomethylhydrazine, and 1,1- Dimethylhydrazine in Aqueous and Soil Samples by LC/MS/MS)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			NOTE: all H1 holding time outlier flags were removed. Samples were prepped and analyzed within project specific holding times.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Sample -001 MS/MSD recoveries were both biased low for hydrazine. Field sample -001 and the field duplicate -002 were qualified as estimated with UJ/M flags/reason codes.
Was the MS/MSD RPD within project acceptance limits?	•			
Were surrogate recoveries within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?	•			
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data recommended for rejection (exclusion) in the data validation process?		•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN6964_1. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 107 results (17.17%) out of the 623 results (sample and field QC samples) reported are qualified based on review and 18 results (2.89%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Jim Tomalia

February 11, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284709-5 (LB)/ WG284709-5	Chrysene	0.04800	< 0.036	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284709-6 (BS)/ WG284709-6	2-Methylnaphthalene	14.90	39 - 114	10 - 114	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Dibenz (a,h)anthracene	24.95	44 - 131	10 - 131	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (g,h,i)perylene	29.05	44 - 128	10 - 128	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Indeno(1,2,3-c,d)pyrene	29.30	48 - 130	10 - 130	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (b)fluoranthene	45.40	53 - 126	10 - 126	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (a)anthracene	55.00	59 - 120	10 - 120	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB1-AUG2020	EB	2-Methylnaphthalene	0.190	0.0970 UL	0.0970 UJ		ug/l	C
NHFLA-EB1-AUG2020	EB	Benzo(a)anthracene	0.190	0.0970 UL	0.0970 UJ		ug/l	C
NHFLA-EB1-AUG2020	EB	Benzo(b)fluoranthene	0.190	0.0970 UL	0.0970 UJ		ug/l	C
NHFLA-EB1-AUG2020	EB	Benzo(g,h,i)perylene	0.190	0.0970 UL	0.0970 UJ		ug/l	C
NHFLA-EB1-AUG2020	EB	Dibenz(a,h)anthracene	0.190	0.0970 UL	0.0970 UJ		ug/l	C
NHFLA-EB1-AUG2020	EB	Indeno(1,2,3-c,d)pyrene	0.190	0.0970 UL	0.0970 UJ		ug/l	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW5OB-A-AUG2020 (N)/ SN6964-1		3.200	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW5OB-B-AUG2020 (N)/ SN6964-2		3.190	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW5OB-C-AUG2020 (N)/ SN6964-3		3.040	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Antimony	0.08400	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Zinc	0.2100	< 0.17	< 2	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Magnesium	0.7400	< 0.68	< 10	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Sodium	3.200	< 1.5	< 100	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Potassium	6.700	< 2.9	< 100	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Chromium	0.1500	< 0.026	< 1	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Lead	1.010	< 0.087	< 0.5	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Aluminum	2.400	< 0.71	< 30	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW5OB-A-AUG2020	N	Antimony	0.890	0.200 J	0.550 U		mg/kg	L
NHFLA-MW5OB-B-AUG2020	N	Antimony	1.60	0.310 J	1.00 U		mg/kg	L
NHFLA-MW5OB-C-AUG2020	N	Antimony	0.820	0.230 J	0.510 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB1-AUG2020 (EB)/ SN6964-4	Copper	0.6500	< 0.19	< 3	ug/l	U/None	V

PBWNH20IMW2 (LB)/ PBWNH20IMW2	Aluminum	6.900	< 4.4	< 100	ug/l	U/None	L	
PBWNH20IMW2 (LB)/ PBWNH20IMW2	Magnesium	9.800	< 7.8	< 100	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB1-AUG2020	EB	Aluminum	100	10.0 J	40.0 U		ug/l	L
NHFLA-EB1-AUG2020	EB	Copper	3.00	0.650 J	2.00 U		ug/l	L
NHFLA-EB1-AUG2020	EB	Magnesium	100	13.0 J	80.0 U		ug/l	L
NHFLA-EB1-AUG2020	EB	Sodium	1000	120 J	400 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW5OB-A-AUG2020 (N)/ SN6964-1		14.28	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW5OB-B-AUG2020 (N)/ SN6964-2		14.27	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW5OB-C-AUG2020 (N)/ SN6964-3		14.12	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7471, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW5OB-A-AUG2020 (SD)/ SN6964-001P	Mercury	-37.37	80 - 124	30 - 125	percent	J/X	M	
NHFLA-MW5OB-A-AUG2020 (MS)/ SN6964-001S	Mercury	-33.16	80 - 124	30 - 125	percent	J/X	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW7471

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW5OB-A-AUG2020	N	Mercury	0.190	0.377 N	0.377 J	-	mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB1-AUG2020 (EB)/ SN6964-4	Acetone	4.500	< 2.2	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284832-2 (LB)/ WG284832-2	Bromomethane	1.100	< 0.49	< 2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284832-1 (BS)/ WG284832-1	Methylene chloride	125.0	74 - 124	10 - 124	percent	J/None	C	
WG284832-1 (BS)/ WG284832-1	Methyl tert-butyl ether (MTBE)	132.8	71 - 124	10 - 124	percent	J/None	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-TB1-AUG2020	TB	Methylene chloride	5.00	1.50 JL	1.50 J	+	ug/l	C/I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284835-1 (BS)/ WG284835-1	Methylene chloride	64.20	70 - 128	10 - 128	percent	J/UJ	C	
WG284835-1 (BS)/ WG284835-1	Methyl tert-butyl ether (MTBE)	71.60	73 - 125	10 - 125	percent	J/UJ	C

NHFLA-MW5OB-C-AUG2020	N	trans-1,2-Dichloroethene	4.00	2.00 UL	2.00 UJ		ug/kg	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB1-AUG2020 (TB)/ SN6964-5	1,2-Dichloroethane-d4	120.0	81 - 118	10 - 118	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-TB1-AUG2020	TB	Methylene chloride	5.00	1.50 JL	1.50 J	+	ug/l	C/I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB1-AUG2020 (TB)/ SN6964-5	Methylene chloride	1.500	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284708-2 (BS)/ WG284708-2	Benzaldehyde	370.0	10 - 189	10 - 189	percent	J/None	C	
WG284708-2 (BS)/ WG284708-2	Caprolactam	5.100	10 - 86	10 - 86	percent	J/X	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB1-AUG2020	EB	Caprolactam	9.70	7.30 UL	7.30 X		ug/l	C/I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW5OB-C-AUG2020 (N)/ SN6964-3	2,4,6-Tribromophenol	30.60	39 - 132	10 - 132	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?	•			Field sample surrogate recoveries acceptable. QC batch method blank WG284709-5 had 1 of 3 surrogates biased high - no qualification required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC WG284709-5 detection below LOQ for chrysene did not result in field sample result qualifications.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC WG284709-6 low bias recoveries for 2-methylnaphthalene, benzo (a)anthracene, benzo(b)fluoranthene, indeno(123cd)pyrene, dibenzo (ah)anthracene and benzo(ghi)perylene. Sample -004 results for all these target analytes were qualified as estimated with UJ/C flags/reason codes.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Calibration outliers as noted in SDG case narrative were not addressed as part of this stage 2A review.
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			Removed H2 flags for soil samples since all were analyzed within project criteria (3 days vs 28 days recommended).
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

Review Questions

Method: SW8270

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Samples -003 and -003DL had 1 of 3 acid fraction surrogates biased low. Client sample -003 acid fraction analytes were qualified with UJ/I flags/reason codes. NOTE: base-neutral fraction analyte flags were removed from database.Sample -004 acid fraction surrogates were outliers biased low and less than 10% for 2 of 3 surrogates and biased low above 10% recovery for 1 of 3 acid and base-neutral fraction surrogates. Sample -004 acid fraction analyte results were qualified rejected with X/I flags qualifiers and base-neutral analyte results qualified estimated with UJ/I flags/reason codes.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC WG284713-2 recoveries biased low for atrazine, caprolactam, 3-nitroaniline - samples -001, -002, -003 results for these analytes qualified J/UJ flags with C reason codes. Recovery for 4-chloroaniline biased low below reject limit so these results in samples -001, -002, -003 qualified X/C. Benzaldehyde and bis-2-ethylhexylphthalate biased high - samples -001, -002, -003 bis-2-ethylhexylphthalate results qualified J/L. QC WG284708-2 benzaldehyde biased high - no qualifications required and caprolactam biased low below project lower rejection level so sample -004 caprolactam result qualified as rejected with X/C flag.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Calibration outliers as noted in SDG case narrative were not addressed as part of this stage 2A review.

Review Questions

Method: SW9045

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?			•	
Were target analytes in the method blank less than MDL?			•	
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Facility:	C02NY0079-02, Nike BU 51/52, Launch Area
Event:	Nike BU 51/52 - Hamburg NY - First Soil Sampling Event
SDG:	SN7007
Guidance Document:	Nike BU 51/52 Quality Assurance Project Plan
Prime Contractor:	Seres-Arcadis JV
Project Manager:	Jennifer Singer
Contract Laboratory(ies):	Katahdin Analytical Services, Westbrook, ME
Data Review Contractor:	CADENA LLC
Data Review Level:	S2AVEM
Primary Data Reviewer:	Jim Tomalia, Senior Environmental Compliance Specialist
Date Submitted:	December 09, 2020 - revised report submitted January 24, 2021 - based on DoD chemist review feedback.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7007. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 106 results (17.01%) out of the 623 results (sample and field QC samples) reported are qualified based on review and 18 results (2.89%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

NOTE: Hydrazine results are reported as subcontracted data in this submittal but the electronic data is reported under report ID 11491-1 in FUDSChem. Please see 11491-1 DVR for summary.

Jim Tomalia

January 24, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284709-5 (LB)/ WG284709-5	Chrysene	0.04800	< 0.036	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284709-6 (BS)/ WG284709-6	2-Methylnaphthalene	14.90	39 - 114	10 - 114	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Dibenz (a,h)anthracene	24.95	44 - 131	10 - 131	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (g,h,i)perylene	29.05	44 - 128	10 - 128	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Indeno(1,2,3-c,d)pyrene	29.30	48 - 130	10 - 130	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (b)fluoranthene	45.40	53 - 126	10 - 126	percent	J/UJ	C	
WG284709-6 (BS)/ WG284709-6	Benzo (a)anthracene	55.00	59 - 120	10 - 120	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB2-AUG2020	EB	2-Methylnaphthalene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Benzo(a)anthracene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Benzo(b)fluoranthene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Benzo(g,h,i)perylene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Dibenz(a,h)anthracene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Indeno(1,2,3-c,d)pyrene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB2-AUG2020 (EB)/ SN7007-4	Pyrene-d10	51.40	53 - 166	10 - 166	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB2-AUG2020	EB	2-Methylnaphthalene	0.190	0.0950 UL	0.0950 UJ		ug/l	C/I
NHFLA-EB2-AUG2020	EB	Acenaphthene	0.190	0.0950 U	0.0950 UJ		ug/l	I
NHFLA-EB2-AUG2020	EB	Acenaphthylene	0.190	0.0950 U	0.0950 UJ		ug/l	I

NHFLA-EB2-AUG2020	EB	Phenanthrene	0.190	0.0950 U	0.0950 UJ		ug/l	I
NHFLA-EB2-AUG2020	EB	Pyrene	0.190	0.0950 U	0.0950 UJ		ug/l	I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW1OB-A-AUG2020 (N)/ SN7007-1		7.140	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW1OB-B-AUG2020 (N)/ SN7007-2		7.130	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW1OB-C-AUG2020 (N)/ SN7007-3		7.120	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Antimony	0.08400	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Zinc	0.2100	< 0.17	< 2	mg/kg	U/None	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB2-AUG2020 (EB)/ SN7007-4	Chromium, Hexavalent	0.002700	< 0.00076	< 0.025	mg/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284706-1 (LB)/ WG284706-1	Chromium, Hexavalent	0.001500	< 0.00076	< 0.025	mg/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW7196

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB2-AUG2020	EB	Chromium, Hexavalent	0.0250	0.00270 J	0.0125 U		mg/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW1OB-A-AUG2020 (N)/ SN7007-1		13.27	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW1OB-B-AUG2020 (N)/ SN7007-2		13.25	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW1OB-C-AUG2020 (N)/ SN7007-3		13.22	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB2-AUG2020 (EB)/ SN7007-4	Acetone	4.100	< 2.2	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284832-2 (LB)/ WG284832-2	Bromomethane	1.100	< 0.49	< 2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284832-1 (BS)/ WG284832-1	Methylene chloride	125.0	74 - 124	10 - 124	percent	J/None	C	
WG284832-1 (BS)/ WG284832-1	Methyl tert-butyl ether (MTBE)	132.8	71 - 124	10 - 124	percent	J/None	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284835-1 (BS)/ WG284835-1	Methylene chloride	64.20	70 - 128	10 - 128	percent	J/UJ	C	
WG284835-1 (BS)/ WG284835-1	Methyl tert-butyl ether (MTBE)	71.60	73 - 125	10 - 125	percent	J/UJ	C	
WG284835-1 (BS)/ WG284835-1	trans-1,2-Dichloroethene	72.20	74 - 125	10 - 125	percent	J/UJ	C	
WG284835-1 (BS)/ WG284835-1	Chloroform	75.60	78 - 123	10 - 123	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW1OB-A-AUG2020	N	Chloroform	4.80	2.40 UL	2.40 UJ		ug/kg	C

NHFLA-MW1OB-B-AUG2020	N	trans-1,2-Dichloroethene	5.00	2.50 UL	2.50 UJ		ug/kg	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB2-AUG2020 (EB)/ SN7007-4	1,2-Dichloroethane-d4	120.0	81 - 118	10 - 118	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB2-AUG2020	EB	Acetone	5.00	4.10 J	4.10 J	+	ug/l	I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284708-2 (BS)/ WG284708-2	Benzaldehyde	370.0	10 - 189	10 - 189	percent	J/None	C	
WG284708-2 (BS)/ WG284708-2	Caprolactam	5.100	10 - 86	10 - 86	percent	J/X	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB2-AUG2020	EB	Caprolactam	9.50	7.10 UL	7.10 X		ug/l	C/I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Automated Data Review Detail Report for SN7007
C02NY0079-02, Nike BU 51/52, Launch Area
Nike BU 51/52 Quality Assurance Project Plan

Anomalies Count

Test/Extraction Method/Leach	Field Samples Outside of Compliance	Analytes Outside of Compliance
BNASIM/SW3550/NONE	1	2
SW6010/SW3050/NONE	3	20
SW7196/SW3060/NONE	3	3
SW8270/SW3550/NONE	3	90

Anomalies are cases where the reported RL exceeds that specified in the governing project document.

Reporting Anomalies

Test Leach	FieldSample ID	Type	Dilution	Analyte	Result	DL	LOD	LOQ/RL	Project RL	Units

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reporting Anomalies

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Method blank WG284709-5 had one of three surrogates outside of project criteria biased high. Qualifications were not applied based on this QC surrogate recovery outlier and electronic data was not available in FUDSChem database. Sample -004 had 1 of 3 surrogates biased low so all results were qualified as estimated with UJ flags and I reason codes.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284709-5 chrysene detections below the LOQ did not result in qualification of field data.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG584709-6 LCS recoveries were outliers biased low for 2-methynaphthalene benzo(a)anthracene, benzo(b)fluoranthene, indeno(123cd)pyrene, dibenzo(ah)anthracene and benzo(ghi)perylene. Client sample -004 results for these analytes were qualified as estimated with UJ flags and C reason codes.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Calibration issues identified in case narrative not addressed as par of this stage 2A review.
Were DoD QSM corrective actions followed if deviations were noted?		•		
Were any data rejected during the verification process?		•		

Review Questions

Method: LYDKHN (Lloyd Kahn Method for the Determination of Total Organic Carbon in Sediment, USEPA Region II Method)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			note: Qualifiers J/H2 assigned to all samples in database were removed since test hold time was not exceeded (7 days vs 14 days recommended in project QAPP).
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010 (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch PBSHN27ICS1 detections below the LOQ for aluminum, antimony, arsenic, cadmium, calcium, chromium, iron, magnesium, potassium, sodium and QC batch PBSNH26ICS1 for aluminum, antimony, chromium, lead (above LOQ), magnesium, potassium, sodium, zinc. Client samples -01, -02, -03 antimony results and sample -001 SODIUM and -003 CADMIUM results were qualified as non-detect at the LOD with U/L flags based on method blank detections.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify soil field sample detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•

Review Questions

Method: SW8260 (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Surrogate recoveries were biased high for 1 of 4 surrogates in client sample -004. All detections for these samples were qualified as estimated with J/I/+ flags. Non-detects did not require qualification
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG2284832-2 method blank had a detection below the LOQ for bromomethane. Qualification was not required for field results based on this method blank detection.
Were target analytes in the field blank less than MDL?		•		Trip blank was non-detect but equipment blank had a detection for acetone that was not used to qualify field sample data.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG284835-1 recoveries were outliers biased low for methylene chloride, trans-1,2-dichloroethylene, MTBE and chloroform. Client samples -001 and -002 results for these analytes were qualified as estimated with UJ flags and C reason codes. QC batch WG284832-1 recoveries were biased high for methylene chloride and MTBE but qualification of field results was not required based on these high bias QC outliers since associated results were non-detect.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard outliers not addressed as part of stage 2A data validation.
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Sample -004 surrogate recoveries were outliers biased low and less than 10% for 1 of 3 acid fraction surrogates and biased low but above 10% for the remaining 2 of 3 acid fraction surrogates. Client sample -004 acid fraction results were qualified as unusable with X flags and I reason codes. 1 of 3 base-neutral fraction surrogates was also an outlier biased low so all base-neutral fraction results were qualified as estimated with UJ flags and I reason codes (UJ flags replaced X flags in database).
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG284708-2 (water) LCS recovery was biased low and less than 10% for CAPROLACTAM so this result was qualified as unusable in samples -004 with X flags and C reason code. QC LCS WG284708-2 (water) high bias for benzaldehyde did not require qualification for field sample results. QC batch WG284713-2 recoveries were biased high for benzaldehyde and bis-2-ethylhexylphthalate so client samples -001, -002, -003 bis-2-ethylhexylphthalate detections were qualified as estimated with J flags and C reason codes. Low recovery bias for caprolactam, 3-nitroaniline and atrazine resulted in qualification of these sample -001, -002, -003 results as estimated with J flags if detected and UJ flags if non-detect and C reason codes. 4-Chloroaniline recovery as biased low and less than 10% so sample -001, -002, -003 results for this analyte were qualified as unusable with X flags and C reason codes.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Calibration issues with peak tailing were not addressed as part of this stage 2A review.
Were DoD QSM corrective actions followed if deviations were noted?		•		

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Were any data rejected during the verification process?	•			Sample -004 acid fraction analytes. Sample -004 caprolactam. Samples -001, -002, -003 4-chloroaniline.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7037. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- MS Recovery
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 69 results (7.58%) out of the 910 results (sample and field QC samples) reported are qualified based on review and 14 results (1.54%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Hydrazine field sample results and QC are included in this SDG but electronic data is in separate SDG (11807 -1). Please reference validation report 11807-1 for data qualification summary.

Jim Tomalia

January 24, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284983-1 (LB)/ WG284983-1	Chrysene	0.07700	< 0.036	< 0.2	ug/l	U/None	L	
WG284983-1 (LB)/ WG284983-1	Pyrene	0.08200	< 0.059	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method LYDKHN, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW7OB-A-AUG2020 (MS)/ WG285074-5	Total Organic Carbon	141.8	75 - 125	30 - 150	percent	J/None	M	
NHFLA-MW9OB-B-AUG2020 (MS)/ WG285074-4	Total Organic Carbon	9.407	75 - 125	30 - 150	percent	J/X	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for LYDKHN

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW7OB-A-AUG2020	N	Total Organic Carbon	760	23000	23000 J	+	ug/g	M
NHFLA-MW9OB-B-AUG2020	N	Total Organic Carbon	1100	47000	47000 J	-	ug/g	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW7OB-A-AUG2020 (N)/ SN7037-3		6.040	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW7OB-A-AUG2020 (N)/ WG285074-5		6.040	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW7OB-B-AUG2020 (N)/ SN7037-4		6.060	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW7OB-C-AUG2020 (N)/ SN7037-5		6.060	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW9OB-A-AUG2020 (N)/ SN7037-1		6.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW9OB-A-AUG2020 (N)/ WG285074-3		6.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW9OB-B-AUG2020 (N)/ SN7037-2		6.180	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW9OB-B-AUG2020 (N)/ WG285074-4		6.180	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Cadmium	0.008200	< 0.0079	< 0.5	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Arsenic	0.07500	< 0.068	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Antimony	0.1200	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Magnesium	0.8500	< 0.68	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Iron	1.900	< 1.4	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Potassium	13.00	< 2.9	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Sodium	6.400	< 1.5	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Chromium	0.08200	< 0.026	< 1	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Aluminum	3.000	< 0.71	< 30	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Calcium	3.600	< 1.8	< 10	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

NHFLA-MW9OB-B-AUG2020	N	Cadmium	0.460	0.133 J	0.280 U		mg/kg	L

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW9OB-B-AUG2020	N	Sodium	93.0	75.3 J	93.0 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	Antimony	0.05700	< 0.055	< 1	ug/l	U/None	V	
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	Lead	0.09600	< 0.075	< 1	ug/l	U/None	V	
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	Vanadium	0.6000	< 0.5	< 5	ug/l	U/None	V

Quality Control Outliers for test method SW7196, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284735-1 (LB)/ WG284735-1	Chromium, Hexavalent	0.002500	< 0.00076	< 0.025	mg/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW7OB-A-AUG2020 (N)/ SN7037-3		12.06	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW7OB-B-AUG2020 (N)/ SN7037-4		12.04	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW7OB-C-AUG2020 (N)/ SN7037-5		12.02	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW9OB-A-AUG2020 (N)/ SN7037-1		12.16	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW9OB-B-AUG2020 (N)/ SN7037-2		12.24	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284885-2 (LB)/ WG284885-2	Methylene chloride	2.600	< 1.1	< 5	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-TB3-AUG2020	TB	Methylene chloride	5.00	1.40 JB	2.50 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	1,2-Dichloroethane-d4	122.0	81 - 118	10 - 118	percent	J/None	I	
NHFLA-TB3-AUG2020 (TB)/ SN7037-7	1,2-Dichloroethane-d4	122.0	81 - 118	10 - 118	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW7OB-C-AUG2020 (N)/ SN7037-5	1-Bromo-4-fluorobenzene (4-Bromofluorobenzene)	129.0	79 - 119	10 - 119	percent	J/None	I	
NHFLA-MW9OB-A-AUG2020 (N)/ SN7037-1	Dibromofluoromethane	578.0	78 - 119	10 - 119	percent	J/None	I	
NHFLA-MW9OB-A-AUG2020 (N)/ SN7037-1	1,2-Dichloroethane-d4	714.0	71 - 136	10 - 136	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW7OB-C-AUG2020	N	Acetone	20.0	9.80 J	9.80 J	+	ug/kg	I/TR

NHFLA-MW9OB-A-AUG2020	N	Acetone	37.0	61.0	61.0 J	+	ug/kg	I
NHFLA-MW9OB-A-AUG2020	N	Carbon disulfide	7.40	3.00 J	3.00 J	+	ug/kg	I/TR
NHFLA-MW9OB-A-AUG2020	N	Methylene chloride	37.0	29.0 J	29.0 J	+	ug/kg	I/TR
NHFLA-MW9OB-A-AUG2020	N	Toluene	7.40	8.20	8.20 J	+	ug/kg	I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB3-AUG2020 (TB)/ SN7037-7	Methylene chloride	1.400	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284841-1 (LB)/ WG284841-1	Bis(2-ethylhexyl)phthalate	250.0	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW7OB-A-AUG2020	N	Bis(2-ethylhexyl)phthalate	510	510 B	510 U		ug/kg	L
NHFLA-MW7OB-B-AUG2020	N	Bis(2-ethylhexyl)phthalate	520	520 B	520 U		ug/kg	L
NHFLA-MW9OB-A-AUG2020	N	Bis(2-ethylhexyl)phthalate	370	350 JB	370 U		ug/kg	L
NHFLA-MW9OB-B-AUG2020	N	Bis(2-ethylhexyl)phthalate	380	280 JB	290 U		ug/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284982-2 (BS)/ WG284982-2	Benzaldehyde	440.0	10 - 189	10 - 189	percent	J/None	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284841-2 (BS)/ WG284841-2	Benzaldehyde	282.0	10 - 134	10 - 134	percent	J/None	C	
WG284841-2 (BS)/ WG284841-2	Caprolactam	36.29	46 - 117	10 - 117	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW7OB-A-AUG2020	N	Caprolactam	360	270 UL	270 UJ		ug/kg	C
NHFLA-MW7OB-B-AUG2020	N	Caprolactam	370	280 UL	280 UJ		ug/kg	C
NHFLA-MW7OB-C-AUG2020	N	Caprolactam	360	270 UL	270 UJ		ug/kg	C
NHFLA-MW9OB-A-AUG2020	N	Caprolactam	370	280 UL	280 UJ		ug/kg	C
NHFLA-MW9OB-B-AUG2020	N	Caprolactam	380	290 UL	290 UJ		ug/kg	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	2,4,6-Tribromophenol	12.90	43 - 140	10 - 140	percent	J/UJ	I	
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	Phenol-d6	5.420	10 - 90	10 - 90	percent	J/X	I	
NHFLA-EB3-AUG2020 (EB)/ SN7037-6	2-Fluorophenol	6.420	19 - 119	10 - 119	percent	J/X	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB3-AUG2020	EB	2,4,5-Trichlorophenol	24.0	18.0 U	18.0 X		ug/l	I
NHFLA-EB3-AUG2020	EB	2,4,6-Trichlorophenol	9.60	7.20 U	7.20 X		ug/l	I
NHFLA-EB3-AUG2020	EB	2,4-Dichlorophenol	9.60	7.20 U	7.20 X		ug/l	I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284983-1 (water) prep blank had detections below the LOD for pyrene and chrysene. Qualification of field results was not required based on these prep blank detections.
Were target analytes in the field blank less than MDL?		•		
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	LCS only
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Case narrative comments associated with Stage 3 deliverable non-conformances including Internal Standard responses, ICAL, ICV, CCV for 8270D SIM-PAH analysis were not addressed as part of this level 2A data package review.
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: LYDKHN (Lloyd Kahn Method for the Determination of Total Organic Carbon in Sediment, USEPA Region II Method)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			NOTE: Hold time qualifiers were removed from database since analytical hold time (6 days) was within the 14 day hold time requirement for this project.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Sample NHFLA-MW9OB-B-AUG2020 MS recovery was an outlier biased low (10%) and sample NHFLA-MW7OB-A-AUG2020 recovery was an outlier biased high (142%) so both of these samples were qualified as estimated with J flags.
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?				
Were QAPP specified laboratory PQLs achieved?

Review Questions

Method: SW8260 (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Method 8260C surrogate recoveries were outside of project criteria biased high for 2 of 4 surrogates in client sample -001 original run (samples -001 and -002 were re-analyzed but not reported in FUDSChem data base). Surrogates were outliers biased high for 1 of 4 surrogates in client samples -005, -006, -007. The following results should be qualified as estimated with J/I/ + qualifiers: samples -001 - acetone, toluene, carbon disulfide, methylene chloride. Samples -005 - acetone, carbon disulfide.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		Method 8260C QC batch WG2848852-2 method blank had a detection below the LOQ for methylene chloride. Client sample -007 result for this analyte was qualified as non-detect at the LOD with U/L flag/reason code.
Were target analytes in the field blank less than MDL?		•		Trip blank had a detection for methylene chloride below the LOQ that was no used to qualify field sample results.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?		•		
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Sample NHFLA-EB3-AUG2020 acid fraction surrogate recoveries were all outliers biased low with 2 of 3 recoveries less than 10%. Acid fraction analyte results only for this sample should be considered UNUSABLE and qualified with X flags. NOTE: database flags were removed for base-neutral fraction analytes in this sample since those fraction specific surrogate recoveries were acceptable. Sample NHFLA-MW7OB-A-AUG2020 surrogates were outliers biased marginally low (38.9% recovery) for 1 of 3 acid fraction surrogates. The acid fraction target analyte results in this sample should be considered estimated and were qualified with UJ flags if non-detect and J flags when detected.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284841 prep blank had a detection below the PQL for bis-2-ethylhexylphthalate. Samples NHFLA-MW9OB-A-AUG2020 and NHFLA-MW9OB-B-AUG2020 results for this analyte are considered non-detect at the PQL and qualified with U flags. Samples NHFLA-MW7OB-A-AUG2020 and NHFLA-MW7OB-B-AUG2020 results for this analyte were above the PQL so it was updated to the level detected and qualified with U flags.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG284841-2 recovery was an outlier biased low for Caprolactam. All soil client sample results for this analyte were qualified as estimated and qualified with UJ flags. Benzaldehyde high bias recovery in QC batches WG284982-2 and WG284841-2 did not result in qualification for field results.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Case narrative comments associated with Stage 3 deliverable non-conformances including Internal Standard responses, ICV, CCV for 8270D analysis were not addressed as part of this level 2A data package review.

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?	•			Sample NHFLA-EB3-AUG2020 acid fraction surrogate recoveries were all outliers biased low with 2 of 3 recoveries less than 10%. Acid fraction analyte results only for this sample should be considered UNUSABLE and qualified with X flags. NOTE: database flags were removed for base-neutral fraction analytes in this sample since those fraction specific surrogate recoveries were acceptable.

Review Questions

Method: SW9045 (Soil pH)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?			•	
Were target analytes in the method blank less than MDL?			•	
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only.
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Facility:	C02NY0079-02, Nike BU 51/52, Launch Area
Event:	Nike BU 51/52 - Hamburg NY - First Soil Sampling Event
SDG:	SN7081
Guidance Document:	Nike BU 51/52 Quality Assurance Project Plan
Prime Contractor:	Seres-Arcadis JV
Project Manager:	Jennifer Singer
Contract Laboratory(ies):	Katahdin Analytical Services, Westbrook, ME
Data Review Contractor:	CADENA
Data Review Level:	S2AVEM
Primary Data Reviewer:	Jim Tomalia, Senior Environmental Compliance Specialist
Date Submitted:	December 03, 2020 - revised report submitted January 25, 2021 based on DoD chemist review recommendations.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7081. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- LCS Recovery
- LCS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 93 results (14.93%) out of the 623 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

NOTE: Hydrazine results were reported in this SDG PDF lab report as subcontracted data but associated SEDD did not include hydrazine data. Hydrazine validation review narrative and qualifications are summarized separately in SDG 11806-1.

Jim Tomalia

January 25, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284983-1 (LB)/ WG284983-1	Chrysene	0.07700	< 0.036	< 0.2	ug/l	U/None	L	
WG284983-1 (LB)/ WG284983-1	Pyrene	0.08200	< 0.059	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284898-1 (LB)/ WG284898-1	Benzo (g,h,i)perylene	3.200	< 2	< 20	ug/kg	U/None	L	
WG284898-1 (LB)/ WG284898-1	Indeno(1,2,3-c,d)pyrene	3.700	< 1.9	< 20	ug/kg	U/None	L	
WG284898-1 (LB)/ WG284898-1	Dibenz (a,h)anthracene	3.800	< 1.8	< 20	ug/kg	U/None	L	
WG285191-1 (LB)/ WG285191-1	Benzo (a)anthracene	2.000	< 1.9	< 20	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW16-C-AUG2020	N	Benzo(g,h,i)perylene	23.0	13.0 J	23.0 U		ug/kg	L
NHFLA-MW16-C-AUG2020	N	Indeno(1,2,3-c,d)pyrene	23.0	15.0 J	23.0 U		ug/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284898-2 (BS)/ WG284898-2	Benzo(a)pyrene	40.48	50 - 125	10 - 125	percent	J/UJ	C	
WG284898-2 (BS)/ WG284898-2	Anthracene	46.18	50 - 114	10 - 114	percent	J/UJ	C	
WG285191-2 (BS)/ WG285191-2	Benzo (b)fluoranthene	47.08	53 - 128	10 - 128	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW16-A-AUG2020	N	Anthracene	18.0	48.0 L	48.0 J	-	ug/kg	C
NHFLA-MW16-A-AUG2020	N	Benzo(a)pyrene	18.0	240 L	240 J	-	ug/kg	C
NHFLA-MW16-B-AUG2020	N	Anthracene	21.0	190 L	190 J	-	ug/kg	C
NHFLA-MW16-B-AUG2020	N	Benzo(a)pyrene	21.0	330 L	330 J	-	ug/kg	C
NHFLA-MW16-C-AUG2020	N	Anthracene	23.0	4.10 JL	4.10 J	-	ug/kg	C/TR
NHFLA-MW16-C-AUG2020	N	Benzo(a)pyrene	23.0	14.0 JL	14.0 J	-	ug/kg	C/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW16-A-AUG2020 (N)/ SN7081-1		5.370	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW16-B-AUG2020 (N)/ SN7081-2		5.350	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW16-C-AUG2020 (N)/ SN7081-3		5.220	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Cadmium	0.008200	< 0.0079	< 0.5	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Arsenic	0.07500	< 0.068	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Antimony	0.1200	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Magnesium	0.8500	< 0.68	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Iron	1.900	< 1.4	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Potassium	13.00	< 2.9	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Sodium	6.400	< 1.5	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Chromium	0.08200	< 0.026	< 1	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Aluminum	3.000	< 0.71	< 30	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Calcium	3.600	< 1.8	< 10	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW16-A-AUG2020	N	Antimony	0.720	0.180 J	0.450 U		mg/kg	L
NHFLA-MW16-A-AUG2020	N	Cadmium	0.450	0.228 J	0.270 U		mg/kg	L
NHFLA-MW16-B-AUG2020	N	Antimony	0.770	0.300 J	0.480 U		mg/kg	L
NHFLA-MW16-B-AUG2020	N	Cadmium	0.480	0.421 J	0.480 U		mg/kg	L
NHFLA-MW16-C-AUG2020	N	Antimony	0.970	0.460 J	0.610 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Lead	0.08100	< 0.075	< 1	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Chromium	0.6400	< 0.22	< 5	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Copper	0.8400	< 0.19	< 3	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Manganese	1.600	< 0.35	< 2	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Aluminum	12.00	< 4.4	< 100	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Sodium	140.0	< 19	< 1000	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Magnesium	18.00	< 8	< 100	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Calcium	43.00	< 21	< 100	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Cobalt	0.1500	< 0.06	< 1	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Thallium	0.2600	< 0.06	< 1	ug/l	U/None	V	
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Barium	1.700	< 0.27	< 2	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBWNH28IMW2 (LB)/ PBWNH28IMW2	Copper	0.4600	< 0.18	< 3	ug/l	U/None	L	
PBWNH28IMW2 (LB)/ PBWNH28IMW2	Magnesium	13.00	< 7.8	< 100	ug/l	U/None	L	
PBWNH28IMW2 (LB)/ PBWNH28IMW2	Sodium	41.00	< 19	< 1000	ug/l	U/None	L	
PBWNH28IMW2 (LB)/ PBWNH28IMW2	Aluminum	8.300	< 4.4	< 100	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB4-AUG2020	EB	Aluminum	100	12.0 J	40.0 U		ug/l	L
NHFLA-EB4-AUG2020	EB	Copper	3.00	0.840 J	2.00 U		ug/l	L
NHFLA-EB4-AUG2020	EB	Magnesium	100	18.0 J	80.0 U		ug/l	L
NHFLA-EB4-AUG2020	EB	Sodium	1000	140 J	400 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Chromium, Hexavalent	0.0009600	< 0.00076	< 0.025	mg/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284995-1 (LB)/ WG284995-1	Chromium, Hexavalent	0.002600	< 0.00076	< 0.025	mg/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW7196

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB4-AUG2020	EB	Chromium, Hexavalent	0.0250	0.000960 J	0.0125 U		mg/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW16-A-AUG2020 (N)/ SN7081-1		11.25	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW16-B-AUG2020 (N)/ SN7081-2		11.22	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW16-C-AUG2020 (N)/ SN7081-3		11.08	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	Acetone	2.900	< 2.2	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284885-2 (LB)/ WG284885-2	Methylene chloride	2.600	< 1.1	< 5	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-TB4-AUG2020	TB	Methylene chloride	5.00	1.70 JB	2.50 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB4-AUG2020 (EB)/ SN7081-4	1,2-Dichloroethane-d4	120.0	81 - 118	10 - 118	percent	J/None	I	
NHFLA-TB4-AUG2020 (TB)/ SN7081-5	1,2-Dichloroethane-d4	121.0	81 - 118	10 - 118	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB4-AUG2020	EB	Acetone	5.00	2.90 J	2.90 J	+	ug/l	I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW16-A-AUG2020 (N)/ SN7081-1	Toluene-d8	243.0	85 - 116	10 - 116	percent	J/None	I	
NHFLA-MW16-A-AUG2020 (N)/ SN7081-1	1-Bromo-4-fluorobenzene (4-Bromofluorobenzene)	297.0	79 - 119	10 - 119	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW16-A-AUG2020	N	Acetone	17.0	7.20 J	7.20 J	+	ug/kg	I/TR
NHFLA-MW16-A-AUG2020	N	Methylene chloride	17.0	5.60 J	5.60 J	+	ug/kg	I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB4-AUG2020 (TB)/ SN7081-5	Methylene chloride	1.700	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284899-1 (LB)/ WG284899-1	Bis(2-ethylhexyl)phthalate	1900	< 98	< 330	ug/kg	U/None	L	
WG285192-1 (LB)/ WG285192-1	Bis(2-ethylhexyl)phthalate	2800	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW16-A-AUG2020	N	Bis(2-ethylhexyl)phthalate	320	1900 BL	240 U		ug/kg	L/C
NHFLA-MW16-B-AUG2020	N	Bis(2-ethylhexyl)phthalate	360	2200 BL	270 U		ug/kg	L
NHFLA-MW16-C-AUG2020	N	Bis(2-ethylhexyl)phthalate	420	2500 BL	310 UJ		ug/kg	L/I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284982-2 (BS)/ WG284982-2	Benzaldehyde	440.0	10 - 189	10 - 189	percent	J/None	C	
WG285183-2 (BS)/ WG285183-2	Benzaldehyde	310.0	10 - 189	10 - 189	percent	J/None	C	
WG285183-2 (BS)/ WG285183-2	Caprolactam	7.680	10 - 86	10 - 86	percent	J/X	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284899-2 (BS)/ WG284899-2	4-Chloroaniline	15.09	17 - 106	10 - 106	percent	J/UJ	C	
WG284899-2 (BS)/ WG284899-2	Bis(2-ethylhexyl)phthalate	158.1	51 - 133	10 - 133	percent	J/None	C	
WG284899-2 (BS)/ WG284899-2	Benzaldehyde	269.5	10 - 134	10 - 134	percent	J/None	C	
WG284899-2 (BS)/ WG284899-2	3-Nitroaniline	32.10	33 - 119	10 - 119	percent	J/UJ	C	
WG285192-2 (BS)/ WG285192-2	Atrazine	10.18	47 - 127	10 - 127	percent	J/UJ	C	
WG285192-2 (BS)/ WG285192-2	3,3'-Dichlorobenzidine	132.9	22 - 121	10 - 121	percent	J/None	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Automated Data Review Detail Report for SN7081
C02NY0079-02, Nike BU 51/52, Launch Area
Nike BU 51/52 Quality Assurance Project Plan

Reporting Anomalies

Test Leach	FieldSample ID	Type	Dilution	Analyte	Result	DL	LOD	LOQ/RL	Project RL	Units
SW8270/SW3550/NONE	NHFLA-MW16-C-AUG2020	N	1	Phenol	310 UJ	200	310	420	330	ug/kg

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?	•			Method blank WG284898-1RA had one of three surrogates outside of project criteria biased low. Qualifications were not applied based on this QC surrogate recovery outlier.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284983-1 (pyrene and chrysene) and WG285191-1 (benzo(a)anthracene) detections below the LOQ did not result in qualification of field data. QC batch WG284898-1 detections below LOQ for indenot(123cd)pyrene and benzo (ghi)perylene resulted in qualification of these analyte results for sample -003 with U/L flags (non-detect at LOQ).
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG285191-2 low bias for benzo (b)fluoranthene did not require qualification for final field data reported in database. QC batch WG284898-2 low bias recoveries for anthracene and benzo(a)pyrene resulted in qualification for these analytes in samples -001, -002 and -003 as estimated with J/C qualifiers.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard and calibration outliers noted in case narrative were not addressed in this stage 2A deliverable.
Were DoD QSM corrective actions followed if deviations were noted?		•		See case narrative for calibration issues.
Were any data rejected during the verification process?		•		

Review Questions

Method: LYDKHN (Lloyd Kahn Method for the Determination of Total Organic Carbon in Sediment, USEPA Region II Method)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			Hold time outliers in data base were removed. Project hold time for soils is 14 days and field samples in this submittal were analyzed in 5 days from sample collection.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8260 (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Surrogate recoveries were biased high for 2 of 4 surrogates in client samples -001 and -004. All detections for these samples were qualified as estimated with J/I/+ flags. Non-detects did not require qualification. Sample -005 had 1 of 4 surrogates biased high but associated results were all non-detect so qualifications were not required.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284885 method blank had a detection below the LOQ for methylene chloride. Client sample -005 results for this analyte were considered non-detect at the LOQ and qualified with U/L flags.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•

Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Samples -001, -002, -003 final results were reported from re-analysis data. Only sample -003RE had a surrogate outlier - 1 of 3 base-neutral fraction surrogates biased low. Client sample -003 base-neutral fraction analytes were qualified as estimated with UJ/I flags if non-detect and J/I flags if detected. The original analyses for each had multiple surrogate recovery outliers. Client sample -004 had 1 of 3 acid fraction surrogate recoveries outside of project criteria biased low so all acid fraction analytes for this sample were qualified as estimated with UJ/I flags. Revision of qualifiers in data base were made based on fractions not affected by surrogate non-conformances.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch method blanks WG284899-1 and WG285192-1 had detections below the LOQ for bis-2-ethylhexylphthalate. Qualifications of non-detect at the LOQ with U/L flags were made for this analyte in samples -001, -002, -003. NOTE: QC batch WB284899-1 also had 6 of 6 surrogate recoveries outside of project criteria biased low. - this blank was not used to qualify final reportable field sample data.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch LCS recoveries were outliers as follows: WG284899-2: low bias - 4-chloroaniline, 3-nitroaniline and biased high for benzaldehyde and bis-2-ethylhexylphthalate (this batch was not used to qualify final reportable results). WB285183-2: low bias less than 10% recovery - caprolactam and high bias benzaldehyde (this batch was not used to qualify final reportable results). WG285192-2 : low bias for caprolactam and atrazine and high bias for benzaldehyde, 3,3-dichlorobenzidien and bis-2-ethylhexylphthalate. Client samples -001, -002, -003 results for caprolactam and atrazine were qualified estimated with UJ/C flags. No qualification was required based on the high bias QC outliers.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7117. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 25 results (5.21%) out of the 480 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Hydrazine field sample results and QC are included in this SDG but electronic data is in separate SDG (12373-1). Please reference validation report 12373-1 for data qualification summary.

Jim Tomalia

January 25 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Pyrene	0.06900	< 0.056	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Chrysene	0.08300	< 0.034	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Benzo (b)fluoranthene	0.1200	< 0.084	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Indeno(1,2,3-c,d)pyrene	0.1300	< 0.049	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Benzo (g,h,i)perylene	0.1300	< 0.061	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Benzo(a)pyrene	0.1400	< 0.062	< 0.19	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Benzo (k)fluoranthene	0.2200	< 0.046	< 0.19	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285105-1 (LB)/ WG285105-1	Chrysene	0.04300	< 0.036	< 0.2	ug/l	U/None	L	
WG285105-1 (LB)/ WG285105-1	Indeno(1,2,3-c,d)pyrene	0.05600	< 0.052	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB5-AUG2020	EB	Chrysene	0.190	0.0830 J	0.0940 U		ug/l	L
NHFLA-EB5-AUG2020	EB	Indeno(1,2,3-c,d)pyrene	0.190	0.130 J	0.190 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285101-1 (LB)/ WG285101-1	Indeno(1,2,3-c,d)pyrene	3.200	< 1.9	< 20	ug/kg	U/None	L	
WG285101-1 (LB)/ WG285101-1	Benzo (g,h,i)perylene	3.500	< 2	< 20	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW2-A-AUG2020	N	Benzo(g,h,i)perylene	24.0	19.0 J	24.0 U		ug/kg	L
NHFLA-MW2-A-AUG2020	N	Indeno(1,2,3-c,d)pyrene	24.0	19.0 J	24.0 U		ug/kg	L
NHFLA-MW2-B-AUG2020	N	Benzo(g,h,i)perylene	23.0	5.90 J	11.0 U		ug/kg	L
NHFLA-MW2-B-AUG2020	N	Indeno(1,2,3-c,d)pyrene	23.0	5.60 J	11.0 U		ug/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	2-Methylnaphthalene-d10	115.0	43 - 92	10 - 92	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB5-AUG2020	EB	Benzo(a)pyrene	0.190	0.140 J	0.140 J	+	ug/l	I/TR
NHFLA-EB5-AUG2020	EB	Benzo(b)fluoranthene	0.190	0.120 J	0.120 J	+	ug/l	I/TR
NHFLA-EB5-AUG2020	EB	Benzo(g,h,i)perylene	0.190	0.130 J	0.130 J	+	ug/l	I/TR
NHFLA-EB5-AUG2020	EB	Benzo(k)fluoranthene	0.190	0.220	0.220 J	+	ug/l	I
NHFLA-EB5-AUG2020	EB	Pyrene	0.190	0.0690 J	0.0690 J	+	ug/l	I/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW2-A-AUG2020 (N)/ SN7117-1		9.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW2-A-AUG2020 (N)/ WG285582-3		9.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW2-A-AUG2020 (N)/ WG285582-4		9.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW2-B-AUG2020 (N)/ SN7117-2		9.070	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Antimony	0.08400	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Zinc	0.2100	< 0.17	< 2	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Magnesium	0.7400	< 0.68	< 10	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Sodium	3.200	< 1.5	< 100	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Potassium	6.700	< 2.9	< 100	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Chromium	0.1500	< 0.026	< 1	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Lead	1.010	< 0.087	< 0.5	mg/kg	U/None	L	
PBSNH26ICS1 (LB)/ PBSNH26ICS1	Aluminum	2.400	< 0.71	< 30	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW2-A-AUG2020	N	Antimony	1.90	0.760 J	1.20 U		mg/kg	L
NHFLA-MW2-B-AUG2020	N	Antimony	1.70	0.430 J	1.10 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Cobalt	0.07200	< 0.06	< 1	ug/l	U/None	V

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB5-AUG2020	EB	Copper	3.00	1.80 J	2.00 U		ug/l	L
NHFLA-EB5-AUG2020	EB	Lead	1.00	0.370 J	0.500 U		ug/l	L
NHFLA-EB5-AUG2020	EB	Magnesium	100	89.1 J	100 U		ug/l	L
NHFLA-EB5-AUG2020	EB	Potassium	1000	100 J	400 U		ug/l	L
NHFLA-EB5-AUG2020	EB	Sodium	1000	485 J	1000 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW2-A-AUG2020 (N)/ SN7117-1		10.21	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW2-B-AUG2020 (N)/ SN7117-2		10.19	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Methylene chloride	1.800	< 1.1	< 5	ug/l	U/None	V	
NHFLA-EB5-AUG2020 (EB)/ SN7117-3	Acetone	2.300	< 2.2	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG284976-2 (LB)/ WG284976-2	Methylene chloride	2.100	< 1.1	< 5	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB5-AUG2020	EB	Methylene chloride	5.00	1.80 J	2.50 U		ug/l	L
NHFLA-TB5-AUG2020	TB	Methylene chloride	5.00	2.60 J	5.00 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285867-2 (LB)/ WG285867-2	Methylene chloride	11.00	< 7.9	< 25	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW2-A-AUG2020 (N)/ SN7117-1	1,2-Dichloroethane-d4	140.0	71 - 136	10 - 136	percent	J/None	I	
NHFLA-MW2-B-AUG2020 (N)/ SN7117-2	1,2-Dichloroethane-d4	141.0	71 - 136	10 - 136	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB5-AUG2020 (TB)/ SN7117-4	Methylene chloride	2.600	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Trip Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW2-A-AUG2020	N	Methylene chloride	27.0	11.0 J	14.0 U		ug/kg	T
NHFLA-MW2-B-AUG2020	N	Methylene chloride	23.0	8.50 J	12.0 U		ug/kg	T

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285102-1 (LB)/ WG285102-1	Bis(2-ethylhexyl)phthalate	260.0	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285104-2 (BS)/ WG285104-2	Benzaldehyde	390.0	10 - 189	10 - 189	percent	J/None	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285102-2 (BS)/ WG285102-2	Caprolactam	31.98	46 - 117	10 - 117	percent	J/UJ	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW2-A-AUG2020	N	Caprolactam	400	300 UL	300 UJ		ug/kg	C
NHFLA-MW2-B-AUG2020	N	Caprolactam	380	280 UL	280 UJ		ug/kg	C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Table of All Qualified Results

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Method blank and LCS for QC batch WG285105 had one of three surrogates outside of project criteria biased high. Qualifications were not applied based on this QC surrogate recovery outlier. Sample -003 had 1 of 3 surrogates biased high so all detected analyte results are considered estimated and flagged J.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285101-1 had detections below the LOQ for indeno(123cd)pyrene and benzo (ghi)perylene and QC batch WG285105-1 detections below the LOD for chrysene and indeno(123cd)pyrene. Client sample -003 results for chrysene and indeno(123cd)pyrene were qualified as non-detect at the LOD with U flags and samples -001 and -002 indeno (123cd)pyrene and benzo(ghi)perylene qualified as non-detect at the LOD and qualified with U flags.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify soil field sample detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: LYDKHN (Lloyd Kahn Method for the Determination of Total Organic Carbon in Sediment, USEPA Region II Method)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			note: Qualifiers J/H2 assigned to all samples in database were removed since test hold time was not exceeded (8 days vs 14 days recommended in project QAPP).
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Sample -001 MS was an outlier biased low (74%) so field result was qualified as estimated with a J flag.
Was the MS/MSD RPD within project acceptance limits?			•	MS only analyzed.
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

Review Questions

Method: SW8260 (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?		•		Re-analysis results for -01RA and -002RA which were extracted outside of project required holding times were not reported in the SEDD.
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Surrogate recoveries were biased high for 1 of 4 surrogates in client samples -001 and -002 (-001RA and -002RA recoveries acceptable). All detections for these samples were qualified as estimated with J/I/+ flags. Non-detects did not require qualification
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG284976-2 and WG285867-2 had detections below the LOQ for methylene chloride. Client samples -001RA, -002RA, -003 and -004 results for methylene chloride were qualified as non-detect at the LOQ with U flags and L reason codes.
Were target analytes in the field blank less than MDL?		•		Trip blank had a detection for methylene chloride that was used to qualify samples -001 and -002 methylene chloride results as non-detect at the LOQ and were qualified with U flags and T reason codes. Equipment blank had detections below the LOQ for methylene chloride (qualified non-detect) and acetone. Qualifications were not applied based on these equipment blank detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard and calibration outlier issues noted in casenarrative were not addressed as part of thisstage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?	•			
Were any data rejected during the verification process?		•

Were surrogate recoveries within project acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285102-1 method blank had a detection below the LOQ for bis-2-ethylhexylphthalate. Qualifications were not required based on this method blank detection.
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG285104-2 recoveries were outliers biased high for benzaldehyde - qualification was not required. QC batch WG285102-2 recovery was biased low for caprolactam - field samples -001 and -002 results for this analyte were qualified as estimated with UJ flags and C reason codes.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW9045 (Soil pH)

Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?			•	
Were target analytes in the method blank less than MDL?			•	
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Facility:	C02NY0079-02, Nike BU 51/52, Launch Area
Event:	Nike BU 51/52 - Hamburg NY - First Soil Sampling Event
SDG:	SN7165
Guidance Document:	Nike BU 51/52 Quality Assurance Project Plan
Prime Contractor:	Seres-Arcadis JV
Project Manager:	Jennifer Singer
Contract Laboratory(ies):	Katahdin Analytical Services, Westbrook, ME
Data Review Contractor:	CADENA LLC
Data Review Level:	S2AVEM
Primary Data Reviewer:	Jim Tomalia, Senior Environmental Compliance
Date Submitted:	Specialist December 08, 2020 - Resubmitted February 11, 2021 to add qualifiers to sample -001 method 6010 based on PDS/SD outliers.

Field Sample ID	Lab Sample ID	Matrix	Type/Type Code	BNASIM	LYDKHN	SW6010	SW6020	SW7196	SW7470	SW7471	SW8260	SW8270	SW9045

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7165. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 22 results (3.53%) out of the 623 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Hydrazine field sample results and QC are included in this SDG but electronic data is in separate SDG (12376-1). Please reference validation report 12376-1 for data qualification summary.

Analytical Method	Data Reviewer Comment
BNASIM	No additional comments; see Checklist for detail.
LYDKHN	No additional comments; see Checklist for detail.
SW6010	No additional comments; see Checklist for detail.
SW6020	No additional comments; see Checklist for detail.
SW7196	No additional comments; see Checklist for detail.
SW7470	No additional comments; see Checklist for detail.
SW7471	No additional comments; see Checklist for detail.
SW8260	No additional comments; see Checklist for detail.
SW8270	No additional comments; see Checklist for detail.
SW9045	No additional comments; see Checklist for detail.

Jim Tomalia

February 11, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Benzo (k)fluoranthene	0.05200	< 0.048	< 0.2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Benzo (g,h,i)perylene	0.07500	< 0.064	< 0.2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Dibenz (a,h)anthracene	0.07800	< 0.069	< 0.2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Benzo(a)pyrene	0.08200	< 0.065	< 0.2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Indeno(1,2,3-c,d)pyrene	0.08400	< 0.051	< 0.2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Benzo (b)fluoranthene	0.1200	< 0.087	< 0.2	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285105-1 (LB)/ WG285105-1	Chrysene	0.04300	< 0.036	< 0.2	ug/l	U/None	L	
WG285105-1 (LB)/ WG285105-1	Indeno(1,2,3-c,d)pyrene	0.05600	< 0.052	< 0.2	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for BNASIM

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB6-AUG2020	EB	Indeno(1,2,3-c,d)pyrene	0.200	0.0840 J	0.0980 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285101-1 (LB)/ WG285101-1	Indeno(1,2,3-c,d)pyrene	3.200	< 1.9	< 20	ug/kg	U/None	L	
WG285101-1 (LB)/ WG285101-1	Benzo (g,h,i)perylene	3.500	< 2	< 20	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW10-A-AUG2020 (N)/ SN7165-1		8.020	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW10-B-AUG2020 (N)/ SN7165-2		8.010	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW10-C-AUG2020 (N)/ SN7165-3		8.020	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Cadmium	0.008200	< 0.0079	< 0.5	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Arsenic	0.07500	< 0.068	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Antimony	0.1200	< 0.07	< 0.8	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Magnesium	0.8500	< 0.68	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Iron	1.900	< 1.4	< 10	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Potassium	13.00	< 2.9	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Sodium	6.400	< 1.5	< 100	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Chromium	0.08200	< 0.026	< 1	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Aluminum	3.000	< 0.71	< 30	mg/kg	U/None	L	
PBSNH27ICS1 (LB)/ PBSNH27ICS1	Calcium	3.600	< 1.8	< 10	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW10-A-AUG2020	N	Antimony	0.870	0.440 JN	0.540 UJ		mg/kg	L/M
NHFLA-MW10-B-AUG2020	N	Antimony	0.670	0.370 J	0.420 U		mg/kg	L
NHFLA-MW10-C-AUG2020	N	Antimony	0.780	0.300 J	0.490 U		mg/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Barium	0.3500	< 0.27	< 2	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Chromium	0.4400	< 0.22	< 5	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Sodium	150.0	< 19	< 1000	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Aluminum	16.00	< 4.4	< 100	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Calcium	160.0	< 21	< 100	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Iron	244.0	< 13	< 100	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Magnesium	25.00	< 8	< 100	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Copper	3.080	< 0.19	< 3	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Manganese	2.800	< 0.35	< 2	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Lead	0.09200	< 0.074	< 1	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Chromium	0.5200	< 0.22	< 5	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Copper	1.300	< 0.18	< 3	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Magnesium	16.00	< 7.8	< 100	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Aluminum	17.00	< 4.4	< 100	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Calcium	28.00	< 20	< 100	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Sodium	72.00	< 19	< 1000	ug/l	U/None	L	
PBWNH27IMW1 (LB)/ PBWNH27IMW1	Iron	88.00	< 13	< 100	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB6-AUG2020	EB	Aluminum	100	16.0 J	40.0 U		ug/l	L
NHFLA-EB6-AUG2020	EB	Chromium	5.00	0.440 J	4.00 U		ug/l	L
NHFLA-EB6-AUG2020	EB	Copper	3.08	3.08	3.08 U		ug/l	L
NHFLA-EB6-AUG2020	EB	Iron	244	244	244 U		ug/l	L
NHFLA-EB6-AUG2020	EB	Magnesium	100	25.0 J	80.0 U		ug/l	L
NHFLA-EB6-AUG2020	EB	Sodium	1000	150 J	400 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Chromium, Hexavalent	0.002800	< 0.00076	< 0.025	mg/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW10-A-AUG2020 (N)/ SN7165-1		9.120	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW10-B-AUG2020 (N)/ SN7165-2		9.100	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW10-C-AUG2020 (N)/ SN7165-3		9.070	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Toluene	0.5300	< 0.27	< 1	ug/l	U/None	V	
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Methylene chloride	1.700	< 1.1	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB6-AUG2020 (TB)/ SN7165-5	Methylene chloride	1.200	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB6-AUG2020 (EB)/ SN7165-4	Diethyl phthalate	4.500	< 2	< 9.8	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285102-1 (LB)/ WG285102-1	Bis(2-ethylhexyl)phthalate	260.0	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Table of All Qualified Results

Test Method: BNASIM	Extraction Method: SW3510							
FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB6-AUG2020	EB	Indeno(1,2,3-c,d)pyrene	0.200	0.0840 J	0.0980 U		ug/l	L

Test Method: SW6010	Extraction Method: SW3050							
FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
D	MS RPD
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		LCS WG285105-2 had one of three surrogates outside of project criteria biased high. Qualifications were not applied based on this QC surrogate recovery outlier and electronic data was not available in FUDSChem database.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285101-1 (indeno(123cd)pyrene and benzo(ghi)perylene) and WG285105-1 (chrysene)detections below the LOQ did not result in qualification of field data.QC batch WG285105-1 detections below LOQ for indeno (123cd)pyrene resulted in qualification of this analyte results for sample -004 with U/L flags (non-detect at LOD).
Were target analytes in the field blank less than MDL?	•			Equipment blank detections were not used to qualify field sample results.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			LCS ONLY.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010 (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch NH27ICS1 method blank had detections below the LOQ for aluminum, antimony, arsenic, cadmium, calcium, chromium, iron, magnesium, potassium, sodium. Client samples -01, -02, -03 antimony results were qualified as non-detect at the LOD with U/L flags based on method blank detections.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify soil field sample detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		MS/MSD recoveries from sample -001 spike were outlers biased low for antimony and zinc. These sample -001 results were qualified as estimated with UJ flags if non-detect and J flags if detected using M reason code. Recoveries were biased high AND low for chromium, lead and potassium so these sample -001 results were also qualified estimated with J flags and M reason codes. Nickel and Vanadium recoveries were biased low for the MS only so these were also qualified as estimated with J flags and M reason codes. Aluminum, calcium, iron, magnesium and manganese recoveries were not used to qualify field data since the sample results were greater than 4X the amount spiked.
Was the MS/MSD RPD within project acceptance limits?		•		Sample -001 MS/MSD RPD's were outliers for chromium, lead, potassium and zinc so these were qualified estimated with J flags and D reason codes. Aluminum and calcium RPD outliers were not used to qualify results due to 4X rule noted above.
Were the post spike recoveries within project acceptance limits?		•		Silver PDS outlier for sample -001. Aluminum, calcium, iron, magnesium, manganese PDS spike levels not considered significant compared to sample concentrations so not used to qualify results. Silver qualified estimated J flag.
Were the serial dilution RPD values within project acceptance limits?		•		Sample -001 SD outliers for barium, calcium, iron, lead, manganese, nickel, zinc. All qualified estimated J flag.
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7207. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Field Duplicate RPD
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- MS RPD
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 318 results (25.46%) out of the 1249 results (sample and field QC samples) reported are qualified based on review and 1 results (0.08%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Hydrazine field sample results and QC are included in this SDG but electronic data is in separate SDG (12240-1). Please reference validation report 12240-1 for data qualification summary.

Analytical Method	Data Reviewer Comment
BNASIM	PRECISION represented by MS/MSD RPD and field duplicate RPD results was very poor for samples -001 and its field duplicate -004 and sample -002 and its field duplicate -005 as most target analytes for both the MS/MSD/RPD and FD were outliers. This was not evaluated beyond the QC provided in this submittal but poor sample homogeneity is initially suspected.
LYDKHN	No additional comments; see Checklist for detail.
SW6010	No additional comments; see Checklist for detail.
SW6020	No additional comments; see Checklist for detail.

Jim Tomalia

February 11, 2021

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method BNASIM, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Benzo (k)fluoranthene	0.05200	< 0.046	< 0.19	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Benzo(a)pyrene	0.08600	< 0.062	< 0.19	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Benzo (g,h,i)perylene	0.08700	< 0.061	< 0.19	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Indeno(1,2,3-c,d)pyrene	0.09200	< 0.049	< 0.19	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Dibenz (a,h)anthracene	0.09900	< 0.066	< 0.19	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Benzo (b)fluoranthene	0.1400	< 0.084	< 0.19	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method BNASIM, Field Duplicate RPD

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW15-A-AUG2020 (N)/ SN7207-4	Naphthalene	156.0	< 22	< 22	ug/kg	J/UJ	D3

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method BNASIM, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method BNASIM, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MS2-AUG2020 (SD)/ WG285634-6	Acenaphthene	55.56	< 20	< 20	rpd	J/UJ	D	
NHFLA-MS2-AUG2020 (SD)/ WG285634-6	Phenanthrene	55.71	< 20	< 20	rpd	J/UJ	D	
NHFLA-MS2-AUG2020 (SD)/ WG285634-6	Benzo (a)anthracene	56.91	< 20	< 20	rpd	J/UJ	D	
NHFLA-MS2-AUG2020 (SD)/ WG285634-6	Pyrene	57.58	< 20	< 20	rpd	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-DUP1-AUG2020 (FD)/ SN7207-4		7.940	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-DUP2-AUG2020 (FD)/ SN7207-5		7.840	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW15-A-AUG2020 (N)/ SN7207-1		7.940	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW15-B-AUG2020 (N)/ SN7207-2		7.830	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW15-C-AUG2020 (N)/ SN7207-3		7.800	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW6-A-AUG2020 (N)/ SN7207-6		7.700	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7		7.690	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Field Duplicate RPD

Field duplicate analyses are performed in order to assess sample collection/laboratory precision for each sample matrix. Summary forms were evaluated and compared to electronic data deliverables. Field duplicate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW15-A-AUG2020 (N)/ SN7207-4	Manganese	104.2	< 50	< 50	rpd	J/UJ	D3	
NHFLA-MW15-A-AUG2020 (N)/ SN7207-4	Chromium	123.4	< 50	< 50	rpd	J/UJ	D3	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Field Duplicate RPD for SW6010

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-DUP1-AUG2020	FD	Chromium	1.60	20.5	20.5 J		mg/kg	D3
NHFLA-DUP1-AUG2020	FD	Manganese	0.800	828 N*	828 J		mg/kg	D3/D
NHFLA-MW15-A-AUG2020	N	Chromium	1.80	86.6	86.6 J		mg/kg	D3
NHFLA-MW15-A-AUG2020	N	Manganese	0.920	2630	2630 J		mg/kg	D3/D

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Quality Control Outliers for test method SW6010, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Zinc	61.12	82 - 113	30 - 125	percent	J/UJ	M	
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Aluminum	666.7	74 - 119	30 - 125	percent	J/None	M	Spike amount Insignificant
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Vanadium	77.85	82 - 114	30 - 125	percent	J/UJ	M	
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Nickel	78.84	83 - 113	30 - 125	percent	J/UJ	M	
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Lead	80.58	81 - 112	30 - 125	percent	J/UJ	M	
NHFLA-MSD1-AUG2020 (SD)/ SN7207-004P	Copper	80.81	81 - 117	30 - 125	percent	J/UJ	M	
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Aluminum	-31.65	74 - 119	30 - 125	percent	J/X	M	Spike amount Insignificant
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Manganese	-679.9	84 - 114	30 - 125	percent	J/X	M	Spike amount Insignificant
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Chromium	125.0	85 - 113	30 - 125	percent	J/None	M	
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Calcium	187.4	81 - 116	30 - 125	percent	J/None	M	Spike amount Insignificant
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Zinc	54.84	82 - 113	30 - 125	percent	J/UJ	M	
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Potassium	67.30	81 - 116	30 - 125	percent	J/UJ	M	
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Lead	74.07	81 - 112	30 - 125	percent	J/UJ	M	
NHFLA-MSD2-AUG2020 (SD)/ SN7207-005P	Antimony	26.22	79 - 114	30 - 125	percent	J/X	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW6010, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MS1-AUG2020 (SD)/ SN7207-004P	Iron	21.91	< 20	< 20	rpd	J/UJ	D	
NHFLA-MS1-AUG2020 (SD)/ SN7207-004P	Manganese	26.34	< 20	< 20	rpd	J/UJ	D	
NHFLA-MS1-AUG2020 (SD)/ SN7207-004P	Potassium	29.77	< 20	< 20	rpd	J/UJ	D

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285198-1 (LB)/ WG285198-1	Chromium, Hexavalent	0.002400	< 0.00076	< 0.025	mg/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW7196

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB7-AUG2020	EB	Chromium, Hexavalent	0.0250	0.00540 J	0.0125 U		mg/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MS1-AUG2020 (MS)/ WG285618-3	Chromium, Hexavalent	70.74	84 - 110	30 - 125	percent	J/UJ	M	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS Recovery for SW7196

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-DUP1-AUG2020	FD	Chromium, Hexavalent	0.570	0.340 U	0.340 UJ		mg/kg	M
NHFLA-MW15-A-AUG2020	N	Chromium, Hexavalent	0.570	0.340 U	0.340 UJ		mg/kg	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-DUP1-AUG2020 (FD)/ SN7207-4		8.250	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-DUP2-AUG2020 (FD)/ SN7207-5		8.140	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW15-A-AUG2020 (N)/ SN7207-1		8.250	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Qualified Results associated with the MS Recovery for SW7470

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB7-AUG2020	EB	Mercury	0.200	0.0210 JN*	0.0210 J	-	ug/l	M/D/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7470, MS RPD

The objective of matrix spikes/matrix spike duplicates (MS/MSD) RPD analysis is to demonstrate acceptable method precision by the laboratory at the time of analysis. MS/MSD analyses are also performed to generate data that determines the long-term precision of the analytical method on various matrices. Non-homogenous samples can impact the apparent method precision. Summary forms were evaluated and compared to electronic data deliverables. Matrix spikes/matrix spike duplicates results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB7-AUG2020 (SD)/ SN7207-008P	Mercury	0.2480	< 0.2	< 0.2	ug/l	J/UJ	D	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the MS RPD for SW7470

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB7-AUG2020	EB	Mercury	0.200	0.0210 JN*	0.0210 J	-	ug/l	M/D/TR

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Toluene	0.4400	< 0.27	< 1	ug/l	U/None	V	
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Methylene chloride	1.600	< 1.1	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285741-10 (LB)/ WG285741-10	Methylene chloride	9.600	< 7.9	< 25	ug/kg	U/None	L	
WG285988-2 (LB)/ WG285988-2	Methylene chloride	11.00	< 7.9	< 25	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-DUP1-AUG2020	FD	Methylene chloride	24.0	11.0 J	12.0 UJ		ug/kg	L
NHFLA-DUP2-AUG2020	FD	Methylene chloride	20.0	9.70 JMM	10.0 UJ		ug/kg	L/M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW15-B-AUG2020 (N)/ SN7207-2	1,2-Dichloroethane-d4	158.0	71 - 136	10 - 136	percent	J/None	I	
NHFLA-MW15-B-AUG2020 (N)/ SN7207-2	1-Bromo-4-fluorobenzene (4-Bromofluorobenzene)	47.20	79 - 119	10 - 119	percent	J/UJ	I	
NHFLA-MW15-B-AUG2020 (N)/ SN7207-2	Dibromofluoromethane	68.80	78 - 119	10 - 119	percent	J/UJ	I	
NHFLA-MW15-C-AUG2020 (N)/ SN7207-3	1,2-Dichloroethane-d4	138.0	71 - 136	10 - 136	percent	J/None	I	
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	1,2-Dichloroethane-d4	146.0	71 - 136	10 - 136	percent	J/None	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-DUP1-AUG2020 (FD)/ SN7207-4		14.40	< 14	< 28	days	J/UJ	H1	Test Exceeds UWL
NHFLA-DUP2-AUG2020 (FD)/ SN7207-5		14.32	< 14	< 28	days	J/UJ	H1	Test Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Trip Blank

The purpose of trip blanks is to determine the existence and magnitude of cross-contamination problems resulting from the shipping of samples. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in trip blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-TB7-AUG2020 (TB)/ SN7207-9	Methylene chloride	1.400	< 1.1	< 5	ug/l	U/None	T	
NHFLA-TB8-AUG2020 (TB)/ SN7207-10	Methylene chloride	1.400	< 1.1	< 5	ug/l	U/None	T	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB7-AUG2020 (EB)/ SN7207-8	Diethyl phthalate	3.700	< 1.9	< 9.4	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285192-1 (LB)/ WG285192-1	Bis(2-ethylhexyl)phthalate	2800	< 98	< 330	ug/kg	U/None	L	
WG285635-1RA (LB)/ WG285635-1RA	Bis(2-ethylhexyl)phthalate	4100	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, LCS Recovery

The laboratory control sample/laboratory control sample duplicate (LCS/LCSD) serves as a monitor of the overall performance of each step during the analysis, including the sample preparation. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285183-2 (BS)/ WG285183-2	Benzaldehyde	310.0	10 - 189	10 - 189	percent	J/None	C	
WG285183-2 (BS)/ WG285183-2	Caprolactam	7.680	10 - 86	10 - 86	percent	J/X	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, MS Recovery

Data for matrix spikes/matrix spike duplicates (MS/MSD) are generated to determine long-term precision and accuracy of the analytical method on various matrices and to demonstrate acceptable compound recovery by the laboratory at the time of sample analysis. These data alone cannot be used to evaluate the precision and accuracy of individual samples. However, when exercising professional judgment, MS/MSD data can be used in conjunction with other available QC information. Reported results were evaluated to determine compliance with the required acceptance criteria, and summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MS1-AUG2020 (MS)/ WG285635-3	Bis(2-ethylhexyl)phthalate	190.1	51 - 133	10 - 133	percent	J/None	M	
NHFLA-MS1-AUG2020 (MS)/ WG285635-3	Benzaldehyde	494.5	10 - 34	10 - 134	percent	J/None	M	
NHFLA-MS2-AUG2020 (MS)/ WG285635-5	Bis(2-ethylhexyl)phthalate	413.6	51 - 133	10 - 133	percent	J/None	M

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	Nitrobenzene-d5	31.20	37 - 122	10 - 122	percent	J/UJ	I	
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	2,4,6-Tribromophenol	33.90	39 - 132	10 - 132	percent	J/UJ	I	
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	2-Fluorophenol	34.20	35 - 115	10 - 115	percent	J/UJ	I	
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	2-Fluorobiphenyl	36.60	44 - 115	10 - 115	percent	J/UJ	I	
NHFLA-MW6-B-AUG2020 (N)/ SN7207-7	Terphenyl-d14	46.20	54 - 127	10 - 127	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Chromium, Hexavalent (Colorimetric) (SW7196/SW3060)	**Recovery Limit**	**RPD Limit**	**MS Percent Recovery**	**MS Percent Recovery**		
Chromium, Hexavalent (mg/kg)	84-110	20	70.7	94.3	0.570 UJ	0.540 U

Notes:
Shaded cells identify any compounds that were outside the acceptable MS/MSD recovery limit.
Bold = Bolded result indicates positively identified compounds in the parent sample

µg/L = micrograms per liter
%R = percent recovery
ID = Identification
MS = Matrix Spike
MSD = Matrix Spike Duplicate
NA = Not Applicable
RPD = Relative Percent Difference
U = Compound was not detected and was reported at the limit of quantitation (LOQ).
VOC = volatile organic compound

UJ = The analyte was analyzed for, but was not detected. The reported LOQ is approximate.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Notes:
Shaded cells identify any compounds that were outside the acceptable MS/MSD recovery limit.
Bold = Bolded result indicates positively identified compounds in the parent sample

µg/L = micrograms per liter
%R = percent recovery
ID = Identification
MS = Matrix Spike
MSD = Matrix Spike Duplicate
NA = Not Applicable
RPD = Relative Percent Difference
U = Compound was not detected and was reported at the limit of quantitation (LOQ).
VOC = volatile organic compound

UJ = The analyte was analyzed for, but was not detected. The reported LOQ is approximate.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Shaded cells identify any compounds that were outside the acceptable MS/MSD recovery limit.
Bold = Bolded result indicates positively identified compounds in the parent sample

µg/L = micrograms per liter
%R = percent recovery
ID = Identification
MS = Matrix Spike
MSD = Matrix Spike Duplicate
NA = Not Applicable
RPD = Relative Percent Difference
U = Compound was not detected and was reported at the limit of quantitation (LOQ).
VOC = volatile organic compound

UJ = The analyte was analyzed for, but was not detected. The reported LOQ is approximate.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Notes:
Shaded cells identify any compounds that were outside the acceptable MS/MSD recovery limit.
Bold = Bolded result indicates positively identified compounds in the parent sample

µg/L = micrograms per liter
%R = percent recovery
ID = Identification
MS = Matrix Spike
MSD = Matrix Spike Duplicate
NA = Not Applicable
RPD = Relative Percent Difference
U = Compound was not detected and was reported at the limit of quantitation (LOQ).
VOC = volatile organic compound

UJ = The analyte was analyzed for, but was not detected. The reported LOQ is approximate.
J = The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
D	MS RPD
D3	Field Duplicate RPD
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
M	MS Recovery
T	Trip Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?	•			note: surrogate recoveries for sample -001DL were diluted to below reliably quantifiable levels so were not used to qualify results.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285184-1RA method blank had detections below the LOQ for benzo (b)fluoranthene, benzo(k)fluoranthene, benzo (a)pyrene, indeno(123cd)pyrene, dibenzo (ah)anthracene, benzo(ghi)perylene and chrysene. Client sample -008 results for all these results with the exception of chrysene were qualified as non-detect at either the LOD or the LOQ and qualified with U flags and L reason codes. QC batch WG285191-1 method blank had a detection for benzo(a)anthracene. Field samples associated with this method blank were not used as final reportable results so qualifications were not made in the database based on this method blank detection. QC batch WG285634-1 method blank had detections below the LOQ for benzo (b)fluoranthene, benzo(k)fluoranthene, dibenzo (ah)anthracene, benzo(a)pyrene, benzo (ghi)perylene and indeno(123cd)pyrene. This method blank was not associated with reportable results so was not used to qualify field data.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify field sample results.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG285191-2 LCS had recoveries biased low for benzo(b)fluoranthene. Client samples -001, -002, -003, -005, -006, -007 results for this analtye were qualified as estimated with J flags if detected and UJ flags if non-detect.
Was the LCS/LCSD RPD within project acceptance limits?			•	LCS only.
Was a MS/MSD pair prepared with each batch?	•			

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Were MS/MSD recoveries within project acceptance limits?		•		Sample -004 MS/MSD recoveries were ALL outside of project criteria biased low and high except for acenaphthylene. Since most of the spike recoveries were not used due to 4X rule only the following edits were made to the database based on these MS/MSD outliers: NAPHTHALENE, 2-METHYLNAPHTHALENE, ACENAPHTHENE, DIBENZO (AH)ANTHRACENE, FLUORENE - M reason codes and all (except acenaphthylene) RPD's were outliers so all results also received D reason codes. NOTE: sample -001 (parent sample for field duplicate) was also qualified in the same manner. Sample -005 MS/MSD recoveries were ALL outside of project criteria biased low and high except for acenaphthylene. Since most of the spike recoveries were not used due to 4X rule only the following edits were made to the database based on these MS/MSD outliers: NAPHTHALENE, 2-METHYLNAPHTHALENE, DIBENZO(AH)ANTHRACENE - M reason codes and all (except acenaphthylene, 2-methylnaphthylene, dibenzo(ah)anthracene) RPD's were outliers so all results also received D reason codes. NOTE: sample -002 (parent sample for field duplicate) was also qualified in the same manner.
Was the MS/MSD RPD within project acceptance limits?		•		see above for narration.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?		•		Samples -001 (field) and -004 (field duplicate) duplicate RPD's were outside of project criteria for all target analytes EXCEPT 2-methylnaphthalene, naphthalene, acenaphthylene and fluorene. Samples -002 (field) and -005 (field duplicate) duplicate RPD's were outside of project criteria for all target analytes EXCEPT 2-methylnaphthalene, naphthalene and acenaphthylene. These outliers were qualified as estimated with J flags and D3 reason codes. NOTE: analytes associated with results below the LOQ or ND were not subject to qualification.
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard and calibration outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?		•		
Were any data rejected during the verification process?		•

Review Questions

Method: SW6010 (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch NH28IMW2 had detections below the LOQ for aluminum, copper, magnesium, sodium. Client sample -008 results for these metals were qualified as non-detect at the LOD and qualified with U flags and L reason codes. QC batch PBSNH31ICS1 had detections below the LOQ for aluminum, calcium, chromium, iron, magnesium, potassium, sodium and QC batch PBSNI01HCS1 detections for aluminum, barium, calcium, chromium, magnesium, potassium, sodium and zinc and QC batch NI02ICS1 for magnesium and nickel. Qualifications were not required based on these soil prep batch method blank detections.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify soil field sample detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			lcs only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		MS/MSD for sample -004 were outliers biased low for antimony, lead, nickel, zinc and copper and biased high for potassium with MS/MSD RPD outlier for silver. MS recoveries were subject to the 4X rule for aluminum, calcium, iron, magnesium and manganese. Client samples -004 and -001 (field duplicate source sample) results for antimony, lead, nickel, zinc, potassium and copper were qualified estimated with J flags and M reason codes. Flags were removed for vanadium for samples -001 and -004.MS/MSD for sample -005 were outliers biased low for antimony, zinc, potassium and biased high for chromium, arsenic, copper and silver and biased high and low for lead with MS/MSD RPD outliers for copper and silver. MS recoveries were subject to the 4X rule for aluminum, calcium, iron, magnesium and manganese. Client samples -005 and -002 (field duplicate source sample) results for antimony, lead, zinc, potassium, chromium, arsenic and copper were qualified estimated with J flags and M reason codes. Silver did not require qualification since results were non-detect with a high MS bias.

Review Questions

Method: SW6010 (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Was the MS/MSD RPD within project acceptance limits?		•		See MS narration for RPD outliers. In addition to copper and silver the 4X result MS/MSD RPD's were outliers for iron, manganese, potassium in sample -004 and calcium, potassium, manganese for sample -005. Associated field sample results (-004 and -001 for iron, manganese, potassium, silver) (-005 and -002 for calcium, copper, iron, manganese and silver) were qualified estimated with D reason codes.
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?		•		Field duplicate -004 and field sample -001 duplicate RPD's were outside of project criteria for chromium and manganese. These results were qualified with D3 reason codes in both samples.
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•

Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		One of four surrogate recoveries were biased high in client samples -003 and -007. Methylene chloride results in these samples should be considered estimated and qualified with J flags. One of four surrogate recoveries was biased high and 2 of 4 biased low in client sample -002. All field sample -002 results should be considered estimated and qualified with UJ flags if non-detect and J flags if detected. NOTE: all re-analysis sample surrogate recoveries were biased low for 1 of 4 surrogates so were not used as final results.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285741-10 and WG285988-2 method blanks had detections below the LOQ for methylene chloride. Client samples -004 and -005 methylene chloride results were qualified as non-detect at the LOD and qualified with U flags and L reason codes.
Were target analytes in the field blank less than MDL?		•		Trip blank had a detection below the LOQ for methylene chloride and equipment blank detections were for methylene chloride and toluene.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?	•			
Were MS/MSD recoveries within project acceptance limits?		•		Sample -004 MS/MSD recoveries were outliers biased low for most target analytes. Sample -001(field duplicate parent sample) and -004 result qualifications are summarized in appropriate QC outlier table. Sample -005 MS/MSD recoveries were outliers biased low for multiple target analytes. Please see appropriate QC outlier table for detailed list of sample -005 and -002 (parent sample to field duplicate -005) target analyte flags.
Was the MS/MSD RPD within project acceptance limits?		•		Sample -004 MS/MSD RPD's were outliers for 2-hexanone, isopropylbenzene, methylacetate. Sample -001 (parent sample for -004 field duplicate) and -004 results associated with these outliers were non-detect so qualification was not required based on these MS/MSD RPD outliers.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?	•			
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary

Review Questions

Method: SW8260 (Volatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard, CCV outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?		•		
Were any data rejected during the verification process?		•		

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			Sample -007 was re-analyzed outside of holding time (-007RA) so this data was not used for final reportable results.
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?		•		Sample -007 original analysis had 5 of 6 surrogate outliers biased low. All results were qualified as estimated with UJ flags if non-detect and J flags if detected and I reason codes.
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batches WG285192-1 and WG285635-1 had detections above the LOQ for bis-2-ethylhexylphthalate. Client samples -001, -002, -003, -004, -005, -006, -007 results for this analyte were qualified as non-detect at the LOQ with U flags and L reason codes.
Were target analytes in the field blank less than MDL?		•		Equipment blank had a detection for diethylphthalate below the LOQ.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?		•		QC batch WG285192-2 recoveries were biased high for benzaldehyde, 3,3-dichlorobenzidine, bis-2-ethylhexylphthalate and biased low for caprolactam and atrazine. Client samples -001, -002, -003, -004, -005, -006, -007 results for caprolactam and atrazine should be considered estimated and qualified with UJ flags and C reason codes and bis-2-ethylhexylphthalate results for samples -001 and -004 J flagged with C reason codes. QC batch WG285183-2 recoveries were biased high for benzaldehyde and biased low below 10% for caprolactam. Client sample -008 caprolactam results should be considered unusable and was qualified with an X flag and C reason code. QC batch WG285635 LCS high bias outliers for benzaldehyde and bis-2-ethylhexylphthalate and low bias outlier for caprolactam were not associated with any final reportable results.
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?	•			

Review Questions

Method: SW8270 (Semivolatile Organic Compounds by Capillary GC/MS)				
Review Questions	Yes	No	NA	Comment
Were MS/MSD recoveries within project acceptance limits?		•		Sample -004 MS/MSD recoveries were outliers biased high for benzaldehyde and bis-2-ethylhexylphthalate and biased low with an RPD outlier for 4-chloroaniline and RPD outlier only for 2,4-dimethylphenol. Client samples -001 (duplicate source sample) and -004 results for bis-2-ethylhexylphthalate were qualified estimated with J flags and 4-chloroaniline qualified estimated with UJ flags and M reason codes. Sample -005 MS/MSD recoveries were outliers biased high for benzidine and bis-2-ethylhexylphthalate. Client samples -002 (duplicate source sample) and -005 bis-2-ethylhexylphthalate results were qualified estimated with J flags and M reason codes.
Was the MS/MSD RPD within project acceptance limits?		•		See RPD comments above in MS/MSD outlier section.
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?	•			
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		ICAL, ICV, calibration and peak tailing outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?		•		CA's for all of the above outliers could not be confirmed from the stage 2A report.
Were any data rejected during the verification process?	•			Caprolactam results for field sample -008.

This report assesses the analytical data quality associated with the analyses listed on the preceding cover page at S2AVEM data validation level. This assessment has been made through a combination of automated data review (ADR) and supplemental manual review, the details of which are described below. The approach taken in the review of this data set is consistent with the requirements contained in the Nike BU 51/52 Quality Assurance Project Plan and the additional guidance documents incorporated by reference to the extent possible. Where definitive guidance is not provided, results have been evaluated in a conservative manner using professional judgment.

Sample collection was managed and directed by Seres-Arcadis JV; analyses were performed by Katahdin Analytical Services, Westbrook, ME and were reported under sample delivery group (SDG) SN7239. Data have been evaluated electronically based on electronic data deliverables (EDDs) provided by the laboratory, and hard copy data summary forms have also been reviewed during this effort and compared to the automated review output by the reviewers whose signatures appear on the following page. Findings based on the automated data submission and manual data verification processes are detailed in the ADR narrative and throughout this report.

All quality control (QC) elements associated with this SDG have been reviewed by a project chemist in accordance with the requirements defined for the project. This review is documented in the attached Data Review Checklists. The QC elements listed below were supported by the electronic deliverable and were evaluated using ADR processes.

- Blank - Negative
- Equipment Blank
- Extracted Internal Standard
- Lab Blank
- Lab Replicate RPD
- LCS Recovery
- LCS RPD
- MS Recovery
- Prep Hold Time
- Surrogate
- Test Hold Time
- Trip Blank

Results of the ADR process were subsequently reviewed and updated as applicable by the data review chemists identified on the signature page. Quality control elements that were not included in the electronic deliverable were reviewed manually and findings are documented within this report. Summaries of findings and associated qualified results are documented throughout this report.

A total of 130 results (20.87%) out of the 623 results (sample and field QC samples) reported are qualified based on review and 0 results (0.00%) have been rejected or deemed a serious deficiency. Trace values, defined as results that are qualified as estimated because they fall between the detection limit and the reporting limit/limit of quantitation, are not counted as qualified results in the above count. The qualified results are detailed throughout this report and discussed in the narrative below, where appropriate.

Narrative Comments

Hydrazine field sample results and QC are included in this SDG but electronic data is in separate SDG (13059-1). Please reference validation report 13059-1 for data qualification summary.

Reviewed by Jim Tomalia, Senior Environmental Compliance Specialist, CADENA LLC

As the Reviewer, I certify that I have performed a data review process in accordance with the requirements of the project guidance document, and have compared the electronic data to the laboratory's hard copy report and have verified the consistency of a minimum of 10% of the reported sample results and method quality control data between the two deliverables.

Quality Control Outliers for test method LYDKHN, Prep Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of extraction found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW13-A-AUG2020 (N)/ SN7239-1		6.930	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW13-B-AUG2020 (N)/ SN7239-2		6.900	< 0	< 0	days	J/X	H2	Prep Exceeds UCL
NHFLA-MW13-C-AUG2020 (N)/ SN7239-3		6.860	< 0	< 0	days	J/X	H2	Prep Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6010, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Barium	0.02800	< 0.025	< 0.5	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Chromium	0.08700	< 0.026	< 1	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Zinc	0.2000	< 0.17	< 2	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Magnesium	1.500	< 0.68	< 10	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Aluminum	2.200	< 0.71	< 30	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Sodium	3.500	< 1.5	< 100	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Potassium	5.400	< 2.9	< 100	mg/kg	U/None	L	
PBSNI01ICS1 (LB)/ PBSNI01ICS1	Calcium	6.400	< 1.8	< 10	mg/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW6020, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB8-AUG2020	EB	Barium	2.00	1.90 J	2.00 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Beryllium	1.00	0.0570 J	0.200 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Calcium	110	110	110 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Chromium	5.00	2.21 J	4.00 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Magnesium	100	30.0 J	80.0 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Manganese	2.00	1.60 J	2.00 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Potassium	1000	47.0 J	400 U		ug/l	L
NHFLA-EB8-AUG2020	EB	Sodium	1000	240 J	400 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB8-AUG2020 (EB)/ SN7239-4	Chromium, Hexavalent	0.001200	< 0.00076	< 0.025	mg/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW7196, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285231-1 (LB)/ WG285231-1	Chromium, Hexavalent	0.001300	< 0.00076	< 0.025	mg/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW7196

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB8-AUG2020	EB	Chromium, Hexavalent	0.0250	0.00120 J	0.0125 U		mg/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW7196, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW13-A-AUG2020 (N)/ SN7239-1		7.240	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW13-B-AUG2020 (N)/ SN7239-2		7.210	< 1	< 2	days	J/X	H1	Test Exceeds UCL
NHFLA-MW13-C-AUG2020 (N)/ SN7239-3		7.160	< 1	< 2	days	J/X	H1	Test Exceeds UCL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB8-AUG2020 (EB)/ SN7239-4	Methylene chloride	1.400	< 1.1	< 5	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285324-2 (LB)/ WG285324-2	Methylene chloride	1.100	< 1.1	< 5	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB8-AUG2020	EB	Methylene chloride	5.00	1.40 J	2.50 U		ug/l	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285867-2 (LB)/ WG285867-2	Methylene chloride	11.00	< 7.9	< 25	ug/kg	U/None	L	
WG286120-2 (LB)/ WG286120-2	Methylene chloride	11.00	< 7.9	< 25	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8260

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW13-A-AUG2020	N	Methylene chloride	23.0	15.0 J	23.0 UJ		ug/kg	L/I
NHFLA-MW13-B-AUG2020	N	Methylene chloride	21.0	13.0 J	21.0 UJ		ug/kg	L/H1
NHFLA-MW13-C-AUG2020	N	Methylene chloride	21.0	11.0 J	21.0 U		ug/kg	L

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW13-A-AUG2020 (N)/ SN7239-1	1-Bromo-4-fluorobenzene (4-Bromofluorobenzene)	75.60	79 - 119	10 - 119	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8260

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8260, Test Hold Time

Hold times are ascertained based on project requirements. Holding times were determined by comparing the chain of custody records with the dates of analysis found in the electronic data deliverable and laboratory summary forms. Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-MW13-A-AUG2020 (N)/ SN7239-1		14.17	< 14	< 28	days	J/UJ	H1	Test Exceeds UWL
NHFLA-MW13-B-AUG2020 (N)/ SN7239-2		18.12	< 14	< 28	days	J/UJ	H1	Test Exceeds UWL
NHFLA-MW13-C-AUG2020 (N)/ SN7239-3		14.14	< 14	< 28	days	J/UJ	H1	Test Exceeds UWL

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Test Hold Time for SW8260

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Equipment Blank

The purpose of equipment blanks is to determine the existence and magnitude of cross-contamination problems resulting from the process during sampling. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in equipment blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB8-AUG2020 (EB)/ SN7239-4	Diethyl phthalate	4.200	< 1.9	< 9.7	ug/l	U/None	V	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285454-1 (LB)/ WG285454-1	Bis(2-ethylhexyl)phthalate	14.00	< 1.7	< 10	ug/l	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

No results associated with this QC element required qualification.

Quality Control Outliers for test method SW8270, Lab Blank

The purpose of laboratory blanks is to determine the existence and magnitude of cross-contamination problems resulting from laboratory activities. Reported results were evaluated to determine compliance with the required acceptance criteria. Summary forms were evaluated and compared to electronic data deliverables. Findings of this review, and contaminants found in laboratory blanks are listed below along with any associated qualified results.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285330-1 (LB)/ WG285330-1	Bis(2-ethylhexyl)phthalate	4600	< 98	< 330	ug/kg	U/None	L	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Lab Blank for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW13-A-AUG2020	N	Bis(2-ethylhexyl)phthalate	360	3000 BL	3000 J	+	ug/kg	L/C

Findings of this review, and any associated qualified results, are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
WG285330-2 (BS)/ WG285330-2	3,3'-Dichlorobenzidine	125.1	22 - 121	10 - 121	percent	J/None	C	
WG285330-2 (BS)/ WG285330-2	Bis(2-ethylhexyl)phthalate	235.3	51 - 133	10 - 133	percent	J/None	C	
WG285330-2 (BS)/ WG285330-2	Benzaldehyde	237.1	10 - 134	10 - 134	percent	J/None	C	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the LCS Recovery for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-MW13-A-AUG2020	N	Bis(2-ethylhexyl)phthalate	360	3000 BL	3000 J	+	ug/kg	L/C
NHFLA-MW13-B-AUG2020	N	Bis(2-ethylhexyl)phthalate	380	3700 BL	3700 J	+	ug/kg	L/C
NHFLA-MW13-C-AUG2020	N	Bis(2-ethylhexyl)phthalate	380	4800 BL	4800 J	+	ug/kg	L/C

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.

Quality Control Outliers for test method SW8270, Surrogate

Method performance for individual samples is demonstrated through spiking activities. All samples are spiked with surrogate compounds prior to sample preparation. The sample itself may produce effects due to such factors as interferences and high concentrations of analytes. Summary forms were evaluated and compared to electronic data deliverables. Surrogate results that were outside of the acceptance criteria are listed below.

Sample ID/ Lab Sample ID	Analyte	Result	Warning Limits	Control Limits	Units	Qualifier	Reason Code	Comment
NHFLA-EB8-AUG2020 (EB)/ SN7239-4	2,4,6-Tribromophenol	37.90	43 - 140	10 - 140	percent	J/UJ	I	

Where two qualifiers are listed, such as 'J/UJ', the first applies to positive results, and the second to non-detect results.
Upper and Lower Warning and Control Limits are abbreviated UWL, LWL, UCL, and LCL in the Comment field.

Qualified Results associated with the Surrogate for SW8270

FieldSample ID	Type	Analyte	LOQ	Lab Result	Qualified Result	Bias	Units	Reason
NHFLA-EB8-AUG2020	EB	2,4,5-Trichlorophenol	24.0	18.0 U	18.0 UJ		ug/l	I
NHFLA-EB8-AUG2020	EB	2,4,6-Trichlorophenol	9.70	7.30 U	7.30 UJ		ug/l	I
NHFLA-EB8-AUG2020	EB	2,4-Dichlorophenol	9.70	7.30 U	7.30 UJ		ug/l	I
NHFLA-EB8-AUG2020	EB	2,4-Dimethylphenol	9.70	7.30 U	7.30 UJ		ug/l	I
NHFLA-EB8-AUG2020	EB	2,4-Dinitrophenol	24.0	18.0 U	18.0 UJ		ug/l	I
NHFLA-EB8-AUG2020	EB	2-Chlorophenol	9.70	7.30 U	7.30 UJ		ug/l	I

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Table of Results with Modified Qualifiers

Modified Qualifiers for test method LYDKHN

FieldSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
NHFLA-MW13-A-AUG2020	N	Total Organic Carbon	880	22000	22000 J	22000	
NHFLA-MW13-B-AUG2020	N	Total Organic Carbon	940	15000	15000 J	15000	
NHFLA-MW13-C-AUG2020	N	Total Organic Carbon	880	17000	17000 J	17000	

Modified Qualifiers for test method SW6020

FieldSample ID	Type	Analyte	LOQ	Lab Result	ADR Result	Modified Result	Reason
NHFLA-EB8-AUG2020	EB	N-Nitrosodiphenylamine	9.70	7.30 U	7.30 UJ	7.30 U	

Analytes not found in project samples are reported as not detected at the limit of detection (LOD) unless blank contamination occurs and then the sample may be reported as not detected at the (LOQ) based on the sample concentration.
In instances where no LOD is provided, results are reported down to the LOQ.
Trace values are not included in the qualified results table unless additional reason codes are associated.

Rejected Results

Automated Data Review Detail Report for SN7239
C02NY0079-02, Nike BU 51/52, Launch Area
Nike BU 51/52 Quality Assurance Project Plan

Anomalies Count

Test/Extraction Method/Leach	Field Samples Outside of Compliance	Analytes Outside of Compliance
SW6010/SW3050/NONE	3	22
SW7196/SW3060/NONE	3	3
SW8270/SW3550/NONE	3	90

Anomalies are cases where the reported RL exceeds that specified in the governing project document.

Reporting Anomalies are cases where the laboratory quantitation limit (LOQ or RL) exceeds the Project Quantitation Limit Goal or Reporting Limt specified in the governing project document.

Reason Code Definitions

Code	Definition
C	LCS Recovery
H1	Test Hold Time
H2	Prep Hold Time
I	Surrogate recovery outside project limits.
L	Lab Blank
TR	Trace Level Detect
V	Equipment Blank

Flag Code and Definitions

Flag	Definition
U	Undetected: The analyte was analyzed for, but not detected.
UJ	The analyte was not detected; however, the result is estimated due to discrepancies in meeting certain analyte-specific quality control criteria.
J	Estimated: The analyte was positively identified, the quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
R	The data are rejected due to deficiencies in meeting QC criteria and may not be used for decision making.
B	Blank contamination: The analyte was found in an associated blank above one half the RL, as well as in the sample.
UB	The analyte was also detected in an associated laboratory or field blank at a concentration comparable to the concentration in the sample. The reported result has been requalified as not detected.
X	The sample results (including non-detects) were affected by serious deficiencies in the ability to analyze the sample and to meet published method and project quality control criteria. The presence or absence of the analyte cannot be substantiated by the data provided. Acceptance or rejection of the data should be decided by the project team (which should include a project chemist), but exclusion of the data is recommended.

Review Questions

Method: BNASIM (GC/MS-SIM Analysis by SW8270)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Were surrogate recoveries within project acceptance limits?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?	•			
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?		•		Internal standard and calibration outlier issues noted in case narrative were not addressed as part of this stage 2A validation review.
Were DoD QSM corrective actions followed if deviations were noted?		•		
Were any data rejected during the verification process?		•		

Review Questions

Method: LYDKHN (Lloyd Kahn Method for the Determination of Total Organic Carbon in Sediment, USEPA Region II Method)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			Removed H2 qualifiers for samples -001, -002, -003. Test performed in 7 days versus 14 day recommended hold time.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?	•			
Were target analytes in the field blank less than MDL?			•	
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?	•			
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6010 (Trace Metals by Inductively Coupled Plasma/Atomic Emission Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch PBSNI01HCS1 detections for aluminum, barium, calcium, chromium, magnesium, potassium, sodium and zinc. Qualifications were not required based on these soil prep batch method blank detections.
Were target analytes in the field blank less than MDL?		•		Equipment blank detections were not used to qualify soil field sample detections.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			lcs only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW6020 (Trace Metals by Inductively Coupled Plasma/Mass Spectrometry)				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch PBWNH31IMW2 prep blank had detections below the LOQ for aluminum, barium, beryllium, calcium, chromium, copper, lead, magnesium, manganese, potassium, sodium. Client sample -004 results for the following metals were qualified as non-detect at either the LOD or LOQ with U flag and L reason code: barium, beryllium, chromium, magnesium, manganese, potassium, sodium. Client sample -004 calcium result was qualified as non-detect at the amount reported in the sample (110ug/l adjusted LOQ) and qualified with a U flag and L reason code.
Were target analytes in the field blank less than MDL?		•		Sample -004 was the equipment blank.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS only
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?			•	
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?			•	
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary

Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•		

Review Questions

Method: SW7196 (Chromium, Hexavalent (Colorimetric))				
Review Questions	Yes	No	NA	Comment
Did Chain-of-Custody information agree with laboratory report and EDD for requested field samples and tests?	•			
Were samples preserved properly and received in good condition?	•			
Were holding times met?	•			H1 reason codes were removed for soil samples since holding times were within project criteria.
Were all requested target analytes reported?	•			
Was a method blank prepared and analyzed with each batch?	•			
Were target analytes in the method blank less than MDL?		•		QC batch WG285231 had a detection below the LOQ. Field sample -004 result was qualified as non-detect with a U flag and L reason code.
Were target analytes in the field blank less than MDL?		•		Equipment blank detection was qualified as noted above as non-detect at the LOQ due to method blank detection.
Was an LCS/LCSD pair prepared and analyzed with each batch?	•			LCS ONLY
Were LCS/LCSD recoveries within project acceptance limits?	•			
Was the LCS/LCSD RPD within project acceptance limits?			•	
Was a MS/MSD pair prepared with each batch?		•		Only 1 MS was reported in the batch QC. Method requires spiking for soluble and insoluble MS.
Were MS/MSD recoveries within project acceptance limits?			•	
Was the MS/MSD RPD within project acceptance limits?			•	
Were the post spike recoveries within project acceptance limits?			•	
Were the serial dilution RPD values within project acceptance limits?			•	
Was the laboratory duplicate RPD within project acceptance limits?	•			
If a field duplicate was analyzed, were the RPDs within QAPP acceptance limits?			•	
Were QAPP specified laboratory PQLs achieved?	•			Unless otherwise noted in specified in anomaly outlier summary
Have all Laboratory Case Narrative comments/findings been addressed in the data review process?	•			
Were DoD QSM corrective actions followed if deviations were noted?			•	
Were any data rejected during the verification process?		•
