1. Introduction

The New England District (NAE) of the US Army Corps of Engineers (USACE) is currently preparing a feasibility study for improvements to the New Haven Harbor Federal navigation project (FNP). Aspects of the study include: deepening the main ship channel from 35 feet to a depth up to 42 feet at mean lower low water (MLLW); widening the main ship channel from 400 feet to 500 feet inshore of the breakwaters and to 600 feet on the seaward side; widening the channel bend at Southwest Ledge from 560 feet to a minimum of 780 feet; straightening the channel bend downstream of the existing turning basin; revising the location of the turning basin; and deepening the turning basin from 35 feet to a depth up to 42 feet MLLW. These combined actions would require the mechanical removal of approximately 4,500,000 cubic yards of sediment and 55,100 cubic yards of rock. To the extent practical, suitable material will be beneficially reused for beach nourishment, marsh creation, upland construction projects, and to cover historic dredged material mounds in Long Island Sound. The remainder of the material is expected to be suitable for unconfined placement at the Central Long Island Sound Disposal Site (CLDS).

The purpose of the sampling effort described in this report was to characterize the material that would be produced by the proposed improvement dredging project as well as to aid in the USACE's evaluation of this material for the various placement alternatives. In support of this goal, sediments from 26 core locations within New Haven Harbor were selected to undergo physical, chemical, and biological testing in accordance with the evaluation requirements set forth in the Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters (U.S. Environmental Protection Agency [EPA]/USACE, 2004). A work plan (AECOM, 2017a – Appendix A) was prepared to guide this effort in response to the project requirements identified by NAE in the Statement of Work (SOW) dated 31 May 2017. This report summarizes the methodology used for field sampling and laboratory analysis as well as the results of testing which will be used by NAE to generate a dredged material suitability determination.

1.1 Relevant regulations/standards

Data for the dredged material suitability evaluations under the Marine Protection, Research, and Sanctuaries Act (MPRSA) and Clean Water Act (CWA) have been collected based on quality standards outlined in *QA/QC Guidance for Sampling and Analysis of Sediments, Water and Tissues for Dredged Material Evaluations* (EPA, 1995). Evaluations have followed guidance provided in the Green Book (EPA/USACE, 1991), the *Inland Testing Manual* (EPA/USACE, 1998), and the *Regional Implementation Manual* (RIM) (EPA/USACE, 2004).

2. Methods

Field and laboratory methods are detailed in the project work plan (AECOM, 2017a), comprised of a Field Sampling Plan (FSP) and a Quality Assurance Project Plan (QAPP). These documents are included in Appendix A. Brief summaries of the methods used are included in the following subsections.

2.1 Field sampling

Sample locations were established by NAE and distributed throughout proposed project area in New Haven Harbor. Final sampling locations are depicted in Figures 1 and 2. Appropriate volumes of dredge area sediment and water were collected at each of 26 harbor stations for the physical, chemical, and biological testing from August 8 – 17, 2017 as described in the sections below. Sediment and water from the CLDS Reference Site (CLDS-Ref) were also collected to facilitate the evaluation of the dredge area material for placement at that location. A full field report (AECOM, 2017b) describing the sampling effort is provided in Appendix B.

Vessel positioning and the determination of actual core sample locations were accomplished utilizing a Differential Global Positioning System (DGPS) with an attempt to collect each core within 3 meters or less of the target location. Local National Oceanic and Atmospheric Administration (NOAA) tide data was obtained from Station 8465705 in real time in order to calculate tidal height in feet above MLLW. Table 2 of the Field Report (AECOM, 2017b) lists the actual coring positions for each coring attempt.

Field observations including penetration depth, material recovery, visual descriptions, and core photographs are also provided in the Field Report (AECOM, 2017b).

1 – Sample collected using grab sampler. Other samples collected using vibracoring device.

2 – Seawater samples used to prepare elutriate samples for multiple composites.

Figure 1 Actual Coring and Water Sampling Locations – Inner Harbor

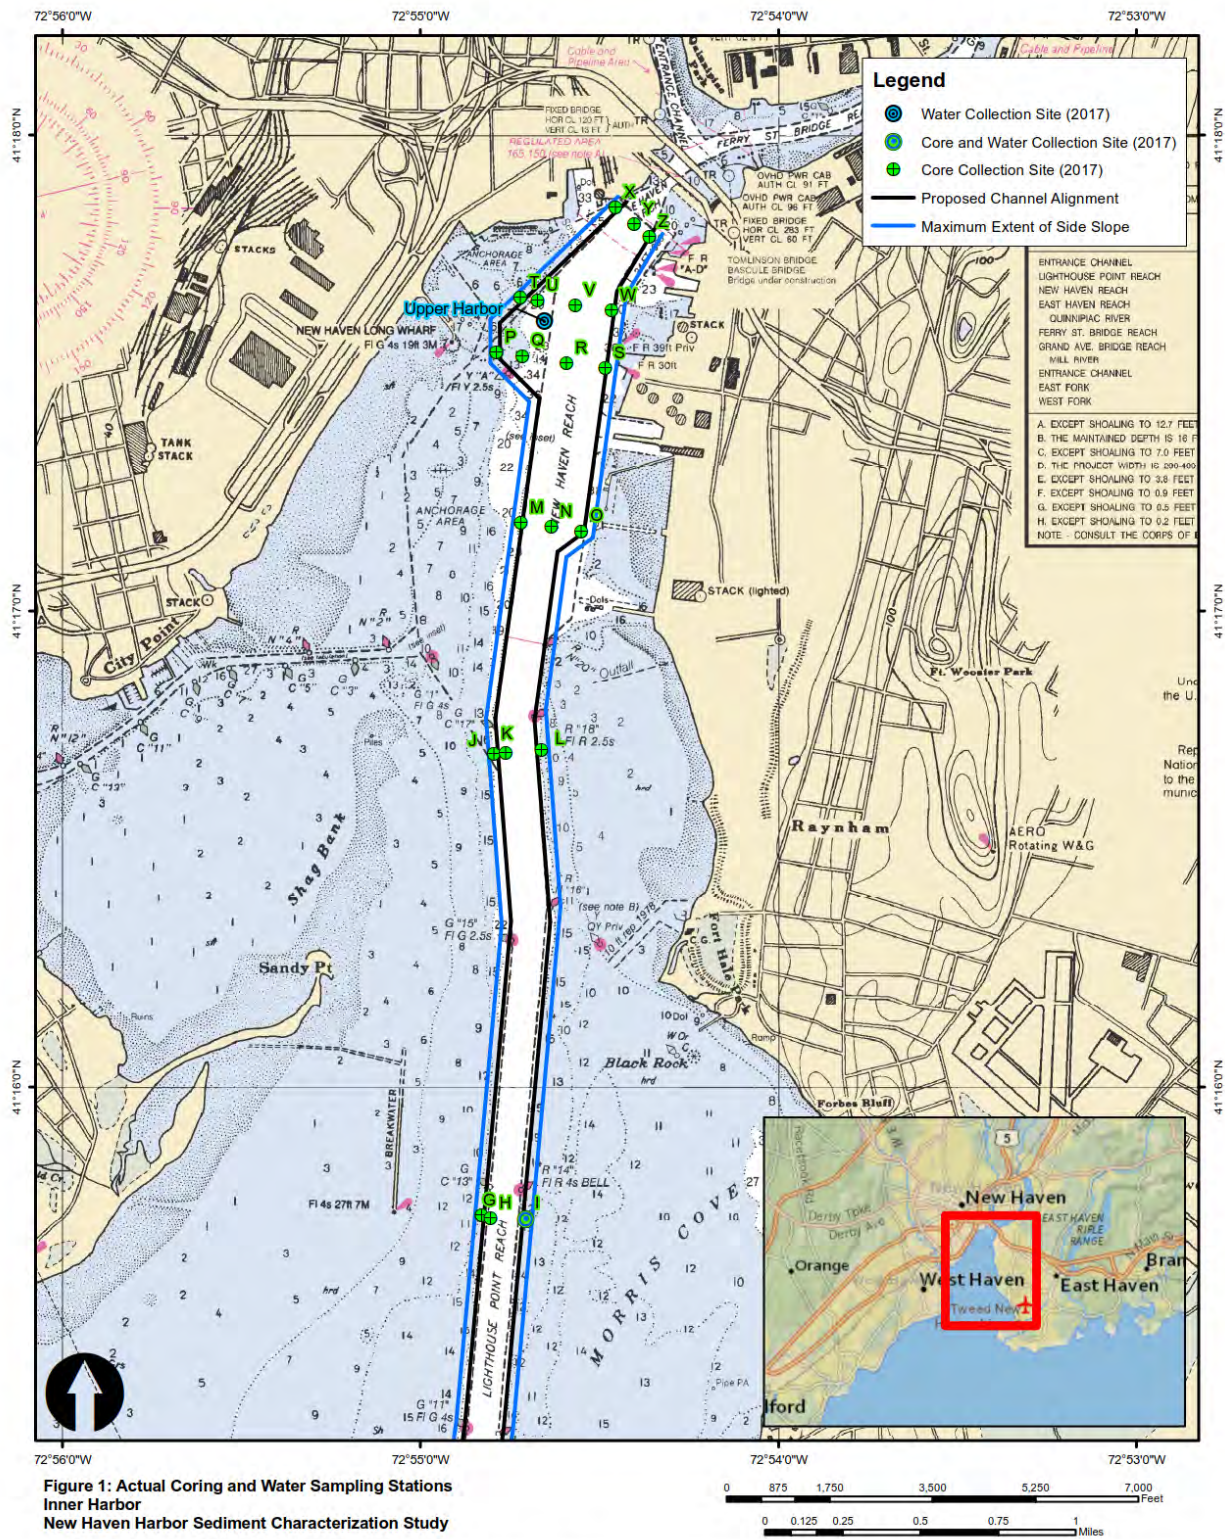

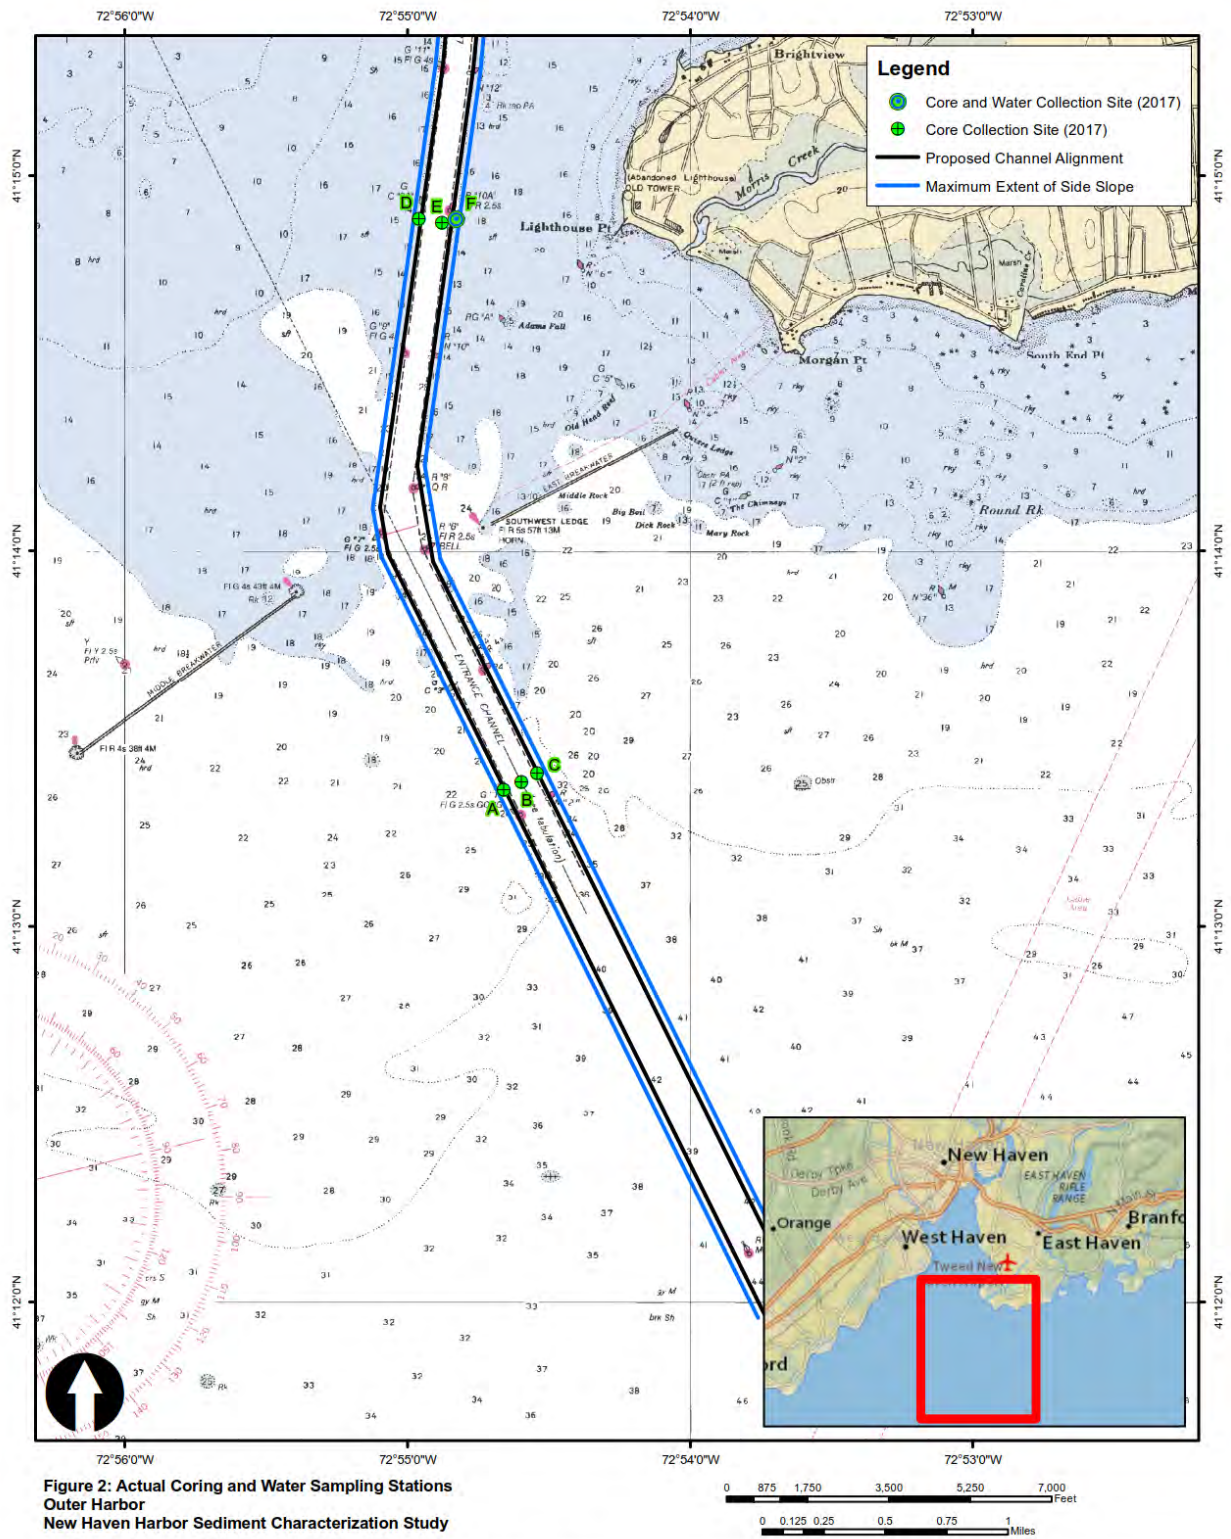

Figure 2 Actual Coring and Water Sampling Locations – Outer Harbor

2.1.1 Sediment collection

An initial core was collected to project depth at each of the 26 harbor stations for grain size and chemistry using a 3.5-inch diameter vibracore (Figures 1 and 2). Field characterization of the sediment cores determined which sediment horizons were selected for analysis (Table 1). Based on the initial grain size results NAE directed the project team to composite sediments from the core locations and depth intervals outlined in Table 2 for toxicological/biological testing. Additional cores were then collected in order to obtain a sufficient volume of sediment from the sample interval at each location for elutriate preparation, 10-day toxicity, and 28-day bioaccumulation testing.

Reference sediment was collected from CLDS-Ref using a Ted Young modified Van Veen grab sampler and a Ponar grab sampler. All sediment samples were transferred to a refrigerated box truck immediately after returning to the dock. The field report (AECOM, 2017b) provided in Appendix B provides additional detail related to the sampling in the harbor and the reference location.

2.1.2 Surface water collection

Water from the vicinity of the sediment composites in New Haven Harbor (dredge site water) and the CLDS reference area (suspended particulate phase [SPP] dilution water) were collected on August 17, 2017 using a pump and tubing system as outlined in the work plan (Table 2, Figures 1 and 2). The CLDS reference water was collected using a large volume Niskin bottle. Water samples were also transferred to the refrigerated box truck immediately after returning to the dock.

2.1.3 Sampling deviations/difficulties encountered

There are a few notes of interest relative to the New Haven Harbor sediment collection effort:

1. Significant changes to bottom topography were encountered relative to the last bathymetric study of the harbor. At all locations, the planned core length required to attain the target depth (project depth plus a 2-foot allowable over depth) required adjustment in the field using field collected depth soundings and real time tidal correction data from NOAA.
2. According to the SOW, the sediment cores were supposed to be characterized via ASTM 2488. However, they were not. To compensate for this sediment from each sample intervals analyzed for grain size via hydrometer (ASTM 7928) in order to obtain more detailed information on the distribution of fine grained sediments in the project area. Due to the large volume of sediment required from a short interval at station NHH-C during the second week of the program, two individual cores were stacked within a single 5-foot core barrel prior to processing. The stacking process involves advancing the vibracore barrel to the target depth, raising the core barrel out of the sediment, and then advancing the barrel again. The approach greatly reduced the time to collect required sediment volume. Prior to proceeding with the stacked approach, a single 5-foot core was collected for comparison to the stacked core samples to verify that appropriate materials and recovery were retained within the 20 stacked samples.
3. Similarly, sediment volume collection at NHH-I would have required a large number of cores due to the shallow project depth (2.5 feet). In order to meet schedule constraints, the NAE Technical Manager approved collection using a Van Veen/ ponar grab sampler.

2.2 Sample processing and analysis

The project QAPP provides detailed descriptions of all aqueous, sediment, and tissue sample handling and the methods used for chemical, physical and biological testing. Section B.6 of the QAPP (AECOM, 2017a) summarize the chemical and physical testing methods used and Section B.7 summarizes the bioassay and bioaccumulation test methods. Only minor deviations from the QAPP were noted and these are discussed in Section 4.1 for the biological testing and Section 4.2 for the analytical chemistry. These deviations are not expected to have an impact on the usability of the data for decision making.

The analytical project team included two laboratories:

- EnviroSystems Inc. (ESI)(Hampton, NH) provided processing facilities and performed bulk sediment, SPP, and bioaccumulation bioassays, and elutriate chemistry testing; and
- Alpha Analytical Laboratories (Mansfield, MA) provided chemical and physical testing services.

Sediment samples for chemical or physical testing were transferred directly from the field to the associated laboratory. All other samples (bulk sediment or water grab samples) were transferred to the processing facility (ESI) for further processing before subsequent testing commenced. All field to lab and inter-lab transfers were conducted under chain-of-custody (COC) procedures as specified in the project work plan. These records are included in the laboratory backup appendices.

2.2.1 Phased testing

Testing was conducted in two phases. The first phase provided NAE with rapid sediment grain size results to enable NAE to develop a compositing scheme for subsequent testing. The second phase represented full scale testing of the site material including physical and chemical testing performed on individual sediment samples, and elutriate chemistry testing, toxicity bioassays and bioaccumulation bioassays performed on the sample composites identified in Table 2.

2.2.2 Sample handling

As outlined in the work plan, cores representing the depth interval of interest were collected via vibracore (Table 1). After collection, the core was cut into 5.0-foot sections to facilitate handling. The liner of those individual core sections were then split longitudinally, photographed, and described/ logged. At many of the stations, two depth intervals were selected for sampling due to changes in stratigraphy (composition and color). After logging was complete, the requisite core section (surface to project depth) was transferred to storage containers (5-gallon polyethylene buckets) and the entire interval homogenized to obtain depth-integrated samples. Sub-samples were collected for rapid grain size analysis and chemistry. The remaining material was retained for biological testing and kept in labeled, 5-gallon polyethylene buckets prior to compositing. Once the compositing scheme had been determined, a second set of cores was advanced in order to collect the necessary volume for biological testing.

Water samples were collected via Niskin bottle and a pump/ tubing assembly, stored in labeled, 5-gallon polyethylene carboys, and kept on ice until returning to the dock. All sediment and water samples were securely stored in a locked, refrigerated box truck (set to 4°C) for the duration of the field effort. At the conclusion of the sampling program, all samples were delivered to ESI's laboratory on August 18, 2017. During the sampling program, there were not any deviations from the sample hold times and preservation conditions outlined in the workplan (Appendix A).

The field report (AECOM, 2017b) provided in Appendix B provides additional detail related to the sampling handling and processing.

2.2.3 Test sample preparation and compositing

Following the sample compositing direction from NAE, eight harbor sediment composites were prepared by combining equal volumes of the material from the various stations collected via vibracore for subsequent testing. Sample composites were prepared by AECOM staff on August 21-22, 2017 at ESI according to the work plan (Appendix A). The sample compositing scheme is depicted in Table 2.

2.2.4 Physical and chemical sample analysis

Physical and chemical analysis methods are fully detailed in the project work plan (Appendix A). In some cases, specialized or modified methods were specified to accommodate unique project objectives. A description of the specialized or modified methods is also provided in this section. All laboratory reports for physical and chemical analyses are provided in Appendices C and D, respectively.

The project team used EPA SW-846 8270D-SIM /680M for the analysis of polychlorinated biphenyl (PCB) congeners. The selected gas chromatography/mass spectrometry (GC/MS) method is generally preferred because it provides

more definitive quantitation and identification of the target PCB congeners and is less prone to interferences or mis-identification than the earlier 8082 (gas chromatography/electron capture detector [GC/ECD]) method. Table 3 summarizes the analytes, analytical methods and method detection limits achieved for the bulk sediment chemistry analyses of the individual core samples.

2.2.5 Elutriate/suspended particulate phase sample preparation and analysis

New Haven Harbor dredge site water was used in the preparation of all chemical elutriates and formed the basis of all elutriate/SPP sample preparations. Water from CLDS was used for all SPP dilutions in the toxicity tests.

Each elutriate/SPP batch was prepared by adding the homogenized sediment to the site water in a 1:4 volumetric ratio, stirring the mixture for 30 minutes, and then allowing the mixture to settle for 1 hour. The supernatant was siphoned off prior to chemical and biological evaluations. Chemical samples were also centrifuged as required by the protocols. All samples were stored at or below 4°C when not in use. Elutriate samples were containerized for chemistry analysis (i.e., filtration of metals samples, analysis of metals and (total) organic compounds). Table 4 provides a summary of the elutriate/ SPP preparation.

Elutriate samples were analyzed for metals, pesticides, pentachlorophenol, and PCB congeners. Most seawater metal measurements were aided with an initial preconcentration step to separate the analytes of interest from the interfering salt matrix. An inductively coupled plasma mass spectrometer (ICP/MS) was then used for the analysis of the extracted metals. Alternate methods (as specified in the work plan) were used to measure chromium 6 (Cr6+), and mercury (Hg) in the elutriate/seawater matrix. Table 5 summarizes the analytes, analytical methods and method detection limits achieved for the elutriate chemistry analyses.

Water column bioassays were conducted in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998) and the project work plan (AECOM, 2017a). Test organisms for the water column bioassays included *A. bahia*, *Menidia beryllina*, and *Arbacia punctulata*. Table 6 summarizes the test conditions for these bioassays and Table 7 identifies the dates of the SPP testing. The toxicity tests were completed on a total of eight elutriate samples that were split into two groups of four and analyzed in two separate rounds of assays (referred to as Round 1 and Round 2) with staggered start dates, each with their own respective laboratory control samples and reference samples. All SPP testing was started before the 24-hour holding time for suspended particulate phase solutions. Results and protocol deviations are described in Section 3.2.2.

2.2.5.1 Test species

A. bahia were ≤ 5 days old and were obtained from cultures maintained by Aquatic Resource Organisms (ARO) of Hampton, New Hampshire. *M. beryllina* were 9-14 days old at the start of the assay and were obtained from Aquatic BioSystems, Inc., (ABS), Fort Collins, Colorado for the Round 1 assay, and from ARO for the Round 2 assay. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. Organisms were transferred to test vessels using a large bore pipet to minimize the amount of water added to test solutions.

Adult *A. punctulata* were from cultures maintained by ESI. Original stock was obtained from a commercial supplier. Adult sea urchins are maintained in the laboratory for as long as they are viable. Male and female urchins are maintained in separate chambers at a temperature of approximately $12 \pm 3^\circ\text{C}$ after spawning.

2.2.5.2 Reference toxicant assays

ESI completed acute 96-hour sodium dodecyl sulfate (SDS) reference toxicant assays for *A. bahia* and *M. beryllina*. Results were within two standard deviations of the historic mean of ESI's control charts, indicating that the test organisms were healthy. The *A. punctulata* copper reference toxicant assay was also within two standard deviations of the corresponding control chart mean. Table 8 summarizes the results of the reference toxicant assays conducted in support of the SPP assays.

Although the work plan (AECOM, 2017a) specified that the reference toxicant assays be conducted concurrent with the SPP tests, the reference toxicant assays were conducted approximately a week after the SPP tests terminated. The RIM does not specify that the assays be conducted concurrently and the lack of concurrence between the project assay and the reference toxicant assays does not impact the findings of the project assays.

2.2.6 10-day whole sediment toxicity testing

Bulk sediment bioassays are an important part of the overall suitability testing framework for CLDS consideration and agency guidance specifies that a filter feeder, a deposit feeder, and a burrowing organism be represented in the assay. Ten-day whole sediment bioassays were performed using the crustacean *Americamysis bahia* (mysid shrimp) and the crustacean amphipod *Leptocheirus plumulosus* to represent these feeding strategies in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998), and the project work plan (AECOM, 2017a). *A. bahia* is a filter and deposit feeder that spends much of its time in the water above the sediment-water interface. The amphipod *L. plumulosus* builds burrows in the sediment and feeds on particles that are in suspension and on the sediment surface.

Table 9 summarizes the test conditions for the 10-day whole sediment toxicity tests. Assays with both species began on September 1, 2017 and were terminated on September 11, 2017. The control sediment used in the assays was natural sediment collected from the Hampton Estuary, Hampton, New Hampshire. The area is not known to receive any direct industrial inputs and has been used as a laboratory reference sediment in the testing of marine sediments for over 25 years. Overlying seawater was obtained from the Hampton Estuary. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. Seawater is obtained through a filter system located on the bottom of the estuary at a point approximately 1 mile from the open ocean.

Results and protocol deviations are described in Section 3.1.3.

2.2.6.1 Test species

A. bahia were obtained from ARO. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *A. bahia* used in the assay were ≤ 5 days old at the start of the test.

L. plumulosus were obtained from cultures maintained by ARO. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *L. plumulosus* were non-reproductive adults.

2.2.6.2 Reference toxicants

As part of the laboratory quality control program, standard reference toxicant assays were conducted with a subsample of the organisms received for testing, for each test species. ESI completed an acute 96-hour SDS reference toxicant assay for *A. bahia* and 96-hour cadmium reference toxicant assay for *L. plumulosus*. Results were within two standard deviations of the historic mean of ESI's control charts, indicating that the test organisms were healthy. Table 10 summarizes the results of the reference toxicant assays conducted in support of the SPP assays.

2.2.7 28-day bioaccumulation bioassay and analysis

The 28-day solid phase/bioaccumulation evaluation was conducted in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998) and the project work plan (AECOM, 2017a) using the bivalve *Macoma nasuta* and the burrowing polychaete *Nereis virens*. Table 11 summarizes the test conditions for the 28-day bioaccumulation bioassay.

The *M. nasuta* assays were initiated on August 29, 2017 and were completed on September 26, 2017. The *N. virens* assays were initiated on August 31, 2017 and came down on September 28, 2017. Results and protocol deviations are described in Section 3.3.1.

At the end of the 28-day bioaccumulation assay exposure period and the 24 hour depuration period, the test organisms were recovered, rinsed/depurated with clean seawater, homogenized, frozen and transferred to the chemistry laboratory for preparation and analysis. Tissue samples were analyzed for metals, PAHs, pesticides, PCB congeners. Table 12 summarizes the analytes, analytical methods and method detection limits achieved for the tissue chemistry analyses.

2.2.7.1 Test species

M. nasuta, 15-40 mm in total length, were obtained from ARO. Organisms were field collected along the Washington coast and shipped to ARO via overnight delivery. At ESI, the clams were placed in clean holding sediment with flowing seawater and monitored for at least 24 hours prior to use. Damaged bivalves and those that would not close when prodded were discarded. The *Macoma* test commenced on August 29, 2017. A total of 30 organisms were added to each replicate in order to obtain sufficient tissue at test termination.

Adult *N. virens* were also obtained from ARO. Worms were collected in the field from the Damariscotta River in Boothbay Harbor, Maine and delivered to ARO. At ESI, the worms were placed in clean holding sediment with flowing seawater and monitored for at least 24 hours prior to use. Damaged and inactive worms were not used in the assay. The *Nereis* test assay commenced on August 31, 2017 with a total of 20 organisms added to each replicate in order to obtain sufficient tissue at test termination.

2.2.7.2 Reference toxicants

ESI completed acute 96-hour copper reference toxicant assays for *M. nasuta* and *N. virens* concurrent with the 28-day bioassays. Results were within two standard deviations of the historic mean of ESI's control charts, indicating that the test organisms were healthy. Table 13 summarizes the results of the reference toxicant assays conducted in support of the 28-day bioassays.

2.3 Data analysis

The array of chemical, physical and biological testing that was performed on the New Haven sediments provides a comprehensive data set from which material quality and its suitability for various alternative placement options, including unconfined placement at the CLDS, can be assessed. These data sets were generally evaluated in the following ways:

- Biological testing data were compared to reference or control values;
- Tissue chemistry results were compared to the reference site tissue chemistry using non-parametric and t-tests.

A description of these evaluation methods is provided below.

2.3.1 Toxicity bioassay statistics

Survival and effects data were analyzed using statistical software (CETIS) to determine significant differences between the project sediments and the laboratory control, and between project sediments or suspended phase solutions and the agency-selected reference site sediments or solutions. Survival data were evaluated to determine homogeneity of sample variances and normality of distribution. Data sets were subsequently evaluated using the appropriate parametric or non-parametric analysis. Pair-wise comparisons were based on the appropriate statistical analysis presented in the EPA decision tree guidelines specified in individual test methods. Statistical difference was evaluated at $\alpha=0.05$. For the SPP testing, acute exposure endpoints, the median lethal concentration (LC50) and the median effective concentration (EC50; in the *Arbacia* testing), were calculated and responses in the undiluted SPP solutions were evaluated against the responses in the reference site diluent.

2.3.2 Bioaccumulative tissue statistics

The statistical analyses of body burden data were completed to determine significant differences between the reference sediment and each site composite sample. The statistical analyses were completed for all compounds of concern identified in the work plan; however the findings of significance discussed in Section 3.3.3 focus only on those compounds detected in the reference sample. Per RIM guidelines, the MDL is used in instances when a compound is not detected for purposes of calculating a mean concentration. MDLs used in statistical computations are adjusted for differences in tissue mass and final extract volumes used in the analysis for each sample.

Data were evaluated to determine homogeneity of sample variances and normality of distribution using appropriate statistics. Data sets were subsequently evaluated using the appropriate parametric or non-parametric Analysis of Variance (ANOVA) statistic. Statistical difference was evaluated at $\alpha = 0.05$.

3. Results and discussion

The following sections present results evaluating the following potential exposure pathways that may be applicable to various placement options:

- Direct exposure to the dredged material (DM) following placement (bulk sediment);
- Direct exposure to the water column during/after mixing (elutriate and particulate phase analysis); and
- Bioaccumulation potential resulting from DM exposure over a period of time (bioaccumulation bioassays followed by tissue analysis).

The DM testing program proceeded in two phases. Phase 1 rapid grain size analyses were conducted to support sample pooling decisions and maximize full scale testing efficiency. Physical and chemical analyses were later repeated during Phase 2 of the testing program for chemical, physical, and biological testing data connectivity.

3.1 Sediment physical, chemical and toxicity characteristics

Bulk sediment quality and character are based on physical, chemical and toxicity bioassay tests. A wide range of chemical parameters was examined and toxicity was determined using 10-day exposures to crustaceans and amphipods. Detailed physical and chemical sediment measurements are provided in Table 14 (Phase 1) and Table 15 (Phase 2). The following sections present these findings; full laboratory backup files are provided in Appendices C, D, and E.

3.1.1 Sediment texture

Two primary sediment characteristics are sediment grain size and organic carbon content. Understanding sediment particle sizes and corresponding mineralogy is critical for evaluating sediment chemistry because chemical components vary naturally based on the mineralogy present. For example, chemical affinity to naturally occurring organic compounds, and chemical enrichment within biogenic carbon material are important processes that result in chemical enrichment within sedimentary organic carbon.

Table 14 (Phase 1) and Table 15 (Phase 2) summarize the sediment textures observed at the site. Backup laboratory grain size data for Phase 1 and Phase 2 are included in Appendices C1 and C2, respectively. Grain size data for the New Haven Harbor sediment samples showed that most samples were comprised predominantly of fine-grained materials (silt and clay) with a sub-set of samples containing predominantly sand (Table 15). Grain size correlated fairly well with total organic carbon (i.e., higher TOC values are generally related to samples with higher silt/clay fractions) (Table 5).

3.1.2 Sediment chemistry

After basic sediment properties like grain size and TOC content are understood (Tables 3 through 5), the chemical properties can be evaluated. Tables 16 through 20 summarize the results of the bulk sediment chemistry analyses conducted on 44 of the 51 samples submitted for grain size analysis. Backup laboratory sediment chemistry data are included in Appendix D1. An overview of findings per parameter is presented below.

In cases where values were below the laboratory reporting limit (RL), the result is considered undetected and qualified with a "U" in the data table.

3.1.2.1 Metals

Each of the eight metals analyzed (As, Cd, Cr, Cu, Pb, Hg, Ni, Zn) except mercury were present in all sediment samples at levels greater than the project reporting limits (Table 17). Mercury was reported as non-detect in six of the 44 samples and was reported as an estimated value between the method detection limit (MDL) and RL in three samples.

3.1.2.2 Polycyclic Aromatic Hydrocarbons (PAHs)

PAH compounds were detected in all but six of the 44 samples (Table 18). In all samples with detected PAHs, concentrations of high molecular weight (HMW)¹ PAHs were greater than the concentrations of the low molecular weight (LMW)² PAHs. The highest concentration of HMW and LMW PAHs (13,503 and 2,964 ug/kg, respectively) were measured in the field duplicate collected from the top horizon at location NHH-X (sample NHH-X-REP-TOP) with generally similar levels measured in the parent sample.

3.1.2.3 Pesticides

Pesticides were generally undetected or detected at low levels among in the samples (Table 19). Technical chlordane constituents, 4,4' DDE, 4,4' DDD, and 4,4' DDT were the most frequently detected pesticides; gamma-BHC (Lindane) was reported at two locations. Dieldrin and Endosulfan II were reported in several samples but results were qualified for interference and dual column precision that exceeds method criteria; this issue was also noted for several 4,4' DDT results.

3.1.2.4 Polychlorinated Biphenyls (PCBs)

Measurable concentrations of multiple PCB congeners were reported in 33 of the 44 samples (Table 20). Similar to the PAHs, the highest concentration of Total PCBs³ (1,658 ug/kg) was measured in the field duplicate collected from the top horizon at location NHH-X (sample NHH-X-REP-TOP) with generally similar levels measured in the parent sample.

3.1.2.5 Equipment Rinsate Blanks

Four rinsate blank samples (coring equipment, Niskin Bottle, pump and grab sampler) were analyzed for metals, PAHs, pesticides and PCBs (data are presented in Appendix D). No PCBs or pesticides were detected in any of the rinse blank samples above target reporting limits. Naphthalene was detected in all four rinse blank samples and ten other PAHs were also detected in the grab sampler rinsate. Chromium was detected in all four rinse blank samples and copper, nickel, and zinc were also detected in the grab sampler rinsate. Levels of constituents detected in the rinsate blanks were orders of magnitude lower than concentrations of these metals analyzed in sediment samples.

3.1.3 Whole sediment toxicity

A summary of survival data from the *A. bahia* and *L. plumulosus* assays is included in Table 21. Support data, including copies of bench sheets, are included in Appendix E1. Table 22 summarizes the laboratory control results and other assay acceptability criteria.

Before organisms were added to the test vessels, ammonia levels in the pore water were determined and pore water was found to contain unionized ammonia levels above 0.8 mg/L. Test initiation was delayed and test chambers were renewed daily with one volume addition of overlying water during this pre-assay phase. The sediments were monitored until colorimetric testing showed acceptable ammonia levels. As discussed in Section 3.1.3.1, pore water ammonia samples collected at the start of the *L. plumulosus* assay showed unionized ammonia levels in Composite 6 and Composite 8 were above the 0.8 mg/L threshold. However, ammonia toxicity does not appear to have impacted the results for these samples (see discussion in Section 3.1.3.1).

3.1.3.1 *A. bahia* 10 day solid phase assay

Mean mysid survival in the laboratory control sediment was 92%, and met guideline acceptance criteria (e.g. mean survival >90%; >70% in any replicate). Mean survival in the reference sediment was 98%. Survival of mysid shrimp exposed to New Haven Harbor sediment composites groups ranged from 74 to 96%. Statistical analyses show that there were negative effects on survival for mysids exposed to site Composite samples 1, 5 and 6 as compared to

¹ Calculated as the sum of concentrations for fluoranthene, pyrene, benz(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene, and benzo(ghi)perylene.

² Calculated as the sum of concentrations for naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, and anthracene.

³ Calculated as the sum of the 18 NOAA congeners multiplied by 2.

mysids exposed to the CLDS reference sediment. The difference in survival from the CLDS reference sediment was <20% for Composite samples 1 and 5, however it was >20% for Composite sample 6.

3.1.3.2 *L. plumulosus* 10 day solid phase assay

Mean amphipod survival in the laboratory control was 94% and met acceptance criteria. Survival among organisms exposed to reference sediment was 95%, with mean survival of amphipods exposed to harbor sediments ranging from 87 to 96%. The statistical analyses show that there were no negative effects on survival for amphipods exposed to any of the site composites, except for Composite 8, as compared to amphipods exposed to the CLDS reference sediment. In Composite 8 however, the difference in survival from the CLDS reference sediment was <20%.

3.1.3.1 Whole sediment protocol deviations

Review of the data collected for these assays documented a few minor deviations from the method protocol and/or ESI's standard procedures.

Protocol requires that the *A. bahia* and *L. plumulosus* assays be conducted at $20 \pm 1^\circ\text{C}$. A temperature spike occurred beginning in the overnight hours at the outset of the assay, and the hourly temperatures exceeded the protocol range for approximately 16 hours reaching a maximum of 29.6°C at 5:37 AM on Saturday morning, September 2, 2017. The technician conducting the study assessed the temperature control unit of the water bath being used and determined that the unit was set to 19.5°C , with a thermostat reading of 19°C , indicating that the unit had malfunctioned. To correct the issue, the unit was disabled and room temperature adjusted to compensate. No further temperature deviations were noted for the remainder of the assay as demonstrated by the mean temperature of 20.8°C , which falls within the protocol range. The maximum temperature recorded also falls within the acceptable range for the species.

Protocol requires that the dissolved oxygen (DO) levels are maintained at or above 6 mg/L, and the assays were aerated from the start to ensure this requirement was met. However, there were sporadic DO measurements that fell below 6 mg/L in both assays (1 measurement in the *L. plumulosus* assay and 4 measurements in the *A. bahia* assay). There were no notations indicating a reason for this, however it is most likely that aeration tubes had fallen out of the test vessels and were replaced on discovery. The mean DO levels were well above the threshold, indicating that overall the desired DO levels were maintained.

To reduce pore water ammonia concentrations prior to the start of the assays, the overlying water was renewed daily for one week prior to the addition of the test organisms. However, upon review of final ammonia data it was determined that the unionized ammonia levels in Composites 6 and 8 of the *L. plumulosus* assay were above the protocol threshold limit of 0.8 mg/L for assay initiation, with calculated unionized ammonia values of 1.64 and 0.86 mg/L, respectively. No significant effects occurred with organisms exposed to Composite 6, which had two times the level of unionized ammonia than the threshold. There was only an 8% difference in mean survival for Composite 8 as compared to the reference site, and the unionized ammonia levels in Composite 8 had reached 0.11 mg/L by test day 3, suggesting that organism exposures above the target threshold were limited. This, coupled with the fact that no significant effect occurred in Composite 6, suggest that effects in Composite 8 do not stem from ammonia toxicity. A colorimetric test is used to determine total ammonia values during the pre-assay monitoring phase of testing. Given that this approach is reliant on analyst interpretation, it likely was unclear that total ammonia values were high enough to result in a protocol excursion.

These lab issues are considered to have had no impact on the outcome of the assays.

3.2 Water column evaluations

Water column evaluations performed in this study incorporated the analysis of chemical elutriate samples and SPP bioassay tests. The full suite of chemicals were measured in the elutriate mixtures to evaluate possible DM effects on water quality at the CLDS. SPP toxicity bioassays included three test species: crustacean, fish, and sea urchin larvae. Acute toxicity as well as very sensitive (larvae) developmental effects have been evaluated.

3.2.1 Elutriate chemistry

Table 23 summarizes elutriate chemistry results obtained after mixing the site materials with reference site seawater to simulate DM mixing at the CLDS. Backup laboratory elutriate chemistry data are included in Appendix D2.

Pentachlorophenol and pesticides were below or only slightly above target reporting limits for all samples analyzed. PCBs were below or slightly above reporting limits in most samples with Composite 6 and Composite 7 having Total PCB levels approximately ten-fold higher than the other samples.

In general, metals results were also below or slightly above reporting limits in most samples, with the exception of As and Zn which were detected in all samples. Chromium, copper, and nickel were also each detected in at least one sample.

3.2.2 SPP bioassay results

The SPP endpoints and adverse effects are presented in Table 24. Laboratory summary reports, including laboratory bench data, are presented in Appendix E2. All SPP laboratory control samples met minimum test acceptability criteria. Survival in laboratory controls was 100% for *A. bahia* in Rounds 1 and 2 and *M. beryllina* in Round 1 and 96% for *M. beryllina* in Round 2. This meets the minimum test acceptability criteria of $\geq 90\%$ survival in the laboratory control and is an indication that the test organisms were healthy and not stressed by handling. In the *A. punctulata* assays, embryo counts in the laboratory control treatment for Round 1 showed 83% of the embryos survived at the end of the assay and, of the original embryos, 83% were normally developed pluteus larvae. In Round 2, 76% of the laboratory control embryos survived and 72% of the original embryos were normally developed pluteus larvae. These results meet the minimum test acceptability criteria of $\geq 70\%$ embryo survival and $\geq 70\%$ normal development in the laboratory control sample.

A notable amount of total ammonia (>10 mg/L) was observed in the elutriates from Composites 2, 3, 4, 5, 6, 7, and 8 at the start of the assays for all three test species. EPA guidance suggests that ammonia, generally in the unionized form, can be a source of toxicity when total ammonia values are >5 mg/L (EPA 2002). EPA Ambient Water Quality Criteria (AWQC) for unionized ammonia in saltwater references LC50 values for two of the species tested: *A. bahia* (1.04 mg/L) and *M. beryllina* (0.88 mg/L) (EPA 1989). AWQC for unionized ammonia in saltwater are not available for *A. punctulata*, however, effects levels are available in the literature for urchin species ranging from 0.06 mg/L for an EC-50 for development (Maguire Group Inc., 2003) to approximately 0.336 mg/L for a 96-hour LC50 (Chang-Hoon Lee et al., 2013). Calculated unionized ammonia values from the start of the assays for these composites and species ranged between 0.5 to 2.1 mg/L (*A. bahia*), 0.4 to 2.1 mg/L (*M. beryllina*) and 0.4 to 1.9 mg/L (*A. punctulata*). Consequently, given the low levels of contaminants detected in the elutriate samples (Table 23; Section 3.2.1) it is possible that any observed toxicity in these composites discussed below is a product of total and unionized ammonia content, rather than sediment-related contaminants of concern.

3.2.2.1 *A. bahia* and *M. beryllina* Acute SPP evaluations

Mysid shrimp were not adversely affected by exposure to SPP solutions prepared from Composites 1, 2, 3, 4, and 5 with LC50 values of $>100\%$ for these samples. LC50 values for Composites 6, 7, and 8 were 68%, 65%, and 84% respectively. As described above, elevated ammonia levels in the SPP solutions likely contributed to the observed toxicity for Composites 6, 7, and 8. Total ammonia levels in these three SPP solutions ranged from 40 to 62 mg/L at the start of the assay and from 19 to 36 mg/L at test termination.

Minnows were not adversely affected by exposure to SPP solutions prepared from Composites 1, 2, 3, and 4 with LC50 values of $>100\%$ for these samples. Minnow LC50 values ranged from 46 to 78% in the remaining four composites. Total ammonia levels in Composites 5, 6, 7 and 8 ranged from 34 to 62 mg/L at the start of the assay and from 12 to 15 mg/L at test termination and these levels likely contributed to the observed minnow toxicity in these tests.

3.2.2.2 *A. punctulata* Acute SPP evaluations

Arbacia punctulata is the most sensitive of the project SPP exposed species. Survival and normal development were quantified when it was determined that the majority of the larvae ($>90\%$) had reached the pluteus larval stage.

Review of the data collected at the end of the assay indicate that all but one composite elutriate solution had significant negative impacts on embryonic survival and/or development, with LC50s ranging from 9 to 35% for survival and with EC50s ranging from 1 to 17% for development. Composite 1 had LC50 and EC50 values of >100%.

As described above, ammonia levels were elevated at the start of the assays and *A. punctulata* appears to be even more sensitive to ammonia than the mysid shrimp or minnows. Composite 1, which showed no toxicity, had a total ammonia level of 1.8 mg/L at both test initiation and termination. The remaining composites had higher total ammonia levels ranging from 12 to 62 mg/L at test initiation. At test termination, total ammonia levels for Composites 2, 3, and 4 had reduced slightly from their start levels and ranged from 10 to 15 mg/L. Ammonia levels were inadvertently not measured at test termination for Composites 5, 6, 7, and 8, but given the elevated levels at test initiation (34 to 62 mg/L), it is expected that the test termination levels would have remained elevated. It is expected that the elevated ammonia levels in these composite samples contributed to the observed survival and development impacts in these tests.

3.2.2.1 SPP protocol deviations

Review of the data collected for these assays documented a few minor deviations from the method protocol and/or ESI's standard procedures.

The protocol requires that the assays be conducted at $20 \pm 2^\circ\text{C}$ for the *A. bahia* and *M. beryllina* assays, and $20 \pm 1^\circ\text{C}$ for the *A. punctulata* assay. Although the assays were, for the most part, maintained in incubators set at their target temperatures, some temperatures recorded during the assays fell outside of the protocol range due to the ambient laboratory temperature at the time that dilutions were mixed and water quality measurements were taken. These species can tolerate temperatures within the ranges measured, and EPA protocol allows temperatures of $25 \pm 2^\circ\text{C}$ for these species. It was noted that the incubator for the Round 1 mysid assays was initially set too high but was corrected and possibly over-compensated the next day.

In addition, the protocol requires that the assays be conducted at a salinity of $30 \pm 2\text{‰}$. It is not uncommon for the salinity to drift upwards during assay conduct due to evaporation and exceed the protocol requirement, but the salinities are adjusted daily as needed to account for this occurrence. In a few instances of the Round 1 mysid assay, the measured salinity was slightly below the acceptable range.

Last, due to technician oversight ammonia samples were not collected for analysis at assay initiation for the laboratory control or CLDS reference samples. Likewise, during Round 2 of the minnow and mysid assays the final ammonia samples were not collected for analysis. Rather, ammonia samples were taken from the 50% test concentration when the assays were terminated at 96 hours. Similarly, ammonia samples were not collected at the end of the Round 2 urchin assays.

These lab issues are considered to have had no impact on the outcome of the assays.

3.3 28-day bioaccumulation bioassay

To evaluate bioaccumulation potential of harbor sediments, the clam *Macoma nasuta* and the worm *Nereis virens* were exposed to material from the eight sediment composite groups. Table 25 provides a summary of the *M. nasuta* and *N. virens* survival data and Table 26 summarizes the laboratory control results and other assay acceptability criteria. Tissue chemistry data and statistical results (relative to reference) are summarized in Table 27 and Table 28. Laboratory bench sheets are included in Appendix E3.

3.3.1 Survival analysis

Mean *M. nasuta* survival was 97% and 99% for clams maintained in the laboratory control and reference (CLDS-Ref) site sediments, respectively. Mean percent survival of the bivalves exposed to harbor sediment composite groups ranged from 96 to 99%. The statistical evaluation of the survival data showed no significant reduction in survival for bivalves maintained in the site composites when compared to the CLDS reference sediment, with the exception of Composite 8; however, the difference in survival was <10% as compared with the CLDS reference sediment.

Polychaete survival was 92% and 98% in the laboratory control and reference (CLDS-Ref), respectively. Mean percent survival among *N. virens* exposed to harbor sediments ranged from 93 to 98%. The statistical evaluation of the data showed no significant reduction in survival for polychaetes maintained in the site composites when compared to the CLDS reference sediment, with the exception of Composite 6; however, the difference in survival was <10% as compared with the CLDS reference sediment.

Survival of clams and worms met established guideline criteria. Surviving organisms for both species tested provided sufficient tissue for preparation and analysis of body burdens.

3.3.1.1 28-day bioaccumulation bioassay protocol deviations

Review of the data collected for these assays documented one minor deviation from the method protocol and/or ESI's standard procedures.

The hourly temperature logger was activated on Day 0 (August 29, 2017) of the *M. nasuta* assay, 2 days earlier than the *N. virens* test was initiated. Due to an oversight, the temperature logger was removed from the temperature controlled room at the end of the *M. nasuta* assay on September 26, 2017, two days prior to the end of the *N. virens* assay. Therefore, hourly temperatures were not measured for the final two days of the *N. virens* assay. There were no abnormalities observed in the daily water quality measurements that were collected during this period. This represents a deviation from ESI's SOP and a data gap, however this deviation is considered to have had no impact on the outcome of the assays.

3.3.2 Tissue chemistry

Test organism tissues were analyzed for the full set of chemical parameters established for the program (AECOM, 2017a) to evaluate the bioaccumulative aspect of the project material. The chemical results provided in Table 27 (*M. nasuta*) and Table 28 (*N. virens*) are presented on a wet weight basis. Backup laboratory tissue chemistry data are included in Appendix D3. Statistical comparisons of tissue body burdens are discussed in Section 3.3.3.

Seven of the eight metals analyzed (As, Cd, Cr, Cu, Pb, Ni, Zn) were detected in all tissue composite samples. Mercury was not detected in clam tissues from Composites 1, 5, and 6. PAHs were detected in all tissue composite samples. For both clams and worms, the highest levels of PAHs were measured in Composite 8. Individual pesticides were detected infrequently in clam tissues and not at all in worm tissues. Endrin was the most frequently detected pesticide in the clam tissues. PCBs were detected in both clam and worm tissues from all composites except clam tissues from the CLDS reference site and Composite 1. Clam tissues from Composite 6 had the highest PCB concentrations.

3.3.3 Tissue body burden analysis

Review of *M. nasuta* tissue data document statistically significant uptake of several chemicals (Table 27). Based on NAE criteria, there were significant increases in body burdens for clams reared in site composites as compared to reference tissue for the following chemicals: cadmium, chromium, copper, lead, five PAHs (benzo[a]anthracene, benzo[b]fluoranthene, fluoranthene, phenanthrene and pyrene) and DDE. Nickel, zinc, and endrin were the only chemicals detected in reference tissue that did not demonstrate significant uptake in site composite tissue. Tissue from Composites 4, 5, 6, 7 and 8 consistently demonstrated significant increases in body burden. There was also significant uptake of pyrene from Composite 2.

Review of *M. nasuta* body burden data showed that the following chemicals were also detected in site composite tissues, but no further analysis was required because the chemical was not detected in reference tissue: four PAHs (benzo[a]pyrene, benzo[k]fluoranthene, chrysene, and indeno[1,2,3-cd]pyrene), nine PCB congeners (8, 44, 52, 66, 101, 105, 118, 138 and 153) and six pesticides (cis-chlordane, trans-nonachlor, DDT, DDD, dieldrin and beta-Endosulfan). These chemicals were primarily present at high concentrations in Composites 4, 5, 6, 7 and 8.

The review of *N. virens* tissue data also found statistically significant uptake of several chemicals in site composites (Table 28). The statistical evaluation found there were significant increases in body burdens for worms maintained in site composites as compared to reference site tissue for the following chemicals: copper, zinc, four PAHs (acenaphthene, acenaphthylene, naphthalene and phenanthrene) and two PCB congeners (138 and 153). It should

be noted that nearly all PAHs and PCBs reflect higher mean tissue concentrations in the site composites as compared with the reference composites, and the majority of these mean concentrations are at or near the MDL suggesting interferences with the tissue matrix, rather than actual detection of these chemicals in worm tissue. This is true for zinc and two of the PAHs (acenaphthene and naphthalene); all were found to be significantly higher in site composite tissue as compared with reference tissue. The same is true for phenanthrene, which was detected at or near the MDL in all composites except Composite 1 where the phenanthrene was detected above the reporting limit. In this instance, however, the only hit above the reporting limit (in replicate A) was identified as an outlier. Tissue from Composite 4 demonstrated significant uptake of copper, and Composites 6, 7, and 8 demonstrated significant increases in body burden for the PCB congeners 138 and 153. The other incidences of significant uptake of chemicals from Composites 2, 3, 4, 5, 6, 7 and 8 appeared to be at or near the MDL.

Review of body burden data for *N. virens* showed that the following chemicals were also detected in site composite tissues, but no further analysis was required because the chemical was not detected in reference tissue: four PAHs (anthracene, fluoranthene, fluorene and pyrene) and four PCB congeners (52, 101, 180 and 187). Most of these chemicals were primarily present at high concentrations in Composites 4, 5, 6, 7 and 8, although many of these chemicals were also present at low concentrations (at or slightly above the MDL) in Composite 1.

Results of body burden data generated from recovered *M. nasuta* and *N. virens* tissue consistently showed significant uptake of chemicals from Composites 4, 5, 6, 7 and 8. There were also sporadic incidences of significant uptake of chemicals from Composites 2 and 3, however these appeared to be at or near the MDL except in a few instances (e.g., fluorene and pyrene uptake in the clam from Composite 2).

Composite 5	85%	95%	90%	100%	80%	90%	Yes
Composite 6	85%	75%	70%	50%	90%	74%	Yes ²
Composite 7	90%	70%	90%	100%	100%	90%	No
Composite 8	100%	90%	90%	100%	100%	96%	No

***L. plumulosus* percent survival results**

	Replicate Survival at the End of 10 Days Exposure (%)					Mean Survival (%)	Statistically Different from CLDS Reference ¹ ?
	A	B	C	D	E		
Lab Control	90%	95%	95%	95%	95%	94%	--
CLDS Reference	95%	100%	90%	90%	100%	95%	--
Composite 1	95%	100%	85%	100%	95%	95%	No
Composite 2	85%	100%	85%	90%	95%	91%	No
Composite 3	90%	85%	95%	95%	100%	93%	No
Composite 4	100%	100%	95%	95%	90%	96%	No
Composite 5	95%	90%	90%	100%	85%	92%	No
Composite 6	95%	80%	85%	90%	95%	89%	No
Composite 7	90%	100%	100%	90%	100%	96%	No
Composite 8	90%	75%	90%	90%	90%	87%	Yes

1 – Statistically significant difference ($\alpha=0.05$) from CLDS Reference.

2 – Greater than a 20% difference in survival compared to CLDS Reference.

Table 22 Summary of laboratory control performance and assay acceptability criteria – 10-day whole sediment

Endpoint / Measurement	Protocol Criteria	Unit	<i>A. bahia</i>	<i>L. plumulosus</i>
Mean Survival		%	92%	94%
	Laboratory Control $\geq 90\%$	Protocol Met	Yes	Yes
Salinity	Minimum: <i>A. bahia</i> - 28ppt	ppt	29.0	18.8
	<i>L. plumulosus</i> - 18ppt	Protocol Met	Yes	Yes
	Maximum: <i>A. bahia</i> - 32ppt	ppt	31.8	22.3 ^a
	<i>L. plumulosus</i> - 22ppt	Protocol Met	Yes	Yes
Temperature	Mean: 20 \pm 1°C	Daily / Hourly °C	20.5 / 20.8	20.6 / 20.8
	Minimum: 17°C	Daily / Hourly °C	19.5 / 19.6	19.7 / 19.6
	Maximum: 23°C	Daily / Hourly °C	22.1 / 29.6 ^b	22.2 / 29.6 ^b
		Protocol Met	Yes / No ^b	Yes / No ^b

^a The value meets the protocol requirement when rounded to the whole number precision reflected in the method, therefore is not considered a protocol deviation.

^b Refer to Section 3.1.3.1 for a discussion of the deviation.

Results presented are the mean of three replicate samples.
Reporting limit (RL) used to represent non-detects in calculation of replicate means and summations for Total DDX and Total PCBs.
Total PCBs calculated as the sum of the 18 NOAA congeners multiplied by 2.
J – Estimated value.
U – Not detected above the laboratory RL.
T – Compound identification is tentative.

Composite 8	95%	100%	100%	95%	95%	97%	No

1 – Statistically significant difference ($\alpha=0.05$) from CLDS Reference.

No composites showed a greater than 10% difference from the CLDS Reference.

Table 26 Summary of laboratory control performance and assay acceptability criteria – 28-day bioaccumulation bioassay

Endpoint/ Measurement	Protocol Criteria	Unit	<i>M. nasuta</i>	<i>N. virens</i>
Mean Survival	Laboratory control >90%	%	97%	92%
		Protocol Met	Yes	Yes
Tissue Mass	Sufficient for analysis	Protocol Met	Yes	Yes
Salinity	Minimum: 28ppt	ppt	28.1	28.4
		Protocol Met	Yes	Yes
	Maximum: 32ppt	ppt	30.4	30.3
		Protocol Met	Yes	Yes
Temperature	Mean: 12-16°C	Daily/Hourly	12.5 / 12.7	12.4 / 12.7 ^a
	Minimum: 9°C	Daily/Hourly	11.9 / 12.2	11.8 / 12.2 ^a
	Maximum: 15°C	Daily/Hourly	12.8 / 14.1	12.6 / 14.1 ^a
		Protocol Met	Yes	Yes

^a The *M. nasuta* and *N. virens* assays did not run concurrently, the *M. nasuta* assay started and ended 2 days earlier than the *N. virens* assay. However, the shared hourly temperature logger was removed from the temperature-controlled room at the end of the *M. nasuta* assay, two days before the end of the *N. virens* assay, therefore these measurements were not collected. The values reported for *N. virens* are the same as for *M. nasuta*. See Section 3.3.1.1 for a discussion of the protocol deviation.

Table 27 Mean wet weight chemical concentrations and statistical findings for *M.nasuta* tissue

Results presented are the mean of five replicate samples.

1 - Totals calculated for informational purposes only. Statistical analysis not conducted on total values and qualifiers not applied.

Statistical qualifiers -

- a - Analyte not detected (below MDL) in at least one replicate; mean value was calculated using the project specific MDL for non-detected values.
- b - Analyte estimated (detected below RL but above MDL) in at least one replicate; mean value calculated using estimated value.
- c - Analyte was detected in the treatment tissue sample replicates at an equal or higher mean concentration than in the associated reference site tissue, however statistical analysis is not required as the analyte was not detected in any of the reference site replicates.

NS - Not Significant - mean tissue body burden was not statistically different from the associated reference site mean body burden. Statistical significance accepted at α=0.05.
S - Significant - mean tissue body burden was statistically different, greater than the associated reference site mean body burden. Statistical significance accepted at α=0.05
NS/S indicates that a statistical outlier was detected and the findings of significance were different with and without the statistical outlier included in the analysis.

Results presented are the mean of five replicate samples.

1 - Totals calculated for informational purposes only. Statistical analysis not conducted on total values and qualifiers not applied.

Statistical qualifiers -

- a - Analyte not detected (below MDL) in at least one replicate; mean value was calculated using the project specific MDL for non-detected values.
- b - Analyte estimated (detected below RL but above MDL) in at least one replicate; mean value calculated using estimated value.
- c - Analyte was detected in the treatment tissue sample replicates at an equal or higher mean concentration than in the associated reference site tissue, however statistical analysis is not required as the analyte was not detected in any of the reference site replicates.

NS - Not Significant - mean tissue body burden was not statistically different from the associated reference site mean body burden. Statistical significance accepted at α=0.05.
S - Significant - mean tissue body burden was statistically different, greater than the associated reference site mean body burden. Statistical significance accepted at α=0.05
NS/S indicates that a statistical outlier was detected and the findings of significance were different with and without the statistical outlier included in the analysis.

4. Chemical analyses QA/QC

This section provides quality control information and documents the overall quality of the analytical data upon which the project conclusions are drawn. Project QA/QC information (e.g., laboratory control survival, reference toxicant results) for the biological testing program are discussed in Sections 2 and 3.

The chemical data collected during the investigation were of sufficient quality and sensitivity to meet the project objectives. The majority of the QC results associated with the analytical parameters met the measurement objectives presented in Section 5 and 10 of the work plan (AECOM, 2017a). Specific nonconformances with those measurement objectives are presented in the laboratory report narrative, RIM Checklist and validation memo associated with each laboratory report. A full set of QC sample findings (method blanks, duplicate precision results, laboratory control sample results, and matrix spike results) is provided in Appendix D, Chemistry Laboratory Data.

4.1 Analytical sensitivity

The sensitivity of program chemical measurements can sometimes dictate the ultimate usefulness of the final data. Results that are insufficiently sensitive to detect changes can limit the final project conclusions. The New Haven project required RLs were specified in the agency approved work plan (AECOM, 2017a) to detect sedimentary contaminant considerations, ambient seawater and elutriate concentrations, and bioaccumulative tissue concerns.

The work plan prepared by AECOM (AECOM, 2017a) summarized the laboratory RLs and project required RLs. Nondetect chemistry results were reported at laboratory RLs since they provide greater confidence. The majority of the RLs for all sample matrices met the QAPP specifications. Some deviations from work plan-specified (AECOM, 2017a) limits occurred in the sediment matrix but these deviations were very minor. The RL for sedimentary PAH compounds was typically 0.03 milligrams per kilogram (mg/kg) versus the specified 0.01 mg/kg; the RL for pesticides and PCB congeners was typically 0.002 versus 0.001 mg/kg. Overall, these small deviations in the sediment sample set are not considered to affect the project data quality.

4.2 Contamination concerns

Sample contamination can sometimes affect sample results, particularly when measuring chemical parameters at very low concentrations. In this study, potential contamination has been monitored using equipment blank QC samples. In this study, a few target analytes were detected in the equipment blanks associated with the coring equipment and the grab sampler, but at very low levels and are not considered to have an impact on sample results.

4.3 Data precision

Analytical precision was measured at the laboratory level using laboratory control sample (LCS) duplicates or matrix spike duplicates.

Sediment measurement precision

Sediment analysis precision was evaluated using matrix spike duplicates and LCS duplicates. Precision relative percent difference (RPD) objectives for this project ranged from 20 for metal parameters to 30 for trace organic parameters. RPD criteria were not met for individual organic parameters and metals in matrix spike duplicates but this may be attributed to sample homogeneity.

Elutriate and ambient seawater measurement precision

Elutriate and ambient seawater analysis precision was evaluated using matrix duplicates, matrix spike duplicates, and Laboratory Control Sample (LCS) duplicates. RPD objectives for this project were equivalent to the sediment objectives (20 percent for metals, 30 percent for trace organic compounds). The RPD criteria were met for all elutriate parameters with the exception of Aldrin in the Composite 7 elutriate where the RPD was reported as 34%; this deviation should not impact data usability.

Tissue measurement precision

Tissue analysis precision was evaluated using matrix spike and LCS duplicates. The tissue RPD objectives for this project were also 20 percent for metals and 30 percent for trace organic compounds. The RPD criteria were not met for all target analytes but this may be the result of sample homogeneity. These variances are not considered to adversely affect the tissue dataset.

4.4 Data accuracy

Accuracy was evaluated using several QC sample types by calculating the percent recovered for each parameter of interest. A recovery value of 100% corresponds to 100% accuracy in this analysis. LCS and matrix spiked samples were incorporated as accuracy QC samples. Additionally, surrogate spikes were used to evaluate the accuracy of organic measurements and certified reference materials (CRMs) were included where available.

4.4.1 Sediment analysis accuracy

Percent recovery objectives for sediment measurements were met with few exceptions. Results for individual target analytes exceeded control limits in some matrix spikes; this is generally indicative of a sample specific matrix interference. Also, Trans Nonachlor measured in a sediment CRM was outside of the certified range. None of the exceedances are considered to negatively impact data usability.

4.4.2 Elutriate and ambient seawater analysis accuracy

The hexavalent chromium method blank result associated with analytical batch 444W was flagged as high in the QC summary report. However, it appears the result for this blank was a value between the MDL and RL and should not have a significant impact on the usability of data for associated samples. Percent recovery objectives for the aqueous project samples were all within laboratory specified accuracy limits.

4.4.3 Tissue analysis accuracy

LCSS, matrix spikes, and SRMs were used to assess the accuracy of the tissue chemical measurements. The SRMs represent an excellent measure of overall analytical accuracy. For pesticides, cis-Chlordane was measured slightly below the certified range in one SRM analysis. For the PCB Congener analysis elevated recoveries were reported for C13-BZ#28.

Matrix spike recovery measurements were largely within work plan specified limits. Selected compounds were biased low and within 30 percent of the target QC accuracy range. A detailed discussion of these results can be found in the individual data validation memos.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

AECOM

Revision: 0

Date: August 2017

This Sampling and Analysis Plan (SAP) has been prepared by AECOM for the United States Army Corps of Engineers, New England District (NAE) to support NAE's harbor maintenance program at New Haven Harbor, New Haven, Connecticut. This SAP has been prepared in accordance with Engineering Manual 200-1-3 *Requirements for the Preparation of Sampling and Analysis Plans*.

A.0 Field Sampling Plan (FSP)

A.1 Project Background

In its mission to provide safe and reliable navigation channels, the U.S. Corps of Engineers (USACE), monitors the water depths in Federal Navigation Projects (FNPs) for safety. The New England District of the Corps of Engineers (NAE) is preparing a feasibility study for improvements to the New Haven Harbor FNP. NAE has developed this Task Order to collect the environmental data necessary to support the impact assessment for dredging and placement of the material at the Central Long Island Sound Disposal Site (CLDS).

The proposal for the improved FNP consists of:

- Deepening the main channel from a 35 foot main channel to 42 feet at mean lower low water (MLLW);
- Widening the main channel from 400 feet to 500 feet in shore of the breakwater and widening to 600 feet outside the breakwater;
- Widening the channel bend at Southwest Ledge from 560 feet to a minimum of 780 feet;
- Straightening the channel bend downstream of the existing turning basin; and,
- Deepening the turning basin from 35 feet to 42 feet MLLW.

NAE is currently proposing to mechanically dredge approximately 4,500,000 cubic yards of sediment and 55,100 cubic yards of rock from the area. To the extent practical, these materials will be reused beneficially to beach nourishment, marsh creation, upland construction projects, and to cover historic dredge material mounds in Long Island Sound. The remainder will be placed, if suitable, at the CLDS.

A.2 Project Organization and Responsibilities

Highly qualified individuals have been selected for each of the tasks to ensure that the project objectives are accomplished accurately and efficiently. The project organization and work breakdown is depicted in **Figure A-1**. Individual responsibilities are detailed below.

NAE Technical Manager (TM)

The NAE Technical Manager, Mr. Ben Loyd, will be consulted during the project planning and performance phases. As the primary point of contact for the Corps and this scope of work, Mr Loyd will be in weekly contact with the AECOM project team during sample preparation, and physical and chemical analysis, and in the event any problems are encountered.

AECOM Program Manager (PM)

Mr. Don Dwight, serving as AECOM's Program Manager (PM), will provide overall leadership in the performance of this task order with regular NAE and AECOM team communications. Mr. Dwight will verify that the right people are committed to contract tasks, that safety and quality systems are in place, regular reviews are undertaken, issues resolved without delay and contractual specifications met or exceeded.

AECOM Deputy Program Manager (DPM)

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

AECOM

Revision: 0

Date: August 2017

Ms. Maura Surprenant, serving as AECOM's Program Manager (DPM), will provide daily leadership in the performance of this task order with regular NAE and AECOM team communications. Ms. Surprenant will assist Mr. Dwight with daily duties including ensuring that the right people are committed to contract tasks, that safety and quality systems are in place, regular reviews are undertaken, issues resolved without delay and contractual specifications met or exceeded.

AECOM Task Order Manager

Mr. Ryan McCarthy will serve as the AECOM Task Order Manager, with the responsibility for technical, financial, and scheduling matters related to this task. Mr. McCarthy, as the point of contact between task leads, safety and quality managers, and program management, will communicate regularly with the project team to discuss action items, schedule, financial, and technical considerations on a regular basis during the implementation of this SAP and will procure the subcontractor team.

Mr. McCarthy will also oversee the preparation of the task reports to ensure they meet or exceed NAE specifications, particularly as required by NAE's Regional Implementation Manual (RIM; EPA/USACE, 2004). Raw and statistical data will be provided to fully support agency dredged material (DM) suitability decision-making. All reports will be available electronically and all sediment data will be provided in electronic data deliverable (EDD) format meeting RIM requirements. Quality control (QC) summary tables will be included with each data submission.

AECOM

Revision: 0

Date: August 2017

AECOM Health & Safety Officer (SO)

Mr. Richard Renzi, CIH is AECOM's Safety Officer dedicated to this investigation with direct communication to the AECOM Task Order Manager. He will prepare/ review all modifications to the project Accident Prevention Plan (APP), and any applicable Activity Hazard Analyses (AHA). Specific duties include:

- On behalf of AECOM, reviewing and approving the APP and amendments and ensuring that EM-385-1-1 requirements are fully met before delivery to the NAE TM for approval;
- Advising the AECOM Task Order Manager on matters relating to health and safety at the site;
- Conducting accident investigations;
- Maintaining regular contact with the project team to evaluate site conditions and new information that might require modifications to the APP; and
- Overseeing the Site Safety Officer (SSO).

Project Quality Assurance (QA) Officer

Ms. Debra Simmons will serve as the Project QA Officer and has overall responsibility for quality assurance oversight. Ms. Simmons has led quality assurance programs for more than 30 years and in this role will communicate directly to the AECOM Task Order Manager. Specific responsibilities include:

- Implementation of this SAP upon approval;
- Reviewing and approving QA procedures on behalf of AECOM, including any modifications to existing approved procedures;
- Ensuring that QA audits of the various phases of the project are conducted as required; and
- Providing QA technical assistance to project staff.

Field Services Task Leader & Chief Scientist

Mr. C. Steve Howe, serving as the Field Services Task Leader and Chief Scientist will provide leadership in every aspect of the field program, and implement the sediment and water collection program. Mr. Howe will oversee the field services subcontractor (OSI) and all field sample collection activities.

The Field Services Task Leader has overall responsibility for completion of all field activities in accordance with the FSP and Quality Assurance Project Plan (QAPP) and is the communication link between the Task Order Manager and the field team. This individual also acts as the Site Safety Officer (SSO) and will engage the field personnel in daily safety discussions, field safety related documentation (float plans, etc.) and will be the primary point of contact for all field related safety communications. Specific responsibilities of the Field Services Task Leader and Chief Scientist include:

- Coordinating activities in the field, and assigning specific duties to field team members;
- Collecting samples, conducting field measurements, and decontaminating equipment according to documented procedures stated in the FSP and QAPP;
- Mobilizing and demobilizing of the field team and subcontractors;
- Directing the activities of subcontractors in the field;

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

AECOM

Revision: 0

Date: August 2017

- Resolving any logistical problems that could potentially hinder field activities, such as equipment malfunctions or availability, personnel conflicts, or weather dependent working conditions;
- Implementing field QC including issuance and tracking of measurement and test equipment; the proper labeling, handling, storage, shipping, and chain of custody (COC) procedures used at the time of sampling; and control and collection of all field documentation;
- Ensuring that field documentation and data are complete and accurate
- Communicating any nonconformance or potential data quality issues to the Task Order Manager.
- Serving as SSO; and
- Preparing the Field Report.

Physical & Chemistry Laboratory Coordinator

Ms. Mary O'Connell-Kozik, as the Physical & Chemistry Laboratory Coordinator, will manage the subcontractor chemistry/physical testing laboratories. Ms. O'Connell-Kozik, a Senior Chemist, will serve as the liaison between field and laboratory personnel; supervise data review activities, and author related progress reports.

Biology/Bioassay Laboratory Coordinator

Ms. Christine Archer, an Eco toxicologist and former bioassay laboratory biologist, will serve as the Biology/Bioassay Laboratory Coordinator. Ms. Archer will coordinate with the biology laboratory to implement sample composite formation, preparation of elutriate samples, and performance and reporting of the 10-day, suspended particulate phase (SPP), and 28-day bioassay results along with all relevant statistics.

Data Manager

Mr. Jim Herberich ensure every aspect of data recording and electronic measurement records are complete and accurate, and that sediment chemistry EDDs are transferred to NAE as defined in the RIM (EPA/USACE, 2004).

Ocean Surveys, Inc. Project Manager

AECOM has selected Ocean Surveys, Inc. (OSI) located in Old Saybrook, CT to provide field services and equipment for the project. OSI will be responsible for providing and maintaining the sampling vessel, vessel and equipment handling staff, appropriate field equipment for positioning the vessel and coring to the project/sample depth.

Mr. Ken Cadmus, the project field survey leader (or designee), will captain the survey vessel and oversee navigational and shipboard operations. Mr. Cadmus (or designee) will implement the field survey requirements specified in this SAP when approved.

Alpha Analytical Laboratory Project Manager

Ms. Elizabeth Porta, Alpha Analytical Laboratory Project Manager will oversee the implementation of this SAP and the specifications detailed in Section B (QAPP). Alpha Analytical will be responsible for the grain size and chemical analyses of the sediments collected as part of this program. Ms. Porta will communicate with the AECOM Task Order Manager to confirm the condition of samples arriving at the laboratory, verify the COC specified sample list and testing requirements, bring any project concerns to the AECOM Physical Laboratory Coordinator without delay, and transmit EDDs and corresponding laboratory reports to the project data manager in the formats specified.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut**AECOM**Revision: 0
Date: August 2017

ESI Laboratory Manager

Mr. Ken Simon, ESI Laboratory Manager will oversee the implementation of this SAP and the specifications detailed in Section B (QAPP). ESI will be responsible for all biological and chemical laboratory activities, including elutriate/ SPP sample preparation, toxicological testing and reporting. He will communicate with the appropriate AECOM Laboratory Coordinator (Biology, Chemistry) to confirm the condition of samples arriving at the laboratory, verify the COC specified sample list and testing requirements, oversee the preparation of sample composites, standard chemical elutriate and SPP preparations, and all project bioassays. Mr. Simon will bring any project concerns to the appropriate AECOM Laboratory Coordinator without delay (Biology, Chemistry), and transmit chemistry EDDs and related laboratory reports, and bioassay results with corresponding statistics and reports to the AECOM Laboratory Coordinators according to the established project schedule.

A.3 Project Scope and Objectives

The objective of this work is to acquire data for the characterization of sediments proposed to be dredged for New Haven Harbor FNP improvement.

A.3.1 Task Description

This New Haven Harbor FNP Environmental Assessment Project will require the collection of discrete sediment samples from 26 stations throughout the FNP to represent the material to be dredged. Samples (cores) collected from discrete locations within the FNP footprint will be pooled into groups of stations with similar grain size characteristics for full-scale testing. Seawater will also be needed to evaluate potential water column impacts (i.e., the formation of chemical elutriate and suspended particulate phase samples).

The proposed work consists of taking sediment cores to project depth plus 2 feet of over depth (see **Table A-1**) from 26 locations along a stretch within the FNP to be analyzed for parameters as defined in Tasks 5 through 11. Samples from locations where similar material is found may be composited; it is anticipated that the sediment samples will be composited into eight groups for analysis. Reference site sediments should be

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

AECOM

Revision: 0

Date: August 2017

collected from the CLDS Reference Site located at latitude 41.134850 and longitude 72.835690. The testing results will be used to characterize the sediment in order to determine the suitable alternatives available for disposal.

Surface water samples will be collected from areas representing the sediment core composite samples and from CLDS for use in preparation of elutriate samples and biological analyses.

General guidance for this work is found in the EPA/ USACE regional protocol “Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters” (April 6, 2004). Sampling, testing, and QA/QC procedures as required and detailed in the RIM are referenced in each task of this scope of work (SOW).

To accomplish the full range of project requirements, NAE has established the following 12 tasks:

Task	Description
1	Sampling and Analysis Plan
2	Accident Prevention Plan
3	Sampling for Physical Analysis, Sediment Chemistry, Elutriate, and Biological Testing
4	Sample Preparation for Physical Analysis, Sediment Chemistry, Elutriate and Biological Testing
5	Sediment Grain Size Analysis
6	Sediment Chemistry
7	Standard Elutriate Testing
8	Suspended Phase Acute Toxicity Testing
9	10-day Whole Sediment Acute Toxicity Testing
10	28-Day Bioassay/Bioaccumulation
11	Tissue Analysis
12	Reporting

A.3.2 Health and Safety

A program specific APP will be developed and submitted to NAE prior to the commencement of any field efforts. The APP will be prepared in accordance with EM-385-1-1. The APP will address any unusual or unique aspects of the proposed scope of work to be executed (e.g., working on water, vibracore operations, etc.). A draft version of the APP will be submitted electronically to the Safety and Occupational Health Office and to the NAE Technical Manager. The final version will be submitted electronically along with one hard copy.

Additionally, the APP will address any AECOM-specific policies and procedures that need to be followed over the course of the field program, and should be considered a “living document” as they can be updated based on changing site conditions. Additionally, task-specific AHA documents will be prepared for use in the field for each major phase of work to be completed. A major phase of work is defined as an operation involving a type of work presenting hazards not experienced in previous operations or where a new subcontractor or work crew is to perform the work. The analysis shall define all activities to be performed,

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

AECOM

Revision: 0

Date: August 2017

identify the sequence of work, the specific hazards anticipated, and the control measures to be implemented to eliminate or reduce each hazard to an acceptable level. Prior to the commencement of any field work, the training records for all staff (AECOM and subcontractors) proposed to be utilized on this program will be reviewed to ensure that they are current.

The SSO for this project is Mr. C. Steve Howe. Mr. Howe will be responsible for general day-to-day field health and safety of AECOM and its subcontractors, ensuring that all field staff participates in daily tailgate/dockside safety meetings, ensuring correct application/ usage of personal protective equipment (PPE) by field staff, and monitoring field activities for adherence to the APP. Mr. Howe will also responsible for hosting a project Healthy and Safety kickoff meeting for all staff prior to mobilization. In the event of an incident, Mr. Howe is responsible for initial response protocols, incident management, and proper reporting. Mr. Howe and all field staff have “Stop Work Authority” in the event an employee identifies a condition or act that is likely to cause an Imminent Danger situation.

All safety meetings/ briefings will be documented and submitted to the NAE as part of standard reporting procedures. The USACE Contractor Monthly Summary Record of Injuries/ Illness and Work Hour Exposure form will be completed each month and submitted electronically to the NAE Technical Manager no later than close of business on the 10th calendar day of the following month.

A.3.3 Project Mobilization

Upon NAE's approval of this SAP along with the project APP, the project team will mobilize a field survey to core sediments within the harbor area, collect surface sediment at the CLDS Reference Site, and collect seawater from the harbor and reference site.

Early in the program, NAE will evaluate the sediment texture (rapid 24 hour grain size analysis), chemical composition (bulk sediment chemistry) and determine a discrete sample compositing scheme. Following collection and compositing of bulk sediment samples, elutriate, toxicity, and biological testing will commence.

** CLDS Reference Site.

Together, these tasks address the potential risks to marine life posed by the material to be dredged:

- **Whole sediment exposure** will be assessed with physical, chemical, and whole-sediment bioassay data [Tasks 5, 6, & 9]. The RIM (EPA/ USACE, 2004) summarizes the wide range of parameters

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: FSP

Revision: 0

Date: August 2017

included in the assessment. The biological testing incorporates a sediment amphipod and mysid shrimp in particular to identify the potential impacts to sediment-associated organisms.

- **Aquatic life exposures** may be assessed with a chemistry screening approach, but are generally modeled using a mixture of seawater and the material to be dredged corresponding to standard chemical elutriates and SPP samples. Chemical elutriate results are used to ensure that Ambient Water Quality Criteria (AWQC) will not be exceeded at the dredged material placement site (CLDS) four hours after discharge, or outside of the site boundary at any time. SPP toxicity testing results are used to develop a Limiting Permissible Concentration (LPC), and, based on regulatory modelling by ADDAMS/ STFATE, are also used to determine Marine Protection, Research, and Sanctuaries Act (MPRSA) §103 water column compliance [Tasks 7 & 8].
- **Bioaccumulation potential** will also be evaluated to address any potential longer-term effects, measured directly using worm and clam organisms over a 28-day period [Tasks 10 & 11]. Findings will be compared to Food and Drug Administration (FDA) levels and used to evaluate ecological health risks.

A.3.4 Applicable Regulations/ Standards

This project has been designed to collect environmental data needed to characterize the sediment to be dredged within the various dredging units, and determine suitability for placement unconfined in the marine environment under MPRSA §103, detailed in the Ocean Dumping Regulations (Title 40, Code of Federal Regulations, [CFR] 220-229). As such, the work will be guided by NAE's *Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters* (RIM, EPA/ USACE, 2004), the *Evaluation of Dredged Material Proposed for Ocean Disposal – Testing Manual* (Green Book, EPA/ USACE, 1991), and the *Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S.* (Inland Testing Manual, EPA/ USACE, 1998). These regulations are adhered to within the jurisdictional area of the NAE by the RIM and the laws and regulations of the New England states (where this FNP project is located).

A.3.5 Project Schedule

The sampling schedule is provided in **Table A-3** and **Figure A-2** along with project milestones and deliverables.

The project schedule is an accelerated schedule. As such, elutriate and biological testing shall occur concurrently with the sampling for Tier 2 evaluation.

A.4 Non-measurement Data Acquisition

AECOM anticipates that relevant grain size or other site information reviewed by NAE for planning purposes would be available if needed. However, these historical data are likely too dated to be applicable for the current site characterization effort.

A.5 Field Activities

The approach selected by NAE to meet the project objectives requires the collection of the following sample types:

- Sediment cores (26 stations within New Haven Harbor)

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: FSP

Revision: 0

Date: August 2017

- Surface sediment grab sampling (CLDS Reference Site)
- Single- to multiple-depth seawater collection (composite of surface, mid-depth, and bottom water collection at the harbor stations and at the CLDS Reference Site when overlying water depth > 30 ft MLLW, and mid-depth only for depths < 30 ft MLLW)

Sediments retained from the individual harbor collection stations will be maintained as discrete samples until NAE, based on a rapid grain size reporting, approves continuation of the program and the final pooling/composite scheme.

A.5.1 Harbor and CLDS Reference Site Sediment

Sediment within the FNP will be cored to the authorized depth (plus allowable over dredge) to fully characterize the sediment prism that requires removal/dredging. At the reference site, only the surface sediment character is relevant for comparison purposes and so a grab sampler is the sampling equipment of choice.

Large sediment volumes will be needed in the event that the full range of testing is required for the program. This section details the locations, composite preparation, field and laboratory measurements, and QC sampling requirements.

A.5.1.1 Coring Collection Locations

NAE has determined that 26 sampling stations are sufficient to characterize the FNP to be dredged. Station positions are detailed on **Table A-1** and depicted in **Figure A-3**.

Table A-3 Schedule of Milestones and Deliverables

Task	Milestone ¹	Schedule
	TASK NOTICE TO PROCEED	21 Jul 17
	PLANNING	
1, 2	SAP & APP preparation; station position & utility verifications	24 -27 Jul 17
	SAP delivered to NAE after 2 day preparation & station positions verification	27 Jul 17
	APP delivered to NAE following 2 day preparation	27 Jul 17
	New Haven Harbor Master & USCG alerted to NAE sampling needs & timing	5 Jun 17
	NAE SAP & APP review, AECOM finalizes, NAE approves SAP & APP	1-4 Aug 17
	SAMPLE COLLECTION, RAPID TAT SEDIMENT GRAIN SIZE, & SAMPLE POOLING	
3	Field Effort: 10 sediment survey days to collect 26 stations	7-17 Aug 17
	Discrete harbor station sediments shipped to laboratory for 24 h grain size analysis	7-9 Aug 17
	Field Effort: 1-day CLDS Ref sediment and water plus all harbor water stations	17 Aug 17
4	Discrete harbor station grain size analysis (24 h TAT)	8-10 Aug 17
5	Rapid 24 h GS data reported to NAE for review	9-11 Aug 17
	NAE amends sample pooling scheme as needed	11 Aug 17
	NAE approval to proceed as appropriate based on sediment grain size	11 Aug 17
	Bulk sediment composite preparation	20-21 Aug 17

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

All plotted/ target sampling positions will be reviewed with the NAE TM as part of the SAP approval process to ensure location accuracy. Channel stations E, H, K, and O are in the vicinity of the Cross Sound Cable. Currently AECOM has generalized mapping information (e.g., NOAA chart/ maps) and communication from the NAE ETL (5/2/17 & 5/11/17 emails from Ben Loyd). OSI is coordinating with the Cross Sound Cable group and has obtained as-built construction information regarding the actual location of the submarine cable prior to the initiation of the coring program. This is to verify target locations are positioned such that damage to the cable will not occur. All utility crossings and outfall locations associated with the sampling areas will also be reviewed with NAE before the field program begins.

A.5.1.2 Discrete/Composite Sediment Sampling Requirements

Initially, the 26 cores will be processed and sub-sampled (up to 2 per core) aboard the sampling vessel and will be maintained as discrete samples. These horizons will be sub-sampled for bulk sediment analytical testing and grain size. The sub-samples will be analyzed for grain size on an expedited schedule. NAE will then review the discrete data and verify the sample composite/ pooling scheme and approve continued testing as appropriate. This sample pooling approach will provide NAE with a smaller set of FNP sample composites to test, thereby reducing the sample collection and testing effort.

The sediment volume needed from each station and station sets that may be pooled together to form composites are detailed on **Table A-1**. As indicated, 25 gallons of sediment will be required for each of the final area composites and an additional 21 gallons (minimum) will be needed from the CLDS Reference Site. Additionally, the sample volumes needed for the array of testing parameters are detailed on **Table A-4** *Sample Mass/ Volume Requirements*.

Sample pooling approved by NAE will be performed at the biological laboratory. Composite preparation procedures are detailed in Section B of this SAP (QAPP).

Table A-4 Sample Mass/ Volume Requirements (minimum)

Parameter	Units	Sediment Volume		Water Volume	
		Per Tested Sample or Composite	CLDS Reference Site	New Haven Harbor	CLDS Reference Site
Sediment Parameters					
Grain Size	L	0.075	0.075	-	-
Metals	L	0.2	0.2

¹PAHs measured only in (sediment) equipment blank.

²Pentachlorophenol measured only in background water.

³Minimum sample volume required.

*Per composite

A.5.1.3 Sample Collection and Field & Laboratory Analysis

Navigation. Vessel positioning for all sediment collections will be accomplished utilizing a Differential Global Positioning System (DGPS) Integrated with HYPACK software with an accuracy of 1 meter or less according to AECOM Standard Operating Procedures (SOP) NHH-G-02 (Appendix A). Local tide data will be obtained to calculate tidal height in feet above MLLW. This measurement will facilitate the calculation of the required penetration depth needed to reach the desired project depth. The depths indicated in Table A-1 should be consulted. If the overlying water depth is different from those estimated in Table A-1, the sediment penetration depth will be adjusted accordingly, in consultation with NAE.

Depth to sediment will be measured using a measurement tape/ lead line immediately preceding each coring deployment to identify the exact mudline for coring purposes. Additionally, a precision survey echo sounder with an accuracy of ± 0.1 feet will provide continuous monitoring of sediment depth/ harbor bottom.

Care will be taken to avoid sample contamination from sampling gear, airborne dust, vessel engine exhaust, cross contamination, etc. If wind/current/ traffic conditions allow, engines will be shut off during sampling; otherwise, sampling will be performed upwind of exhaust and contamination sources. Final sample mixing will be performed in the laboratory for greater contamination control.

Collection & Analysis. The harbor locations will be cored using vibracoring equipment according to AECOM SOP NHH-S-03 (Appendix A), and grab samples of the surface sediment from the CLDS Reference Site will be collected using a Ted Young/ Van Veen grab sampler according to AECOM SOP NHH-S-01 (Appendix A). AECOM is planning on using rigid polycarbonate core liners for this project. **Table A-5** lists the equipment intended for use during project performance and equipment calibration /checking requirements are detailed in **Table A-6**. All sampling will be performed as specified in the project Scope of Work dated 31 May 2017.

Section: FSP

Revision: 0

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Table A-5 Proposed Sampling Gear for the New Haven Harbor FNP Sampling Task

Equipment	Description	Objective
Sampling Vessel	37-foot coring barge ¹	All harbor station sampling
Sampling Vessel	25-foot Parker ¹	Reference station sampling
Refrigerated Storage Vehicle	26-foot Refrigerated Box Truck	Chilled sample storage during the field program
DGPS	AG-132 DGPS with Omnistar and USCG Beacons; Hydrographic Survey Software HYPACK)	Vessel positioning and data collection
Equipment	Description	Objective
Vibracorer	Vibracorer fitted with rigid liners, core cutter, and catcher	The collection of all harbor cores
Grab Sampler	Ted Young/ Van Veen Grab	Reference sediment collection
Water Pump & Tubing	Diaphragm pump and tubing (short length for harbor sampling).	Harbor and CLDS Reference water collections
Niskin Bottle	Messenger activated sampling bottle for specified depths	CLDS Reference water collection
Weight Bearing Line/Cable	Non-contaminating measured lead line	Water depth measurements

¹Conforms to health and safety measures found in the USACE Safety and Health Requirements Manual EM 385-1-1 (November 30, 2014)

Table A-6 Field Instrument Calibration, Checking, and Corrective Action

Parameter/ Instrument	Calibration Frequency	Calibration Standards	Acceptance Criteria/ Corrective Action
Water Depths JRC Precision echosounder (or equivalent)	Initial: Each time instrument is turned on.	Deployable metal plate and metering line	Within 10% of metering line instrument will be replaced
Station Locations Trimble Pro-XRS DGPS (or equivalent)	Initial: Start of field program	Survey of benchmark	3 meter accuracy minimum or DGPs to be replaced
	Check: Daily	Survey of benchmark	
Temperature/ Refrigerated Storage Truck	Check twice daily	Alternate thermometer	Within 0.5°C of the stationary monitoring thermometer. Re-calibrate stationary thermometer as needed.

Initially, one core will be collected from all locations for rapid turn-around grain size and bulk sediment chemistry analysis (total organic carbon, percent moisture, metals, PCBs, pesticides, and PAHs). From locations A, F, G, J, M, P, S, T, W and Z, an additional core will be collected and kept intact for NAE archive. These cores will be received by an NAE archaeologist at the conclusion of the sampling activities. The archive cores will be retained in an upright position at 4°C±2°C. The penetration depth for each core sample

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

will be to either the project depth (Table A-1) or refusal, whichever is reached first. Upon sample retrieval, the sampling team will adhere to the following handling sequence:

- Once on deck/ removed from the core barrel, cores will be maintained in an upright position (cores in flexible liners will be hung upright) to allow surface sediment to settle (ca. 15 min) before removing overlying water.
- After overlying water is removed and adhering to contamination control procedures, core liners will be opened longitudinally and cores split (moving from lower clean to upper dirty) for logging purposes using pre-cleaned stainless steel utensils.
- Sediment profiles will be described and recorded on core log forms along with digital photographic references (Attachment 1).
- Photographs of each core will include core number, date, orientation (top, bottom) and scale. Descriptions will include general texture, color, odor, strata, core length, depth of penetration and any other pertinent observations.
- The first core from each location will be visually described/logged and if significant vertical stratification is observed within the sediment column (greater than two feet in thickness), then subsamples will be collected from each horizon for grain size and analytical parameters. If possible, NAE will be contacted to discuss the findings. It is anticipated two subsamples per core will be collected.
- Cores showing significant differences will be retained in the liners.
- The presence of live eelgrass in any sample will be noted and a count of eelgrass stems with roots/ shoots recorded.
- Samples will be chilled while on board, and transferred to a refrigerated box truck daily during field operations with temperature monitored to ensure that the storage temperature is maintained at $4^{\circ}\text{C} \pm 2$.

If less than 80% core recovery is achieved, the core sample recovered will be retained but considered insufficient. At each station where this occurs, another attempt will be made to recover a sufficient sediment core. All sample collections will also be recorded on Daily Activity Logs (Attachment 2). Project documentation requirements are provided in Section A.6.

On a daily basis, the discrete grain size samples/ bulk chemistry samples will be transported via laboratory courier for rapid 24-hour reporting. As the grain size data come in, NAE will have the discrete grain size data and will provide guidance regarding the sample pooling/ composite scheme, and whether the full scope of remaining tests is to proceed on all FNP reaches.

Once the final composite scheme has been approved by NAE, additional sediment cores will be collected from the 26 locations to achieve the volume required to conduct the elutriate and biological testing. These subsequent cores will be collected and the appropriate depth intervals can be transferred directly into the sampling containers (e.g., buckets) without need for additional examination.

All remaining samples will be delivered to the laboratory performing the sample pooling/ composite preparation at the end of the final (water collection) field sampling day. At the laboratory, sub-samples will be collected equally from each horizon required to create a composite sample. By this schedule, the

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

composite formation may begin without delay, given the short 14 day hold time limitation for the water used in the project bioassays (**Table A-7** and Attachment 5).

After the sample composites are prepared, with NAE's approval, the elutriate chemistry (metals, PCBs, pesticides, and PAHs) and biological tests (SPP, 10-d whole sediment, 28-d bioaccumulation bioassays, and tissue analysis) may proceed. Refer to the task order QAPP (Section B) for a listing of the detailed parameters and species to be tested. The project will follow the schedule/ tiered approach laid out in **Table A-3** and **Figure A-2**.

Table A-7 Sample Container, Preservations, and Holding Time Requirements

Sediment Parameters	Volume/Mass	Container	Preservation	Storage	Holding Time
Physical Parameters	8-oz	Plastic	Chill	4±2 °C	NA
Chemistry	16-oz	Amber glass	Chill or Freeze	4±2 °C	28 days (Hg) 180 days (other metals)
Bulk Chemical/ Biological Testing Material	5-Gal Buckets (see Tables A-1 and A-4 for vol)	Plastic	Fill Completely	4°C dark/airtight	90 days

Aqueous Parameters	Volume/Mass	Container	Preservation	Storage	Holding Time
Metals	1-L	Plastic	HNO ₃ to pH<2	4±2 °C	28 d (Hg) 180 d (other metals)
PAHs¹	1-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
Pesticides	1-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
PCBs	1-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
Pentachlorophenol	1-L x 2	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
Bulk Chemical/ Biological Testing Material	5-Gal Cubitainers (see Tables A-2 and A-4 for vol)	Plastic	Fill Completely	4°C dark/airtight	14 d

¹PAHs measured only in (sediment) equipment blank

²Pentachlorophenol measurement not needed in sediment EB; only pump EB and chemical elutriate.

A.5.1.4 QC Samples & Frequency

Contamination control is one of the important aspects of environmental sample collection efforts. For this reason, equipment blank QC samples will be collected from all equipment that comes in contact with the sediment and surface water samples.

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

A total of four sediment equipment blanks will be collected during the program:

- One equipment rinse blank will be collected from the NHH coring equipment;
- One equipment rinse blank will be collected from the NHH water sampling equipment;
- One equipment rinse blank will be collected from the CLDS grab sampling equipment; and
- One equipment rinse blank will be collected from the CLDS water sampling equipment.

In each case, high purity deionized water (DIW) will be poured over collection equipment (e.g., surface water sampling bottle, core liners, cutters, catchers, and processing utensils or grab sampler) or run through the pump, and collected in a chemistry container set (**Table A-4**).

A standard set of laboratory QC will be included in the analytical program as defined in the QAPP, but will not require any additional volume collected during field operations beyond those mass/ volumes already specified (**Table A-1** and **Table A-4**).

A.5.1.5 Sample Containers and Preservation Techniques

The sediment storage containers specified for the project are provided on **Table A-7**. Large/ bulk sediment samples will be transferred to UN-Compliant plastic 5 gallon buckets, smaller discrete samples needed for rapid grain size analysis and other purposes will be transferred to smaller plastic and glass containers. Seawater samples will be stored in 5 gallon cubitainers. All samples will be transferred to a refrigerated storage truck on shore.

Subsamples from each station collected for the purposes of station specific grain size analysis and for chemistry will be containerized and preserved/ stored as specified on **Table A-7** and transferred to the analytical laboratory (Alpha). Tissue samples will not be collected during field activities; the storage of tissues obtained from laboratory bioaccumulation bioassays is addressed in Section B.7-3 and **Table B-10**.

A.5.1.6 Decontamination Procedures

Sediment cores will be collected in new core liners that do not require decontamination. The coring equipment that contacts project samples (e.g., core head, catcher, & splitting equipment) will be decontaminated between deployments according to SOP NHH-G-03 (Decon Level 1). The grab sampler will also be cleaned thoroughly to remove any dust/ film before the reference sediment is collected. Level 1 decontamination procedures (SOP NHH-G-03) applied to sediment collection equipment corresponds to the following procedure:

- Non-phosphate soap solution wash/ brush-down;
- Thorough rinse with site water

Re-cleaning between discrete grab samples at the CLDS Reference Site will not be necessary unless the grab sampler is compromised in some way as determined by the field scientist. Stainless steel spoons used to homogenize the sediment will be cleaned in the same manner.

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

A.5.2 New Haven Harbor and CLDS Reference Site Water

As required by NAE's SOW, seawater from the harbor will be used in the preparation of chemical elutriates and SPP samples and seawater from CLDS Reference Site will be used for preparing dilutions in the SPP toxicity testing dilution series. Given the inherent purity of seawater, collection and handling procedures must follow strict contamination control procedures as discussed in this section. To minimize sample contamination risks, seawater will be collected using a high purity/ pre-cleaned diaphragm pump and tubing system.

A.5.2.1 Water Collection Locations

Water sample collections are planned in the vicinity of each composite group in the proposed dredge area. Water samples will be collected using either a non-contaminating pump with dedicated tubing, or a discrete grab water sampler per AECOM SOP NHH-W-01 (Appendix A). Seawater will also be collected at the CLDS Reference Site for the purposes of SPP dilution series preparations.

Water will be collected from mid-depth when the overlying water depth is less than 30 feet. Where water depth exceeds 30 feet, a composite sample will be created from near surface, mid-depth, and near bottom (3 feet above sediment).

A.5.2.2 Bulk Water Sampling Requirements

As indicated in **Table A-2**, the project team anticipates pooling selected sample groups before full-scale testing commences. To meet the full range of potential testing requirements, a minimum of 123 gallons of seawater will be collected from the harbor and 23 gallons from the CLDS Reference Site (**Table A-2** and **Table A-4**).

A.5.2.3 Sample Collection and Field & Laboratory Analysis

Navigation. The same navigation equipment and protocol used for the sediment collection effort will be used for the water collection effort (AECOM SOP NHH-G-02; Appendix A).

Seawater Collection. Seawater collections at harbor locations will proceed step-wise “up gradient” until the last (inner harbor) water is collected for added cross-contamination control since inner harbor stations are expected to contain higher levels of turbidity and trace chemical constituents relative to outer harbor waters.

Seawater from the harbor area (site water) and the reference area (SPP dilution water) will be collected using a pre-cleaned diaphragm pump and CFLEX™ tubing system at the surface (three feet below the surface), at the mid depth, and near the sediment bottom (three feet above the sediment surface) where water is greater than 30 feet deep. For shallower locations (less than 30 feet of water), water will be collected from mid-depth only. Given the water depth at the reference area, a Niskin bottle may be utilized. **Table A-5** includes the multi-parameter instrument sensors intended for use during water collection portion of the project and instrument calibration requirements are detailed in **Table A-6**.

All water column collections will be performed according to SOP NHH-W-01 (Appendix A). The volume to be collected at each proposed location needed for the project is detailed in **Table A-2** and **Table A-4**. Water collections will be recorded in the field log book and on daily activity logs (Attachment 2).

Pertinent field observations (turbidity, sheen, blooms, etc.) will be recorded on the field collection log and all water collections will also be recorded on daily activity logs (Attachment 2). Project documentation requirements are provided in Section A.6.

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

In the evening of the final water collection field day, all samples will be transferred to the biological laboratory (ESI) using the refrigerated storage truck. Upon NAE's final approval, sample preparations may begin the following day, to ensure adherence to 14-day hold time for all surface water to be used in the elutriate preparation and the SPP bioassays.

A.5.2.4 QC Samples and Frequency

QC sampling of the water collection program will include collection of a pump blank during the field effort to verify operation cleanliness. To prepare the equipment blank, high purity DIW will be pumped through all (connected) tubing sets and dispensed to a chemistry container set (**Table A-4**). If utilized, a Niskin bottle will also have an equipment blank prepared. It is therefore anticipated that two equipment blanks will be collected for surface water sampling.

A standard set of analytical QC samples will be included in the laboratory program, but additional volume beyond that already specified (**Table A-4**) will not be required.

A.5.2.5 Sample Containers and Preservation Techniques

Bulk water samples collected in the field will be contained in clean/ new five gallon plastic cubitainers and placed on ice for preservation. Discrete seawater samples for rinsate blanks will be contained in smaller plastic (metals) and glass (trace organics) bottles. Water sample containerization and preservation requirements are detailed on **Table A-7**. In addition to icing immediately following collection, the water samples will be transferred to the refrigerated box truck upon returning to the dock.

A.5.2.6 Decontamination Procedures

The tubing used to collect the water will be new/ previously unused and cleaned prior to use in the following manner:

- Deionized water (DIW) rinse
- Dilute Liquinox™ rinse
- DIW rinse
- Seawater flush for two minutes before collection

If tubing is used at the CLDS site, separate tubing sets will be used for harbor water vs. the higher purity CLDS Reference Site water to further minimize any potential cross-contamination. Further cleaning will not be necessary since water collections will proceed step-wise "up gradient" until the last (inner harbor) water is collected. However, each water station sampling will begin with a two minute site water flush.

A.6 Field Operations Documentation

Field documentation will include sediment core and grab sampling logs, with narratives describing relative grain sizes, color, odor, strata, core length and depth of penetration along with other pertinent sediment sampling observations. As indicated, digital photos of each core, including core number, date, top, bottom, and scale will be collected and sampling activities will be recorded on daily activity logs. Seawater collection data (profile information, unique observations) will be recorded in the field logbook.

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

The full range of information to be included in field records is provided on **Table A-8**. Field documents developed for this task are provided as Attachments 1 and 2.

A.6.1 Field Logbook and Field Sheets

Field logbooks will provide the means of recording the data collection activities performed during the investigation. As such, entries will be described in as much detail as possible so that persons reviewing site data can reconstruct a particular situation without reliance on memory.

Field logbooks will be bound field survey books or notebooks, and assigned to the field personnel, but will be stored in the project files when not in use. Each logbook will be identified by the project-specific document number.

The title page of each logbook will contain the following:

- Person to whom the logbook is assigned;
- The logbook number;
- Project name and number;
- Project start date; and
- End date.

Entries into the logbook will contain a variety of information. At the beginning of each entry, the date, start time, weather, names of all sampling team members present, and the signature of the person making the entry will be entered. The names of any visitors and the purpose of their visit will also be recorded in the field logbook.

Table A-8 Summary of Field Information

General Information	Record Location ¹
Project/task name/general location	All (A,B,C,D, and E)
Personnel on site (AECOM, clients, site contacts, regulators, oversight personnel, subcontractors, general public)	A, B
Results of phone calls, conversations	B
Chronology of activities, including mobilization, investigatory activities, and demobilization	B
Weather conditions (initial and any changes; temperature, barometric pressure, wind conditions, precipitation)	B
Tidal and atmospheric information (if applicable)	B, E
Subcontractors, description of services to be provided, and any issues (equipment problems, corrective action, stand by time)	B
Health and safety (H&S) tailgate meetings, H&S monitoring	Refer to APP
Description of major equipment (survey vessels, sampling platforms, sampling devices) and any problems or conditions that might impact performance or data quality	A, B
Equipment decontamination	D

¹ A: Daily Activity Log; B: Field Notebook; C: COC Form; D: Sample Processing Form; E: Water Quality Data Log

Field logbooks will be supplemented by standardized forms, such as coring logs and daily activity logs (Attachment 1 and 2). All measurements made and samples collected will be promptly recorded. All entries will be made in permanent ink, signed, and dated, and no erasures or obliterations will be made. If an incorrect entry is made, the information will be crossed out with a single strike mark that is signed and dated by the sampler. Whenever a sample is collected, or a measurement is made, latitude and longitude information will be recorded. The number of photographs taken of the sampling location will be noted. All equipment used to make measurements will be identified, along with time and date of calibration and checking.

A.6.2 Photographic Records

Each sediment core will be photographed with a scale/ measuring tape for future reference. Each photograph will contain the core ID, the date, orientation (top/ bottom), a scale along the entire core length, and unique features (indicated with a pointer). Photographic records (electronic format) will be maintained in the project files and included in the field report.

A.6.3 Sample Documentation

The data management strategy for this task comprises the following elements:

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

- Assignment of unique sample codes. This code is used to track the sample from collection, through the analysis, to reporting.
- Data retention. Data will be retained in accordance with the requirements stated in Section A.6.5 of this SAP.

A.6.3.1 Sample Identification/Numbering

For each set of samples collected, the sample containers will be labeled with the following information:

- Project Name (New Haven Harbor DM Suitability Study 2017);
- Unique sample identification number (e.g., NHH-A thru Z, or NHH-CLDS)
- Date and time of sample collection;
- Name or initials of collector;
- Sample preservation/storage condition; and
- Type of analysis (grain size, etc.).

QC samples will be labeled in the following manner:

- Equipment blanks: NHH-EB-XXXX-mm/dd/yy where XXXX corresponds to the equipment type (either pump or grab) and mm/dd/yy corresponds to the collection date.
- Replicates: The sample identification (ID) is to be appended with “-Rep”

Water samples collected for the preparation of SPP/ Elutriate mixtures will be labeled NHC-1 thru NHC-8 as outlined in **Table A-2**.

A.6.3.2 Chain-of Custody Records

Custody is one of several factors necessary to satisfy the two major requirements for data admissibility: relevance and authenticity. Sample custody is addressed in two parts: field sample collection and laboratory analysis. Refer to AECOM SOP NHH-G-04 (Appendix A) for further details.

The field team is personally responsible for the care and custody of the samples until they are transferred or dispatched properly to the laboratories. Field procedures have been designed such that as few people as possible will handle the samples.

All sample containers will be identified by the use of adhesive sample labels. The sample numbering system is presented in Section 6.3.1. Sample labels will be completed for each sample using waterproof ink unless prohibited by weather conditions. For example, a logbook notation would explain that a pencil was used to fill out the sample label because the pen would not function in wet weather.

Samples will be accompanied by properly completed Chain-of-Custody (COC) forms. The sample codes will be listed on the COC form. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the record. This record documents the transfer of custody of

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

samples from the sampler to another person, to a mobile laboratory, to the permanent laboratory, or to/from a secure storage location. An example COC form is attached (Attachment 3).

A.6.3.3 Field Instrument Calibration & Documentation

As discussed in Section A.5 *Field Activities*, navigational positioning will be acquired using DGPS instrumentation. Field measurements will include station position information.

Navigation instrumentation will be checked daily each day that seawater is sampled, and checked at the end of each seawater sampling day, as specified on **Table A-6**, following the procedures detailed in SOP NHH-G-02 (Appendix A).

Records of navigational accuracy and checking results will be recorded at the time of calibration or checking in the bound field logbook.

A.6.3.4 Documentation Procedures/ Data Management and Retention

Entries in field logbooks and on standardized forms will be reviewed for outliers and omissions prior to leaving the sampling site. Navigational data will be collected using DGPS integrated with PC-based navigational software. Actual survey positions will be documented at the time of sample collection on the electronic navigation charts and downloaded as survey records.

Photographic records collected of each core/ sample with scale during the course of study will be maintained in the project directory established for the project. If a case arises whereby a unique horizon >2 feet in thickness is encountered, photograph(s) should be transmitted to NAE (if possible) for real-time discussion and decision-making regarding potential segregation of the material.

Any potential deviation from the workplan must be discussed with the Task Order Manager and NAE TM and corrective actions documented as discussed in Section 10. If uncertainties arise, then the Chief Scientist may suspend activities until clarification is obtained from the task leadership (AECOM Task Order Manager, NAE TM).

AECOM's data manager, Mr. Jim Herberich, will establish an environmental database for the project where all measurement data will reside. Field station positions, collection dates/times, field analytical data and field observations will be included. Sample collection times will begin the COC record, based on unique sample IDs for discrete and composite samples, and all physical, chemical or biological laboratory data will be maintained. The database will provide the source data for project progress, draft and final reports. Sediment data will be provided in EDD format matching NAE's preferred format among the RIM specified formats. All EDDs will be checked using the most current EDD Checker available on the RIM website. Only EDDs that pass the Checker without error will be submitted, along with the Checker report.

All field/ project records will be maintained on the project website accessible only to designated AECOM and NAE personnel for a minimum of 5 years. Archived project files will include all field records as specialized log forms and measurement data, station position EDDs, logbook photocopies, photographs, calibration records, corrective action reports, and audit reports. The field report, final maps, progress reports, laboratory reports, and the draft and final Task Order reports will also be placed on the project website, as discussed in the QAPP Section of this SAP (Section B.13 *Reports*).

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

A.7 Sample Packaging and Shipping

All sample shipments will be accompanied by the COC record identifying the contents. The original record and one copy will accompany the shipment, and one copy will be retained by the sampler and placed in the project files.

Bulk samples will be transported via refrigerated truck; discrete samples will be properly packaged on ice at 4°C for shipment and dispatched to the laboratory for analysis according to AECOM SOP NHH-G-05 (Appendix A). A separate signed COC will be enclosed in and secured to the inside top of each sample box or cooler.

All project samples will be transferred by project couriers; common carriers are not anticipated. If common carriers become necessary for discrete sample shipments, then samples will be placed in plastic coolers for storage and transfer according to procedures detailed in AECOM SOP NHH-G-05. In these cases, custody seals will be attached to the front and back opposite corners of the cooler and covered with clear plastic tape after being signed by field personnel. The cooler will be strapped shut with strapping tape in at least two locations and the waybill will be retained in the project file.

A.8 Field Assessment/ Inspection

Sampling and subcontractor equipment will be checked by the Chief Scientist or designee during mobilization, initially before use, and at the end of each day. Furthermore, a field audit may be scheduled at the discretion of the Task Order Manager to verify the inspection process and to review methods and documentation from collection through final packaging and shipment.

Preliminary results of the audit will be reviewed with the Task Order Manager to ensure that deficiencies adversely affecting data quality are immediately corrected.

For this task, critical supplies for field activities will be tracked by the Field Survey Task Leader in the following manner.

Critical Supplies and Consumables	Inspection Requirements and Acceptance Criteria
Sample Containers	Visually inspected upon receipt for cracks/ breakage/ cleanliness. Must be accompanied by certificate of analysis.
Field Equipment & Instrumentation	Functional checks to ensure proper operation and testing (echo sounder, DGPS)
Sampling Equipment	Visually inspected for obvious defects, damage, and contamination

Supplies and consumables not meeting acceptance criteria will initiate the appropriate corrective action. Corrective measures may include repair or replacement of measurement equipment, and/or notification of vendor and subsequent replacement of defective or inappropriate materials. All actions will be documented in the project files.

Field equipment testing activities are listed in **Table A-6** along with non-conformance corrective actions. The laboratory system of inspection and acceptance of supplies and consumable is documented in each project laboratory QA manual.

Section: FSP

Revision: 0

Date: August 2017

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Field data will be reviewed daily by the Field Survey Task Leader to ensure that the records are complete, accurate, and legible and to verify that the sampling procedures are in accordance with the protocols specified in the FSP and QAPP.

A.9 Nonconformance/Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter unacceptable procedures or poor performance that can affect data quality. Corrective action proposed and implemented should be documented in QA reports to management. Corrective action should only be implemented after approval by the Task Order Manager or designee.

Field Corrective Action

Corrective action in the field may be needed when the sample network is changed (i.e., more/ less samples, sampling locations other than those specified in the workplan, etc.), or when sampling procedures and/ or field analytical procedures require modification, etc., due to unexpected conditions. The field team may identify the need for corrective action. The Chief Scientist and Task Order Manager will notify the NAE Technical Manager who will approve the corrective measure. The Chief Scientist will ensure that the corrective measure is implemented by the field team.

Corrective actions will be implemented and documented in the field records (SOP NHH-G-01 in Appendix A). Documentation will include:

- A description of the circumstances that initiated the corrective action;
- The action taken in response;
- The final resolution; and
- Any necessary approvals.

No staff member will initiate corrective action without prior communication of findings through the proper channels. If uncertainties arise in the field, the Chief Scientist may suspend field activities until clarification is obtained from the NAE TM.

B.0 Quality Assurance Project Plan (QAPP)

B.1 Project Laboratory Organization and Responsibilities

Two laboratories will support the NHH environmental testing task: Alpha Analytical (Alpha), and EnviroSystems Inc. (ESI). The laboratory organization and work breakdown is depicted in **Figure A-1** and **Table B-1**.

Table B-1 Laboratory Roles and Responsibilities

Sediment grain size and bulk chemistry

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

The Alpha Laboratory Manager is Christopher Ouellette, and the Alpha Project Manager will be Ms. Liz Porta. Ms. Porta will have responsibility for technical, financial, and scheduling matters related to physical and chemistry testing tasks (Task 5 and 6). Ms. Mary O'Connell-Kozik, AECOM's Physical/Chemistry Laboratory Coordinator, in general will be the point of contact for the laboratory task leads and safety and quality managers.

The ESI Laboratory Manager is Mr. Ken Simon, and the ESI Project Manager will be Mr. Kirk Cram, with responsibility for technical, financial, and scheduling matters related to sample processing, chemical analyses, and bioassay testing tasks (Tasks 4, 7, 8, 9, 10, and 11). Ms. Christine Archer, AECOM's Biology/Bioassay Laboratory Coordinator, will be the point of contact for the biology laboratory task leads and safety and quality managers. Ms. Mary O'Connell-Kozik, AECOM's Chemical Laboratory Coordinator, will also interface with the analytical laboratory task leads and safety and quality managers.

The Laboratory Managers in these organizations are ultimately responsible for the data produced by the laboratory. Specific responsibilities include:

- Implementing and adhering to the laboratory QA manual and all corporate policies and procedures within the laboratory,
- Approving the standard operating procedures (SOPs),
- Maintaining adequate staffing documented on organization charts, and
- Implementing internal/external audit findings corrective actions.
- Laboratory QA Coordinator
- The Laboratory QA Coordinator reports to the Laboratory Manager. Specific responsibilities include:
 - Approving SOPs;
 - Assessing and maintaining the laboratory QA manual implementation within the facility operations;
 - Recommending resolutions for ongoing or recurrent non-conformances within the laboratory;
 - Performing QA assessments; and

Reviewing and approving corrective action plans for non-conformances, tracking trends of non-conformances to detect systematic problems, and initiating additional corrective actions as needed.

The Laboratory Project Manager in these organizations is the primary point of contact between the laboratory and the appropriate AECOM Laboratory Coordinators. Specific responsibilities of the Laboratory Project Manager include:

- Monitoring analytical and QA project requirements for a specified project,
- Acting as a liaison between the client and the laboratory staff,
- Reviewing project data packages for completeness and compliance to client needs, and
- Monitoring, reviewing, and evaluating the progress and performance of projects.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

B.2 Data Assessment and Responsibilities

Organization of the data assessment tasks are detailed in **Table B-2**. Chemical data will be verified by the Alpha QA department to check that the laboratory tasks followed the specified methods and conform to the QAPP including measurement quality objectives (MCOs) and reporting specifications. Chemical laboratory reports and data/EDD submittals will also be validated to check for completeness, evaluate quality control sample results and apply validation qualifiers as needed based on MCO non-compliance (e.g., blank contamination, etc.).

Similarly, the biological data will be verified by the ESI QA department to check that the laboratory tasks followed the specified methods, and conform to the QAPP specifications, including ancillary bioassay test water quality data collection.

B.3 Data Quality Objectives

The data quality objectives (DQOs) for this task have been established by EPA and the Corps of Engineers as documented in the RIM document (EPA/USACE, 2004). The DQO process, that is –problem statement, goal identification and study questions, new data/analysis requirements, study boundaries, analytical approach with corresponding performance/acceptance criteria - have been incorporated into this SAP.

Table B-2 Data Assessments Organization and Responsibilities

Task	Data Verification Responsibility	Data Validation Responsibility
Task 5 <ul style="list-style-type: none"> Rapid 24 h Discrete Grain Size Reporting Task 6 <ul style="list-style-type: none"> Bulk Sediment Chemistry 	James Todaro Alpha Analytical, 320 Forbes Boulevard Mansfield, MA 02048 (508) 822-9300	Sharon McKechnie, AECOM 250 Apollo Drive Chelmsford, MA 01824 978-905-2317

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

B.3.1 Data Use Background

The assessment of dredged material typically follows a tiered testing approach. If data collected in earlier tests are insufficient to provide a basis for an environmental conclusion, then additional testing (higher level tiers) is undertaken to collect additional data. For example, if the 24-hour TAT grain size data identified that the accumulated sediment to be dredged was only coarse-grained (i.e. sandy) material, then the exclusionary criteria admitting placement in the marine environment unconfined without further testing may be met. Conversely, fine-grained sediments will require added testing before an impact assessment can be completed and a decision made with respect to the final dredged material placement.

Based on NAE decision-making, physical, chemical, and biological (bioassay) data may be generated during the performance of this Task Order to evaluate potential AWQC and LPC exceedances (Elutriate & SPP bioassays), potential toxicity to sediment-associated organisms (10-d whole sediment bioassay with an amphipod and shrimp), and potential chemical bioaccumulation (28-d bioaccumulation clam and worm bioassays) with corresponding tissue chemistry information.

Overall, the data will be used to evaluate potential environmental impacts associated with the proposed maintenance dredging project in the New Haven Harbor FNP, but each data type will be addressed separately in the following sections.

B.3.2 Measurement Quality Objectives

Measurement quality objectives (MQOs) for sensitivity are well established and published in the RIM document for this task. Required methods and corresponding target reporting limits are provided in the RIM document, summarized in this section, and detailed on **Table B-3** (sediment physical & chemical measurements), **Table B-4** (aqueous chemistry), **Table B-5** (tissue chemistry).

Hexachlorobenzene	SW-846	8081B	0.001	0.001	ppm
¹ RL – Reporting limit. Listed laboratory RLs correspond to clam and worm species. RLs for plant tissues will be higher by a factor of five. LL – Low Level					

For this task, systematic checks have been included to ensure data quality. MQOs corresponding to the QC samples are detailed in **Table B-6** (Physical/Chemistry) and **Table B-7** (Bioassays) to ensure that the Data Quality Indicators (DQIs) support the task data usability quality requirements. Quantitative laboratory DQIs for accuracy are supported through the analysis of QC samples as method blanks, matrix spikes, standard reference materials, and in the case of bioassays, through the use of reference toxicants and the monitoring of controls (control survival).

DQIs for precision are supported with the analysis of QC sample spike and/or laboratory duplicates. Field blanks and in some cases field duplicates can also provide important indications of data quality and field blanks have been included in this task (refer to FSP). Completeness of targeted field and laboratory scopes is another important indicator of overall usability/quality.

Qualitative DQIs addressing representativeness and comparability will be assured to some degree through the high number of stations to be sampled, and the subsequent formation of composite samples. The specified use of RIM specified methods will also assure comparability of the dataset to historical data sets generated for similar purposes.

The MQOs established for the quantitative DQIs have been defined below for this task.

Precision

Precision is a measure of the degree to which two or more measurements are in agreement. Laboratory precision will be assessed through the calculation of Relative Percent Difference (RPD) for laboratory duplicate samples, either as matrix spike/ matrix spike duplicates (MS/MSDs) or as laboratory duplicates. Laboratory precision control limits are provided in **Table B-6**. Specific formulas/equations supporting these and other DQIs are provided in Section B.8 *Data Reduction/ Calculation of Data Quality Indicators*.

Accuracy

Accuracy is the degree of agreement between the observed value and an accepted reference or true value. Field accuracy will be assessed through the use of equipment rinse blanks and through the adherence to all sample handling, preservation, and holding time requirements. Laboratory accuracy will be assessed through the analysis of MS/MSDs, standard reference materials, laboratory control samples (LCSs), and surrogate compounds, and the subsequent determination of percent recoveries (%Rs). Accuracy control limits are provided in **Table B-6**.

^aQC samples analyzed at a frequency of one per batch of 20 or fewer samples, except surrogates are added to each sample.

Corrective Action Codes:

- 1 Flag results if <5x blank concentration, re-extract or reanalyze the entire batch.
- 2 Re-extract sample, re-analyze sample or document and narrate
- 3 Flag results
- 4 Flag results
- 5 Investigate, re-analyze or flag results
- 6 Re-extract/reanalyze entire batch if all analytes are outside limits; if selected analytes affected, investigate and provide narrative.

Data Qualifiers:

- J: Analyte detected < laboratory achieved detection limit (i.e., ssRL for organics and RL for metals) but above MDL.
E: Estimate, result > highest concentration level in the calibration.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

B: Analyte concentration is <5x the level found in the procedural blank (the qualifier is only applied to the affected field samples).

U: Not detected above laboratory achieved reporting detection limit

Q: QC value outside the accuracy or precision criteria goal.

Table B-7 Bioassay Measurement Quality Objectives

QC Parameter	Measure or Acceptance Criteria	Corrective Action
SPP Toxicity Testing	<i>Menidia menidia</i> : ≥90% control survival <i>Americamysis bahia</i> : ≥90% control survival <i>Arbacia punctulata</i> : ≥70% control survival	Re-run Test
10-Day Whole Sediment Acute Testing	<i>Leptocheirus plumulosus</i> : control ≥90% mean survival in control <i>Americamysis bahia</i> : ≥90% mean survival in control	Re-run Test
Bioaccumulation	<i>Macoma nasuta</i> and <i>Nereis virens</i> bioaccumulation	Re-run Test
Reference Toxicity Tests (10-day and SPP)	≥90% mean survival in control (and within control chart limits)	Repeat entire test series

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under normal conditions. "Normal conditions" are defined as the conditions expected if the sampling plan was implemented as planned.

- Field completeness is a measure of the amount of valid samples obtained during all sampling for the project. The field completeness objective is greater than 95%.
- Laboratory completeness is a measure of the amount of valid measurements obtained from all the measurements taken in the project. The laboratory completeness objective is greater than 95%.

All analytical data that do not meet the listed MQOs will be submitted to the appropriate AECOM Laboratory Coordinator for review and assessment of the potential impact of the results. Affected samples may be reanalyzed at the discretion of the AECOM Task Order Manager. Data accepted outside these criteria will be flagged with the appropriate data qualifier (**Table B-6** and **Table B-7**), and the rationale for accepting results will be thoroughly documented.

B.4 Sample Receipt, Handling, Custody, and Holding Time Requirements

B.4.1 Sample Receipt Condition Verification/Documentation

Upon sample receipt at the respective laboratories, the condition of samples and associated packaging will be evaluated and documented on a sample receipt form (Attachment 4). As noted on the form, temperature, container condition, unique or unusual sample observations, labeling discrepancies, preservation status, COC completeness, etc. will be documented and a copy sent to the appropriate AECOM Laboratory Coordinator without delay.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the COC form (Attachment 3). This record documents the transfer of custody of samples from the sampler to another person, to the permanent laboratory, or to/from a secure storage location.

B.4.2 Corrective Action for Incoming Samples

Corrective actions may in some cases be taken on incoming samples that do not meet storage requirements. All actions are to be discussed with the Task Order Manager, and may include re-containerizing samples when containers are cracked, etc.

Corrective actions will be documented in the project file. Documentation will include:

- A description of the circumstances that initiated the corrective action;
- The action taken in response;
- The final resolution; and
- Any necessary approvals.

No person will initiate corrective action without prior communication of findings through the proper channels.

B.5 Sample Preparation for Physical, Chemical, & Biological Tests (Task 4)

Station homogenates will be prepared initially in the field by mixing the sediment within each bucket with large pre-cleaned stainless steel spoons as additional core material is added. In this way, the discrete subsamples collected for grain size and chemical archive will represent the station samples.

Stations will be re-homogenized at the bioassay laboratory (ESI) before sample pooling commences by mixing the full volume collected from each station in a large 40-L HDPE plastic bin. These same bins will be used to mix the station composites, one bin per composite for storage between subsampling for the Elutriate/SPP samples, the 10-day bioassay, and the 28-day bioassay.

Composites will be prepared by mixing **equal volumes** from each station to form the final composite sample (see **Table A-1** for compositing scheme). Sample container and storage requirements for the range of potential measurements are detailed on **Table A-7** and Attachment 5.

Tools used in sample transfer and mixing will be either stainless steel or Teflon pre-cleaned using the Level III decontamination procedure detailed in SOP NHH-G-03 (Appendix A). Composite labeling will be as specified in **Table A-1** and **Table A-2**. Materials will be retained (refrigerated) until NAE accepts/approves the final project report.

B.6 Analytical Procedures—Physical & Chemical Parameters (Task 5, 6, 7, & 11)

B.6.1 Sediment Procedures (Tasks 5 & 6)

Sediment physical and chemical parameters will be analyzed by two NAE approved laboratories, Alpha and ESI. The laboratory QAPP for Alpha was submitted to and approved by NAE. Periodic updates have been submitted to NAE, most recently in April 2017. The laboratory QAPP for ESI was submitted to and approved by NAE. Periodic updates have been submitted to NAE, most recently in April 2016.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Initially, discrete samples collected from the 26 individual sampling stations will be wet sieved by Alpha to determine gravel, sand, silt and clay (#4, 10, 40 and 200 sieves) on a fast (24-hour) turnaround time.

Following NAE's data review/approval and composite preparation, bulk sediment samples will be analyzed by sieve-hydrometer (Task 5; Alpha) and sediment chemical methods (Task 6; Alpha). **Table B-3** details the methods and Reporting Limits (RLs) established as DQOs (equivalent to RIM requirements) to meet project objectives.

Grain size analysis (with hydrometer) of the harbor composites and reference site sample shall be conducted according to the methods described in ASTM D422 and Alpha SOP 2183 (Revision 8, June 2017) Particle Size Analysis of Soils-With/Without Hydrometer and reported as percentages retained by weight in the following size classes at a minimum:

- Cobble (3" sieve)
- Gravel (no. 4 sieve)
- Coarse Sand (no. 10 sieve)
- Medium Sand (no. 40 sieve)
- Fine Sand (no. 200 sieve)
- Fine Grained Material (passing the no. 200 sieve)

Results will be reported on a dry-weight basis, and will include distribution curves. QC results will be reported on NAE's QC Summary Tables (Appendix B).

Total Organic Carbon (TOC) will be analyzed as detailed in Alpha SOP 17452 Total Organic Carbon and Soot in Soil, Sediment (Revision 1, July 2015). All samples will be analyzed in duplicate. Results will be reported on a dry-weight basis.

Trace Organic Parameters as PAHs, PCB Congeners and pesticides will be analyzed following Alpha SOPs 2157, Analysis of Polynuclear Aromatic Hydrocarbons and PCB Congeners by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (Revision 13, May 2016) and 2158, Determination of Organochlorine Pesticides By Gas Chromatography/Electron Capture Detection (GC/ECD) (Revision 13, June 2017). Samples are extracted three times using appropriate solvent. Extracts are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques. Target compound identification will be based on dual-column analysis for GC analyses or reference mass spectral identification for GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using external standards for GC analyses and internal standards for GC-MS analyses.

All results will be reported in microgram per kilogram ($\mu\text{g/kg}$) dry weight.

Metals (arsenic, cadmium, chromium, copper, lead, nickel, and zinc) will be analyzed following procedures in Alpha SOP 2137, Inductively Coupled Plasma-Mass Spectrometry (Revision 13, April 2016). Sample preparation will be conducted according to the SOP. An aliquot of digestate will be nebulized into a spray chamber where a stream of argon carries the sample aerosol through a quartz torch and injects it into the radio frequency inductively coupled plasma. The ions produced in the plasma are introduced to the mass spectrometer for quantification against a single point initial calibration. All results are reported in milligrams per kilogram (mg/kg) dry weight.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Mercury will be analyzed following procedures in Alpha SOP2143, Mercury Determination in Tissue and Soil/Sediment Samples by Cold Vapor Atomic Fluorescence Technique (CVAf) (Revision 8, July 2015) Sediment samples (approximately 1 g) will be digested by hot plate in an aqua regia acid solution. An aliquot of the digest will then be prepared with HCL/BrCl and hydroxylamine hydrochloride solution. Mercury in the digested sample is reduced to elemental mercury, aerated from solution and introduced into the spectrophotometer. The emission is measured and compared to a multi-level initial calibration for quantification. All results will be reported in mg/kg dry weight.

B.6.2 Elutriate/ SPP Preparation & Aqueous Analytical Procedures (Task 7)

The preparation of elutriate and SPP samples will utilize the sediment composites prepared under Task 4 detailed above. Elutriate and other (i.e., equipment blanks, CLDS Reference Site water) aqueous samples will be analyzed for trace metals, PAHs (equipment blank only), PCBs/pesticides and pentachlorophenol (not in CLDS water equipment blank). The samples will be prepared in glass containers. The elutriate/ SPP preparation must commence no later than 14 days after seawater collection. Elutriate and SPP samples will be prepared concurrently and used within 24 hours of preparation.

The elutriate/SPP samples are prepared by placing one volume of test sediment and four volumes of dredging site water (i.e. harbor water) from the appropriate site in an eight-gallon glass container and mixing vigorously with a magnetic stir bar. Additionally, the sediment/water mixture will be hand stirred at approximately 10 minute intervals during the mixing period. At the end of the 30-minute period, the sediment/water mixture will be allowed to settle for one hour and the supernatant (elutriate/SPP) siphoned off for testing. Sufficient sediment and seawater volumes are used to prepare samples for chemical analysis of the elutriate and SPP bioassays. If required, the SPP portion may be centrifuged (only enough to clear the water so organisms can be seen) to facilitate biological observations.

The elutriate samples will be prepared in **triplicate** for the analyses of PCBs/pesticides, pentachlorophenol, and trace metals. Elutriate samples will be centrifuged at ESI, split for metals and organic analysis, and then containerized per **Table A-7** and Attachment 5 requirements. Elutriate blanks are defined for this project as the site water (used to prepare elutriates) that are run through the entire elutriate preparation process for background correction purposes.

Table B-4 details the list of target elutriate analytes, corresponding analytical method references, and target detection limits for the aqueous project samples.

Trace Organic Parameter elutriate and elutriate blank samples will be centrifuged at ESI and analyzed at ESI. Rinsate blank samples will be transferred to ESI directly from the field. PAH (sediment equipment blank), pentachlorophenol, PCB Congeners and pesticides will be analyzed following the ESI SOPs 1345 (Revision 3, March 2012) Analysis of ABN Compounds by GC/MS, 1351 (Revision 9, March 2016) Analysis of Pesticides and PCBs in Extracts of Soil, Tissue and Water and 1391 (Revision 1, May 2013) Analysis of Selected PCB Congeners by GC/MS. Water samples will be extracted according to ESI SOPs 1367 (Revision 3, March 2013) Extraction of Pentachlorophenol and Other ABN Compounds in Aqueous Samples and 1344 (Revision 9, April 2014) Extraction of Pesticides and PCBs in Aqueous Samples.

Samples are extracted three times using appropriate solvent. Extracts are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Target compound identification will be based on dual- column analysis for GC analyses or reference mass spectral identification for GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using external standards for GC analyses and internal standards for GC-MS analyses.

All results will be reported in microgram per liter (µg/L) units.

Metals elutriate and elutriate blank samples will be prepared and analyzed at ESI. The reference site water samples will be transferred to ESI directly from the field. Elutriate and elutriate blank samples will be analyzed for ten metals: arsenic, cadmium, hexavalent chromium, copper, nickel, lead, silver, selenium, zinc, and mercury.

Mercury will be analyzed following procedures in ESI SOP 1365 (Revision 5, June 2012), Mercury in Water by Cold Vapor Atomic Fluorescence Spectrometry. Water samples will be digested with a BrCl solution followed by reduction with a hydroxylamine hydrochloride solution. Mercury in the digested sample will be reduced to elemental mercury, aerated from solution and introduced into the fluorescence detector. The emission will be measured and compared to a multi level initial calibration for quantification.

Arsenic, cadmium, copper, nickel, lead, selenium, silver, and zinc will be extracted from seawater according to ESI SOP1323 (Revision 8, January 2015) Sample Preparation; Trace Metals Digestion and analyzed according to ESI SOP1369 (Revision 9, June 2016) Determination of Trace Metals by ICP-MS Analysis.

Hexavalent chromium will be analyzed according to ESI SOP 1353 (Revision 12, July 2015) Hexavalent Chromium.

All metals results will be reported in mg/L units.

B.6.3 Tissue Analytical Procedures (Task 11)

Although the 28-day bioaccumulation testing will be performed on all composite group sediment samples, chemical analyses will only be performed on tissue samples for those sediments that pass the 10-day whole sediment acute toxicity test. **Table B-5** lists the potential parameters that may be analyzed in the bioaccumulative tissue samples. If selected parameters are not detected in selected sediment composites, then those parameters may be omitted from tissue testing with NAE approval.

Trace organic tissue parameters as PAHs, PCB Congeners and Pesticides will be analyzed after preparation following Alpha SOPs 2157 (Revision13, May 2016) Analysis of Polynuclear Aromatic Hydrocarbons and PCB Congeners by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring and 2158, Determination of Organochlorine Pesticides By Gas Chromatography/Electron Capture Detection (GC/ECD) (Revision 13, June 2017). Samples are extracted three times using appropriate solvent. Extracts are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques.

Target compound identification will be based on dual- column analysis for GC analyses or reference mass spectral identification for GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using external standards for GC analyses and internal standards for GC-MS analyses.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

All tissue results will be reported in nanograms per gram (ng/g) on a wet weight basis.

Lipid Content in tissue samples will be determined according to NOAA Tech Memo 130, 1998. An aliquot of tissue is weighed in a tared glass vial and the lipid content of the sample is extracted using a specific ratio of solvent to water. The sample is serially extracted three times. The organic layer is removed and dried over sodium sulfate. The extract is evaporated to dryness, leaving the lipid content. Amount of residue is determined gravimetrically.

The results will be reported in % wet tissue.

Metals tissue samples will be processed according to Alpha SOP 2137 (Revision 13, April 2016) Inductively Coupled Plasma-Mass Spectrometry.

For metals other than mercury, an aliquot of the digestate will be analyzed following procedures in Alpha SOP 2137. By this procedure, the digestion solution is nebulized into a spray chamber where a stream of argon carries the sample aerosol through a quartz torch and injects it into the radio frequency inductively coupled plasma. The ions produced in the plasma will be introduced to the mass spectrometer for quantification against a single point initial calibration.

Mercury will be analyzed following procedures in Alpha SOP 2143 (Revision 8, July 2015) Mercury Determination in Tissue and Soil/Sediment Samples by Cold Vapor Atomic Fluorescence Technique. An aliquot of the digest is prepared with HCL/BrCl and hydroxylamine hydrochloride solution. Mercury in the digested sample will be reduced to elemental mercury, aerated from solution and introduced into the fluorescence detector. The fluorescence will be measured and compared to a multi-level initial calibration for quantification.

All metals results will be reported in micrograms per gram (µg/g) on a wet weight basis.

B.6.4 Preventive Maintenance

Routine testing and preventive maintenance is performed by the laboratory as part of their QA program. Details on the type of checks, frequencies, and corrective actions associated with the physical and chemical project measurements are included in the corresponding laboratory QA manuals.

B.6.5 Calibration Procedures & Frequency

Specific laboratory method calibration procedures and frequency requirements are detailed in NAE QC summary tables, referenced in the RIM (EPA/ USACE, 2004) and included in Appendix B.

Calibration procedures for laboratory instruments will consist of initial calibrations, initial calibration verifications, and continuing calibration verification. The SOP for each analysis performed in the laboratory describes the calibration procedures, their frequency, acceptance criteria, and the conditions that will require recalibration. This information is summarized in the laboratory QA Manuals.

The laboratory maintains documentation for each instrument which includes the following information: instrument identification, serial number, date of calibration, analyst, calibration solutions, and the samples associated with these calibrations.

Inspection/ Acceptance of Supplies and Consumables

The laboratory system of inspection and acceptance of supplies and consumable is documented in the laboratory QA Manuals.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Supplies and consumables not meeting acceptance criteria will initiate the appropriate corrective action. Corrective measures may include repair or replacement of measurement equipment, and/or notification of vendor and subsequent replacement of defective or inappropriate materials. All actions will be documented in the project files.

B.6.6 Laboratory QC Procedures

Each batch of sediment samples analyzed for TOC, organics and metals will be prepared with a routine set of QC samples. For TOC, all samples will be analyzed in duplicate and QC samples will also include one method blank and one standard reference material. For organics, QC samples will include one matrix spike, one matrix spike duplicate, one sample duplicate, and one sediment standard reference material sample. Metals will include one matrix spike, one sample duplicate, and one standard reference material sample.

Each batch of twenty aqueous samples analyzed for organic contaminants and metals will be prepared with a set of QC samples as specified in the RIM. For organic contaminant analysis, QC samples will include one method blank, one laboratory control sample, one matrix spike, and one matrix spike duplicate. For metals analyses, QC samples will include one method blank, one laboratory control sample, one matrix spike and one matrix spike duplicate.

Each batch of twenty or fewer tissue samples analyzed for organic contaminants (PCB/ pesticides and PAHs) and metals will be prepared with a routine set of QC samples, including one method blank, one laboratory control sample, one matrix spike, one matrix spike duplicate, one sample duplicate, and one tissue standard reference material sample. For lipid content analysis, one sample duplicate will be prepared with each batch of tissue samples.

Physical and chemical measurement quality objectives (MQOs) for sediment, elutriate, and tissue sample types are provided in **Table B-6**.

B.6.7 Performance and System Audits

Sediment and tissue analytical programs include SRMs, providing an excellent way to audit the performance of laboratory procedures for sample preparation and analysis. Field and/or laboratory system audits may be performed at the discretion of the NAE TM to ensure project personnel are performing project related tasks according to the project specific SAP and associated field and laboratory SOPs.

Field Audit

As detailed in Section A.9 of the FSP, the AECOM Field Services Task Leader will be responsible for ensuring that the approved procedures documented in the SAP and QAPP are being followed. The Task Leader will review field sampling records, field measurement results, and field instrument operating and calibration records. The Field Services Task Leader will also be responsible for monitoring procedures for sample collection, handling, and packaging procedures, QA procedures, chain-of-custody, and sample documentation, etc.

If significant deficiencies are noted, corrective action will be implemented as discussed in Section B.6.8.

Laboratory Audit

Laboratory audits are conducted periodically by AECOM as part of their analytical subcontractor monitoring program. A typical systems audit includes review of the following areas:

- QA organization and procedures,

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Personnel training and qualifications,
- Sample log-in procedures,
- Sample storage facilities,
- Analyst technique
- Adherence to laboratory SOPs and project SAP,
- Compliance with QA/QC objectives,
- Instrument calibration and maintenance,
- Data recording, reduction, review, and reporting, and
- Cleanliness and housekeeping.

Preliminary results of the audit are discussed with the Laboratory Manager, Laboratory Project Manager, and Laboratory QA Coordinator. A written report that summarizes audit findings and recommends corrective actions is prepared and submitted to the Laboratory Manager for response, and to the AECOM Project Manager.

Data Package Audits

Audits of analytical data packages will be conducted for 100% of the packages received as part of the data validation process (Section B.11). The review will include an evaluation of the package to ensure that (1) all required deliverables are provided, (2) the package contains the information necessary to reproduce the reported results, and (3) the QC acceptance criteria specified in the SAP were met. Any deficiencies will be communicated to the laboratory and documented in the project files.

Audit Samples

Audit samples will be incorporated into the program as discussed in the Laboratory QC Procedures section above. Results for the audit/SRM samples will be reviewed by the Physical & Chemistry Laboratory Coordinator and compared to the acceptable limits provided by the vendor. Failure to meet the acceptance criteria will result in the review of the results and supporting data by the laboratory to identify the cause of the failure. Depending on the outcome of this review, subsequent corrective actions may include the following:

- Qualification/flagging of affected data,
- Discarding affected data and re-analysis, or
- Discarding affected data, re-sampling, and re-analysis.

B.6.8 Nonconformance & Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter SAP specification nonconformance, unacceptable procedures, or out-of-limit QC performance that can affect data quality. Corrective action can occur during field activities, laboratory analyses, data validation, and data assessment. All corrective action proposed and implemented will be documented as detailed in Section 13 Reports.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Corrective action should only be implemented after approval by the AECOM Task Order Manager, or her designee. Field related corrective action is discussed in Section A.10 of the FSP.

Laboratory Corrective Action

Corrective action in the laboratory may occur prior to, during, and after initial analyses. A number of conditions such as broken sample containers, multiple phases, low/high pH readings, and potentially high concentration samples may be identified during sample log-in or analysis. Following consultation with laboratory analysts and supervisory personnel, it may be necessary for the Laboratory QA Coordinator to approve the implementation of corrective action. If the nonconformance causes project objectives not to be achieved, the AECOM Task Order Manager will be notified.

These corrective actions are performed prior to release of the data from the laboratory. The corrective action will be documented in both the laboratory's corrective action files, and in the narrative data report sent from the laboratory to the AECOM (Chemical or Biological) Laboratory Coordinator and the AECOM Task Order Manager. If the corrective action does not rectify the situation, the laboratory will contact the AECOM Task Order Manager who, in concert with the AECOM (Chemical or Biological) Laboratory Coordinator and NAE's TM, will determine the action to be taken and inform the appropriate personnel.

Physical & Chemical Measurements

The need for corrective action may be identified during either data validation or data assessment. Potential types of corrective action may include resampling by the field team or reinjection/reanalysis of samples by the laboratory. These actions are dependent upon the ability to mobilize the field team and whether the data to be collected is necessary to meet the required QA objectives. If the AECOM Laboratory identifies a corrective action situation, the AECOM Task Order Manager will be responsible for informing the appropriate personnel.

B.6.9 Corrective Action Reports to Management

QA reports will be submitted to the AECOM Task Order Manager to ensure that any problems identified during the sampling and analysis programs are investigated and the proper corrective measures taken in response. The QA reports will include:

- All results of field and laboratory audits,
- Problems noted during data validation and assessment, and
- Significant QA/QC problems, recommended corrective actions, and the outcome of corrective actions.

QA reports will be prepared by the AECOM Project QA Officer and submitted on an as-needed basis.

B.7 Analytical Procedures – Bioassays (Tasks 8, 9, & 10)

All toxicity testing will be conducted following protocol guidance presented in NAE's RIM (EPA/USACE, 2004) and in the Inland Testing Manual (EPA/USACE, 1998).

B.7.1 SPP Bioassays (Task 8)

SPP toxicity tests will commence no later than 24 hours after the SPP is prepared. SPP from each of the six composites will be tested at 100%, 50%, 10%, and 0% concentrations, using the CLDS Reference Site water as the dilution water. Three species, *M. menidia*, *A. bahia*, and *A. punctulata*, will be exposed to the

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

SPP dilution series, reference site water, as well as a clean seawater control (i.e., laboratory control). All SPP tests will be conducted static, with aeration provided if dissolved oxygen falls below 40% saturation (~4 mg/L at 20°C and 30 parts-per-thousand). The *M. menidia* and *A. bahia* tests are 96-hour duration; the *A. punctulata* larval development test is 48-72-hour duration. A reference toxicant test of the same duration, using potassium chloride or copper in clean seawater, will be performed concurrently with each SPP test. Specific test conditions for the SPP tests are provided in **Table B-8**.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Table B-8 Suspended Particulate Phase Testing Conditions

Parameter	Americamysis bahia	Menidia menidia	Arabacia punctulata
Treatments (SPP prepared from sediment composites and harbor water)*	8 Sample Composites and 1 CLDS Reference Site water	8 Sample Composites and 1 CLDS Reference Site water	8 Sample Composites and 1 CLDS Reference Site water
Replicates	5	5	5
Test population	1-5 days old	7-10 day with 24 hours variation	2 hours after fertilization
Temperature	Mean of $20 \pm 1^{\circ}\text{C}$ Maximum Deviation of 3°C	Mean of $20 \pm 1^{\circ}\text{C}$ Maximum Deviation of 3°C	Mean of $20 \pm 1^{\circ}\text{C}$ Maximum Deviation of 3°C
Dissolved Oxygen	40% Saturation	40% Saturation	NA
pH	NA	NA	NA
Salinity	25 – 30 ‰ $\pm 10\%$	25 – 30 ‰ $\pm 10\%$	30-32‰
Ammonia	NA	NA	NA
Feeding	Daily, <24 hour old Artemia nauplii	Daily, <24 hour old Artemia nauplii	None
Reference Toxicant	KCL	KCL	Copper

*Study design also includes laboratory control.

B.7.2 10-day Whole Sediment Bioassay (Task 9)

The 10-day whole sediment toxicity test is proposed to commence less than two weeks after the sediment collection data (tests must commence no later than six weeks post collection). The decision to proceed with this testing will be at the direction of the NAE. Protocol for the whole sediment toxicity assays will be based on guidance established in the RIM (EPA/USACE, 2004).

Whole sediment acute toxicity testing will be performed using the marine invertebrates *Leptocheirus plumulosus* and *A. bahia*. *L. plumulosus* and *A. bahia* will be exposed to all eight sample composites plus the CLDS Reference Site sediment. A laboratory control will also be run with each test. Tests with each species will be 10-day static renewal exposures with mortality as the endpoint. Depending on the concentrations of ammonia in bulk sediment and/or overlying water, the test chambers may require purging to reduce ammonia below toxic levels.

The acceptable porewater ammonia concentration for *L. plumulosus* at test initiation is 60 mg/L total ammonia (EPA, 2001). For *L. plumulosus*, ammonia purging and monitoring will follow the guidance in Method for Assessing the Chronic Toxicity of Marine and Estuarine Sediment-associated Contaminants with the Amphipod *Leptocheirus plumulosus* (EPA, 2001), which calls for aerating the sample and replacing two volumes of overlying water per day until thresholds are met. Overlying and porewater ammonia will be monitored each day during the purging period.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

The acceptable overlying water ammonia concentration for *A. bahia* is 0.6 mg/L as unionized ammonia. For *A. bahia*, ammonia purging and monitoring will follow the guidance in the 1994 memo from Elizabeth Sunderland to Mario Del Vicario (EPA/USACE 2002) which calls for replacing two volumes of overlying water per day until the unionized ammonia thresholds is met. Overlying ammonia will be monitored each day during the flushing period.

For both test species, organisms (20 per chamber) will be introduced to the test chambers once ammonia levels are within acceptable levels. Overlying water will be monitored on Days 0, 3, and 10 of the test, per the guidance in Appendix F of the Inland Testing Manual (Day 0, 10 monitoring) and NAE (intermediate Day 3 monitoring).

The static-renewal test conditions of one exchange per day should ensure that ammonia remains within acceptable range. However, if the Day 3 monitoring results show that ammonia was above the acceptable range, the static-renewal frequency will be increased to two exchanges per day. Other water quality parameters (temperature, pH, dissolved oxygen, and salinity) will be measured in all replicates at test initiation, in one replicate per day during the test, and again in all replicates at test termination.

The bioassay tests will also include a concurrent 96-h, water-only, reference toxicant test using cadmium (for *L. plumulosus*) or copper/ sodium dodecyl sulfate (for *A. bahia*) to assess the sensitivity of each test population. Specific test conditions for the whole sediment toxicity tests are provided in **Table B-9**.

Table B-9 10-day Whole Sediment Test Conditions

Parameter	<i>Leptocheirus plumulosus</i>	<i>Americamysis bahia</i>
Treatments*	8 Sample Composites and 1 CLDS Reference Site Control	8 Sample Composites and 1 CLDS Reference Site Control
Replicates	5	5
Test population	Juvenile -non reproductive adult (2-4mm)	1-5 days old
Temperature	Mean of 25± 2°C Maximum Deviation of 3°C	Mean of 20 ± 1°C Maximum Deviation of 3°C
Dissolved Oxygen	40% Saturation	40% Saturation
pH	NA	NA
Salinity	20 – 30‰ ±10%	25 – 30‰ ±10%
Ammonia	Porewater unionized ammonia <0.8 mg/L	Overlying water unionized ammonia <0.6 mg/L
Feeding	None	Daily, <24 hour old Artemia nauplii
Reference Toxicant	Cadmium	Copper / Sodium Dodecyl Sulfate

*Study design also includes laboratory control.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

B.7.3 28-day Bioaccumulation Bioassay (Task 10)

Project bioaccumulation tests will commence within six weeks of sample collection. Chemical analyses will only be performed on tissue samples for sediments that pass the 10-day whole sediment acute toxicity test. Bioaccumulation tests will be performed by ESI according to the NAE Regional Guidance (EPA/USACE 1998, 2004).

Macoma nasuta and *Nereis virens* will be exposed to the eight sample composites, plus the CLDS Reference Site sediment, and native control sediments (i.e., negative laboratory control), for 28 days under flow-through conditions. *M. nasuta* and *N. virens* will be tested in separate 10-gallon aquaria, with five replicate aquaria per treatment. Twenty organisms will be introduced into each replicate aquaria.

Water quality parameters (temperature, dissolved oxygen, pH, and salinity) will be measured in all replicates at test initiation, in at least one replicate per treatment daily, and in all replicates at test termination. Flow rates into individual aquaria are measured daily and adjusted as necessary from Days 0 through 27 of the bioaccumulation test. If necessary, aeration will be provided to all test chambers to maintain dissolved oxygen >40% saturation.

At the end of the 28-day testing period, *M. nasuta* and *N. virens* will depurate in clean seawater for 24 hours. Following depuration, organism tissues will be homogenized, transferred into the appropriate chemistry jars for tissue chemistry analyses and stored frozen (<20°C) until analysis. Tissue sample container and storage requirements are detailed in **Table B-10** and Attachment 5.

Table B-10 Sample Container, Preservation, and Holding Time Requirements for Tissue Samples

Tissue Parameters	Mass (g)	Container	Preservation	Storage	Holding Time
Lipids	0	N/A – lipid content obtained from organic analysis			
Moisture	2-10	Glass	Freeze	-20°C	14 d
Organic Chemistry (PAHs/PCBs/Pesticides)	40	Glass	Freeze	-20°C	14 d (extract)/ 40 d (analyze) when thawed
Metals Chemistry	10	Glass	Freeze	-20°C	28 d (Hg), 180 d (other metals) when thawed

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Specific test conditions for the 28-day bioaccumulation test are provided in **Table B-11**.

Table B-11 28-Day Bioaccumulation Bioassay Test Conditions

Parameter	<i>Macoma nasuta</i>	<i>Nereis virens</i>
Treatments*	8 Sample Composites and 1 CLDS Reference Site Control	8 Sample Composites and 1 CLDS Reference Site Control
Replicates	5	5
Test population	Adult clam	Adult Polychaete; 3-15 grams
Temperature	Mean of $12 \pm 2^{\circ}\text{C}$ Maximum Deviation of 3°C	Mean of $12 \pm 2^{\circ}\text{C}$ Maximum Deviation of 3°C
Dissolved Oxygen	40% Saturation	40% Saturation
pH	NA	NA
Salinity	25 – 30‰ $\pm 10\%$	25 – 30‰ $\pm 10\%$
Ammonia	NA	NA
Feeding	None	None
Reference Toxicant	NA	NA

*Study design also includes laboratory control.

B.7.4 Preventive Maintenance

Routine testing and preventive maintenance of instrumentation needed to carry out bioassay test chamber monitoring is performed by the laboratory as part of their QA program. Details on the type of checks, frequencies, and corrective actions associated with the physical and chemical project measurements are included in the corresponding laboratory QA manuals.

B.7.5 Calibration Procedures & Frequency

Calibration of bioassay monitoring instrumentation will be guided by the procedures detailed in the laboratory QA manual.

Ammonia and pH measurement probes will be calibrated immediately before (daily) use and at the finish of (daily) monitoring activities. Thermometers and temperature recording devices will be checked daily against a standard thermometer. Dissolved oxygen probes will also be checked before (daily) use and at the finish of (daily) monitoring activities.

B.7.6 Laboratory QC Procedures

All bioassays will include a negative control, and a concurrent 96-hour, water-only, reference toxicant test to assess the sensitivity of each test population.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Additionally, the biological QC elements detailed in the NAE QC summary tables, referenced in the RIM (EPA/USACE, 2004) and included in Appendix B will be adhered to, including test species age/health, control abnormality and mortality acceptance criteria and test-specific acceptability requirements.

B.7.7 Performance and System Audits

Bioassay programs include the use of reference toxicants to audit the performance of bioassay laboratory procedures. Laboratory system audits may be performed at the discretion of the NAE TM to ensure project personnel are performing project related tasks according to the project specific SAP and associated field and laboratory SOPs.

Laboratory Audit

ESI laboratory audits are conducted periodically by AECOM as part of their analytical subcontractor monitoring program. A typical systems audit includes review of the following areas:

- QA organization and procedures,
- Personnel training and qualifications,
- Sample log-in procedures,
- Sample storage facilities,
- Analyst technique
- Adherence to laboratory SOPs and project SAP,
- Compliance with QA/QC objectives,
- Equipment calibration and maintenance,
- Data recording, reduction, review, and reporting, and
- Cleanliness and housekeeping.

Preliminary results of the audit are discussed with the Laboratory Manager, Laboratory Project Manager, and Laboratory QA Coordinator. A written report that summarizes audit findings and recommends corrective actions is prepared and submitted to the Laboratory Manager for response, and to the AECOM Project Manager.

Data Package Audits

Audits of bioassay reports will be conducted for 100% of the packages received as part of the data review process. The review will include an evaluation of the package to ensure that (1) all required deliverables are provided, (2) the package contains the information necessary to reproduce the reported results, and (3) the QC acceptance criteria specified in the SAP were met. Any deficiencies will be communicated to the laboratory and documented in the project files.

Audit Samples

Audit samples will be incorporated into the program as discussed in the Laboratory QC Procedures section above. Reference toxicant results will be reviewed by the Biology/Bioassay Laboratory Coordinator and compared to the acceptable limits provided by the vendor. Failure to meet the acceptance criteria will result

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

in the review of the results and supporting data by the laboratory to identify the cause of the failure. Depending on the outcome of this review, subsequent corrective actions may include the following:

- Qualification/flagging of affected data,
- Discarding affected data and re-analysis, or
- Discarding affected data, re-sampling, and re-analysis.

B.7.8 Nonconformance & Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter SAP specification nonconformance, unacceptable procedures, or out-of-limit QC performance that can affect data quality. All corrective action proposed and implemented will be documented as detailed in Section 13 Reports.

Corrective action should only be implemented after approval by the AECOM Task Order Manager, or her designee.

Biological Laboratory Corrective Action

Corrective action in the laboratory may occur prior to, during, and after initial analyses. A number of conditions such as low/high water quality readings may be identified. Following consultation with laboratory personnel, it may be necessary for the Laboratory QA Coordinator to approve the implementation of corrective action. If the nonconformance causes project objectives not to be achieved, the AECOM Task Order Manager will be notified.

These corrective actions are performed prior to release of the reports from the laboratory. The corrective action will be documented in both the laboratory's corrective action files, and in the narrative report sent from the laboratory to the AECOM Biology/Bioassay Laboratory Coordinator and the AECOM Task Order Manager. If the corrective action does not rectify the situation, the laboratory will contact the AECOM Task Order manager who, in concert with the AECOM Biology/Bioassay Laboratory Coordinator and NAE's TM, will determine the action to be taken and inform the appropriate personnel.

B.8 Data Reduction/ Calculation of Data Quality Indicators

In addition to measurement sensitivity discussed previously, data usability will depend on the measurement accuracy and precision, as indicated by the corresponding accuracy and precision QC samples (i.e., method & equipment blanks, matrix spike samples, laboratory control samples (LCSs), certified/standard reference materials (CRMs/SRMs), and replicates). The field and laboratory data collected during this investigation will be used to achieve the objectives identified in Section A.7 of this QAPP. The QC results associated with each analytical parameter for each matrix will be compared to the measurement objectives presented in Section A.7.2 of this QAPP.

This section details the calculation of these DQIs.

B.8.1 Accuracy Assessment

One measure of accuracy will be percent recovery (%Rs), which is calculated for matrix spikes, surrogates, LCSs, and CRMs/SRMs. Percent recoveries for matrix spike results will be determined according to the following equation:

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

$$\%R = \frac{(Amount\ in\ Spiked\ Sample - Amount\ in\ Sample)}{Known\ Amount\ Added} \times 100$$

Percent recoveries for LCS, CRM/SRM, and surrogate compound results will be determined according to the following equation:

$$\%R = \frac{Experimental\ Concentration}{Known\ Amount\ Added} \times 100$$

An additional measure of accuracy is blank contamination. The blanks associated with this project include laboratory method blanks and equipment rinsate blanks. The results of the laboratory and field blanks will be compared to the objectives in stated Section B.3.2 of the QAPP. Failure to meet these objectives may indicate a systematic laboratory or field problem that should be investigated and resolved immediately. Associated data may have limitations placed on its use, depending on the magnitude of the problem.

B.8.2 Precision Assessment

The RPD between sample replicates is calculated to compare to precision objectives (Section 3). The RPD will be calculated according to the following formula.

$$RPD = \frac{(Amount\ in\ Sample\ 1 - Amount\ in\ Sample\ 2)}{0.5 (Amount\ in\ Sample\ 1 + Amount\ in\ Sample\ 2)} \times 100$$

Failure to achieve precision objectives may result in the associated data having limitations placed upon its use.

Completeness Assessment

Completeness is the ratio of the number of valid sample results to the total number of samples analyzed with a specific matrix and/or analysis. Following completion of the analytical testing, the percent completeness will be calculated by the following equation:

$$Completeness = \frac{(number\ of\ valid\ measurements)}{(number\ of\ measurements\ planned)} \times 100$$

Failure to meet the completeness objective will require an assessment to determine if the missing or invalid data are critical to achieving the project objectives. Corrective actions may include re-sampling or re-analysis, depending on the type of problem, logistical constraints, etc.

B.8.3 Comparison to Project Objectives

In addition, the data obtained will be both qualitatively and quantitatively assessed on a project-wide, matrix-specific, and parameter-specific basis. Factors to be considered in this assessment of field and laboratory data will include, but not necessarily be limited to, the following:

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Conformance to the field methodologies proposed in the FSP and QAPP,
- Conformance to the analytical methodologies provided in the QAPP,
- Adherence to proposed sampling strategy,
- Presence of elevated detection limits due to matrix interferences or contaminants present at high concentrations,
- Unusable data sets based on the data review results,
- Data sets identified as usable for limited purposes based on the data review results,
- Status of all issues requiring corrective action, as presented in the QA reports to management,
- Effect of nonconformance (procedures or requirements) on project objectives,
- Adequacy of the data as a whole in meeting the project objectives, and
- Identification of any remaining data gaps and need to reevaluate project decision rules.

This assessment will be performed by the technical team, in conjunction with the Project QA Officer, and the results presented in the final report.

B.9 Laboratory Operations Documentation

Laboratory data reduction procedures will be performed according to the following protocol. All information related to analysis will be documented in controlled laboratory logbooks, instrument printouts, or other approved forms. All entries that are not generated by an automated data system will be made neatly and legibly in permanent, waterproof ink.

Information will not be erased or obliterated. Corrections will be made by drawing a single line through the error and entering the correct information adjacent to the cross-out. All changes will be initialed, dated, and, if appropriate, accompanied by a brief explanation. Unused pages or portions of pages will be crossed out to prevent future data entry. Analytical laboratory records will be reviewed by the supervisory personnel on a regular basis, and by the Laboratory QA Coordinator periodically, to verify adherence to documentation requirements.

Sediment data will be reported on a dry weight basis. All data will be reported down to method detection limits (MDLs). Data between the MDL and the reporting limit (RL) will be flagged as estimated by the laboratory. Non-detected results (i.e., values below the MDL) will be reported as non-detect at the MDL. The detection limits associated with all non-detected results will be corrected for sample-specific factors such as analytical dilutions, percent moisture, sample volume, etc.

Data and report deliverables will be provided within the turnaround time specified in **Table A-3** and **Figure A-2** of the FSP. The chemistry laboratory will provide at least one report in a printed document format (PDF) and one EDD to the Physical and Chemistry Laboratory Coordinator. Upon approval of this SAP, the required format of the EDD will be provided (per the RIM). The hard copy data package will include the information summarized below:

- Case narrative (see description below);

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Cross reference of field sample IDs and laboratory IDs;
- Method summary;
- COC documentation;
- Dates of sample extraction and analysis;
- Description of any data qualifiers used;
- Sample results, including units;
- Sample preparation information;
- Results for MS/MSDs, method or preparation/calibration blanks, LCSs, surrogate spikes, and laboratory duplicates; and
- Matrix-specific MDLs and RLs.

The case narrative will include the client name, project name and number, date of issuance, and a discussion of any deviations from analytical strategy, technical problems, and QC failures or non-conformances. The report will be signed by the Laboratory Project Manager.

Physical testing results will be provided as a hard copy report with grain size curves and as a simple spreadsheet of results (as percent passing each sieve plus hydrometer). The report will include a summary of results, method citations, and QC summary.

All laboratory reports will be maintained on the project website (along with all project related/generated information) with access only to designated AECOM and NAE personnel for a minimum period of five years.

B.10 Data Assessment Procedures

All data generated through field activities or through the analytical program will be reviewed prior to reporting. No data will be disseminated by AECOM until it has been subjected to the procedures summarized below.

B.10.1 Internal Laboratory Review

Prior to the release of any data from the laboratories, the data will be reviewed and approved by laboratory personnel. The review will consist of a tiered approach that will include reviews by the person performing the work, by a qualified peer, and by supervisory and/or QA personnel.

B.10.2 Validation of Analytical Data

Validation of the laboratory deliverables will be performed by AECOM. The laboratory data will be reviewed for the following, as appropriate to the method:

- Completeness of deliverable;
- Technical holding times;

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Laboratory and field blank contamination;
- Surrogate spike recoveries;
- MS/MSD recoveries and relative percent differences (RPDs);
- Laboratory duplicate RPDs;
- LCS recoveries; and
- Field duplicate.

The evaluation will consist of a review of the data package narrative and QC result. If data are considered usable, no data qualification will occur. In the event that serious deficiencies in data quality are noted, the data may be rejected and considered unusable.

B.11 Verification and Validation Methods

B.11.1 Field Data Verification

Field records will be reviewed by the Field Services Task Leader to ensure that:

- Logbooks and standardized forms have been filled out completely and that the information recorded accurately reflects the activities that were performed.
- Records are legible and in accordance with good recordkeeping practices, i.e., entries are signed and dated, data are not obliterated, changes are initialed, dated, and explained.
- Sample collection, handling, preservation, and storage procedures were conducted in accordance with the protocols described in the FSP and QAPP, and that any deviations were documented and approved by the appropriate personnel.

B.11.2 Laboratory Data Verification

Prior to being released as final, laboratory data will proceed through a tiered review process. Data verification starts with the analyst who performs a 100% review of the data to ensure the work was done correctly the first time. The data reduction and initial verification process must ensure that:

- Sample preparation and analysis information is correct and complete,
- Analytical results are correct and complete,
- The appropriate SOPs have been followed and are identified in the project records,
- Proper documentation procedures have been followed, and
- All non-conformances have been documented.

Following the completion of the initial verification by the analyst performing the data reduction, a systematic check of the data will be performed by an experienced peer or supervisor. This check will be performed to ensure that initial review has been completed correctly and thoroughly and will include a review of

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Adherence to the requested analytical method SOP;
- Correct interpretation of chromatograms, mass spectra, etc.;
- Correctness of numerical input when computer programs are used (checked randomly);
- Correct identification and quantitation of constituents with appropriate qualifiers;
- Numerical correctness of calculations and formulas (checked randomly);
- Acceptability of QC data;
- Documentation that instruments were operating according to method specifications (calibrations, performance checks, etc.);
- Documentation of dilution factors, standard concentrations, etc.; and
- Sample holding time assessment.

A third-level review will be performed by the Laboratory Project Manager before results are submitted to clients. This review serves to verify the completeness of the data report and to ensure that project requirements are met for the analyses performed. A narrative to accompany the final report will be prepared by the Laboratory Project Manager.

B.11.3 Validation of Laboratory Deliverables

If requested by the PM, data will be reviewed as described in Sections D.1.3 of the QAPP. Upon completion of the validation, a brief report will be prepared discussing the acceptability of the data.

B.11.4 Verification during Data Management

All manually entered data (e.g., field data) will be proofed 100% against the original. Electronic data will be checked 100% after loading against laboratory data sheets for completeness and spot checked for accuracy.

B.12 Reconciliation with User Requirements

The field and laboratory data collected during this investigation will be used to achieve the objectives identified in Section A.7 of this QAPP. The QC results associated with each analytical parameter for each matrix will be compared to the measurement objectives presented in Section A.7.2 of this QAPP.

B.13 Reports

In addition to any potential audit and/or corrective action reports, several progress reports are scheduled to be delivered prior to submission of the project draft and final reports. The scheduled reports are as follows:

Sediment Chemistry Progress Report

Two copies of a written progress report will be provided within fifteen business days of the start of chemical analysis. The data will also be available by the completion of the 28-day bioaccumulation test to properly inform the decision-making process. Chemistry data will also be reported in the prescribed EDD format (to be finalized after the approval of the SAP). A completeness checklist and Quality Control Summary sheets as prescribed in the RIM will be filled out and submitted with the progress report for all data reported.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

Elutriate Chemistry Progress Report

Two copies of the written progress report will be provided within fifteen business days from completion of elutriate preparation to properly inform the decision-making process. Chemistry data will be approved EDD spreadsheet formats (once the SAP is approved). A completeness checklist and Quality Control Summary sheets as prescribed in the RIM will be filled out and submitted with the progress report for all data reported.

Tissue Progress Report

A written progress report, without statistical analysis, will be provided five weeks after the initiation of the tissue analysis. The report will present tabulated data for each test series and organism analyzed. Statistical analysis will be performed upon approval from NAE of the written progress report. Statistical analyses will be performed using wet weight contaminant data following Appendix D3 of the Inland Testing Manual (Fisher's Least Significant Difference multiple comparisons procedure; EPA/USACE, 1998). Two copies of the written progress report, updated to include results from the statistical analyses, will be provided within two weeks of authorization to proceed with the statistical analyses. An electronic copy of the tissue contaminant data will also be reported according to the "bioaccumulation results spreadsheet" required by the RIM (EPA/ USACE, 2004).

SPP Toxicity Test Progress Report

A progress report, without statistical analysis, will be provided within two weeks from start of SPP test. The report will include summaries of all procedures and present tabulated data for each test series and organism analyzed. Statistical analysis will be performed upon approval from NAE of the written progress report.

Statistical analyses will be performed following Appendix D2 of the Inland Testing Manual (EPA/USACE, 1998). In addition to the written report all data will be submitted in electronic transmittable spreadsheets.

Whole Sediment Acute Toxicity Test Progress Report

Two copies of the written progress report for toxicity and bioassay testing, without statistical analysis, will be provided within four weeks from test initiation. The report will include summaries of all procedures and present tabulated data for each test series and organism analyzed. Statistical analysis will be performed upon approval from NAE of the written progress report. Statistical analyses will be performed following Appendix D2 of the Inland Testing Manual. In addition to the written report all data will be submitted in electronic transmittable spreadsheets.

Draft and Final Reports

A draft report will be prepared to allow NAE an opportunity to review and comment on the document before finalizing. In each case, the draft and final reports will be transmitted to NAE within the established schedule (FSP **Figure A-2** and **Table A-3**) containing the following elements:

- Cover sheet, which includes contract number, statement of data authenticity, and official signature of release.
- Table of contents.
- Case narrative which shall include analytical methods used, field sample and laboratory number correlations, data qualifier definitions, and deviations from established QA/QC procedures with associated corrective action.
- Site Map(s) with sample locations with sufficient scale to show channel lines, shore landmarks such as building and docks.

Sampling and Analysis Plan

Sampling & Environmental Testing – New Haven Harbor FNP
New Haven, Connecticut

Section: QAPP
Revision: 0
Date: August 2017

- Summary tables of chemical analyses and biological tests.
- Complete field report, which includes sampling procedures and any problems or deviations from the SAP encountered.
- Physical testing results (composite data).
- Sediment chemistry results (dry weight basis) for each analyte, which include project name, field sample ID number, batch numbers, collection/extraction/analysis dates, detection limits, and dilution factors.
- Biological testing results (toxicity).
- Sample documentation which includes original Chain of Custody record, shipping documents, and cooler receipt forms.
- QA/QC information which shall include method detection limits for each analyte, spike recoveries including surrogate recoveries, measures of precision, and all control limits for accuracy and precision. The QA/QC samples analyzed for each batch of samples (maximum of 20 samples to a batch) consist of:
 - Method blank.
 - Laboratory Control Sample (LCS).
 - Matrix Duplicate (using sample from project).
 - Matrix Spike/Matrix Spike Duplicate (using sample from project).
 - Standard Reference Material (SRM) (if available with analyte concentrations comparable to the project).
- The sediment chemistry data will also be presented in an EDD according to <http://www.nae.usace.army.mil/reg/rim.htm> under Data Reporting Requirements/Sediment Evaluation/EDD.
- Completion of the Completeness Checklist Table II-1 located under Appendix II of the RIM (Appendix B).

Delivery dates for all reports are provided on **Table A-3** and **Figure A-2**. Project reports, along with all relevant project records will also be maintained on AECOM's project website with access only to designated AECOM and NAE personnel for a minimum period of five years.

Sample Delivery Group Summary

Alpha Job Number : L17XXXX

Received :Month,Day, 2017

Reviewer :Sample Custodian

Account Name : AECOM

Project Number :

Project Name :

Delivery Information

Samples Delivered By : Alpha Courier

Chain of Custody : Present

Cooler Information

Cooler	Seal/Seal#	Preservation	Temperature(°C)	Additional Information
A	Absent/	Ice	2.0	
B	Absent/	Ice	2.0	

Condition Information

All samples on COC received? **YES**

Extra samples received? **NO**

Are there any sample container discrepancies? **NO**

Are there any discrepancies between sample labels & COC? **NO**

Are samples in appropriate containers for requested analysis? **YES**

Are samples properly preserved for requested analysis? **YES**

Are samples within holding time for requested analysis? **YES**

All sampling equipment returned? **NA**

Volatile Organics/VPH

Reagent Water Vials Frozen by Client? **NA**

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 27413
SDG No:
Project:
Delivered via: Client
Date and Time Received: 04/28/16 1340 Date and Time Logged into Lab: 04/28/16 1610
Received By: JTP Logged into Lab by: JTP

Air bill / Way bill: No Air bill included in folder if received? N/A
Cooler on ice/packs: N/A Custody Seals present? N/A
Cooler Blank Temp (C) at arrival: N/A Custody Seals intact? N/A
Number of COC Pages: 1
COC Serial Number(s): N/A
COC Complete: Yes Does the info on the COC match the samples? Yes
Sampled Date: Yes Were samples received within holding time? Yes
Field ID complete: Yes Were all samples properly labeled? Yes
Sampled Time: Yes Were proper sample containers used? Yes
Analysis request: Yes Were samples received intact? (none broken or leaking) Yes
COC Signed and dated: Yes Were sample volumes sufficient for requested analysis? Yes
Were all samples received? Yes Were VOC vials free of headspace? N/A
Client notification/authorization: Not required pH Test strip ID number: N/A

QUALITY CONTROL SUMMARY TABLES

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	
9. Were the samples properly labeled?	
10. Were all the requested data included?	
11. Were the reporting limits met?	
12. Were the chain-of-custody forms properly processed?	
13. Were the method blanks run and were the concentration below the acceptance criteria?	
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	
15. Were the SRM/CRM analyses within acceptance criteria?	

Table II-1 (continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	
19. Were surrogate recoveries within the required acceptance criteria?	
20. Were corrective action forms provided for all non-conforming data?	
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package

Table II-2 (continued): Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for Analyses of Pesticides in Sediment, Tissue and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (< 20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package

Table II-3 (continued): Quality Control Summary for Analyses of Pesticides in Sediment, Tissue and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB congeners) in Sediment, Tissue and Water Matrices

Method Reference Number: 8082A

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration. (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package

Table II-4 (continued): Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB congeners) in Sediment, Tissue and Water Matrices

Method Reference Number: 8082A

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteri a Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package

Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
--------------------------------	--	--	--	-----------------

Table II-5 (continued): Quality Control Summary for Analyses of Metals in Sediments, Tissue and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample.($<20\%$ RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD $<30\%$)			In Data Package

Table II-6 (continued): Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 $\leq 10\%$ mean $\leq 30\%$ mussel/oyster; $\leq 40\%$ clam larvae, $\leq 30\%$ sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 $\leq 10\%$ mean (no chamber $> 20\%$) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Attachment 1 Example of Daily Activity Log

Attachment 2 Field Corrective Action Form

Standard Operating Procedure Field Records

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for documentation of field activities conducted on the New Haven Harbor Federal navigation project (FNP), including sample collection events, field measurements, and site visits. This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Appropriate documentation of field activities provides an accurate and comprehensive record of the work performed, sufficient for a technical peer to reconstruct the day's activities and determine that necessary requirements were met. Field records also provide evidence and support technical interpretations and judgments. The procedures and systems defined in this SOP help ensure that the records are identifiable (reference the project task/activity), legible, retrievable, and protected from loss or damage.
- 1.2** Field data may be recorded electronically or in field logbooks, standardized forms, annotated maps, or photos. This SOP provides general guidance on field recordkeeping; additional details for specific procedures (for example, chain of custody, sample collection) are provided in the SOPs for the individual task.
- 1.3** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** Although record keeping itself does not generally pose significant health and safety risks, the tasks being implemented in the vicinity of individuals keeping records may require attention to safety practices. Project related physical, chemical and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017a).
- 2.2** Daily safety briefings will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

Standard Operating Procedure Field Records

3.0 Interferences

Not Applicable

4.0 Equipment and Materials

The following equipment list contains materials that may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Bound field logbook
- Standardized field data sheets (refer to Section 5.3)
- Black ballpoint pen, Rite-in-Rain[®] pen, or black Sharpie[®] (or equivalent)
- Site maps
- Clipboard
- Three-ring binder or equivalent
- Camera (optional)
- Time piece

5.0 Procedures

5.1 General Requirements

5.1.1 The field records will contain sufficient detail so that the collection effort can be reconstructed without reliance on the collector's memory.

5.1.2 Pertinent field information will be recorded legibly in a logbook and/or an appropriate standardized form (as described herein), or directly onto a portable electronic device, such as a laptop computer. It is recommended that entries made by hand be made in black ballpoint pen.

Standard Operating Procedure Field Records

- 5.1.3** Entries will be signed and dated. No erasures or obliterations will be made. A single line will be drawn through incorrect entries and the corrected entry written next to the original strikeout. Strikeouts are to be initialed and dated by the originator.
- 5.1.4** If a ballpoint pen cannot be used because of adverse weather conditions (rain or freezing temperatures), fine-point Sharpie® or Rite-in-Rain® pens are acceptable substitutes. If conditions are such that only pencil can be used, an explanation will be included in the logbook and the affected data will be photocopied, signed as verified copy, and maintained in the project files as documentation that the information has not been changed.
- 5.1.5** Entries will be factual and observational (i.e., no speculation or opinion), and will not contain any personal information or non-project-related entries. Abbreviations and acronyms will be defined.
- 5.1.6** Field information will be recorded without delay – information recorded significantly after the fact will be dated as such.
- 5.1.7** Field activities and other events pertinent to the field activities will be documented in chronological order. Times will be recorded using Eastern Standard Time (EST) or Eastern Daylight Savings Time (EDT) notation for each entry.

5.2 Field logbooks

- 5.2.1** Field logbooks will be bound waterproof field books. Logbooks will be dedicated to the project and will not be used for any other project or purpose. Separate and dedicated logbooks will be kept for different operations running concurrently (e.g., sample collection on board the vessel, core processing, surface water collection on-board a vessel, surface water collection from the shore); individual tasks making up each operation will be maintained in the same logbook, if possible.
- 5.2.2** The cover and binding of each logbook will be labeled to identify the operation and dates included with the logbook; each page in the logbook will be consecutively numbered. Pages will not be removed or torn out of the logbook.
- 5.2.3** The title page of each logbook will contain the following:
- AECOM contact, AECOM office location, and phone number;
 - The logbook number (assigned at the time the logbook is signed out)
 - Project name and AECOM project number; and
 - Start and end dates of work covered by the logbook.

Standard Operating Procedure Field Records

- 5.2.4** To assist in the return of a field logbook in the event it is lost, the following will also be included on the title page: “\$25 Reward if found and returned to AECOM, 250 Apollo Drive, Chelmsford, Massachusetts 01824”.
- 5.2.5** At the front of each logbook will be a page cross-referencing each author’s printed name, signature, and initials.
- 5.2.6** A page header will appear on the first page of each day’s notes in the logbook, and activities for each day will be recorded on a new page. The page header will include:
- Name of author and other personnel on site (and affiliated organization if applicable);
 - Date;
 - Time of arrival (military time);
 - Proposed activity (task); and
 - Current weather and tidal conditions, and weather forecast for the day.
- 5.2.7** An abbreviated header, containing at least the date, will appear at the top of each additional page for the active date. Field forms require similar header information.
- 5.2.8** The field logbook will provide a chronology of events. At a minimum, documentation in a logbook will include the following (unless documented on a standard form):
- Names of visitor(s), including time of arrival and departure, the visitor’s affiliation, and reason for visit;
 - Summary of project-related communications, including names of people involved and time;
 - Time daily work commences and ceases;
 - Start and stop times of new tasks;
 - Start and stop times of significant stand-by time (work interruptions);
 - Safety or other monitoring data, including units with each measurement;
 - Deviations from approved scope of work, including the necessary approvals;
 - Progress updates;
 - Problems/delays encountered;

Standard Operating Procedure Field Records

- Unusual events; and
- Signature or initials of author on every page.

Additional detail on the contents of the field logbook is provided in Table 1.

5.2.9 The logbook will cross-reference the field forms if necessary; however, whenever possible, details recorded on the standardized forms will not be replicated in the logbook.

5.2.10 If there are additional lines on the page at the end of the day's activities, a line will be drawn through the empty space, and initialed and dated, leaving no room for additional entries.

5.3 Standardized forms

5.3.1 Standard forms for field data are provided with each SOP. The Daily Activity Log is attached to this SOP (Attachment 1). This form will be completed each day of active work and transmitted to the Task Manager or his/her designee. Refer to the appropriate SOP (e.g., core processing) for the forms specific to that task.

5.3.2 The information collected on any field form may alternately be collected electronically by PC/handheld as appropriate.

5.3.3 The following rules apply to the standardized forms:

- Each form will be signed and dated by the person completing the form.
- There will be no blank spaces on the form – unused spaces will have “not applicable” or “not available” explanations.

5.4 Maps and drawings

5.4.1 Pre-existing maps and drawings that include notations made in the field (for example, relocating of sample locations) will be referenced in the logbook and, like all field records, include the project/task name and number, site identification, and be signed/dated by the person that prepared them.

5.4.2 Maps and drawings will include compass orientation and scale. Sketches will include points of reference and distances to the reference points.

Standard Operating Procedure Field Records

5.5 Photographs and other photo documentation

Photographs or videos may be taken by the field team to help document site conditions, sample locations, or sample characteristics. Photographs and videos will be identified in the logbook or on the standard form by a unique numbering system. If photographs are collected by a digital camera, the file number as well as the photograph number will accompany the description of the photograph in the logbook. At a minimum, the date/time the photograph was taken, the general location, a brief description, and the photographer's name will be recorded. Additional information may include Differential Global Positioning System (DGPS) coordinates, direction the photographer was facing, and/or weather conditions. If necessary, an object will be included to indicate the scale of the object in the photograph.

5.6 Electronic files

5.6.1 Electronically recording devices may include data logging systems, laptops, or tablet computers.

5.6.2 Sufficient backup systems will be in place to protect against electronic data loss. Information will be saved to a disk or backed up immediately upon completion. The backup disk or other media (CD, flash drive) will then be stored in a secure location separate from the laptop or tablet.

5.6.3 Files will be uniquely identified and will be stored in the project files on the network in accordance with the workplan (AECOM 2017b). An unedited version of the file will be maintained and all subsequent manipulations tracked.

6.0 Quality Assurance/Quality Control

6.1 Entries in the field forms will be double-checked by the field team members to verify the information is correct.

6.2 Completed field forms will be reviewed by the Field Task Manager and/or his/her designee to verify that the requirements are being met. At a minimum, this should occur at the end of each day. When the review is complete, the reviewer will append his/her initials and date to the pages reviewed for documentation purposes.

6.3 If information recorded in the field is transcribed to another format, the original record will be retained for comparison purposes.

Standard Operating Procedure Field Records

7.0 Data and Records Management

- 7.1** Deviations to the procedures detailed in the SOP or approved plans will be noted in the field logbook or other appropriate field form at the time of occurrence and summarized on the Daily Activity Log (Attachment 1). A formal field correction action form will be completed (Attachment 2) and distributed as specified in the workplan (AECOM 2017b).
- 7.2** Proposed modifications to the SOPs or approved plans will be documented on a field correction action form. An example field correction action form is presented as Attachment 2.
- 7.3** Logbooks that are taken offsite from the field will be photocopied or scanned and filed at the end of each day to mitigate against the loss of historical entries should the logbook be lost in the field.
- 7.4** Field data forms and chain of custody will be filed in the office facility once they have been completed and distributed (if necessary), or at the end of each field day. These documents will be maintained in labeled three-ring binders or contained in some other organized manner that prevents loss.
- 7.5** Distribution of daily forms will be performed according to the needs of the project team and at the direction of the Field Task Manager or designee.

8.0 Personnel Qualifications and Training

- 8.1** Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017a], workplan [AECOM 2017b]). No specialized training is required. Nonetheless, these activities should be reviewed by the Field Task Manager, as described below.
- 8.2** The Field Task Manager is responsible for reviewing and approving the field records for accuracy, completeness, and conformance to the procedures in this SOP. The Field Task Manager is also responsible for ensuring that the field records are distributed to the appropriate personnel during field activities, ensuring that records are maintained properly on site, and for archiving the records upon completion of field activities.

Table 1 Summary of Typical Field Information

General Information	Applicable Record¹
Project/task name/general location	All
Personnel on site (AECOM, clients, site contacts, regulators, oversight personnel, subcontractors, general public)	A, B
Results of phone calls, conversations (See workplan (AECOM 2017b) for project contact information)	B
Chronology of activities, including mobilization, investigatory activities, and demobilization	B
Weather conditions (initial and any changes; temperature, barometric pressure, wind conditions, precipitation)	B
Tidal and atmospheric information (if applicable)	B
Subcontractors, description of services to be provided, and any issues (equipment problems, corrective action, stand by time)	A, B
Health and safety (H&S) tailgate meetings, H&S monitoring	Refer to APP
Description of major equipment (survey vessels, sampling platforms, sampling devices) and any problems or conditions that might impact performance or data quality	A, B, F
Equipment decontamination	B
Any pertinent field observations such as difficulties in sampling or conducting measurements or unusual circumstances that could affect data quality (instrument problems, contamination sources)	B, D, F
Deviations from approved plan (schedule, relocation/elimination of locations, change orders), including rationale and approval	A, B, F
Sample collection and transfer summary, custody information from collection through analysis	C
Field measurements	
Description of Instruments (make, model, serial number) and inspection	B
Measurement date, time, location/station, results (units, any correction factors applied, calculations (if applicable)	D, E
Identity of person performing the measurements	D, E
Sampling information	
Equipment description and inspection	B, D, E
Sample selection criteria/rationale (if different from plan)	A, B, D, E
Sample location (GPS coordinates, depth, compass/distance from fixed points)	D, E
Sample description (recovery, moisture, color, odor, texture, general sediment profile/stratigraphy, artifacts)	D, E
Sample manipulations (homogenization, compositing, filtering, preservation)	D, E
Sample ID, segment/interval, date, time, and sampler identity	B, D, E
Sample parameters, containers (size/type), preservation	
Field and QC sample ID, storage container and conditions for each (sub)sample/parameter set	B, C, D, E

Standard Operating Procedure Navigation/Positioning

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for positioning vessels in the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Positioning will be conducted to locate the vessel(s) with sufficient accuracy and precision to meet project objectives during sampling or measurement activities.
- 1.2** This SOP describes the equipment, field procedures, materials, and documentation procedures necessary to position vessels. Specific information regarding proposed sampling and/or measurement locations is provided in the workplan (AECOM 2017a)
- 1.3** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** The health and safety (H&S) considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017b). The major health and safety considerations for the work associated with navigating/positioning the vessel are the marine safety aspects of the program.
- 2.2** Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

Standard Operating Procedure Navigation/Positioning

3.0 Interferences

Differential global positioning system (DGPS) signal interferences/blockage can occur from time to time by bridges or other structures. These interferences can prevent system function until satellite signals are re-established. If insufficient satellite coverage occurs for proper function, the user will be alerted by the HYPACK system. In these cases the vessel will be repositioned to obtain better satellite coverage.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP;
- Sampling vessel(s) adequately sized and equipped for the task and expected conditions, including high frequency (VHF) radio, ground tackle, and required U.S. Coast Guard safety gear;
- Navigation charts and sampling/measurement locations figure;
- Electronic navigation charts with pre-loaded waypoints for all sampling and measurement locations - refer to the workplan (AECOM 2017a);
- DGPS Receiver with an accuracy of ± 1 foot;
- DGPS External Antennas;
- Field laptop computer with HYPACK survey software;
- Fixed water level measurement and recording gauges (approximately one per river mile);
- Equipment user manuals;
- Table of target sampling/measurement location coordinates;
- Assorted nautical equipment (e.g., anchors, lines, personal flotation devices);
- Logbook and ballpoint pen;
- Sample collection forms; and
- Real time kinematic (RTK) DGPS positioning system (optional).

Standard Operating Procedure Navigation/Positioning

5.0 Procedures

Sampling and measurement activities will be conducted from a vessel. In accordance with procedures outlined below, these vessels must be properly positioned and their position recorded before each activity can begin. The following describes the procedures that will be performed to accurately position sampling vessels at a designated sampling location, and the pertinent observations that will be recorded in the appropriate field notebook and/or data sheet.

Positioning will be achieved by using a DGPS integrated with HYPACK survey software in order to obtain the real time position of the vessel, in relation to planned sampling stations, displayed on an electronic nautical chart. Survey personnel will follow the appropriate sections of equipment user's manuals to ensure proper equipment operation and system performance.

5.1 Positioning the vessel

This section gives the step-by-step procedures for vessel positioning. Observations made during vessel positioning will be recorded on the sample collection forms, other standardized forms, and/or logbook, as appropriate.

A DGPS will be used to establish locations during implementation of activities specified in the workplan (AECOM 2017a). While this SOP provides general guidance and procedural steps, personnel performing positioning activities also will follow the appropriate sections of equipment user's manuals and have the manuals available for reference while operating the equipment.

The following procedures describe the steps to establish position at a location, as well as the steps to adjust the positioning for collection of additional samples.

- 5.1.1** Obtain the appropriate form(s). Initiate the Daily Activity Log provided in SOP NHH-G-01 (Field Records).
- 5.1.2** Obtain the target sampling/measurement locations. These locations will have been selected prior to commencement of field activities, as described in the workplan (AECOM 2017a). The location of each target sampling location will be established in the local State Plane Coordinate System with respect to the North American Datum of 1983 (NAD83).
- 5.1.3** Enter the coordinates for each sampling location as a waypoint into the HYPACK software package. Confirm accuracy of each entry against the coordinates established in the corresponding workplan (AECOM 2017a).

Standard Operating Procedure Navigation/Positioning

- 5.1.4** Configure the HYPACK system for the survey, including setting the survey grid to the local State Plane Coordinate System with respect to the North American Datum of 1983 (NAD83 - feet), and setting the “target ring” or maximum allowable offset based on task specific requirements listed in the corresponding workplan (AECOM 2017a).
- 5.1.5** If less than sub-meter accuracy is required, a DGPS base station will be established over a shore-based marker prior to sampling or measurement operations. The operation and horizontal/vertical accuracy of the vessel mounted DGPS will be verified at another shore-based marker by recording observed horizontal and vertical (XYZ) data and comparing these data to the published XYZ data for a given point. After initial DGPS system verification, a temporary benchmark may be established at a location convenient to the vessel to facilitate daily DGPS system performance verification. DGPS system performance verification will be conducted twice per day and documented in the logbook and vessel data logger. The horizontal and vertical accuracy will be compared to shore-based markers to verify performance. Elevations will be recorded in North American Vertical Datum of 1988 (NAVD88) with an accuracy of +/- one foot.
- 5.1.6** Install the DGPS antennae in a safe location which accurately represents the actual sample or measurement collection point; (e.g., immediately adjacent to a coring well, or mounted to the A-frame).
- 5.1.7** Identify and approach actual sampling/measurement locations by using data from the DGPS/HYPACK system in the navigation mode. The navigation mode provides information on heading, distance remaining, and time remaining. This information is based on the selected waypoint location and the present location of the vessel.
- 5.1.8** For sediment sampling, the vessel will be secured by lowering spud poles once in position within the station “target radius”. In water depths that preclude the use of spud poles, maneuver the vessel approximately 60 feet up-current (or up-wind in slack conditions) of the target, drop the anchor, and pay out anchor line until the vessel drifts within the “target radius”. A second anchor set may be required to increase lateral stability under certain conditions.
- 5.1.9** For water column sampling, the vessel will be positioned over each sampling/measurement location with no contact with the bottom. The operator will utilize the onboard navigation system to attempt to maintain positioning of the vessel within 10 feet of the sampling/measurement location.

Standard Operating Procedure Navigation/Positioning

5.1.10 Once the vessel is on location (and secured, for sediment sampling), note the coordinates from the DGPS unit and check the coordinates to verify that the vessel is within the pre-determined range of the target location as defined in workplan (AECOM 2017a). If not acceptable, adjust the vessel's location, and recheck the position. Repeat this process until the vessel's position is within acceptable range of the target. Record the final coordinates on the appropriate form. Record the actual sampling coordinates electronically (using HYPACK).

5.1.11 Once the coordinates are acceptable, perform the sampling or measurement activity at the location. Record final location coordinates on the appropriate form. For sediment sampling, final location coordinates will be recorded once the sampling device has penetrated the sediment to the target depth or refusal and prior to retrieval. Plot locations onto a master chart or use computer-based, real-time software to verify location.

5.1.12 To adjust the vessel's position to repeat an attempt at sediment sampling, the vessel will be moved by allowing it to rotate around the spud pole or by adjusting an anchor line until the new position for the sampling device has been established. Record the new position.

5.1.13 At the end of the sampling day, check the data loaded onto the DGPS units to verify the existence of locations where data were collected. Download HYPACK navigation files to a portable data storage device and transfer data to an applicable secure project directory.

5.2 Elevation measurements

5.2.1 In order to establish the elevation of the sediment surface at locations within the harbor, a system will be established whereby the water level of the harbor is continuously monitored and recorded for use as a local reference (e.g., local NOAA station).

5.3 Calibration, maintenance, and use of field instruments

5.3.1 Poor DGPS Reception or System Failure

If insufficient satellite coverage occurs for proper function, the user will be alerted by the HYPACK® system. In these cases the Field Task Manager will be notified that verification of the field position of the vessel at the target location cannot be performed. The Field Task Manager will review the situation with respect to available reference resources and may provide the field team with alternate locations, as required by the workplan (AECOM 2017a). The selection of alternate sampling locations will be made jointly through discussions with the Field Task Manager and the boat personnel.

Standard Operating Procedure Navigation/Positioning

When satellite reception is insufficient to meet system accuracy requirements, system error codes will appear on the output screen. Nonetheless, proper operation of the DGPS / HYPACK navigation system can be verified by checking the displayed vessel position on the electronic base map against surrounding geographic features. This activity will be undertaken at the start of each day after start-up as a quick check to verify proper system function. Note: system function errors will be obvious and rigorous checking of the system is not necessary.

5.3.2 Maintenance

Prior to use, the DGPS units will be inspected for functionality. Maintenance and use of DGPS units will follow the appropriate sections of the equipment user's manual. Field personnel will have the manual available for reference. Equipment maintenance will be recorded in the field logbook, including the reason for the maintenance (routine or because of a problem), actions taken, and final resolution (e.g., correction of the problem, replacement of the instrument).

6.0 Quality Assurance/Quality Control

- 6.1** Actual sampling/measurement locations will be verified as being within the workplan-specified radius/tolerance surrounding the target coordinates specified in the workplan (AECOM 2017a). Using a HYPACK navigation system allows the user to see the real time position of the sampling vessel in relation to the designated position of the sampling/measurement station and the user defined “target radius” surrounding each station. This visual confirmation on the electronic chart is also complimented by a HYPACK data display that indicates the actual distance to target. Using these two features ensures proper vessel positioning.
- 6.2** DGPS system performance will be verified by confirming the accuracy of the initial HYPACK configuration (i.e., geographic reference) and by regular system checks during the course of the day.
- 6.3** The quality of the data provided by the DGPS unit is monitored by HYPACK as another control feature built into the system. In the event there is degradation in DGPS signal quality, either by a reduced number of available satellites or satellite geometry, the HYPACK system will alert the operator of the reduced quality of horizontal and vertical precision levels.
- 6.4** Data recorded manually and electronically (see Section 7.2) will be cross-checked for accuracy

Standard Operating Procedure Navigation/Positioning

7.0 Data and Records Management

- 7.1** Field records will be generated as outlined in SOP NHH-G-01 (Field Records). This document provides specifics on recording data for field activities. At a minimum, sample position information (x, y, and z), verification of DGPS system performance, and any positioning-related problems encountered will be recorded. Additional information may be required for sample collection or measurement activities and are outlined in the relevant SOPs.
- 7.2** Position data will be saved electronically at the time of sampling within HYPACK and recorded manually on the sample collection/measurement forms. Although the electronic record represents the primary record, the sample collection/measurement form information will serve as a backup to the electronic file.
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and summarized on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A field correction action form will be completed (refer to SOP NHH-G-01 – Field Records) and distributed as specified in the workplan (2017a).
- 7.4** All records (electronic and hard copy) associated with the activities described in this SOP will be maintained in accordance with the workplan (AECOM 2017a).

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read, and be familiar with, the requirements of this SOP. Vessel navigation and positioning will only be performed by experienced DGPS / HYPACK operators.

Standard Operating Procedure Equipment Decontamination

SOP No.: NHH-G-03
Revision: 0
Date: August 2017
Page 1 of 5

1.0 Scope and Applicability

The purpose of this document is to define the standard operating procedure (SOP) for decontamination of equipment, instruments, and other materials used during implementation of field tasks on the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Decontamination is the process of neutralizing, washing, and rinsing exposed surfaces of equipment to minimize the potential for contaminant migration and/or cross-contamination. This procedure does not apply to personnel decontamination which is described in the site-specific Accident Prevention Plan (APP) (AECOM 2017a).

It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** The health and safety considerations for the work associated with this SOP, including physical, chemical and biological hazards, are addressed in the APP (AECOM 2017a).
- 2.2** Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. As detailed in the APP (AECOM 2017a), everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1** Equipment decontamination should be performed in an area that does not interfere with sampling activities, but sufficiently close to maintain an efficient working environment. Whenever possible, decontamination activities will be performed in a location that is not subject to potential sources of contamination (for example, generators and other combustion engines). Where decontamination is required on a boat, the vessel's engines must be turned off during decontamination. Ideally, boat engines and/or generators should be shut off during

Standard Operating Procedure Equipment Decontamination

collection of equipment blanks, consistent with collection of sediment/ water samples. If this is not possible, then the sampling platform should be positioned upwind from any running combustion engines.

3.2 Equipment that is improperly or inadequately decontaminated may result in biased sample results. To avoid sample contamination, the procedures and equipment specified in this SOP are to be followed. Specifically:

- The decontamination materials, including detergent, water, etc., will meet the specifications of the SOP;
- Buckets and other containers holding decontamination solutions will be labeled to segregate containers holding “dirty” from “clean” solutions, and brushes will be dedicated to a particular step in the decontamination process; and
- Decontaminated equipment that is not immediately reused will be covered/wrapped in plastic or aluminum foil (shiny side out) and marked to indicate it is clean.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP (AECOM 2017a);
- Bristle brushes;
- Plastic wash/rinse buckets or tubs;
- Phosphate-free biodegradable detergent (e.g. Liquinox®, Alconox®);
- Deionized "analyte-free" water (DIW);
- Stainless steel bowls or pans (labeled as needed);
- Aluminum foil;
- Plastic sheeting;
- Zipper-lock bags;
- Tap water (from any treated municipal water supply);
- Sample container(s) for equipment rinsate blank, if collected; and
- Field logbook and standardized forms as needed.

Standard Operating Procedure Equipment Decontamination

5.0 Procedures

Sampling equipment (excluding newly purchased disposable equipment) that comes into contact with the media to be sampled will be decontaminated prior to use in the field to eliminate or minimize cross-contamination. The frequency of decontamination is provided in the task-specific SOPs (for example, surface water sampling, grab sampling, sediment collection via vibracore, core processing). Sufficient decontaminated equipment will be available to be dedicated to the sampling locations planned for each day, where feasible. Equipment will be decontaminated in the area designated for decontamination.

Surface water and sediment samples may be submitted for chemical, biological, and geotechnical analyses as described in the workplan. Sampling equipment will be decontaminated as described in Section 5.0 below. Decontamination of the sampling equipment will be commensurate with the analyses to be performed.

5.1 General preparation

Inspect equipment needed for sample collection to ensure that it is in good working order and establish an equipment decontamination area that includes a collection basin that can be placed beneath the equipment to collect decontamination fluids, brushes, and a series of wash bottles for each of the solutions specified in the following section. Personnel will dress in suitable PPE to reduce exposure to contaminants (refer to the APP [AECOM 2017a]).

- 5.1.1** Residual sediment will be scraped off and the equipment rinsed with site water (on the sampling vessel while on site).
- 5.1.2** Equipment may be rinsed with potable water if needed to further remove gross contamination.
- 5.1.3** Equipment will be placed in a wash tub or bucket (if size allows) containing Alconox® (or other phosphate-free detergent) along with potable water, and scrubbed with a bristle brush or similar utensil.
- 5.1.4** Equipment will be rinsed twice with potable water over a bucket using a squeeze bottle or pump sprayer.
- 5.1.5** Following decontamination, equipment will be placed in a dedicated clean area or will be protected from re-contamination by covering with plastic or wrapping in foil.
- 5.1.6** Rinse water and detergent water will be replaced frequently.

- 5.2** Field instrumentation should be cleaned according to the manufacturer's instructions. Care will be taken to prevent damage to equipment. When possible, instruments which are

Standard Operating Procedure Equipment Decontamination

difficult to decontaminate, such as cameras and data logging instruments, may be protectively wrapped to reduce or eliminate the need for decontamination.

- 5.3** Pumps used for surface water sampling will be rinsed with potable water prior to and following each day of use. Decontamination of the pump between stations or between depths is not required.
- 5.4** Other sampling equipment that might be used and that has had direct contact with sediments or wastes will be decontaminated at a designated area prior to leaving the Site. If the above decontamination procedures are not applicable or feasible, the decontamination procedure will be as follows:
- 5.4.1** Equipment will be wrapped or draped in plastic or placed in the plastic-lined cargo area of a truck for transport to the area designated for decontamination.
- 5.4.2** Equipment will then be rinsed, by hose or high pressure spray, with potable water.
- 5.5** Equipment rinsate blanks will be collected to assess the adequacy of equipment decontamination procedures. Equipment rinsate blanks will be submitted for testing at the frequency specified in the workplan. The equipment rinsate blank collection procedures are included in the SOPs for the individual tasks (surface water sampling, sediment sampling, core processing, etc.) and in the workplan (AECOM 2017b).

6.0 Quality Assurance/Quality Control

- 6.1** Decontamination QA/QC procedures described in Section 5.0 will be performed to assess the adequacy of equipment decontamination procedures. Equipment rinsate blanks will be collected at the frequency specified in the workplan.
- 6.2** It is the responsibility of the Field Task Manager to periodically check/ensure that the equipment decontamination procedures are in conformance with those stated in this SOP.

7.0 Data and Records Management

- 7.1** Documentation of decontamination procedures will be contained in the field logbook or recorded on the appropriate task-specific standardized form and should include:
- A list of equipment being decontaminated along with the date and time;
 - The names of the project staff performing the decontamination;
 - Documentation of equipment rinsate blanks including sample ID, date and time, the equipment rinsed, collector, and parameters; and

Standard Operating Procedure Equipment Decontamination

- 7.2** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and summarized on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A field corrective action form will be completed (refer to SOP NHH-G-01 – Field Records) and distributed as specified in the workplan (AECOM 2017b).

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read, and be familiar with, the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017a], workplan [AECOM 2017b]). Decontamination of field equipment is a relatively simple procedure; no specialized training is needed. However, execution of these activities will initially be supervised by more experienced personnel.

Attachment 1 Example Chain-of-Custody Form

Standard Operating Procedure

Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 1 of 8

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for the chain-of-custody (COC) procedures associated with samples collected in the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). The objective of COC procedures is to provide sufficient evidence of sample integrity to satisfy data defensibility requirements. Samples may include sediment or water collected or generated for chemical, biological, and/or physical analyses, and associated quality assurance (QA) analysis. This SOP is intended to be complete enough so that: 1) the steps which could affect tracking, documentation, or integrity of samples are explained in sufficient detail and 2) different sampling personnel following these procedures will deliver samples to the laboratory which are equally reliable and consistent.
- 1.2** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** Although COC activities do not generally pose significant health and safety risks, sample exposure via external container residues may occur and much of the work going on in the vicinity of sample custodians requires attention to safety practices. Project-related physical, chemical and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017a).
- 2.2** Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

Not applicable.

Standard Operating Procedure Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 2 of 8

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP (AECOM 2017a);
- Sample containers as specified in the workplan (AECOM 2017b)
- Sample labels;
- Chain of custody forms;
- Custody tape or seals;
- Field logbook;
- Ballpoint pen or fine-tipped marker (e.g., Sharpie®); and
- Clear plastic sealing tape.

5.0 Procedures

5.1 General requirements

5.1.1 As few people as possible should handle the samples.

5.1.2 Sampling personnel should be able to testify that tampering of the samples could not occur without their knowledge.

5.2 Sample identification

Each sample, including field samples and quality control (QC) samples (e.g., equipment rinsate blanks, field duplicates) will be assigned a unique identification. Refer to the workplan (AECOM 2017b) for the sample identification protocol.

5.3 Sample labeling

5.3.1 A label will be attached to each bottle used for sampling. Waterproof, adhesive labels are preferred. Labels will be applied to the container, not the lid, whenever possible.

5.3.2 When practical, the project identification, sample matrix, laboratory designation/analyses requested, field sample identification code, and preservation will be typed or printed onto the label before sampling. The label will be protected from water and solvents with clear packing tape, except in cases where not appropriate.

Standard Operating Procedure

Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 3 of 8

- 5.3.3** Completion of the sample labels (including the sampler's initials and the date and time of sample collection) will occur at the time of sample collection. Labels will be completed in waterproof, indelible ink.

5.4 Sample tracking

- 5.4.1** From the time of collection through transportation, the handling of samples will follow COC procedures. A representative from each sampling team (e.g., from each vessel) will be assigned as the field sample custodian. This individual will be responsible for the custody of the samples from collection until release for processing or shipment to the laboratories. The field sample custodian will provide a sample transfer/custody form and the completed and electronic versions of the sample collection forms (refer to SOPs NHH-S-01 – Grab Sampling, NHH-S-02 – Sediment Sampling Using a Vibracorer, and NHH-S-03 – Core Processing) when relinquishing the collected samples for sample processing or shipment. The samples will be verified against the sample transfer/custody form. An example standard chain of custody (COC) form is provided in Attachment 1.

- 5.4.2** A sample is considered under a person's custody if one or more of the criteria are met:

- Sample is in the person's possession;
- Sample is in the person's view after being in person's possession;
- Sample was in the person's possession and then was locked up to prevent tampering; or
- Sample is in a designated secure area.

- 5.4.3** Samples collected for analysis will be continuously tracked and while in transit to the laboratory by use of the following procedures below.

- 5.4.4** Individual sample bottles will be properly labeled and securely sealed before being placed in the container for shipment to the laboratory.

- 5.4.5** Pertinent information will be entered on the COC form (Attachment 1) and will include:

- Project identification
- Signatures of samplers;
- Sample identification code. This code should be unique to the sampling event and to the program and must agree exactly with the field sample identification code recorded on the bottle label;
- Date and time of sample collection,

Standard Operating Procedure Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 4 of 8

- Sample matrix (sediment, water, etc.);
- Analyses requested;
- Number of sample containers;
- Preservative;
- Grab or composite sample designation (if applicable);
- Sampler's remarks (optional). These comments may serve to alert the laboratory to highly contaminated samples or identify QC sample requirements.
- Signatures of individuals involved in sample transfer;
- destination (e.g., laboratory name and location);
- Page number (for example: 1 of 2, 2 of 2);
- If applicable, COC tape numbers; and
- If applicable, the air bill or other shipping number.

This information is consistent with guidance in SW 846, Test Methods for Evaluating Solid Waste (USEPA, 1993).

- 5.4.6** The COC will be manually filled out completely and legibly in indelible ink. COCs may be pre-printed with known information (project identification, parameters to be analyzed, etc.). Corrections will be made, if necessary, by drawing a single line through and initialing and dating the error. The correct information will then be recorded with indelible ink. There should be no unexplained blank spaces. Blank lines will be lined out and initialed and dated.
- 5.4.7** Each COC will be cooler-specific (i.e., list only the samples packed in the cooler). Information on the COC must agree exactly with that recorded on the sample containers. Discrepancies may result in the samples being incorrectly logged into the laboratory or delays in initiating sample analysis.
- 5.4.8** The completed COC form will be signed, dated, enclosed in a sealable plastic bag, and placed in the container prior to shipment/ transfer to a courier. A copy of the COC will be retained by field personnel and stored in a dedicated binder or file. Additional copies will be distributed via email or fax as follows:
- Project Chemist or his/her designee;
 - Data Management Task Manager or his/her designee; and
 - Laboratory project manager at each laboratory being used.
- 5.4.9** If samples are to be shipped by commercial overnight carrier, COC seals must be used and the COC seal numbers recorded on the COC form. Refer to SOP NHH-G-05 –

Standard Operating Procedure Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 5 of 8

Packaging and Shipment of Environmental Samples for specific packaging procedures. Representatives of commercial carriers are not required to sign the COC form.

- 5.4.10** If samples are hand carried to a laboratory, custody will be maintained and documented on the COC form through the process (e.g., from the person packing the cooler to the person transporting the samples to the laboratory).
- 5.4.11** If samples are transmitted to the laboratory by courier, the procedures described in either Section 5.4.10 or 5.4.11 will be followed, depending on whether the courier is a commercial courier or laboratory representative, and whether the cooler has been secured by COC seals prior to pick up by a laboratory courier.
- 5.4.12** Upon receipt at the laboratory, the designated laboratory sample custodian will sign the COC form indicating receipt of the incoming field samples. The samples will be checked against the COC form upon arrival at the laboratory. The receiving personnel will enter all arriving samples into the laboratory system. Any discrepancies between the samples and the COC form(s), or any evidence of tampering with the shipping container or the custody seal will be immediately reported to the Project Chemist. The laboratory sample custodian will check the temperature of the cooler upon arrival at the laboratory and record the measured temperature on the COC and/or appropriate sample/cooler receipt forms. The Project Chemist will be immediately notified of any sample preservation issues, including temperature exceedances.
- 5.4.13** A completed copy of the COC form will be distributed via email or fax to the Project Chemist within 24 hours of sample receipt at the laboratory. The original will be retained by the laboratory.

6.0 Quality Assurance/Quality Control

- 6.1** Completed COCs will be reviewed by the individuals preparing the samples for shipment for completeness, accuracy, and legibility. Specifically, the samples and COC record will be compared to ensure agreement between the sample labels and the COC, and to verify the number of sample containers.
- 6.2** These records are subjected to periodic review by the Field Task Manager to verify adherence to the procedures outlined in this SOP.

Standard Operating Procedure Sample Custody

SOP No.: NHH-G-04
Revision: 0
Date: August 2017
Page 6 of 8

7.0 Data and Records Management

- 7.1** The records associated with the custody process (transfer forms, COC records, airbills, etc.) will be maintained in an organized and contained manner.
- 7.2** COC records will be distributed to the appropriate personnel as described in the SAP.
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and summarized on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A field corrective action form will be completed (refer to SOP NHH-G-01 – Field Records) and distributed as specified in the workplan (AECOM 2017b).

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017a], workplan [AECOM 2017b]). No specialized training is required; however, execution of these activities will initially be supervised by more experienced personnel.

Standard Operating Procedure Sample Packaging and Shipping

SOP No.: NHH-G-05
Revision: 0
Date: August 2017
Page 1 of 6

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for packaging and shipping samples collected on the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Sample packaging and shipment generally involves the placement of individual sample containers into a cooler or other similar shipping container and placement of packing materials and coolant in such a manner as to isolate the samples, maintain the required temperature, and to limit the potential for damage to sample containers when the cooler is transported.
- 1.2** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** Although packaging activities do not generally pose significant health and safety risks, sample exposure via external container residues may occur and much of the work going on in the vicinity of sample custodians/shippers require attention to safety practices. Project related physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017a).
- 2.2** Sample packaging and shipping involves potential physical hazards primarily associated with handling of occasional broken sample containers and lifting of heavy objects. Adequate precautions will be taken, including minimizing the weight of individual coolers, using hand carts to transport coolers, and using the buddy system to lift coolers into and out of vehicles.
- 2.3** Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. As detailed in the APP (AECOM 2017a), everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

Standard Operating Procedure Sample Packaging and Shipping

3.0 Interferences

Improper sample storage or inadequate protection against breakage and cross-contamination could potentially affect sample results. The field team will follow the details of this SOP to minimize these effects.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP (AECOM 2017a);
- Inert packing material (e.g., foam peanuts, vermiculite, cardboard, bubblewrap, etc.);
- Sample containers as specified in the workplan (AECOM 2017b);
- Sample labels;
- Chain of custody (COC) forms;
- Insulated coolers;
- Custody tape or seals;
- Indelible marking pens;
- Shipping tape;
- Sealable plastic bags;
- Temperature blanks (provided by the laboratory);
- Field logbook;
- Ice or similar chilling source;
- Ballpoint pen or fine-tipped marked (e.g., Sharpie®); and
- Clear plastic sealing tape.

5.0 Procedures

5.1 General requirements

Standard Operating Procedure

Sample Packaging and Shipping

- 5.1.1** Vehicular sample transport will adhere to normal/applicable Department of Transportation (DOT) regulations. DOT regulations/guidelines related to sample shipments can be viewed on AECOM's SH&E intranet web page.
 - 5.1.2** An area for storing unused sample containers/coolers and a clean area for sample handling, packaging, and shipment will be identified.
 - 5.1.3** Laboratories will often re-use coolers. The interior and exterior of each cooler received at a project location should be inspected for cleanliness before using it. Any coolers that have cracked interior or exterior linings/panels or hinges should be discarded. Any coolers missing one or both handles should also be discarded if replacement handles (i.e., knotted rope handles) cannot be fashioned in the field.
 - 5.1.4** Excess strapping tape and old shipping labels should be removed. If the cooler interior exhibits visible contamination or odors it should be decontaminated in accordance with NHH-G-03 – Equipment Decontamination prior to use.
 - 5.1.5** The Field Task Manager or designee will notify the laboratory(ies) of the number, type and approximate collection and shipment dates for the samples in advance of any sample transfers and communicate any delays. The laboratory(ies) will provide courier service for all sample shipments.
- 5.2** Sample packaging and shipping will be done in accordance with applicable regulations, as described below:
- 5.2.1** After filling a sample container, affix cap. For sediment/solids containers, secure the cap with clear tape; the use of plastic tape to secure the cap is not required for aqueous containers. Complete the sample label. Apply the label to the sample container and cover with clear tape.
 - 5.2.2** Clean the outside of each sample container by wiping it off with a clean paper towel. Verify that residual sediment has been removed from the outside of the container, and from the area under and around the cap.
 - 5.2.3** Place each glass sample bottle into an individual bubble bag sleeve provided by the lab or wrap each glass bottle/jar individually using bubble wrap secured with tape or rubber bands
 - 5.2.4** Seal each sample container inside a sealable plastic bag.
 - 5.2.5** For those samples that require thermal preservation, place on ice or similar chilling source immediately after collection.
 - 5.2.6** Place plastic bubble wrap matting in the bottom of each cooler or shipping container as needed.

Standard Operating Procedure Sample Packaging and Shipping

SOP No.: NHH-G-05
Revision: 0
Date: August 2017
Page 4 of 6

- 5.2.7** Transfer the samples to the plastic-lined cooler. Place bottles upright into the cooler. If a combination of plastic and glass sample containers are to be packed, alternate them within the cooler to further protect the glass. Use inert packaging material (e.g., cardboard, etc.) to cushion the samples and minimize the potential for breakage by placing additional packing material throughout the voids between sample containers and between any layers within each cooler to a level which meets the approximate top of the sample containers. Packing material may require tamping by hand to reduce the potential for settling. Seal the drains on the ice chest (if present) with shipping tape or plug the drains with silicone sealant or a similar inert substance.
- 5.2.8** Conduct an inventory of sample numbers, fractions and containers when placing samples into the coolers, and check the inventory against the corresponding COC form before sealing the cooler (SOP NHH-G-04 – Sample Custody).
- 5.2.9** For those samples requiring thermal preservation, ice or similar chilling sources sufficient to maintain a temperature of $4^{\circ} \pm 2^{\circ}$ Celsius ($^{\circ}\text{C}$) will be placed inside the cooler during transport. Double bag cubed ice in heavy duty Ziploc type plastic bags to prevent leakage, close the bags, and distribute the packages in a layer over the top of the samples. If sample bottles are bubble wrapped, it is also permissible to insert double bagged ice packages between the sample bottles. Never place un-bagged loose ice directly into a cooler. Use sufficient ice to accommodate reasonable delays in shipment. A temperature blank provided by the analytical laboratory with each cooler will be included in the shipment.
- 5.2.10** Obtain two custody seals and enter the seal numbers on the COC form. Complete sample tracking documentation as described in SOP NHH-G-04 (Sample Custody), and place the documents in a sealable plastic bag inside the ice chest, taped to the inside of the lid.
- 5.2.11** Secure chest lid with shipping tape by covering the entire seal with tape. Sign and date the two custody seals, affix the custody seals on opposing corners of the cooler lid and cover the seals with clear plastic tape.
- 5.2.12** Repeat the above steps for each cooler or shipping container. If more than one cooler is being delivered to a laboratory, mark each cooler as “1 of 2”, “2 of 2”, etc.
- 5.2.13** Transport the shipping container directly to the laboratory or the laboratory courier. Samples will be shipped by close of the same day, whenever possible.

6.0 Quality Assurance/Quality Control

- 6.1** Completed COCs will be reviewed by the individuals preparing the samples for shipment for completeness, accuracy, and legibility. Specifically, the samples and COC record will be

Standard Operating Procedure Sample Packaging and Shipping

compared to ensure agreement between the sample labels and the COC, and to verify the number of sample containers.

- 6.2** The laboratory will notify the Project Chemist within 24 hours of receipt in the event that samples are received broken, that there are sample preservation concerns or holding time exceedances, or there are discrepancies between the custody paperwork and the sample containers.
- 6.3** The procedures and records associated with sample packaging and shipping are subjected to periodic inspection and review by the Field Task Manager to verify adherence to the procedures outlined in this SOP.

7.0 Data and Records Management

- 7.1** The records associated with the shipment process (COC records, etc.) will be maintained in an organized and contained manner.
- 7.2** COC records will be distributed to the appropriate personnel as described in the Work plan (AECOM 2017b).
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and summarized on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A formal nonconformance report (NCR) will be completed (refer to SOP NHH-G-01 – Field Records) and distributed as specified in the workplan (AECOM 2017b).

8.0 Personnel qualifications and training

Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017a], workplan [AECOM 2017b]). No specialized training is required; however, execution of these activities will initially be supervised by more experienced personnel.

Date: August 2017
Page 2 of 11

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for collecting sediment grab samples using a grab sampler deployed from a boat or other sampling platform as part of the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Surface sediment samples will be collected for a variety of chemical, physical, and biological parameters. Grab samplers intended for use on the FNP project include Van Veen grab samplers (including Ted Young modified), power grab samplers and a box corer. This SOP describes the equipment, field procedures, materials, and documentation procedures necessary to collect grab samples. Specific information regarding grab sampling can be found in the associated workplan (AECOM 2017a). This SOP is based on United States Environmental Protection Agency (USEPA) guidance document Methods for Collection, Storage, and Manipulation of Sediments for Chemical and Toxicological Analyses: Technical Manual (USEPA, 2001).
- 1.2** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted based on field conditions, equipment limitations, or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by Project Quality Assurance (QA) Manager and the Task Manager. Deviations from this SOP will be documented in the field records and on a field corrective action form (SOP NHH-G-01 – Field Records) including the reason for the deviation(s). The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1** The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017b),
- 2.2** The health and safety considerations for the work associated with grab sampling include:
- The physical hazards of handling heavy equipment,
 - Pinch hazards associated with the grab or box core sampler,
 - Overhead lifting hazards using boat based winches and A-frames,
 - Marine safety aspects of the program, and

Standard Operating Procedure Sediment Grab Sampling

SOP No.: NHH-S-01
Revision: 0
Date: August 2017
Page 3 of 11

- The specific chemical hazards related to the sediments.

2.3 Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP (AECOM 2017b, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

Grab sampler collection issues generally include mechanical failures, over penetration, or surface sediment loss. Each of these will affect the quality/representativeness of the resulting data. Any sampler that did not trigger properly, or did not completely close will be rejected. Samplers that are either over-filled or appear to have lost surface fines will also be rejected. These details are further discussed in Section 5 (Procedures).

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Coring/sampling vessel, including the necessary navigational, communication, and grab deployment equipment;
- Marine VHF radio;
- Van Veen (or Ted Young modified Van Veen) grab sampler;
- Stainless-steel power grab sampler with pneumatic ram and stainless steel guide;
- Box corer;
- Stand (cradle) on which to place the grab or box core while not in deployment;
- Siphon tubing and bucket or pipette;
- Source of running water (optional);
- Water pump and hoses (optional);
- First aid kit and personal protective equipment (PPE) (refer to APP [AECOM 2017b]);

Standard Operating Procedure Sediment Grab Sampling

- Approved plans, including target sampling locations;
- Sample containers (refer to workplan [AECOM 2017a]);
- Stainless steel bowls/trays and spoons/spatulas (or equivalent);
- Insulated coolers with wet ice;
- Sample labels;
- Waterproof paper and pen;
- Field notebook, Grab Collection Form, and other standardized forms (as needed);
- Ruler and tape measure;
- Digital camera (optional);
- Chain-of-custody forms and seals;
- Decontamination supplies (refer to SOP NHH-G-03 – Equipment Decontamination).

5.0 Procedures

This section gives the step-by-step procedures for collecting grab samples using a grab sampler (Van Veen, Ted Young modified Van Veen, or power grab) or box corer. Observations made during sediment grab sample collection will be recorded on the Grab Collection Form (Attachment 1), and/or a logbook (SOP NHH-G-01 - Field Records).

5.1 Equipment decontamination

The grab sampler or box corer, stainless steel bowls/containers, and stainless steel spoons/spatulas will be cleaned prior to initial use and between each station following the procedures in SOP NHH-G-03 and documented in the field notebook. A sufficient supply of pre-decontaminated small equipment will be mobilized to the sampling locations to minimize the need for performing field decontamination. Larger equipment, such as grab or box core, will however require field decontamination on the vessel between sampling stations. Note: grabs or box corers will not require decontamination between deployments at the same station; only between sampling stations, unless sticky or tar-like materials are encountered.

5.2 Equipment rinsate blanks

Equipment rinsate blanks will be collected at the frequency specified in the workplan (AECOM 2017a) after the sampling gear is decontaminated. The procedure for collecting equipment rinsate blanks and related sample containerization requirements are detailed in Attachment 2.

Standard Operating Procedure Sediment Grab Sampling

SOP No.: NHH-S-01
Revision: 0
Date: August 2017
Page 5 of 11

5.3 Positioning

- 5.3.1** The sediment sampling schedule for the day will be established prior to vessel departure, and sufficient equipment to complete the work will be on-board the sampling/coring vessel. Grab samples are anticipated to be collected adjacent to core collection locations.
- 5.3.2** The sampling/coring vessel will move to a grab/coring location in accordance with SOP NHH-G-02 (Navigation Positioning).

5.4 Sampling preparation

The associated workplan summarize the parameters that require collection at each station, and list the sample mass, container type, preservatives, and storage conditions required for each sample.

5.5 Sampler Deployment and Retrieval

- 5.5.1** Don PPE as required by the APP (AECOM 2017b).
- 5.5.2** Attach the sampler (grab sampler or box corer) to the end of the winch cable with a shackle and tighten the pin.
- 5.5.3** Attach any needed weights to achieve the needed penetration or pads (boards) for stabilization. Arm the grab/box corer.
- 5.5.4** Lower the sampler through the water column until the cable slackens. Nearing the bottom travel time will not exceed 1 m/sec to minimize bow wave disturbance. Record the station location (HYPACK system) and water depth (echo sounder or weighted line) on the Grab Collection Form (Attachment 1).
- 5.5.5** Retrieve the sampler and place it on the stand.
- 5.5.6** Open the sampler and examine it for acceptability:
- The sediment surface should be basically level and intact over the surface area of the grab, with no sign of channeling or sample washout
 - Penetration depth should be sufficient (as measured from the center of the grab) to meet the project requirements
 - The jaws of the sampler should be tightly closed and water should not be substantially leaking from the sampler

Standard Operating Procedure Sediment Grab Sampling

- The surface appears intact (shell hash or coarse material visible on the surface is acceptable as long as the first two criteria are met and the jaws of the grab are tightly closed and not leaking).
- Grabs that are only partially filled, or obviously slumped or pitched due to the sampler hitting at an angle are not considered acceptable. In addition, sediments should not be in contact with the underside of the sampler access doors. Drain overlying water from the sampler (by siphoning, not decanting) until only a thin film remains.

5.5.7 Describe the sample surface (color, texture, odor, etc.) on the Grab Collection Form (Attachment 1); continue to describe the sample during sample processing.

5.5.8 Collect the sample as described below. Future deployments will be adjusted for local sediment conditions by either adding/removing weight or pads to the grab frame to control the penetration depth.

5.5.9 Repeat steps 5.5.4 through 5.5.9 until sufficient grab samples are collected to meet the sample volume requirements for the full set of parameters as specified in the workplan. Care will be taken to ensure that the precise collection interval/horizon specified in the corresponding workplan is collected. Slight adjustments/relocation of the vessel on-station between sampler deployments will be performed according to SOP NHH-G-02.

5.6 Shipboard sample collection

5.6.1 Siphon off the overlying water (or remove via pipette) to the sediment/water interface without substantially disturbing the soft surface sediment. This will be performed by gently allowing the water to drain to one corner of the sampler for siphoning-off.

5.6.2 Sediment to be homogenized (for non-discrete sample parameters) will be placed in a covered plastic bucket (e.g., 3 ½ gallon bucket) provided by the laboratory.

5.6.3 Store the sample containers in an insulated cooler containing wet ice to keep samples cold while on the vessel until they can be transported to shore for further processing or shipment to the corresponding analytical laboratory as described in SOP NHH-G-05 (Sample Packaging and Shipping).

5.6.4 Clean the grab sampler or box corer in accordance with the procedures in SOP NHH-G-03 between stations.

6.0 Quality Assurance/Quality Control

Standard Operating Procedure Sediment Grab Sampling

- 6.1** Completing the Grab Collection Form (Attachment 1) will document that the process is being followed and that pertinent information is being collected and recorded in accordance with the procedures outlined in this SOP.
- 6.2** Entries on the forms and in the field logbook will be double-checked by the samplers to verify the information is correct. Completed forms and field logbook will be reviewed periodically by the Field Task Manager to verify that the requirements are being met.
- 6.3** The workplan (AECOM 2017a) has been prepared to collect representative samples within the NHH per the SOW (NAE 2017). High sediment moisture content, which can impact the achievable reporting/detection limits and sample representativeness, will be evaluated. Samples collected with a high water content will be discussed with the Field Task Manager to evaluate the need to collect added sample or to take added action that would reduce the water content (e.g., allowing the sediment slurry to settle in a bucket followed by siphoning the overlying water).
- 6.4** Data quality evaluations will be based on quality control (QC) sample results. QC samples may include field duplicates and equipment rinsate blanks; collection requirements are tabulated in the associated workplan (AECOM 2017a).
- 6.5** The workplan (AECOM 2017a) lists the proper sediment sample containerization, preservation, and storage conditions required to maintain sample integrity.

7.0 Data and Records Management

- 7.1** Field notes will be kept during sampling activities in accordance with SOP NHH-G-01 - Field Records.
- 7.2** Field data will be distributed to the appropriate personnel as described in the workplan (AECOM 2017a).
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A field corrective action form, including reason and impact on the program, will be submitted to the Task Manager and Project QA Manager for approval.

8.0 Personnel Qualifications and Training

- 8.1** Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017b], workplan [AECOM

Standard Operating Procedure Sediment Grab Sampling

SOP No.: NHH-S-01
Revision: 0
Date: August 2017
Page 8 of 11

2017a)). Inexperienced personnel performing these activities will be initially supervised by the Field Task Manager or his/her designee.

Attachment 2

Equipment Rinsate Blank Collection Procedure

1. Decontaminate the sample handling equipment (e.g., grab, box corer, utensils and basins/bowls) according to the procedures detailed in SOP NHH-G-03 – Equipment Decontamination.
2. Rinse the utensils with de-ionized water (DIW), collect the rinse water in the decontaminated basin/bowl, and pour it into laboratory-provided containers. Note that equipment rinsate blanks for dioxins/furans will substitute hexane for the DIW. Sample volume, container type, preservatives, and storage details are provided in the workplan (AECOM 2017a). QC sample blank containers will be pre-preserved by the laboratory that provides them. Note: equipment blanks may not be appropriate for each parameter
3. Label each container with the sample ID, date and time of collection, and the analytical parameters, cover the label with clear packing tape and fill out the custody form (refer to SOP NHH-G-04 – Sample Custody).
4. Store the samples in a cooler on ice until they are transported to the field facility, under the Field Custody and Transfer Form (refer to SOP NHH-G-04 – Sample Custody), for shipment to the corresponding analytical laboratory following SOP NHH-G-05 – Sample Packaging and Shipping.

Standard Operating Procedure Sediment Coring Using a Vibracorer

SOP No.: NHH-S-02
Revision: 0
Date: August 2017
Page 1 of 11

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for collecting cores using a vibracoring device as part of the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). This SOP describes the equipment, field procedures, materials, and documentation procedures necessary to collect cores using a vibracore. Specific information regarding coring can be found in the associated workplan (AECOM 2017a).
- 1.2** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions, equipment limitations, or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and will be communicated to the NAE Project Manager. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the sampling event or the field activity.

2.0 Health and Safety Considerations

- 2.1** The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017b).
- 2.2** The health and safety considerations for the work associated with vibracoring include:
- The physical hazards of handling heavy equipment;
 - Overhead lifting hazards using boat based winches and A-frames;
 - Marine safety aspects of the program;
 - The specific chemical hazards related to the sediments; and
 - Sharp edges of cut polycarbonate vibracore liners.
- 2.3** Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP (AECOM 2017b), everyone on the field team has the authority to stop

Standard Operating Procedure Sediment Coring Using a Vibracorer

work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1** In some cases, the addition of a piston to the corer may be appropriate and in all cases field personnel should continually monitor the core progression and ensure that the core sample is not vibrated excessively if the downward progression has ceased.
- 3.2** Common interferences encountered during core driving are listed below:

Interference	Possible Effect	Action Taken to Minimize Effect
Vibratory action	Consolidate/compact sediment during driving	Vibrate only as needed to advance the tube; use of a piston to improve recovery; establish minimum acceptance criteria
Loss of material out bottom	Less drive length achieved; gaps in retained sediment	Use core catcher
Blocking	Material doesn't enter core tube or lessens recovery	Move off station and re-drive; establish minimum acceptance criteria
Angled entry	Drive length less than expected and fore-shortened	Make sure that wire line is vertical during core driving
GPS satellite accuracy is low	Less confidence in station location	Wait until DGPS accuracy returns to acceptable limits and resume or use a buoy marker or land-survey techniques to confirm sample location. See SOP NHH-G-02 – Navigation/Positioning.

4.0 Equipment and materials

The following equipment list contains materials which may be needed in carrying out the procedures outlined in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP (AECOM 2017b);
- First aid kit;
- Navigation charts and Core Locations figure;
- Sampling vessel adequate for task at hand and river conditions;

Standard Operating Procedure Sediment Coring Using a Vibracorer

- Marine VHF radio;
- Positioning equipment;
- Vibracoring device;
- Deployment equipment (e.g., A-frames, winches, generator);
- Decontaminated polycarbonate vibracore liners;
- Stainless steel core cutter/catcher;
- Hacksaw;
- Tubing cutter;
- Decontaminated hacksaw blades;
- Decontaminated drill bits and/or Unibits;
- Drill;
- Daily Activity Log (provided in SOP NHH-G-01 – Field Records);
- Sediment Core Collection Record (example provided in Attachment 1);
- Core storage racks to hold cores vertical and cold during temporary storage on-board coring vessel;
- Assorted nautical equipment (e.g., anchors, lines, personal flotation devices [PFDs]);
- Waterproof logbooks, pens, and labels;
- Permanent marker or grease pencil;
- Echo sounder with a resolution of 0.1 foot;
- Weighted line or survey rod, with graduations of 0.1 foot;
- Depth measuring plate;
- Tape measure and ruler;
- Submersible pump and hose;
- Decontaminated core tube caps;
- Electrical tape, duct tape, PVC pipe tape, or “Gorilla” brand tape;
- Camera;
- Stainless steel spoon/ utensils;
- Five gallon buckets; and
- Decontamination equipment/supplies (refer to SOP NHH-G-03 – Equipment Decontamination).

5.0 Procedures

Standard Operating Procedure

Sediment Coring Using a Vibracorer

Cores will be collected using a vibracoring device. Following collection, cores will be processed using on-board core processing station. Core processing procedures are described in SOP NHH-S-04 – Sediment Core Processing.

5.1 Sampling procedures

This section gives the step-by-step procedures for collecting cores using a vibracore. Observations made during sediment core collection should be recorded on the Sediment Core Collection Record (Attachment 1).

5.1.1 Decontamination of equipment

Decontamination of the polycarbonate core liners, core caps, stainless steel core cutter/catcher, hacksaw blades, drill bits, and assemblies will be performed prior to vessel departure in accordance with procedures outlined in SOP NHH-G-03 – Equipment Decontamination. A sufficient amount of decontamination equipment and supplies will be brought on the coring vessel to accommodate the need for miscellaneous, unforeseen decontamination. The hacksaw blade used to cut the core will be decontaminated between each segment following the Level III decontamination protocol as detailed in SOP NHH-G-03 – Equipment Decontamination.

5.1.2 Locating coring position

1. The coring schedule for the day will be established prior to vessel departure, and sufficient equipment to complete the work will be on board the sampling vessel. The coring crew will be informed prior to departure of the coring locations and the number of cores required at each location. The number of cores to be recovered at each location will be determined by the sample volume requirements of the project analytical program.
2. The vibracoring vessel will be positioned at a coring location in accordance with SOP NHH-G-02 - Navigation / Positioning. Upon collection of a sample, the actual sampling site will be documented by a DGPS unit or by a physical measurement from a fixed feature if satellite reception cannot be acquired.

5.1.3 Collection of core samples (boat based)

1. Initiate the Sediment Core Collection Record (Attachment 1).
2. Don PPE as required by the APP (AECOM 2017b).
3. Activate the submersible pump in preparation for cleaning the vibracore and coring tube, upon retrieval.
4. Slowly winch the vibracore into its deployment orientation.

Standard Operating Procedure Sediment Coring Using a Vibracorer

SOP No.: NHH-S-02
Revision: 0
Date: August 2017
Page 5 of 11

6. Obtain water depth (to nearest 0.1 foot) from the echo sounder or via deployment of a weighted line or survey rod with graduations of 0.1 foot. Record on the Sediment Core Collection Record (Attachment 1).
7. Confirm the water depth with the depth in the work plan (AECOM 2017a). If the overlying water depth differs, the project depth and core depth may need to be adjusted. Upon consultation with NAE and the Task Order Manager, adjust depth if necessary and record in the log book and using a field corrective action form (NHH-G-01 – Field Records).
8. Slowly lower the vibracore into the water using the winch or other deployment equipment. Slowly lower the vibracore through the water column to the sediment surface using the water depth reading.
9. Record the “zero” mark on the winch cable.
10. Turn motor of vibracorer on. Slowly lower vibracore into sediment to penetrate the sediment to the workplan-specified target depth (AECOM 2017a), adjusted target depth (see step 7) or refusal. Record the start time on the Sediment Core Collection Record (Attachment 1).
11. Lower vibracore approximately 1 foot more to obtain a “plug” at the bottom of the core (i.e., to minimize loss of sediment from core). Record the end time on the Sediment Core Collection Record (Attachment 1).
12. On completion of the required penetration, or upon vibracore refusal, de-energize the vibracore and allow the core to stabilize for a period of 15 minutes. Record the vibracore penetration depth on the Sediment Core Collection Record (Attachment 1).
13. Record the final core location coordinates on the Sediment Core Collection Record (Attachment 1).
14. Slowly raise the vibracore, while maintaining the core in a vertical position, as field conditions allow.
15. Bring vibracore to sampling vessel deck while maintaining the core in a vertical position. Remove core cutter and core catcher, replace with cap, and secure cap with electrical tape (or equivalent).
16. Clean the vibracore barrel and coring assembly by hosing down the equipment with site water as described in SOP NHH-G-03 – Equipment Decontamination.

Standard Operating Procedure Sediment Coring Using a Vibracorer

SOP No.: NHH-S-02
Revision: 0
Date: August 2017
Page 6 of 11

17. Remove the core tube from the vibracore barrel and place a cap on bottom of the coring tube, keeping the core tube in an upright position, as field conditions allow.
18. Return the vibracore device to its onboard, deck storage location.
19. Clean the core tube by hosing it down with river water. Care should be taken not to direct water into the open end of the core tube.
20. Evaluate whether core penetration and recovery are acceptable using the procedures outlined in Sections 5.1.5 and 5.1.6, respectively.
21. Keeping the core tube upright, as field conditions allow, use a hacksaw with a decontaminated blade or drill with a decontaminated drill bit to make a cut/hole in the core tube approximately 1 to 2 inches above the sediment/water interface and allow the excess water to drain out.
22. Cap the cut end of the tube with decontaminated core cap, secure cap with electrical tape (or equivalent), and draw an arrow toward the cap. Draw an arrow on the coring tube with permanent marker and label "top" to indicate the top of the core. Label the core with the location ID, date, and time, and record this information on the Sediment Core Collection Record (Attachment 1).
23. Mark the side of the core to indicate the sediment-water interface. Measure the recovered length of the sediment in the core tube (to the nearest 0.1 foot to the extent possible) and record it on the Sediment Core Collection Record (Attachment 1). The distance between the top of the sediment in the coring tube and the bottom of the coring tube corresponds to the recovered length. Apparent gaps should be noted on the Sediment Core Collection Record (Attachment 1) and the length and location(s) of the gap(s) should be noted. The total gap length will be subtracted from the total recovery length.
24. Store the core vertically in a core storage rack (capable of keeping cores cold) while on the vessel, until it can be processed. Longer cores (e.g., archeology) will be segmented on the vessel to allow for storage and transportation. Cut these cores at the location of a planned sample segmentation using a hacksaw with a decontaminated blade and recap the exposed ends. Add appropriate markings to indicate the location and unique identification of each segment. (Segments will be identified as AB, BC, CD, etc., with the first letter marked just below the upper cut, and the second letter marked just above the lower cut).

5.1.4 Procedures for determining acceptable core penetration

1. Calculate penetration percentage using the following equation:

Standard Operating Procedure Sediment Coring Using a Vibracorer

SOP No.: NHH-S-02
Revision: 0
Date: August 2017
Page 7 of 11

$$\text{Penetration (\%)} = \frac{\text{actual penetration (feet)}}{\text{target penetration (feet)}} \times 100$$

2. Actual penetration is the depth advanced into the sediment not including the depth advanced to form a plug.
3. Record penetration percentage or penetration start and end depths in the field logbook.
4. If penetration is $\geq 80\%$, then penetration is acceptable. Proceed to Section 5.1.6, Procedures for Determining Acceptable Core Recovery.
5. If penetration is $< 80\%$, then (a) retain core and (b) record on the Sediment Core Collection Record (Attachment 1) if due to refusal or to encountering the red-brown sand or clay. Record additional penetration notes at the Remarks section of the Sediment Core Collection Record (Attachment 1). Adjust the vessel location slightly prior to next sampling attempt in accordance with SOP NHH-G-02 – Navigation/Positioning and project-specific location acceptance criteria in the workplan (AECOM 2017a). Upon three unsuccessful attempts to obtain $> 80\%$ penetration, contact the Field Task Manager to determine if additional cores should be attempted (Section 5.1.6.4, below). Proceed to Section 5.1.6, Procedures for determining acceptable core recovery, below.

5.1.5 Procedures for determining acceptable core recovery

1. Calculate recovery percentage by the following equation:

$$\text{Recovery (\%)} = \frac{\text{recovery (feet)} - \text{gaps (feet)}}{\text{actual penetration (feet)}} \times 100$$

2. Record recovery percentage or recovery length on the in the field logbook.
3. If recovery is $\geq 80\%$, then recovery is acceptable, provided that the core reached refusal or the workplan-specified target depth (AECOM 2017a). Continue processing the core, then move to a new core location in accordance with SOP NHH-G-02 – Navigation/Positioning and project specific target location acceptance criteria. Proceed to Step 2 of Sections 5.1.3 and 5.1.4 for collection of second core. If the recovery $< 80\%$, proceed to Step 4.
4. If recovery is $< 80\%$, then (a) retain core and clearly mark on core cap that recovery is $< 80\%$, and (b) adjust vessel location in accordance with SOP NHH-G-02 – Navigation/Positioning. Upon three unsuccessful attempts to obtain $> 80\%$ recovery, contact the Field Task Manager to determine if additional cores should be attempted and consult with the NAE Project Manager. The vessel will proceed to the next station. Record all attempts on

Standard Operating Procedure Sediment Coring Using a Vibracorer

SOP No.: NHH-S-02
Revision: 0
Date: August 2017
Page 8 of 11

the Sediment Core Collection Record (Attachment 1). Communications with the Field Task Manager will be documented in the field logbook. Failure to collect a core at a specified location will be recorded on the Daily Activity Log (provided in SOP NHH-G-01 – Field Records).

5. Upon collection of acceptable core(s) proceed to Section 5.1.7, Management of cores, below.

5.1.6 Management of cores

1. Containerize excess sediment on the vessel. The field crew will make reasonable attempts to containerize “gross” sediment material produced from coring. Sediment residuals generated from rinsing operations will not be included in such containerization.
2. Verify that the lengths of the core tubes, water depth, and positioning data have been recorded on the Sediment Core Collection Record (Attachment 1).
3. Prior to transit to the next coring location or return to the marina, decontaminate the coring equipment and sampling vessel as described in SOP NHH-G-02 – Equipment Decontamination.
4. Upon completion at a location or transect, the containerized excess sediment may be disposed of overboard prior to moving station.
5. Proceed to next core location specified for that day and repeat above procedures.

6.0 Quality assurance / quality control

- 6.1 Completing the Sediment Core Collection Record (Attachment 1) will document that the process is being followed and that pertinent information is being collected and recorded in accordance with the procedures outlined in this SOP.
- 6.2 Entries on the forms and in the field logbook will be double-checked by the samplers to verify the information is correct. Completed forms will be reviewed periodically by the Field Task Manager his/her designee to verify that the requirements are being met.

7.0 Data and records management

- 7.1 Field notes will be kept during coring activities in accordance with SOP NHH-G-01 – Field Records. The information pertinent to coring activities includes chronology of events, sample

Standard Operating Procedure Sediment Coring Using a Vibracorer

locations (x,y,z), time/date, sampler name, methods (including type of core liner/barrel, if applicable), sampler penetration and acceptability, sample observations, and the times and type of equipment decontamination. This information will be recorded in the field logbook or Sediment Core Collection Record (Attachment 1), as appropriate.

- 7.2** Field data will be distributed to the appropriate personnel as described in the workplan (AECOM 2017a).
- 7.3** Deviations to the procedures detailed in the SOP should be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A formal nonconformance record, including reason and impact on the program, will be submitted to the Task Manager and Project QA Manager for approval.
- 7.4** All records associated with the activities described in this SOP will be ultimately maintained in accordance with the workplan (AECOM 2017a).

8.0 Personnel qualifications and training

- 8.1** The individuals executing these procedures will have read, and be familiar with, the requirements of this SOP and the corresponding workplan (AECOM 2017a). Actual vibracoring operations will be conducted only by personnel experienced with the equipment, but subsequent manipulations, measurements, cutting and labeling procedures are relatively simple and can be implemented by personnel without specialized training. It is recommended that initial core manipulations and handling activities be supervised by more experienced personnel.
- 8.2** Sampling personnel will also be health and safety trained and certified as specified in the APP (AECOM 2017b).

Attachment 2 Example of Field Coring Log

Standard Operating Procedure Core Processing

1.0 Scope and Applicability

- 1.1** The purpose of this document is to define the standard operating procedure (SOP) for processing of sediment cores collected as part of the New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). This processing procedure applies to sediment cores collected using a variety of samplers, including vibracore, push or gravity cores. Core processing includes logging of cores, and the collection of samples for geotechnical, chemical, or other analyses. Core processing will be conducted to meet the sample collection and analysis objectives defined in the associated workplan (AECOM 2017a).
- 1.2** It is fully expected that the procedures outlined in this SOP will be followed by the field team. Procedural modifications may be warranted depending upon field conditions, equipment limitations, or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project Quality Assurance (QA) Manager and the Task Manager and will be communicated to the NAE Project Manager. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the sampling event or the field activity.

2.0 Health and Safety Considerations

- 2.1** The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP) (AECOM 2017b).
- 2.2** Daily safety briefs should be conducted at the start of each working day before any work commences. These daily briefs should be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. As detailed in the APP (AECOM 2017b), everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1** Potential bias/interference related to sediment core processing may be introduced if the sediment/water interface is not properly maintained (i.e., keeping sediment cores vertical and

Standard Operating Procedure

Core Processing

decanting overlying water to avoid surface sediment mixing). Interference may be introduced if sediment has fallen out of the bottom creating spatial gaps in the core stratigraphy. If the core was not advanced vertically, angled contacts may be observed in the core tube.

- 3.2** High sediment moisture content, which can impact the achievable reporting/detection limits and sample representativeness, should be evaluated. Samples collected with very high water content should be discussed with the Field Task Manager to evaluate the need to collect added cores, allow cores to settle, or prioritize the subsampling effort.
- 3.3** Inadequate or improper homogenization of the sediment material may result in samples that are non-representative and/or biased.

Interference	Possible Effect	Action Taken to Minimize Effect
Mixing of sediment/water interface	Inaccurate depth reading and chemical mixing	Stand core tube vertically and let suspended material settle then siphon or drain overlying water
Poor homogenization	Biased physical and chemical results	Mix material in bowl until uniform texture and color
Core not driven vertically or on slope	Angled stratigraphy and contacts	Note visual observations and sample along contacts

- 3.4** Cross contamination of samples may result if sample handling equipment is inadequately or improperly decontaminated. Refer to SOP NHH-G-03 – Equipment Decontamination for decontamination procedures.
- 3.5** Contamination of samples may also result if samples are exposed to certain environmental conditions. Core processing will be conducted in a dedicated area on the vessel. Exposure to potential sources of contamination (e.g., exhaust fumes) will be minimized.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Core cutting table;
- Vertical core stand and containment basin;

Standard Operating Procedure Core Processing

- Fine-gauge stainless steel wire;
- Hacksaw with spare decontaminated blades and case knives;
- Core cutting tool (electric sheet metal shears, router, circular saw, or similar tool, with spares);
- Lithology and Sample Collection Records (data may be collected via hardcopy or electronically; hardcopy examples are provided as Attachment 3);
- Grease pencil/pens;
- Decontamination supplies (refer to SOP NHH-G-03 – Equipment Decontamination);
- Stainless steel bowls/pans and utensils;
- Electric drill;
- Stainless steel dividing blades/knives;
- Aluminum foil, plasticized bench sheeting (white) and marker pens;
- Ruler and tape measure;
- Stadia rod;
- First aid kit and personal protective equipment (PPE) (refer to the APP [AECOM 2017b]);
- Pre-labeled sample bottles for the analyses specified in the workplan (AECOM 2017a);
- Pre-labeled and pre-preserved sample bottles for equipment rinsate samples (see Equipment Rinsate Blank Collection Procedure in Attachment 1);
- Sample processing table (ventilated area);
- Custody forms (refer to SOP NHH-G-04 – Sample Custody);
- Refrigerator and freezer;
- Digital cameras;
- Unified Soil Classification System (USCS) Charts; and
- Core storage rack to hold cores vertical and keep cold prior to either processing or placement in a refrigerator.

5.0 Procedures

The core processing procedure presented in this SOP is a multi-step process. Field samples will be collected in rigid plastic liners and stored vertically to allow fine grained materials to settle out of the overlying water.

Standard Operating Procedure

Core Processing

Cores will be inspected visually, logged and photographed, and samples will be collected and submitted for geotechnical, chemical, and physical analyses, as required by the workplan (AECOM 2017a).

5.1 Equipment decontamination

5.1.1 Decontamination of equipment prior to contact with sediment will be performed in a designated decontamination area. The decontamination will be performed in accordance with procedures outlined in SOP NHH-G-03 – Equipment Decontamination. The sample handling equipment (i.e., stainless steel bowls/containers, spoons/spatulas) will be decontaminated between segments following the procedures in SOP NHH-G-03 and documented in the field records. Core cutting equipment (hacksaw, cutting blades, stainless steel spatulas) will be decontaminated. Equipment decontamination will be conducted sufficiently ahead of the processing activities to allow for the implementation of proper procedures (including drying of decontaminated equipment).

5.1.2 Equipment rinsate blanks will be collected at the frequency specified in the workplan (AECOM 2017a). Procedures for collecting equipment rinsate blanks are included in Attachment 1.

5.2 Preliminary activities prior to core processing

5.2.1 Acquire the necessary sampling equipment (decontaminated stainless steel bowls, utensils), pre-labeled sampling containers, and hardcopy or electronic Sediment Core Collection Records prepared during the coring operations.

5.2.2 At the sample processing area on the boat, cores will be stored vertically prior to processing.

5.2.3 Dry the surface of the core tube with clean paper towels and measure the length of sediment in the core tube.

5.3 Core processing

5.3.1 Don PPE per the APP (AECOM 2017b) (including hearing and eye protection).

5.3.2 Transfer the core to the processing table and make two longitudinal cuts along the core tube using the core cutting table designed for that purpose. Cut the length of the core in two cuts at 180° from each other. Cutting will be performed using a small circular saw, router, electric sheet metal shears, or other appropriate tool. Complete the cut (as needed) using a heavy duty box cutter. Transfer the core intact onto the plasticized bench sheeting. Split the core into longitudinal halves using decontaminated stainless steel spatulas or other (e.g., wire). Open the tube lengthwise

Standard Operating Procedure

Core Processing

and carefully separate the core half-sections and place them on the plasticized bench sheeting.

- 5.3.3** Visually describe the core in the Field Coring Log (Attachment 2). Using the Unified Soil Classification System (USCS) Charts, record the description of the sediment type in the appropriate section of the form and include the total core length, the presence of observable biota or organic matter, odor, and color.
- 5.3.4** Photograph the exposed section of the core in approximately one foot increments. Include a stadia rod for scale, and mark the top and bottom and ends of the core. If foreign objects or gaps are present, or unusual observations are made, photograph the object or subject of the observations. Make sure an adequate amount of light is available to photograph core and include a photograph ID label in the photograph. If core features are photographed, a scale should be provided, along with a label that indicates the core segment/depth in the sediment column. Maintain photographic records as specified in SOP NHH-G-01 – Field Records.
- 5.3.5** Determine sub-sample intervals for subsampling. Subsample each core (approximately two per core) for grainsize and chemical analysis per the workplan (AECOM 2017a).
- 5.3.6** Homogenize the sediment using the pre-cleaned utensils until there is uniformity in the color and texture. Sediment subsamples should be collected as indicated on the core processing form.
- 5.3.7** Transfer homogenized sediments to pre-labeled sample jars for grainsize and chemical analysis.
- 5.3.8** Place the samples in a secure refrigerated area (4°C) until the samples are transferred to the laboratory courier at the end of the day. Transfer the samples to the laboratory(ies) as described in SOPs NHH-G-05 – Sample Custody and NHH-G-06 – Packaging and Shipping.
- 5.3.9** The remaining material from each sub-section of core will be containerized (i.e., 5-gallon bucket), labeled, and stored cold (4°C) under chain of custody.

5.4 Core Collection

- 5.4.1** Once a composting scheme has been approved by NAE, additional sediment cores will be collected to obtain necessary sediment volume. These cores will not be processed but will be containerized directly into buckets per the compositing scheme.

Standard Operating Procedure Core Processing

- 5.4.2** Additional cores for archaeological archive will be collected per the workplan (AECOM 2017a). These cores will be labeled, and maintained vertical, and stored cold (4°C) under chain of custody for transfer to NAE.

6.0 Quality Assurance/Quality Control

- 6.1** Completing the the Field Coring Log (Attachment 2) will document that the process is being followed and that pertinent information is being collected and recorded in accordance with the procedures outlined in this SOP.
- 6.2** Entries on the forms and in the field logbook will be double-checked by the samplers and sample processing personnel to verify the information is correct. Completed forms and field logbook will be reviewed periodically by the Field Task Manager or his/her designee to verify that the requirements are being met.
- 6.3** Data quality evaluations will be based on QC sample results. QC samples may include field duplicates and equipment rinsate blanks; collection requirements are tabulated in the associated workplan (AECOM 2017a).
- 6.4** The workplan (AECOM 2017a) lists the proper sediment sample containerization, preservation, and storage conditions.

7.0 Data and Records Management

- 7.1** Field notes (including photologging, if conducted) will be kept during sampling activities in accordance with SOP NHH-G-01 – Field Records. The form associated with this SOP (Attachment 2) will be filled out completely and accurately.
- 7.2** Deviations to the procedures detailed in the SOP should be recorded in the field logbook at the time of occurrence and included on the Daily Activity Log (refer to SOP NHH-G-01 – Field Records). A field corrective action form, including reason and impact on the program, will be submitted to the Task Manager and Project QA Manager for approval.

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP [AECOM 2017b], workplan [AECOM

Standard Operating Procedure Core Processing

SOP No.: NHH-S-03
Revision: 0
Date: August 2017
Page 7 of 9

2017a)). No specialized training is required; however, inexperienced personnel performing the tasks described in this SOP should be initially supervised by the Field Task Manager or his/her designee.

Standard Operating Procedure Core Processing

Attachment 1

Equipment Rinsate Blank Collection Procedure

1. Decontaminate the sample handling utensils and basins/bowls according to the procedures detailed in SOP NHH-G-03 – Equipment Decontamination.
2. Rinse the utensils with de-ionized water (DIW), collect the rinsewater in the decontaminated basin/bowl, and pour it into laboratory-provided containers. Sample volume, container type, preservatives, and storage details are provided in the workplan (AECOM 2017a). QC sample blank containers should be pre-preserved by the laboratory that provides them. Note: equipment blanks may not be appropriate for each parameter. Refer to the workplan (AECOM 2017a) for the parameters for which equipment rinsate blanks will be collected.
3. Label each container with the sample ID (refer to the corresponding workplan (AECOM 2017a) for the identification nomenclature), date and time of collection, and the analytical parameters, cover the label with clear packing tape and fill out the custody form (refer to SOP NHH-G-05 – Sample Custody).
4. Store the samples in a cooler on ice until they are packed for shipment to the corresponding analytical laboratory following SOP NHH-G-06 – Sample Packaging and Shipping.

Standard Operating Procedure Surface Water Sampling

SOP No.: NHH-W-01
Revision: 0
Date: August 2017
Page 2 of 6

1.0 Scope and applicability

- 1.1** This project Standard Operating Procedure (SOP) defines the operating procedures for the collection of bulk and discrete water samples associated with New Haven Harbor Federal navigation project (FNP). This SOP has been developed in accordance with requirements in the United States Army Corps of Engineers New England District (NAE) Statement of Work (SOW) for the project (NAE, 2017). Water samples are collected either using a bottle-type sampler, or with the aid of a peristaltic (or other equivalent) water pump.
- 1.2** Samples will be collected using a pre-cleaned diaphragm pump and CFLEX™ (or equivalent) tubing system at the surface (three feet below the surface), at the mid depth, and near the sediment bottom (three feet above the sediment surface). If needed, a Niskin bottle may be utilized. Samples will be analyzed for chemical, biological and physical analyses. Water will also be collected for creation of elutriate samples at the laboratory per the workplan (AECOM 2017a). Analytes for a particular program are specified in the workplan (AECOM 2017a).
- 1.3** It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the Project QA Manager and the Task Manager and communicated to the client. Deviations from this SOP will be documented in the field records.

2.0 Health and safety considerations

- 2.1** The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the site specific Accident Prevention Plan (APP; AECOM, 2017b). The major health and safety considerations for the work associated WQ data collections are the near and on-water safety aspects of the program.
- 2.2** Daily safety briefs are to be conducted at the start of each working day before any work commences. These daily briefs are to be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1** Cross-contaminations of samples may result if sample handling equipment is inadequately or improperly decontaminated.

Standard Operating Procedure Surface Water Sampling

- 3.2** Contamination of samples may result if samples are exposed to certain environmental conditions. Exposure to potential sources of contamination (e.g., exhaust fumes) will be minimized.
- 3.3** Care must be taken to avoid disturbing the bed sediment during sampling. Re-suspended bed sediments may contaminate/ artificially bias the surface water samples.
- 3.4** Inappropriate sampling equipment, such as that manufactured from non-inert plastics, may contaminate samples. Using Teflon, polymer, or stainless steel sampling equipment will minimize contamination during sample collection activities.

4.0 Equipment and materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, depending on the field conditions encountered:

- Diaphragm or equivalent water pump, variable speed
- 12-volt battery (as needed)
- CFLEX or equivalent polymer tubing (typical configuration requires 1.2 in. OD)
- Niskin or equivalent sampling bottle
- Sample containers as specified in the workplan (AECOM 2017a)
- Connective (serial) cabling
- Weight bearing line/cable
- Field computer (if applicable)
- Project specific field log book
- Chemical-free wipes
- Disinfectant wipes
- Approved plans, including target sampling locations
- Insulated coolers with wet ice
- Field notebook, pen, standardized forms (as needed)
- Chain-of-custody forms and seals
- Replacement batteries
- GPS

Standard Operating Procedure Surface Water Sampling

SOP No.: NHH-W-01
Revision: 0
Date: August 2017
Page 4 of 6

- Safety gear (work vests, APP specified PPE)
- Nitrile gloves
- Gauntlet gloves
- Storage bags
- Boat with all applicable safety equipment (anchor, etc.)
- Dry storage cooler

5.0 Procedures

5.1 Water Pump/Tubing Set-up

Connect the pump to a 6-volt battery or other power source. The water pumps and associated tubing used on this investigation should be rinsed with potable water before and after each (daily) use. Project tubing should be new at the project start, and rinsed thoroughly with deionized water. The tubing should be sealed in a bag when not in use; open tube ends should also be covered and protected when not in use, including between stations. Between-station rinsing is not generally required but flushing the system with site water at each sampling location is to be performed. The number of minutes required to purge the pump and tubing will be calculated as follows:

$$(((\pi r^2 \times l)/10)/f) \times 3 = \text{minutes to purge the pump}$$

Where:

π = pi

r = half the inner diameter of the tubing (centimeters)

l = length of tubing used on station (meters)

f = flow rate of the pump (liters/minute)

5.2 Field Data and Sample Collections

- 5.2.1** Navigate to sampling stations outlined in the project sampling plan using the GPS unit.
- 5.2.2** Estimate and record the depth of the water. Water depth may be recorded using a weighted line with 0.1 ft increments marked.
- 5.2.3** Samples will be collected from mid-depth when overlying water is less than 30 feet. For locations with greater than 30 feet depth, samples will be composite samples from near top, mid-depth and near bottom (3 feet from sediment) samples per the SOW (NAE 2017) and workplan (AECOM 2017a).

Standard Operating Procedure Surface Water Sampling

SOP No.: NHH-W-01
Revision: 0
Date: August 2017
Page 5 of 6

- 5.2.4** In areas that require pumped collections, flush the tubing with water collected at the depth of interest. Given the small (typically ¼ in) tube diameter, flushing will be complete for a 25-foot tube well within 10 seconds with a flow rate of ~5 L/min or better (Section 5.2).

When the purge is complete, wearing nitrile gloves, fill each sample container while avoiding contact between the sampling tube and the bottle.

If collecting from multiple depths, no additional purging is required between depths of the same location.

- 5.2.5** In areas and for parameters that allow grab sampling, the Niskin or equivalent sampler is lowered to the desired depth. The trigger mechanism is activated to close the sampler and the sampler is retrieved to the boat. Water from the sampler may be poured directly in the sample containers. Place the capped container on ice in a cooler.
- 5.2.6** Samples will be placed in coolers and stored on ice (refer to the SAP for containerization and storage specifications) until shipment or transfer to the laboratory.
- 5.2.7** All discrete water samples should be collected and stored/transferred to laboratories according to the procedures described in FGDs for Packaging and Shipping.

6.0 Quality assurance / quality control

It is the responsibility of the Field Team Leader (FTL) to check the calibration information, to spot check instrument operations, and to check the documentation accuracy of all field staff.

Quality control (QC) samples may include equipment blanks, field and laboratory duplicates.

6.1 Equipment blanks

Equipment blanks will be collected at the frequency specified in the SAP, and from each set of sampling gear (e.g., tubing, tubing outfitted with a filter, and bottle sampler with tubing, etc.), after the sampling gear is decontaminated.

Equipment blanks may be collected if required by the SAP for pumped samples by flushing the collection tube with deionized water and filling a set of containers with deionized water that has been pumped through the system.

If required, bottle blanks may be used to evaluate potential contamination associated with the direct grab sampling technique. In this case, bottles may be filled directly with deionized, capped, bagged, and stored on ice for transfer to the laboratory.

Standard Operating Procedure Surface Water Sampling

SOP No.: NHH-W-01
Revision: 0
Date: August 2017
Page 6 of 6

7.0 Data and records management

Calibration records will be recorded in the field log. Field records will be generated and maintained as outlined in the workplan (AECOM 2017a). The workplan addresses all aspects of collection including data and sample types, station locations, and chronology of events.

Deviations to the procedures detailed in the SOP must be recorded in the field logbook and communicated to the Task Manager and the QA Officer at the end of the day.

8.0 Personnel qualifications and training

The individuals executing these procedures must have read, and be familiar with, the requirements of this SOP and the workplan (AECOM 2017a). Water sample collections are relatively simple procedures requiring minimal training. However, initial instrument calibrations and sample/data collections should be supervised by the FTL.

1. New Haven Harbor 2017 Field Summary

The project field effort commenced August 8th 2017 and was completed on August 17th, 2017. The program was divided into three tasks that were scheduled to occur over a two-week period. The first task was the initial collection of sediment cores at twenty-six (26) stations that were grouped into eight (8) separate transects across the project area. Those cores were analyzed for grain size to determine stations, sampling depths and volume to be collected during the second task for biological and toxicological testing. The initial 26 locations also had samples submitted for chemical analyses. The third task involved sediment and water collection at the Central Long Island Sound Disposal Site (CLDS) reference site.

Ocean Surveys Inc. (OSI), provided field services for the collection of core, grab, and water samples at each of the selected stations. Table 1 summarizes the activities accomplished each day during the survey. Detailed Daily Activity Logs are provided in Attachment 1. All harbor coring activities were conducted aboard the vessel R/V CanDu. CLDS reference site samples (sediment/ water), selected harbor water site samples, and sediment volume samples at station NHH-I were collected from the vessel R/V Ready II.

2. Health and Safety

New Haven Harbor sampling activities were completed without incident. Each participant took an active part during the weekly safety briefings as well as daily safety briefings which are documented on the Daily and Weekly Activity Logs (Attachment 1). The Task Order Manager was de-briefed at the end of each day during field activities. Float Plans covering the days boating activities and safety protocols are compiled as Attachment 2.

3. Sediment collection

Sediments were collected using a 3.5-inch diameter vibracore at most harbor stations as outlined in the project Sampling and Analysis Plan (SAP). An initial core was collected at each of the 26 stations for grain size and chemistry. At station NHH-I, with a project depth of just 2.5 feet, approval was obtained from the U.S. Army Corps of Engineers, New England District (CENAE) Technical Manager to use a Van Veen grab sampler to obtain the volume needed to augment sediment collected from the station during the first week of vibracoring.

The sediment collection process was also modified with approval at station NHH-C during the volume collection week. Due to the large volume needed at the station (23 gallons) and the short target core depth (within the uppermost 2.8 feet), two cores were stacked (i.e., core barrel advanced, withdrawn, and advanced again without removing sediment) within a 5-foot core barrel. The approach greatly reduced the time to collect required sediment volume.

3.1 Vessel Positioning

Vessel positioning and the determination of actual core sample locations was accomplished utilizing a Differential Global Positioning System (DGPS). The coring vessel was held on station with a multi-point anchor spread. The local National Oceanic and Atmospheric Administration (NOAA) tide data were obtained from Station 8465705 to calculate tidal height in feet above mean lower low water (MLLW). Table 2 lists the actual coring positions for each coring attempt.

3.2 Core sample handling

All cores targeted/ specified in the project SAP were successfully collected during the ten-day field effort. Figure 1 depicts the proposed sampling stations targeted for this effort. Multiple cores were required at most stations to collect the full project volume. Given the very soft nature of the harbor sediment, target core penetrations generally went beyond the target project depth in an attempt to reach clay rich material that would aid in core retention in the barrel. Excess material retained in the split core barrels was discarded/ returned to the harbor. Excess material included sediment below project depth as well as sediment collected within the project depth that was subsequently determined to not be of interest due to composition and stratigraphy.

Table 2 lists the exact locations occupied for each station collection, along with core penetration and recovery information. As indicated in Table 2, recovery in cores was typically in excess of 80% (with very few exceptions).

After collection, the core was cut into 5.0-foot sections to facilitate handling. The liner of those individual core sections were then split longitudinally, photographed, and described/ logged. New Haven Core Logs are provided in Attachment 3. At many of the stations, two depth intervals were selected for sampling due to changes in stratigraphy (composition and color). All sub-sampling determinations were made by the USACE field representative. At some of the stations where an upper (or top) and lower (or bottom) interval was delineated, the bottom interval was sandy and determined to not be of interest from a chemical/ toxicological standpoint. Samples from many of those sandy bottom intervals were collected for grain-size analysis only.

After logging was complete, the requisite core section (surface to project depth) was transferred to storage containers (polyethylene plastic buckets). Homogenized material from the bucket containers were subsampled for rapid grain-size analysis and chemistry. Excess materials were retained for later compositing with material collected during the second sampling week. At each transect, one to two cores were collected for archeological review by the USACE archeologist. Those archeological cores were cut into individually labeled, 5-foot sections, and stored horizontally in cold storage until delivery at the USACE Fort Devens facility. All samples retained for analysis (grain size, chemistry, archeology, and toxicology) were stored on the sampling vessel in coolers. At the end of each day, samples were off-loaded from the vessel and transferred into a locked refrigerated box truck set to 2.2 °C. Samples for grain size and chemistry were handed off to the laboratory courier.

Based upon grain-size analyses on cores collected during the first week of the program, additional sediment volume was collected from each transect to attain an approximate 25-gallon total volume for toxicological/ biological testing. At the A-B-C transect (located outside the breakwater), only the uppermost 2.8-feet of sediment from station NHH-C were determined to be of interest, requiring a large number of short cores (NHH-A and NHH-B were excluded due to sand). The NHH-C cores were collected by "stacking" two nearby cores together in a single 5-foot core barrel to limit down time between core attempts and processing time on the boat. A total of twenty three (23 cores) were collected from station NHH-C during the 10-day program.

After the requisite sediment volume was collected at each station, the coring gear and sub-sampling gear was decontaminated as outlined in the SAP.

3.3 Grab sample handling

Grab sampling was accomplished as outlined in the SAP using a Van Veen grab sampler and a Ponar grab sampler. Multiple deployments of the Van Veen and Ponar grab samplers were required to obtain the needed 25-gallons of sediment for testing. For each grab, the sample was examined for disturbance, then transferred to a polyethylene bucket. The sediments collected by grab sampler at the reference site were transferred to the refrigerated box truck upon return to the dock.

3.4 Water collections

Water samples from the harbor area (site water) were collected using a pump and tubing system as outlined in the SAP. All three harbor water samples were collected from mid-depth in the water column. The water sample from the reference area (suspended particulate phase [SPP] dilution water) was collected using a large Niskin bottle. Given the site depth at the CLDS reference area, water was collected from three separate depths in the water column (approximately 3-feet below the surface, mid-depth, and approximately 3-feet off the bottom). Table 3 summarizes the volumes collected at each station. Water samples were also transferred to the refrigerated box truck immediately after returning to the dock.

4. Field QA/QC procedures

Equipment blanks were collected from the coring equipment on August 9th during coring activities. Additional equipment blanks were collected from the Niskin bottle, sediment grab samplers, and pump/ tubing system on August 17th.

All equipment blanks were placed in the locked refrigerated box truck after collection and later iced for courier transport.

All samples were held under chain of custody (COC), and signed for during ownership transfer (Attachment 4).

5. SAP deviations/difficulties encountered

There are a few notes of interest relative to the New Having Haven sediment collection effort:

1. Significant changes to bottom topography were encountered relative to the last bathymetric study of the harbor. At all locations, the planned core depth (project depth plus a 2-foot allowable over depth) required adjustment in the field using real time tidal data from NOAA (which occasionally resulted in a core barrel changeover).
2. Archeological cores were moved from two stations. The core proposed for NHH-Z was moved to NHH-X and the core proposed for NHH-A was moved to NHH-C.
3. Due to the large volume of sediment required from a short interval at station NHH-C during the second week of the program, two individual cores were stacked within a single 5-foot core barrel prior to processing. This approach was approved beforehand by the CENAE Technical Manager, Richard B. Loyd. Prior to proceeding with the stacked approach, a single 5-foot core was collected for comparison to the stacked core samples to verify that appropriate materials and recovery were retained within the 20 stacked samples.
4. Similarly, volume collection at NHH-I would have required a large number of cores due to the shallow sample depth. In order to meet schedule constraints, CENAE Technical Manager, Richard B. Loyd, approved collection using a Van Veen grab sampler from the R/V Ready II.

All project logbook entries are included as Attachment 5.

Table 1 New Haven Survey Field Survey Activity Summary

Date	Survey Activities	Equipment	Platform
7 August 17	Mobilization and refrigerated truck pick up	-	-
8 August 17	Sediment coring at stations - NHH-X, Y, Z, M, N, O, T	Vibracore	R/V CanDu
9 August 17	Sediment coring at stations - NHH - P, Q, U, V, W; Archaeological core collected from NHH - P. Rinseate Blank collected for coring equipment.	Vibracore	R/V CanDu
10 August 17	Sediment coring at stations - NHH - R, S, J, L, K, H (field dup), I	Vibracore	R/V CanDu

¹As recorded on OSI log.

²Transect sediment volume after sieving to remove large organic debris (shells, wood, etc.) and rocks. Transect volumes contributed from each selected coring station were generally similar prior to sieving.

** Additional volume was collected from Station I for transect G-H-I composite on 8/17/17 using grab sampler to capture shallow interval samples (<2.5 feet).

WEEKLY SAFETY MEETING

Date Held: 8/8/17
Time: 0730

CONTRACTOR: AECOM Contract No. DACW33- W912WJ-17-D-003
PERSONNEL PRESENT (check): Contractor ☒ Sub. ☒ Government ☒

SUBJECTS DISCUSSED (check items that were discussed during meeting):

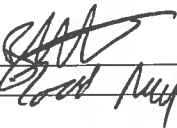

USACE EM385-1-1 ☒ (Specific sections: _____)
On-site Accident Prevention Plan (or Site Safety and Health Plan) ☒
Individual protective equipment (steel-toed boots, safety glasses, etc..) ☒
Prevention of slips/falls ☒
Back injury/safe lifting techniques _____
Fire prevention ☒
First aid ☒
Tripping hazards ☒
Equipment inspection and maintenance ☒
Hoisting equipment, winch and crane safety ☒
Ropes, hooks, chains, and slings ☒
Water safety ☒
Boat safety ☒
HAZMAT, Toxic hazards, contaminated sediments, MSDS, respiratory, ventilation _____
Biological hazards (poison ivy, ticks, wasps, mosquitoes etc) _____
Staging, ladders, concrete forms, safety nets, handrails ☒
Hand tools, power tools, machinery, chain saws ☒
Vehicle operation safety _____
Electrical grounding, temporary wiring, GFCI _____
Lockouts/safe clearance procedures _____
Welding, cutting _____
Excavation hazards/rescue _____
Loose rock/steep slopes _____
Explosives _____
Sanitation and waste disposal ☒
Clean-up, trash ☒

Other safety issues of concern specific to contract that was discussed during meeting:

- WEATHER
- VESSEL TRAFFIC

All persons attending meeting the meeting must sign below or on the back of the form.

Boat Safety Checklist

Keep this page with your boat, ready for inspection. By using this checklist, or one fine-tuned by yourself, you'll be sure that everything is on board and in good working order. Your passengers will appreciate knowing you're concerned about boating safety.

☒ Float plan--let a friend or relative know when you're leaving, where you're going, when you expect to return, what to do if you don't, and a description of your boat

☒ Registration certificate or documentation

☒ Personal Flotation Devices (wearable and throw able)--USCG approved, good condition, readily accessible, assigned and fitted

☒ Fire Extinguishers--right number, size, and class for boat; charged, not corroded, nozzle clear, bracketed, readily accessible

☒ Visual Distress Signals--current dates on flares, proper number, batteries good if lights or EPIRB

☒ Anchors and Line--adequate anchor for bottom, adequate line for water depth

☒ Bilge device --bilge pump operable, alternative bailing device available

☒ Watch or clock--operable

☐ Bright flashlight or searchlight

☒ Navigation lights --tested and operable, spare bulbs

☒ Batteries--fully charged, encased in plastic boxes or terminals covered, securely fastened down

☒ Sound-producing device--horn, whistle appropriate for boat

☐ Alternate propulsion--paddle or oar

☒ First Aid Kit

☒ Tools, spare outboard prop and lock nut

☒ Compass

☒ Sunscreen

Boat Safety Checklist

Keep this page with your boat, ready for inspection. By using this checklist, or one fine-tuned by yourself, you'll be sure that everything is on board and in good working order. Your passengers will appreciate knowing you're concerned about boating safety.

☒ Float plan--let a friend or relative know when you're leaving, where you're going, when you expect to return, what to do if you don't, and a description of your boat

☒ Registration certificate or documentation

☒ Personal Flotation Devices (wearable and throw able)--USCG approved, good condition, readily accessible, assigned and fitted

☒ Fire Extinguishers--right number, size, and class for boat; charged, not corroded, nozzle clear, bracketed, readily accessible

☒ Visual Distress Signals--current dates on flares, proper number, batteries good if lights or EPIRB

☒ Anchors and Line--adequate anchor for bottom, adequate line for water depth

☒ Bilge device --bilge pump operable, alternative bailing device available

☒ Watch or clock--operable

☒ Bright flashlight or searchlight

☒ Navigation lights --tested and operable, spare bulbs

☒ Batteries--fully charged, encased in plastic boxes or terminals covered, securely fastened down

☒ Sound-producing device--horn, whistle appropriate for boat

☒ Alternate propulsion--paddle or oar

☒ First Aid Kit

☒ Tools, spare outboard prop and lock nut

☒ Compass

☒ Sunscreen

☒ Weather Radio

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1727561
Report Date: 12/13/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Report Reissue

This report replaces the report issued on August 9, 2017. The RIM QC Summary Form is included as an addendum.

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1030340-1 Laboratory Duplicate RPD for % Coarse sand (35%), performed on L1727561-08, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1727561
Report Date: 12/13/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

0.16

Grain size distribution curve for Serial No: 12131710:53. The graph plots Percent Finer (0-100) against Grain Size in mm (log scale, 100 to 0.001). The curve shows a material that is 100% finer than 4.75 mm and 72% finer than 0.075 mm.

Grain Size (mm)	Percent Finer (%)
60	100
4.75	100
2.5	98
1.18	95
0.85	90
0.425	83
0.25	78
0.075	72

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	NA
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	NA
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	NA
22. Were the test-specific age requirements met for each test species?	NA
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	NA
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	NA
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	NA

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% Coarse sand (35%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE-NHH FNP

Lab Number: L1727787
Report Date: 08/10/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1030761-1 Laboratory Duplicate RPD for % Coarse sand (172%), % Medium sand (67%), performed on L1727787-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE-NHH FNP
Project Number: 60543021

Lab Number: L1727787
Report Date: 08/10/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Published Date: 1/16/2017 11:00:05 AM

Title: **Certificate/Approval Program Summary**

Page 1 of 1

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility**EPA 624:** m/p-xylene, o-xylene**EPA 8260C:** NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.**EPA 8270D:** NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.**EPA 300:** DW: Bromide**EPA 6860:** NPW and SCM: Perchlorate**EPA 9010:** NPW and SCM: Amenable Cyanide Distillation**EPA 9012B:** NPW: Total Cyanide**EPA 9050A:** NPW: Specific Conductance**SM3500:** NPW: Ferrous Iron**SM4500:** NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.**SM5310C:** DW: Dissolved Organic Carbon**Mansfield Facility****SM 2540D:** TSS**EPA 3005A** NPW**EPA 8082A:** NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:**Drinking Water****EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B****EPA 332:** Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.****Non-Potable Water****SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.****EPA 624:** Volatile Halocarbons & Aromatics,**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.****Mansfield Facility:****Drinking Water****EPA 200.7:** Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1 Hg.****Non-Potable Water****EPA 200.7:** Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.**EPA 200.8:** Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.**EPA 245.1 Hg.****SM2340B**

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Y:\L17\L1727787\L1727787.doc

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package

Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% coarse sand (172%), % medium sand (67%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728048
Report Date: 08/11/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Lab Number: L1728048
Report Date: 08/11/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1031205-1 Laboratory Duplicate RPD for % Coarse sand (129%), % Medium sand (137%), % Fine sand (64%), performed on L1728048-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728048
Report Date: 08/11/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

ASTM D6913/D7928

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% coarse sand (129%), % medium sand (137%), % fine sand (64%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: USACE-NHH-FNP
Project Number: 60543021

Lab Number: L1728229
Report Date: 08/14/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE-NHH-FNP
Project Number: 60543021

Lab Number: L1728229
Report Date: 08/14/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1031751-1 Laboratory Duplicate RPD for % Fine gravel (53%), performed on L1728229-05, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE-NHH-FNP
Project Number: 60543021

Lab Number: L1728229
Report Date: 08/14/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility**EPA 624:** m/p-xylene, o-xylene**EPA 8260C:** NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.**EPA 8270D:** NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.**EPA 300:** DW: Bromide**EPA 6860:** NPW and SCM: Perchlorate**EPA 9010:** NPW and SCM: Amenable Cyanide Distillation**EPA 9012B:** NPW: Total Cyanide**EPA 9050A:** NPW: Specific Conductance**SM3500:** NPW: Ferrous Iron**SM4500:** NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.**SM5310C:** DW: Dissolved Organic Carbon**Mansfield Facility****SM 2540D:** TSS**EPA 3005A** NPW**EPA 8082A:** NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.**Biological Tissue Matrix:** EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:**Drinking Water****EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B****EPA 332:** Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.****Non-Potable Water****SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.****EPA 624:** Volatile Halocarbons & Aromatics,**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.****Mansfield Facility:****Drinking Water****EPA 200.7:** Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1 Hg.****Non-Potable Water****EPA 200.7:** Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.**EPA 200.8:** Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.**EPA 245.1 Hg.****SM2340B**

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% fine gravel (53%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728340
Report Date: 08/15/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1032082-1 Laboratory Duplicate RPD for % Total Gravel (133%), performed on L1728340-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728340
Report Date: 08/15/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% gravel (133%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728340
Report Date: 08/15/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1032082-1 Laboratory Duplicate RPD for % Total Gravel (133%), performed on L1728340-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728340
Report Date: 08/15/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility**EPA 624:** m/p-xylene, o-xylene**EPA 8260C:** NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.**EPA 8270D:** NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.**EPA 300:** DW: Bromide**EPA 6860:** NPW and SCM: Perchlorate**EPA 9010:** NPW and SCM: Amenable Cyanide Distillation**EPA 9012B:** NPW: Total Cyanide**EPA 9050A:** NPW: Specific Conductance**SM3500:** NPW: Ferrous Iron**SM4500:** NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.**SM5310C:** DW: Dissolved Organic Carbon**Mansfield Facility****SM 2540D:** TSS**EPA 3005A** NPW**EPA 8082A:** NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.**Biological Tissue Matrix:** EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:**Drinking Water****EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B****EPA 332:** Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.****Non-Potable Water****SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.****EPA 624:** Volatile Halocarbons & Aromatics,**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.****Mansfield Facility:****Drinking Water****EPA 200.7:** Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1 Hg.****Non-Potable Water****EPA 200.7:** Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.**EPA 200.8:** Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.**EPA 245.1 Hg.****SM2340B**

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% gravel (133%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Lab Number: L1731354
Report Date: 09/28/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Number: 60543021

Lab Number: L1731354
Report Date: 09/28/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1046269-1 Laboratory Duplicate RPD for % Clay fine (156%), performed on L1731354-08, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1731354
Report Date: 09/28/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1731354
Report Date: 09/28/17

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

ASTM D6913/D7928

Title: **Certificate/Approval Program Summary**

Page 1 of 1

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility**EPA 624:** m/p-xylene, o-xylene**EPA 8260C:** NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.**EPA 8270D:** NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.**EPA 300:** DW: Bromide**EPA 6860:** NPW and SCM: Perchlorate**EPA 9010:** NPW and SCM: Amenable Cyanide Distillation**EPA 9012B:** NPW: Total Cyanide**EPA 9050A:** NPW: Specific Conductance**SM3500:** NPW: Ferrous Iron**SM4500:** NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.**SM5310C:** DW: Dissolved Organic Carbon**Mansfield Facility****SM 2540D:** TSS**EPA 3005A** NPW**EPA 8082A:** NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.**Biological Tissue Matrix:** EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:**Drinking Water****EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B****EPA 332:** Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.****Non-Potable Water****SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.****EPA 624:** Volatile Halocarbons & Aromatics,**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.****Mansfield Facility:****Drinking Water****EPA 200.7:** Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1 Hg.****Non-Potable Water****EPA 200.7:** Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.**EPA 200.8:** Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.**EPA 245.1 Hg.****SM2340B**

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	N/A
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	N/A
15. Were the SRM/CRM analyses within acceptance criteria?	N/A
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	N/A
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	N/A
19. Were surrogate recoveries within the required acceptance criteria?	N/A

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	% Clay fine (156%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1731355
Report Date: 10/05/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Lab Number: L1731355
Report Date: 10/05/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Grain Size

The WG1040348-1 Laboratory Duplicate RPD for % Fine gravel (93%), % Total gravel (93%) and % Coarse sand (54%), performed on L1731355-16, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1046682-2 Laboratory Duplicate RPD for % Coarse sand (36%) and % Clay fine (140%), performed on L1731355-23, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1731355
Report Date: 10/05/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

GRAIN SIZE DISTRIBUTION TEST DATA

10/3/2017

Location: NHH-E-BOTTOM

Sample Number: L1731355-25

Sieve Test Data

Post #200 Wash Test Weights (grams): Dry Sample and Tare = 23.90
 Tare Wt. = 0.00
 Minus #200 from wash = 0.0%

Dry Sample and Tare (grams)	Tare (grams)	Sieve Opening Size	Weight Retained (grams)	Sieve Weight (grams)	Percent Finer
23.90	0.00	0.75	0.00	0.00	100.0
		#4	0.00	0.00	100.0
		#10	0.14	0.00	99.4
		#40	2.57	0.00	88.7
		#200	1.48	0.00	82.5

Hydrometer Test Data

Hydrometer test uses material passing #200
 Percent passing #200 based upon complete sample = 82.5
 Weight of hydrometer sample = 23.35
 Automatic temperature correction
 Composite correction (fluid density and meniscus height) at 20 deg. C = 0
 Meniscus correction only = 0.0
 Specific gravity of solids = 2.65
 Hydrometer type = 151H
 Hydrometer effective depth equation: $L = 16.294964 - 0.2645 \times R_m$

Elapsed Time (min.)	Temp. (deg. C.)	Actual Reading	Corrected Reading	K	Rm	Eff. Depth	Diameter (mm.)	Percent Finer

Facility: **Company-wide**

Revision 10

Department: **Quality Assurance**

Published Date: 1/16/2017 11:00:05 AM

Title: **Certificate/Approval Program Summary**

Page 1 of 1

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility**EPA 624:** m/p-xylene, o-xylene**EPA 8260C:** NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.**EPA 8270D:** NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.**EPA 300:** DW: Bromide**EPA 6860:** NPW and SCM: Perchlorate**EPA 9010:** NPW and SCM: Amenable Cyanide Distillation**EPA 9012B:** NPW: Total Cyanide**EPA 9050A:** NPW: Specific Conductance**SM3500:** NPW: Ferrous Iron**SM4500:** NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.**SM5310C:** DW: Dissolved Organic Carbon**Mansfield Facility****SM 2540D:** TSS**EPA 3005A** NPW**EPA 8082A:** NPW: PCB: 1, 5, 31, 87, 101, 110, 141, 151, 153, 180, 183, 187.**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.**Biological Tissue Matrix:** EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:**Drinking Water****EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B****EPA 332:** Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.****Non-Potable Water****SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.****EPA 624:** Volatile Halocarbons & Aromatics,**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9221E.****Mansfield Facility:****Drinking Water****EPA 200.7:** Ba, Be, Cd, Cr, Cu, Ni, Na, Ca. **EPA 200.8:** Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Ni, Se, TL. **EPA 245.1 Hg.****Non-Potable Water****EPA 200.7:** Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.**EPA 200.8:** Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.**EPA 245.1 Hg.****SM2340B**

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	N/A
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	N/A
15. Were the SRM/CRM analyses within acceptance criteria?	N/A
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	N/A
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	N/A
19. Were surrogate recoveries within the required acceptance criteria?	N/A

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check			Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	No	WG1046682-1 % coarse sand (36%) and % clay fine (140%), WG1040348-1 % fine gravel (93%), gravel (93%) and % coarse sand (54%)	In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	N/A		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Lab Number: L1727562
Report Date: 08/29/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Lab Number: L1727562
Report Date: 08/29/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Semivolatile Organics

L1727562-01 and -02: The sample was re-analyzed on dilution in order to quantify the results within the calibration range. The result(s) should be considered estimated, and are qualified with an E flag, for any compound(s) that exceeded the calibration range in the initial analysis. The re-analysis was performed only for the compound(s) that exceeded the calibration range.

The WG1031095-5 Laboratory Duplicate RPDs for cl4-bz#52 (44%) and cl7-bz#170 (34%), performed on L1727562-07, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.

Pesticides

The WG1031089-4 SRM recovery for trans-Nonachlor (220%) and the surrogate BZ 198 column B (159%), are above the acceptance criteria.

Total Metals

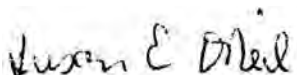

The WG1034116-5 Laboratory Duplicate RPDs for cadmium (25%), chromium (36%), copper (25%), lead (21%), nickel (25%) and zinc (24%), performed on L1727562-07, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.

Total Organic Carbon

The WG1036551-5 MS recovery for total organic carbon (rep1) (60%) performed on L1727562-07, is outside the 75-125% acceptance criteria, possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1727562
Report Date: 08/29/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Alpha Analytical, Inc.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No – see case narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see case narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – see case narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – see case narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV opening for all samples: Column II: hexachlorobenzene @30%, gamma-BHC @ 16%, delta-BHC @ 20%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	Trans-Nonachlor @ 220%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	SRM: BZ198 @ 159%	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	L1727562-07D: C14-BZ#52 @ 44%, C17-BZ#170 @ 34%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery			Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	N/A		In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	YES		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	YES		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

**CT DEP Reasonable Confidence Protocols
Laboratory Analysis
QA/QC Certification Form**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed (including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the CT DEP method-specific Reasonable Confidence Protocol documents)?	YES
1a	Were the method specified preservation and holding time requirements met?	YES
1b	VPH & EPH Methods Only: Was the VPH or EPH Method conducted without significant modifications (see Section 11.3 of respective Methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature (<6°C)?	YES
4	Were all QA/QC performance criteria specified in the CT DEP Reasonable Confidence Protocol documents achieved?	NO
5a	Were reporting limits specified or referenced on the chain-of-custody?	NO
5b	Were these reporting limits met?	N/A
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the Reasonable Confidence Protocol documents?	YES
7	Are project-specific matrix spikes and laboratory duplicates included in this data set?	NO

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1A or question B is "No", the data package does not meet the requirements for "Reasonable Confidence".

Project Name: USACE-NHH FNP
Project Number: 60543021

Lab Number: L1727788
Report Date: 09/01/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE-NHH FNP
Project Number: 60543021

Lab Number: L1727788
Report Date: 09/01/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

RCP Related Narratives

Pesticides

In reference to question 4:

L1727788-10: The surrogate recovery is outside the individual acceptance criteria for BZ 198 (156%), but within the overall method allowances.

The WG1031089-4 SRM recovery for trans-Nonachlor (220%) and the surrogate BZ 198 column B (159%), are above the acceptance criteria.

WG1032133-3: The surrogate recovery is outside the individual acceptance criteria for BZ 198 (163%), but within the overall method allowances.

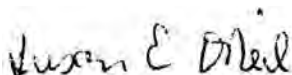

Total Organic Carbon

In reference to question 4:

The WG1037558-4 MS recovery for total organic carbon (rep2) (68%) performed on L1727788-03, is outside the 75-125% acceptance criteria, possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE-NHH FNP
Project Number: 60543021

Lab Number: L1727788
Report Date: 09/01/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	Yes
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No - see case narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see case narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	Yes
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – see case narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV opening for all samples: Column II: hexachlorobenzene @30%, gamma-BHC @ 16%, delta-BHC @ 20%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	Trans-Nonachlor @ 220%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	SRM: BZ198 @ 159%	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	L1727562-07D: C14-BZ#52 @ 44%, C17-BZ#170 @ 34%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly			Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	yes		In Data Package
Method Blank	No target analytes > RL	yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	no	cadmium (25%), chromium (36%), copper (25%), lead	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	YES		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	YES		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728049
Report Date: 09/08/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728049
Report Date: 09/08/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Semivolatile Organics

The WG1033334-4 SRM recoveries, associated with L1728049-01, -02, -03, -04, -06, -07, -08, -09, -10 and -16, are outside the acceptance criteria for Cl3-BZ#28 (39%).

The WG1033339-4 SRM recovery is outside the acceptance criteria for Cl10-BZ#209 (232%).

The WG1033334-6/-7 MS/MSD recoveries, performed on L1728049-16, are outside the acceptance criteria for Naphthalene (47%/47%), Acenaphthylene (48%/48%), Acenaphthene (46%/46%), Fluorene (48%/49%) and Phenanthrene (46%/48%).

The WG1037293-6 MS recovery performed on L1728049-05, is outside the acceptance criteria for one compound; however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially high bias for Benz(a)anthracene (121%).

The WG1033339-7 MSD recovery, performed on L1728049-22, is outside the acceptance criteria for two compounds; however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially low bias for Fluoranthene (41%) and Pyrene (49%).

The WG1037293-5 Laboratory Duplicate RPD for Acenaphthylene (35%), performed on L1728049-05, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1033339-5 Laboratory Duplicate RPD for Acenaphthylene (32%), Cl5-BZ#101 (35%) and Cl7-BZ#187 (32%), performed on L1728049-22, is outside the acceptance criteria. The elevated RPD has been

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728049
Report Date: 09/08/17

Case Narrative (continued)

attributed to the non-homogeneous nature of the native sample.

Pesticides

L1728049-05 was frozen upon receipt to arrest sample holding time.

The WG1033330-4 SRM recovery for trans-Nonachlor (476%) and the surrogate BZ198 column B (205%), are above the acceptance criteria.

The WG1033336-4 SRM recovery for trans-Nonachlor (290%) and the surrogate BZ198 column B (179%), are above the acceptance criteria.

The WG1037294-4 SRM recovery for trans-Nonachlor (320%) and the surrogate BZ198 column B (179%), are above the acceptance criteria.

All recoveries and percent differences (%RPD) for LCS WG1033336-2 and LCSD WG1033336-3 are within SOP criteria (40-140% recovery and 50%RPD); therefore no further action was taken.

The WG1033336-5 MS recovery for Hexachlorobenzene (48%), performed on L1728049-22, is outside the acceptance criteria; however, the associated LCS/LCSD are within the overall method allowances.

Total Metals

The WG1032246-7 MS recovery, performed on L1728049-22, is outside the acceptance criteria for Chromium (201%). A post digestion spike was performed and was within acceptance criteria.

The WG1032246-7 MS recoveries, performed on L1728049-22, are outside the acceptance criteria for Zinc (129%). A post digestion spike was performed and yielded an unacceptable recovery for Zinc (129%). This has been attributed to sample matrix.

Project Number: 60543021

Lab Number: L1728049
Report Date: 09/08/17

Case Narrative (continued)

The WG1032246-7 MS recovery for Copper (239%), performed on L1728049-22, does not apply because the sample concentration is greater than four times the spike amount added.

The WG1032246-7/-8 MS/MSD RPDs for Chromium (22%) and Copper (27%), performed on L1728049-22, are above the acceptance criteria.

The WG1034140-5 Laboratory Duplicate RPD for Mercury (29%), performed on L1728049-22, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Total Organic Carbon

L1728049-16: The Sample Replicate RPD is outside the acceptance criteria of 30%. A double-burn re-analysis was performed with confirming results. The results of the original analysis are reported. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1036606-1 Method Blank, associated with L1728049-03 through -22, has a concentration above the reporting limit. Since the associated sample concentrations are greater than 10x the blank concentration for this analyte, no corrective action is required.

The WG1036606-3 Laboratory Duplicate RPD for (Rep1 - 27%), performed on L1728049-16, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1036606-4/-5 MS/MSD recoveries (Rep1 - 32%/65%) and (Rep2 - 71% - MSD only), performed on L1728049-16, are outside the 75-125% acceptance criteria, possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted. In addition, the RPDs (Rep1 - 32%) and (Rep2 - 32%), performed on L1728049-16, are outside the acceptance criteria of 30%. The elevated RPD has been attributed to the non-homogeneous nature of the

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728049
Report Date: 09/08/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No – see Narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see Narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – See Narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	No	16MS/MSD: Naphthalene 47%/47%, Acenaphthalene 48%/48%, Acenaphthene (46%/46%, Fluorene 48%/49%, Phenanthrene 46%/48% 05MS: Benz(a)anthracene 121% 22MSD: Fluoranthene 41%, Pyrene 49%	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	05D: Acenaphthylene 35% 22D: Acenaphthylene 32%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)

Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes= average No = individual	Opening CCV for Blank/LCS/LCSD: Column B: hexachlorobenzene @ 30%, Opening CCV for 8049-11-14, 15, 17-22: Column B: hexachlorobenzene @ 18%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	SRM1: trans-Nonachlor @476% SRM2: trans-Nonachlor @290% SRM3: trans-Nonachlor @ 320%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	No	22MS: Hexachlorobenzene @ 48%	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	SRM1: BZ198 205% column B SRM2: BZ198 179% column B SRM3: BZ198 179% column B	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	SRM: C13-BZ#28: 39% SRM2: C110-BZ#209: 232%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	22D: C15-BZ#101: 35%, C17-BZ#187: 32%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	No	Annual	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	No	22MS: Chromium (201%); Zinc (129%); Copper (239%) RPDs: Chromium (22%) and Copper (27%)	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	No	-16: TOC (Rep1) (27%)	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE/NHH FNP

Lab Number: L1728343
Report Date: 09/08/17

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Semivolatile Organics

The WG1036086-4 Laboratory Duplicate RPD for, CI4-BZ#49 (33%), performed on L1728343-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

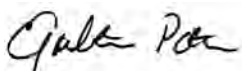

The WG1036086-5/-6 MS/MSD recoveries, performed on L1728343-01, are outside the acceptance criteria for two compounds; however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially high bias for Benzo(b)fluoranthene (121%-MS only) and Fluoranthene (123%-MSD only)

Pesticides

The WG1036085-7 SRM recovery for trans-Nonachlor (367%) and the surrogate BZ198 column B (223%), are above the acceptable criteria.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728343
Report Date: 09/08/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728343
Report Date: 09/08/17

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Alpha Analytical, Inc.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No – see Narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see Narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See Narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – See Narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	No	01MS: Benzo(b)fluoranthene @ 121% 01MSD: Fluoranthene @ 123%	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	Trans-Nonachlor @ 367%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	SRM = BZ198 – 223% column B	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	No	Annually	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	No	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)	Yes		In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Lab Number: L1728961
Report Date: 11/06/17

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: USACE-NHH FNP

Lab Number: L1728961
Report Date: 11/06/17

Case Narrative (continued)

Report Submission

This report replaces the report issued on September 8, 2017. The RIM QC Summary Forms are attached as an addendum.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Pesticides

L1728961-01: The surrogate recovery is outside the individual acceptance criteria for BZ198 (174%), but within the overall method allowances.

WG1034932-3 (LCSD): The surrogate recovery is outside the individual acceptance criteria for BZ198 (193%), but within the overall method allowances.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE-NHH FNP
Project Number: 60543021

Lab Number: L1728961
Report Date: 11/06/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	NA
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – See Narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	L1728961-01- BZ198 column A = 174%	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A	Annually	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Case Narrative (continued)

Report Submission

This report replaces the report issued on September 8, 2017. The RIM QC Summary Forms are attached as an addendum.

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Pesticides

WG1034932-3 (LCSD): The surrogate recovery is outside the individual acceptance criteria for BZ198 (193%), but within the overall method allowances.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: USACE/NHH FNP
Project Number: 60543021

Lab Number: L1728962
Report Date: 11/06/17

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Alpha Analytical, Inc.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	N/A
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	N/A
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	N/A
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – See Narrative (LCSD)

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	N/A		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	N/A		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A	Annually	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes	Results >3x IDL noted, on file at lab	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	 < 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	 < 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

LABORATORY STANDARDS STATEMENT

This study was performed by EnviroSystems, Incorporated at its facility in Hampton, New Hampshire. EnviroSystems' laboratory is accredited by the State of New Hampshire under the National Environmental Laboratory Accreditation (NELAC) program. Additionally, ESI is accredited under the Department of Defense (DoD) ELAP program, ISO/IEC 17025:2005, Certificate Number L2340. All testing conducted by EnviroSystems as part of this program was compliant with NELAC guidelines and standards. Additionally, this study was conducted in accordance with guidelines presented in the 2004 version of the New England District's Regional Implementation Manual (RIM) for Evaluation of Dredged Material Proposed for Disposal In New England Waters. Any deviations from specific elements of the RIM are detailed in the Protocol Deviation Section of this Report.

CHEMICAL ANALYSIS OF A MARINE SEDIMENT - ELUTRIATE SOLUTION:

New Haven Harbor Federal Navigation Project Tier III Sediment Evaluation New Haven Harbor, New Haven Connecticut

1.0 SAMPLE COLLECTION, PRESERVATION AND STORAGE

Sediment samples for chemical and physical analysis were provided by AECOM from locations specified within the project work plan. Samples were received under chain of custody in sample containers appropriate for the specified analysis. Upon arrival at the laboratory, all samples received an internal sample control number and were logged into the project sample control system. Samples were placed in a secure sample holding location and stored at a temperature of $4\pm2^{\circ}\text{C}$ until analysis.

2.0 ANALYSIS

Sample analysis was carried out following methods and protocol specified in the project Sample Analysis Plan by EnviroSystems, Inc. at its Hampton, NH facility. Review of the data report document showed that all sample holding times were met, unless otherwise qualified, that the analytical methods used in the analysis were appropriate for the parameter and sample matrix and met New England District Regional Implementation Manual requirements. Review of supporting quality assurance data documented that, except where qualified, all data collected meet all of the requirements of NELAC, for all NELAC accredited parameters.

3.0 RESULTS

The analysis of elutriate samples were performed following analytical methods as recommended in Table 5 of the New England District RIM document with appropriate updates related to current methods. Trace metals were evaluated using EPA Method 200.9, Inductively Coupled Plasma - Mass Spectrometry (ICP-MS), mercury was evaluated using EPA Method 245.7, Cold Vapor Atomic Fluorescence Spectrometry. Hexavalent Chromium was analyzed using SM 3500 Cr-D. Pentachlorophenol was analyzed by EPA Method 8270C. PCB Congeners were analyzed by EPA Method 8270C - SIM. Pesticides were analyzed by EPA Method 8081B. In cases where dilution of the sample extract was required the final reporting limit remained above the RIM document specified limits and did not result in artificial "Non Detects."

A review of QC data documented one incidence where the %RPD in a matrix spike duplicate was above the limit. There were four incidences of low surrogate recoveries.

A full copy of the analytical report is included in the following data appendix
