1. Introduction

The New England District (NAE) of the US Army Corps of Engineers (USACE) is currently preparing a suitability determination to assess disposal options for materials which may be generated during improvement dredging activities proposed at the New Haven Harbor Federal Navigation Project (FNP) located in New Haven, Connecticut. This report summarizes efforts performed by the AECOM Team (comprised of AECOM Technical Services, Inc., Ocean Surveys Inc. [OSI], EnviroSystems, Inc. [ESI], and Alpha Analytical, Inc. [Alpha]) under Delivery Order # W912WJ-18-F-0109 of USACE Contract W912WJ-17-D-0003.

The AECOM Team work scope included provision of logistical support to NAE and laboratory analysis for the generation of pertinent environmental data. Data generated under this task order will be used by NAE to assess the suitability of materials to be dredged from the New Haven Harbor FNP (depicted in Figure 1) for potential beneficial reuse, for unconfined open water disposal at the Central Long Island Sound Disposal Site (CLDS) and/or for disposal in proposed Confined Aqueous Disposal Cells (CAD Cells) located within the harbor. The CLDS and the corresponding reference locations are depicted in Figure 2.

This report summarizes the methodology used for field sampling and laboratory analysis, the results of the testing and the quality assurance/quality control (QA/QC) details regarding the analyses.

1.1 Project Background

USACE NAE is currently preparing a feasibility study for improvements to the New Haven Harbor FNP. Anticipated project components include: deepening and widening the main ship channel, widening the channel bend at Southwest Ledge, straightening the channel bend downstream of the existing turning basin; and relocating and deepening the turning basin. These combined actions would require the mechanical removal of up to 4,500,000 cubic yards of sediment and up to 32,000 cubic yards of rock depending on the selected channel alignment and dimensions. Dredged sediments are expected to be a mix of poorly graded sand and fine grained material within the existing channel profile and adjacent harbor seafloor with glaciofluvial deposits at depth. To the extent practical, suitable dredged material will be beneficially reused for marsh creation, habitat restoration, and/or as cover of historic dredged material disposal mounds at the CLDS. Unsuitable material will be placed in a CAD cell to be located in the inner harbor.

NAE completed a sampling and testing effort during the summer of 2017 in order to characterize the materials to be dredged. NAE later revised the alignment of the proposed channel and turning basin based on the results of ship simulation modeling. In addition, a portion of the material from the inner harbor was determined to be unsuitable for unconfined open water placement, based on the results of suspended particulate phase and whole sediment bioassays. In July 2018, NAE coordinated a supplemental sampling and analysis plan (SAP) to characterize sediment from reaches of the redesigned project that were not previously sampled, to characterize the material that would be dredged during CAD cell construction, and to further define the extent of unsuitable material in the inner harbor.

The supplemental work described in this report was performed in late 2018/early 2019, and included field sampling efforts, evaluation of sediment chemistry, preparation and chemical evaluation of representative elutriates, suspended particulate phase (SPP) toxicity testing, 10-day whole sediment toxicity testing and 28-day bioaccumulation testing with associated tissue analysis on applicable harbor material (i.e. sediments and water) from thirteen FNP locations identified in NAE's Performance Work Statement (PWS) entitled "*Supplemental Sampling and Testing in Support of the New Haven Harbor Navigation Improvement Project New Haven, Connecticut*" dated 25 July 2018. The PWS scope was subsequently issued to AECOM on 21 August 2018 and was further revised by NAE on 11 October, 2018.

In order to further characterize materials to be generated under the proposed FNP improvement dredging project, sediments from thirteen core locations within the New Haven Harbor were collected by NAE in October 2018 to undergo sediment, water and elutriate chemical analysis, and biological testing in accordance with the evaluation requirements set forth in the EPA/ NAE regional protocol "*Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters*" (RIM: U.S. Environmental Protection Agency [EPA]/USACE, 2004). To support these evaluations, NAE collected related site waters in October 2018 and supplemental site waters in November 2018 (to support ammonia-reduced SPP toxicity testing). CLDS Reference Site sediment and waters were collected by AECOM in October 2018.

AECOM

Sediment, water, elutriate and tissue samples were analysed for individual metals, Polycyclic Aromatic Hydrocarbons (PAHs), Polychlorinated Biphenyls (PCBs), and pesticides in accordance with reporting limits set forth in the RIM in order to determine the suitability of this material for unconfined open water disposal.

A Work Plan (AECOM, 2018a; included as Appendix A) was prepared by AECOM to guide the field sampling and sample handling efforts, as well as the laboratory analyses for samples collected by both NAE and AECOM (NAE's field sampling efforts were completed under the NAE-generated SAP). Field sampling efforts and laboratory analyses described herein were generally completed in accordance with this project Work Plan. Deviations from the Work Plan are described herein. The Work Plan was prepared in accordance with relevant regulations and standards, as described in Section 1.2, below, and in accordance with project-specific requirements identified by NAE in its "Supplemental Sampling and Testing in Support of the New Haven Harbor Navigation Improvement Project New Haven, Connecticut" PWS.

1.2 Relevant Regulations/Standards

Data for the dredged material suitability evaluations under the Marine Protection, Research, and Sanctuaries Act (MPRSA) and the Clean Water Act (CWA) have been collected based on quality standards outlined in *QA/QC Guidance for Sampling and Analysis of Sediments, Water and Tissues for Dredged Material Evaluations* (EPA, 1995). The evaluations have followed guidance provided in the Green Book (EPA/USACE, 1991), the *Inland Testing Manual* (EPA/USACE, 1998), and the RIM (EPA/USACE, 2004).

2. Methods

Field and laboratory methods are detailed in the project Work Plan (AECOM, 2018a; included as Appendix A), which is comprised of a Field Sampling Plan (FSP) and a Quality Assurance Project Plan (QAPP). Brief summaries of the field and laboratory methods used are included in the following subsections.

The Supplemental New Haven Harbor field work described herein was completed by both USACE NAE personnel and individuals on the AECOM and OSI Field Team (collectively the AECOM Field Team). NAE personnel performed sediment and water sampling efforts within the New Haven Harbor FNP. Field activities undertaken by the AECOM Field Team included collection and transport of sediment and water samples from the CLDS Reference Site, as well as receipt and delivery of NAE-collected sediment and water samples obtained from the New Haven Harbor FNP.

Tasks described in Section 2.1, below, as well as in the accompanying Field Report (AECOM, 2018b; included as Appendix B) focus primarily on activities undertaken by the AECOM Field Team. Sampling techniques employed by NAE personnel, relative to sediment and water collection activities on New Haven Harbor, are addressed under separate cover.

2.1 Field Sampling

Sample locations were established by NAE and are distributed throughout the proposed New Haven Harbor FNP project area, as depicted in Figure. The 2018 sampling locations were chosen to augment data collected in the harbor in 2017 and to reflect the revised, anticipated FNP alignment and CAD cell layout. In addition, the CLDS Reference Site sampling location was selected by NAE. The bulk of the project field sampling efforts occurred in October 2018; specifically, sampling commenced on October 22 and was completed on October 26, 2018. To ensure that the waters used in the program's Optional Task 7.1 ammonia-reduced SPP assays remained within hold times, a discrete sampling event was completed by NAE on November, 14, 2018 for the collection of additional dredge site waters from the New Haven Harbor FNP.

The AECOM Field Team program was divided into five subtasks:

- The AECOM Field Team's collection of sediment and water samples at the CLDS Reference Site on October 23, 2018;
- AECOM's receipt of New Haven Harbor sediment and water samples which were collected by NAE (samples collected by NAE on October 22 through 25, 2018) and received by AECOM on October 23 through 25, 2018;
- AECOM's delivery of samples to the project toxicology laboratory (ESI) on October 24, 2018 and two additional deliveries to ESI on October 25, 2018; and,

AECOM

- AECOM's delivery of samples directly to the project chemistry laboratory (Alpha) or to the Alpha courier on October 24 and 25, 2018.
- AECOM arranged for ESI to provide courier service directly to NAE on November 14, 2018 for receipt of the additional New Haven Harbor dredge site waters.

Appropriate volumes of dredge area sediment and water were collected by NAE at each of the thirteen harbor stations for the elutriate and biological testing activities described in the sections below. These samples were subsequently composited by the laboratory into the six project composite samples, as described in the project PWS Table 1.

The AECOM Field Team collected sediment and water samples from the CLDS Reference Site (Figure 2), located at latitude 41.134850 and longitude -72.834690 to further facilitate the evaluation of the dredge area material for potential unconfined open water placement.

CLDS Reference Site samples (sediment/water) were collected by the AECOM Field Team from OSI's sampling platform, the survey vessel *R/V Willing II*. Vessel positioning and the determination of actual sample locations were accomplished utilizing a Differential Global Positioning System (DGPS). The sampling vessel was held on station at the CLDS Reference Site by the vessel captain utilizing real-time navigation software (i.e. Hypack). Attachment 4 of the Field Report (AECOM, 2018b; Appendix B) lists the grab sample positions for each attempt.

The Field Report (AECOM, 2018b) provided in Appendix B provides additional detail regarding field activities, including CLDS Reference Site field observations such as penetration depth, material recovery, visual descriptions and other pertinent observations.

2.1.1 Sediment Collection

Sediments from the New Haven Harbor FNP were collected by NAE using vibracore methodology. These sediment samples were containerized by NAE and transferred to AECOM under chain of custody (COC) at the conclusion of NAE sampling efforts.

CLDS Reference Site sediments were collected by the AECOM Field Team using a modified Van Veen grab sampler as outlined in the project Work Plan. Prior to use, the sediment sample field collection equipment was decontaminated in accordance with the project Work Plan. In addition, equipment blanks were collected on the sediment sampling field collection equipment, in accordance with the project Work Plan.

The New Haven Harbor FNP sediment samples and the CLDS Reference Site sediment samples were transferred to a temperature-controlled refrigerated van unit immediately upon return to the dock and were held at temperature and in accordance with the project Work Plan until delivery to ESI.

2.1.2 Water Collection

Water from the vicinity of the six New Haven Harbor sediment composite locations (dredge site water) was collected by NAE personnel on October 24, 2018 using a pump and tubing system. NAE collected additional New Haven Harbor FNP dredge site waters on November, 14, 2018 in support of the Optional Task 7.1 (ammonia-reduced SPP assays).

Waters from the CLDS Reference Site were collected by the AECOM Field Team on October 23, 2018 using a large volume Niskin bottle as outlined in the Work Plan. Prior to use, the water collection equipment was decontaminated in accordance with the project Work Plan. In addition, Equipment blanks were collected on the water collection equipment, in accordance with the project Work Plan.

Water samples were transferred to the refrigerated van immediately after returning to the dock and held at temperature in accordance with the project Work Plan until delivery to ESI.

2.1.3 Sampling Deviations/Difficulties Encountered

There are two notes of interest relative to the New Haven Harbor / CLDS field sample collection effort:

- During the CLDS Reference Site field sampling operations, sea conditions picked up with larger wave action than was forecast for the day (i.e. approximately 4 foot seas, intermittently). During the water sample collection efforts, the captain and AECOM Field Team determined that it was unsafe and unadvisable to attempt to fill the laboratory glassware with CLDS waters while offshore, due to the wave action. All of the equipment blanks and large volume cube containers had been filled with reference site waters when this decision was made. The CLDS Reference Site laboratory waters, which were collected while at sea, were temporarily containerized in spare large volume cube containers and subsequently transported back to the dock for final containerization into the laboratory-provided glassware. No project work plan deviations were incurred as a result of this change, which was made for Health and Safety reasons. No associated project implications are anticipated.
- The Project Work Plan indicates that *“Samples will be chilled on wet ice while on board the vessel and subsequently transferred to a refrigerated box truck/van daily during field operations. The temperature in the refrigerated vehicle will be regularly monitored to ensure that the storage temperature is maintained at 4° Celsius (C) ±2° C”*. During sample transport, AECOM continuously monitored the conditions aboard the vessel and within the refrigerated van unit as prescribed. In addition, and as a precaution against the potential of malfunctioning refrigeration equipment, AECOM packed the samples with wet-ice during the sample transport to the project toxicology laboratory. During two discrete periods (approximately 20 minutes prior to sample delivery at the project toxicology laboratory on October 25, 2018; and again later that same day), the AECOM transport driver noticed an intermittent malfunction of the refrigerated van’s compressor unit. Upon investigation, the driver determined that the refrigeration compressor was displaying an error code and subsequently notified the AECOM Project Manager, the refrigerated van provider and the NAE Task Manager. Throughout the sample transport operations, and upon sample check-ins at the project toxicology laboratory, AECOM confirmed that cargo area holding temperatures were within or below the Work Plan-prescribed temperature range. Accordingly, and as the samples were also transported on ice, no Project Work Plan “deviation” is noted. Additional details regarding temperatures within the refrigerated van are presented in Appendix B.

Neither of the above items represented a deviation from the approved work plan. As such, no corrective action forms have been prepared. No associated project implications are anticipated as a result of either of the above items.

2.2 Sample Processing and Analysis

The project QAPP provides detailed descriptions of the aqueous and sediment sample handling requirements and the methods used for water column and biological testing. Section B.6 of the QAPP (AECOM, 2018a) summarizes the chemical testing methods used and Section B.7 summarizes the bioassay test methods. Only minor deviations from the QAPP were noted. These minor deviations are discussed in Sections 3 for the biological testing (specifically, in Sections 3.1.2.3, 3.2.2.3, and 3.2.3.4) and in Section 4 for the analytical chemistry. These deviations are not expected to have an impact on the usability of the data for decision making.

The biological and analytical project team included two laboratories:

- EnviroSystems, Inc.. (ESI; Hampton, NH) provided processing facilities and performed SPP analysis, 10-day whole sediment toxicity testing, and 28-day bioaccumulation bioassays; and,
- Alpha Analytical Laboratories (Mansfield, MA) provided sediment, elutriate, and tissue chemistry testing services.

Sediment and water samples were transferred directly from the field to ESI for further processing before subsequent testing commenced. Tissue samples were shipped from ESI to Alpha Analytical Laboratories on December 26, 2018 following the completion of the 28-day bioaccumulation assay. All field to lab transfers (and subsequent lab to lab transfers) were conducted under COC procedures, as specified in the project work plan. COC records are included in the laboratory backup appendices (Appendices C and D), as well as in the Field Report (Appendix B).

2.2.1 Sample Handling

Sample handling and delivery was performed as outlined in the project Work Plan. CLDS Reference Site samples collected by the AECOM Team were stored in labeled, 5-gallon food grade collapsible carboys (water samples) or 3.5-gallon food grade high

density polyethylene pails with locking lids (sediment samples), and kept on wet ice until returning to the dock. All sediment and water samples were securely stored in a locked, refrigerated van (set to $4\pm 2^{\circ}\text{C}$) for the field sample transport effort.

2.2.2 Test Sample Preparation and Compositing

Following the sample compositing scheme outlined in the Work Plan / PWS, sediment composites were prepared by combining equal volumes of the material from the various stations for subsequent testing. The sample compositing scheme is depicted in Table 1. These composite samples were used in the sediment bioassays and to develop elutriate/SPP samples for chemical and toxicological testing. As described in the project PWS, Composite 1 sediment was used in the bulk chemistry, elutriate and SPP analyses; however, as per Table 1 of the PWS, these materials were not subject to the 10-day whole sediment toxicity test or the 28-day bioaccumulation bioassay.

2.2.3 Chemical Sample Analysis

Chemical analysis methods are fully detailed in the project work plan (Appendix A). In some cases, specialized or modified methods were specified to accommodate unique project objectives. A description of the specialized or modified methods is also provided in this section. All laboratory reports for chemical analyses are provided in Appendix C.

Bulk sediment samples were analyzed for total organic carbon (TOC), metals, pesticides, polycyclic aromatic hydrocarbons (PAHs), and polychlorinated biphenyl (PCB) congeners in October and November 2018, accordance with Table 5 of the PWS and in accordance with the protocols recommended in Tables 1, 2, and 3 of the New England District RIM document, with appropriate updates to current analytical methods. As discussed in Section 3.2.3, below, the bulk sediment samples were re-analyzed for PCBs in March 2019 (within specified hold times), due to elevated reporting limits encountered during the initial PCB analysis (which were attributable to the sample dilution methodology employed). The project team used EPA SW-846 8270D-SIM /680M for the analysis of PCB congeners. The selected gas chromatography/mass spectrometry (GC/MS) method is generally preferred because it provides more definitive quantitation and identification of the target PCB congeners and is less prone to interferences or mis-identification than the earlier 8082 (gas chromatography/electron capture detector [GC/ECD]) method. Table 2 summarizes the analytes, analytical methods and method detection limits achieved for the bulk sediment chemistry analyses.

2.2.4 Elutriate/Suspended Particulate Phase Sample Preparation and Analysis

New Haven Harbor dredge site water was used in the preparation of all chemical elutriates and formed the basis of all elutriate/SPP sample preparations. Overlying water from the CLDS Reference Site was used for all SPP dilutions in the toxicity tests.

Each elutriate/SPP batch was prepared by adding the homogenized sediment to the site water in a 1:4 volumetric ratio, stirring the mixture for 30 minutes, and then allowing the mixture to settle for an hour. The supernatant was siphoned off prior to chemical and biological evaluations. Chemical samples were also centrifuged as required by the protocol. All samples were stored at or below 4°C when not in use. Elutriate samples were containerized for chemistry analysis (i.e., filtration of metals samples, analysis of metals and (total) organic compounds). Table 3 provides a summary of the elutriate/SPP preparation.

Elutriate samples were analyzed for metals, pesticides, pentachlorophenol, and PCB congeners in accordance with Table 6 of the PWS and in accordance with the protocol recommended in Table 5 of the New England District RIM document, with appropriate updates to current analytical methods. Chelation extraction and acid digestion followed by analysis using an inductively coupled plasma mass spectrometer (ICP/MS) was used for the analysis of the extracted metals except arsenic, selenium, mercury, and hexavalent chromium. Arsenic and selenium were determined using Hydride Generation Quartz Furnace Atomic Absorption Spectrometry; mercury was determined using Cold Vapor Atomic Fluorescence Spectrometry, and the diphenylcarbazide colorimetric procedure described in Standard Methods 3500-Cr D was used to measure chromium 6 (Cr6+). Table 4 summarizes the analytes, analytical methods and method detection limits achieved for the elutriate chemistry analyses.

Water column bioassays were conducted in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998) and the project Work Plan (AECOM, 2018a). Test organisms for the water column bioassays included

Americamysis bahia, *Menidia beryllina*, and *Arbacia punctulata*. Table 6 summarizes the test conditions for these bioassays and Table 7 identifies the dates of the SPP testing. The toxicity tests were completed on the six harbor dredge site elutriate samples, as well as on the CLDS Reference Site water sample. SPP testing was started before the 24-hour holding time for SPP solutions. Results and protocol deviations are described in Section 3.1.2.

2.2.4.1 Ammonia-Mitigated SPP Assays

Because the organisms used in suspended phase toxicity testing are sensitive to ammonia, excessive ammonia concentrations may cause a toxic response not of interest to the evaluation, which focuses on persistent contaminants. To account for this potential false positive, the EPA and NAE devised a protocol to determine if ammonia is the driver of toxicity in situations where unionized ammonia is present at concentrations that may cause toxicity. After the SPP assays were initiated, ammonia levels were measured and elevated levels were noted. In accordance with the PWS requirements, NAE was notified of the elevated ammonia within 24 hours. NAE issued an authorization for AECOM to proceed with running the optional ammonia-mitigated SPP assays, in addition to the “standard” SPP assays that were included under the initial scope of work.

Following receipt of authorization from NAE, a second set of “mitigated” assays were established wherein each test sediment composite was purged to reduce the ammonia concentration in the sediment prior to preparing the elutriate samples for a second round of ammonia-reduced SPP biological testing. Sediment purges were set up in accordance with the Work Plan and followed the Ferretti method (Ferretti et al, 2000), which involved loading a portion of each composite sediment sample into clean HDPE vessels to a depth of 7-11 mm and adding clean overlying water (Hampton-Seabrook Estuary water used by the laboratory as control water) in a 1:3 ratio of sediment to water. A thin piece of plastic was placed over the sediment prior to adding the overlying water in an effort to keep the sediment from becoming suspended during the addition. The thin piece of plastic was slowly removed after the overlying water was added. Each mitigation vessel was aerated and the temperature, pH, specific conductivity, salinity and dissolved oxygen were recorded daily prior to siphoning off the overlying water.

A small sub-sample was removed daily from each sediment composite and centrifuged to extract pore water. Temperature, pH and salinity of the extract were recorded and the pore water was subsequently analyzed for total ammonia. These data were used to calculate the pore water unionized ammonia levels daily. When the daily value of any composite was below the target threshold of 0.1 mg/L unionized ammonia (AECOM, 2018a), composites were removed from their mitigation vessels, placed in clean HDPE 1-gallon buckets and refrigerated prior to preparing elutriate solutions for use in “mitigated” assays. Table 5 summarizes the results of the ammonia purging process.

2.2.4.2 Test Species

A. bahia were ≤ 5 days old and were obtained from Aquatic Resource Organisms (ARO) of Hampton, New Hampshire. *M. beryllina* were 9-14 days old at the start of the assay and were also obtained from ARO. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. Organisms were transferred to test vessels using a large bore pipet to minimize the amount of water added to test solutions.

Adult *A. punctulata* were obtained from ESI, and the original stock was obtained from ARO of Hampton, New Hampshire. Adult sea urchins are maintained in the laboratory for as long as they are viable. Male and female urchins are maintained in separate chambers at a temperature of approximately $12 \pm 3^\circ\text{C}$ after spawning.

2.2.4.3 Reference Toxicant Assays

ESI completed acute ammonium chloride reference toxicant assays for *A. bahia*, *M. beryllina*, and *A. punctulata*. The LC50s for all three species fell within the 95% confidence limits of their respective control charts, indicating that the test organisms were healthy. Table 8 summarizes the results of the reference toxicant assays conducted in support of the SPP assays.

2.2.5 10-Day Whole Sediment Toxicity Testing

Bulk sediment bioassays are an important part of the overall suitability testing framework for open water disposal consideration and agency guidance specifies that a filter feeder, a deposit feeder, and a burrowing organism be represented in the assay. Ten-day whole sediment bioassays were performed using the crustacean *A. bahia* (mysid shrimp) and the crustacean *Leptocheirus*

plumulosus (amphipod) to represent these feeding strategies in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998), and the project Work Plan (AECOM, 2018a). *A. bahia* is a filter and deposit feeder that spends much of its time in the water above the sediment-water interface. The amphipod *L. plumulosus* builds burrows in the sediment and feeds on particles that are in suspension and on the sediment surface.

Table 9 summarizes the test conditions for the 10-day whole sediment toxicity tests. Assays with both species began on November 9, 2018 and were terminated on November 19, 2018. The *A. bahia* and *L. plumulosus* assays were successful and met test acceptability criterion for survival. The control sediment used in the *A. bahia* assay was natural sediment collected from the Hampton Estuary, Hampton, New Hampshire. The area is not known to receive any direct industrial inputs and has been used as laboratory reference sediment in the testing of marine sediments for over 30 years. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. The Hampton Estuary laboratory control was included to verify the health of the test organisms, and as a relative benchmark for reference site toxicity.

Results and protocol deviations are described in Section 3.2.2.

2.2.5.1 Test Species

A. bahia were obtained from Aquatic Research Organisms, Hampton, NH. Prior to use, test organisms were held for 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *A. bahia* used in the assay were ≤ 5 days old at the start of the test.

L. plumulosus were obtained from cultures maintained by Aquatic Research Organisms, Hampton, NH. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *L. plumulosus* were non-reproductive adults.

2.2.5.2 Reference Toxicants

ESI completed acute 96-hour ammonium chloride reference toxicant assays for *A. bahia* and *L. plumulosus*. Results were within two standard deviations of the historic mean of ESI's control charts, indicating that the test organisms were healthy. Table 10 summarizes the results of the reference toxicant assays conducted in support of the 10-day tests. The LC50 for the two species fell within the 95% confidence limits of their respective control charts.

2.2.6 28-Day Bioaccumulation Bioassay and Tissue Analysis

The 28-day solid phase/bioaccumulation evaluation was conducted in accordance with the RIM (EPA/USACE, 2004), the Inland Testing Manual (EPA/USACE, 1998) and the project Work Plan (AECOM, 2018a) using the bivalve *Macoma nasuta* and the burrowing polychaete *Nereis virens*. Table 11 summarizes the test conditions for the 28-day bioaccumulation bioassay.

The *M. nasuta* assays were initiated November 21, 2018 and were completed on December 19, 2018. The *N. virens* assays were initiated on November 20, 2018 and terminated on December 18, 2018. Results and protocol deviations are described in Section 3.2.3.

At the end of the 28-day bioaccumulation assay exposure period and the 24 hour depuration period, the test organisms were recovered, rinsed/depurated with clean seawater, homogenized, frozen and transferred to the chemistry laboratory for preparation and analysis. Tissue samples were analyzed for total lipids, percent moisture, metals, pesticides, PAHs, and PCB congeners. Table 12 summarizes the analytes, analytical methods and method detection limits achieved for the tissue chemistry analyses.

2.2.6.1 Test Species

M. nasuta, approximately 28-45 mm in total length, were obtained from ARO. Organisms were field collected along the Washington coast and shipped to ARO via overnight delivery. At ESI, the clams were placed in clean holding sediment with flowing seawater and monitored for at least 24 hours prior to use. Damaged bivalves and those that would not close when

prodded were discarded. The *Macoma* test commenced on November 21, 2018. A total of 20 organisms were added to each replicate in order to obtain sufficient tissue at test termination.

Adult *N. virens* were also obtained from ARO. Consistent with historic 28-day bioassays, worms were collected in the field (by Phil Harrington Bait [PHB] of Woolwich, ME) primarily from the Damariscotta River watershed, with (with some organism lots potentially sourced by PHB between Portland, ME and Jonesport, ME). Organisms were delivered directly to ARO. If not used the same day, worms were refrigerated overnight in seaweed. Damaged and inactive worms were not used in the assay. The *Nereis* test assay commenced on November 20, 2018 with a total of 20 organisms added to each replicate in order to obtain sufficient tissue at test termination.

2.2.6.2 Reference Toxicant Assays

ESI completed acute 96-hour copper reference toxicant assays for *M. nasuta* and *N. virens* concurrent with the 28-day bioassays. Results were within two standard deviations of the historic mean of ESI's control charts, indicating that the test organisms were healthy. Table 13 summarizes the results of the reference toxicant assays conducted in support of the 28-day bioassays.

2.3 Data Analysis

The array of water column and biological testing that was performed on the New Haven Harbor sediments provides a comprehensive data set from which a suitability assessment for the anticipated unconfined placement of this material at the CLDS may be determined. These data sets were generally evaluated in the following ways:

- Biological testing data were compared to reference or control values;
- Tissue chemistry results for site sediments were compared to the CLDS Reference Site tissue chemistry using non-parametric and t-tests. Additionally, tissue chemistry results for PCB body-burdens from site sediments and CLDS reference sediments were compared to native "pre-test" (i.e., unexposed) tissue chemistry results.

A description of these evaluation methods is provided below.

2.3.1 Toxicity Bioassay Statistics

Survival and effects data were analyzed using statistical software to determine significant differences between the project sediments and the laboratory control, and between project sediments or suspended phase solutions and the agency-selected reference site sediments or solutions. Survival data were evaluated to determine homogeneity of sample variances and normality of distribution. Data sets were subsequently evaluated using the appropriate parametric or non-parametric analysis. Pair-wise comparisons were based on the appropriate statistical analysis presented in the EPA decision tree guidelines specified in individual test methods. Statistical difference was evaluated at $\alpha=0.05$. For the SPP testing, acute exposure endpoints, the median lethal concentration (LC50) and the median effective concentration (EC50; in the *Arbacia* testing), were calculated and responses in the undiluted SPP solutions were evaluated against the responses in the CLDS Reference Site diluent.

2.3.2 Bioaccumulative Tissue Statistics

The statistical analyses of body burden data were completed to determine significant differences between the CLDS reference sediment and each site composite sample. The statistical analyses were completed for all compounds of concern identified in the Work Plan; however, the findings of significance discussed in Section 3.2.3.3 focus only on those compounds detected in the reference sample.

As noted in Section 3.2.3, elevated levels of select PCBs were detected in replicates of the *N. virens* native pre-test tissue. As such, additional comparisons were completed to evaluate the statistical significance of the PCB body-burden observed in the dredge-site composite samples and the CLDS reference site samples versus corresponding levels observed in native pre-test tissue samples.

AECOM

Per RIM guidelines and direction provided by the NAE (R.B. Loyd, personal communication, March 26, 2018), one-half the MDL is used in instances when a compound of concern is not detected for purposes of calculating a mean tissue concentration and total concentrations for PAHs, PCBs, and pesticides. MDLs used in statistical computations may be adjusted for differences in tissue mass and final extract volumes used in the analysis for each sample.

Data were evaluated to determine homogeneity of sample variances and normality of distribution using appropriate statistics. Data sets were subsequently evaluated using the appropriate parametric or non-parametric Analysis of Variance (ANOVA) statistic. Statistical difference was evaluated at $\alpha = 0.05$.

AECOM

Figure 2 CLDS Reference Site Sediment and Water Sampling Location (Figure from PWS, NAE 2018)

CENTRAL LONG ISLAND SOUND DISPOSAL SITE

Description: The Central Long Island Sound Disposal Site (CLDS) is one of four regional dredged material disposal sites located in the waters of Long Island Sound. CLDS covers a 11.04 km² (3.2 nmi²) area and is centered at 41° 08.950' N, 72° 52.950' W (NAD 83). It is located approximately 10.89 km (5.6 nmi) south of South End Point, East Haven, Connecticut. Since 1977, the management strategy at CLDS has entailed the controlled placement of small to moderate volumes of sediment to form individual disposal mounds on the seafloor. The authorized disposal point (within the overall disposal area) is specified for each dredging project in other project documents.

NOTE: This chart is not intended for use in navigation.

3. Results and Discussion

The Section 3 subsections present results evaluating the following potential exposure pathways associated with the anticipated unconfined open water material placement at the CLDS:

- Direct exposure to the water column during/after mixing (elutriate and particulate phase analysis);
- Direct exposure to the dredged material (DM) following placement (bulk sediment; chemistry previously analyzed); and,
- Bioaccumulation potential resulting from DM exposure over a period of time (bioaccumulation bioassays followed by tissue analysis).

As described in Section 1, NAE completed a sampling and testing effort during the summer of 2017 in order to characterize the materials to be dredged. NAE later revised the alignment of the proposed channel and turning basin based on the results of ship simulation modeling. In addition, a portion of the material from the inner harbor was determined to be unsuitable for unconfined open water placement, based on the results of suspended particulate phase and whole sediment bioassays. In July 2018, NAE coordinated a supplemental SAP to characterize sediment from reaches of the redesigned project that were not previously sampled, to characterize the material that would be dredged during CAD cell construction, and to further define the extent of unsuitable material in the inner harbor.

The October and November 2018 sampling and analysis efforts described herein include the evaluation of sediment chemistry, elutriate chemistry, SPP toxicity testing, 10-day whole sediment toxicity testing and 28-day bioaccumulation bioassay data with accompanying tissue analysis at sampled stations. This data will be used to form the basis of a suitability determination for unconfined open water disposal at the CLDS, as well as the potential for beneficial reuse (i.e. marsh creation, habitat restoration, cover of historic CLDS disposal mounds).

3.1 Water Column Evaluations

Water column evaluations performed in this study incorporated the analysis of chemical elutriate samples and SPP bioassay tests. The full suite of chemicals were measured in the elutriate mixtures to evaluate possible DM effects on water quality in an open water disposal setting. SPP toxicity bioassays included three test organisms: crustacean, fish, and sea urchin larvae. Acute toxicity as well as sensitive (larvae) developmental effects were evaluated.

3.1.1 Elutriate Chemistry

Table 14 summarizes the elutriate chemistry results obtained after mixing the site materials with reference site seawater to simulate DM mixing at an open water disposal site. Analytical results for the CLDS Reference water are also included in Table 14. Laboratory elutriate chemistry data are included in Appendix C.1.

Pentachlorophenol was below the project reporting limit for all elutriate samples analyzed. In general, metals results were also below project reporting limits in most samples, with the exception of As, Cu, and Zn. There were detects above the project reporting limits for As, Zn, and Cu in six, five, and four elutriate samples, respectively. All detects for pesticides and individual PCB congeners in all elutriate samples were below project reporting limits.

3.1.2 SPP Bioassay Results

Two sets of SPP assays were completed using the unmitigated and mitigated sediment (prepared as described in Section 2.2.4), each with their own paired laboratory control and CLDS reference. Other than the different sediment preparations, assay conduct for both the unmitigated and mitigated sediment was the same. The unmitigated assays were completed in two batches, each with their own paired laboratory control and CLDS reference with elutriate solutions 1, 2 and 6 included in the first batch and elutriate solutions 3, 4 and 5 included in the second batch. The mitigated assays were completed using all six elutriate solutions, one shared laboratory control and one shared CLDS reference for each species.

The SPP endpoints and adverse effects are presented in Table 15. Associated SPP water quality data is presented in Table 16 for the unmitigated assays and Table 17 for the ammonia mitigated assays. Laboratory summary reports, including laboratory bench data, are presented in Appendix D.1.

All SPP laboratory control samples in completed assays met minimum survival criteria. *A. bahia* survival was 100% in the laboratory control and 100% in the CLDS reference water treatment for both batches of unmitigated assays and the single batch of mitigated assays. These *A. bahia* results meet the minimum test acceptability criteria of $\geq 90\%$ survival in the laboratory control and are an indication that the test organisms were healthy and not stressed by handling.

The first batch of *M. beryllina* assays conducted using unmitigated sediment for elutriate solutions 1, 2 and 6 demonstrated poor performance in the laboratory control within 24 hours and that test was terminated and re-started. At the end of the 96 hour exposure period for the unmitigated assays, *M. beryllina* survival was 96% in the laboratory control and 98% in the CLDS reference water treatment for the assays completed on elutriate solutions 1, 2 and 6. *M. beryllina* survival was 90% in the laboratory control and 98% in the CLDS reference water treatment for the unmitigated assays completed on elutriate solutions 3, 4 and 5. For the mitigated assays, *M. beryllina* survival was 90% in the laboratory control and 92% in the CLDS reference water treatment at the end of the 96 hour exposure period. These *M. beryllina* results meet the minimum test acceptability criteria of $\geq 90\%$ survival in the laboratory control and are an indication that the test organisms were healthy and not stressed by handling.

In the *A. punctulata* assays, embryo counts in the laboratory control treatment for the first batch of unmitigated assays showed 78% of the embryos survived at the end of the assay and, of the original embryos, 77% were normally developed pluteus larvae. In the second batch of unmitigated assays, embryo counts in the laboratory control treatment showed 86% of the embryos survived at the end of the assay and, of the original embryos, 85% were normally developed pluteus larvae. In the ammonia reduced assays, embryo counts in the laboratory control treatment showed 76% of the embryos survived at the end of the assay and, of the original embryos, 74% were normally developed pluteus larvae. These results meet the minimum test acceptability criteria of $\geq 70\%$ embryo survival and $\geq 70\%$ normal development in the laboratory control sample.

At the start of the unmitigated assays, total ammonia was observed in the elutriates generated from all six composites (ranging from 12 to 37 mg/L) at the start of the assays for all three test species. Total ammonia levels decreased slightly throughout the life of the unmitigated assays for all three species. Calculated unionized ammonia values from the start of the unmitigated assays for all composites ranged between 0.35 to 0.65 mg/L for all three species. In the ammonia reduced composites, total ammonia ranged from 1.1 to 3.4 mg/L and unionized ammonia ranged from 0.042 to 0.090 mg/L at the start of the assays for all three test species. At the end of the assays, total ammonia in the ammonia reduced composites ranged from 1.2 to 3.7 mg/L.

EPA guidance suggests that ammonia, generally in the unionized form, can be a source of toxicity when total ammonia values are >5 mg/L (EPA 2002). EPA Ambient Water Quality Criteria (AWQC) for unionized ammonia in saltwater references LC50 values for two of the species tested: *A. bahia* (1.04 mg/L) and *M. beryllina* (0.88 mg/L) (EPA, 1989). AWQC for unionized ammonia in saltwater are not available for *A. punctulata*, however, effects levels are available in the literature for urchin species ranging from 0.06 mg/L for an EC50 for development (Maguire Group Inc., 2003) to approximately 0.336 mg/L for a 96-hour LC50 (Chang-Hoon Lee et al., 2013).

Total ammonia concentrations were well above 5 mg/L in all of the unmitigated SPP composites. The calculated unionized ammonia levels for the initial urchin assay were above the literature-based effect levels (0.06 to 0.336 mg/L). The calculated unionized ammonia levels for the unmitigated *A. bahia* and *M. beryllina* SPP assays were below the AWQC LC50s (1.04 mg/L and 0.88 mg/L respectively) in all of the composites.

As described below, survival and development results, particularly for the sea urchin, were improved in the ammonia reduced SPP assays. These results indicate that elevated ammonia levels in the initial SPP assays may have contributed to the observed survival and development impacts.

3.1.2.1 *A. bahia* and *M. beryllina* Acute SPP Evaluations

In the unmitigated assays, mysid shrimp were not adversely affected by exposure to SPP prepared from elutriate solutions 1, 2, 4, and 6 with LC50 values of $>100\%$ for these samples. In SPP solutions prepared from Composite 3 and 5, the LC50 values

AECOM

were 74% and 73% respectively. For the ammonia mitigated assays (conducted with elutriate prepared from sediment that was reduced in ammonia), LC50 values were >100% for all six composites.

The first batch of unmitigated *M. beryllina* assays prepared from elutriate solutions 1, 2 and 6 demonstrated poor performance in the laboratory control within 24 hours, therefore that assay was terminated and re-started using the same elutriate sample and lot of test organisms. At the end of the 96 hour exposure period, data generated from the unmitigated assays documented significant negative effects on minnow survival from elutriate solutions 1, 2, 3, 4 and 5. The LC50 values for these elutriate solutions ranged from 56% to 69%. The minnow LC50 was >100% for elutriate solution 6 in the unmitigated assay. For the ammonia mitigated assays, LC50 values were >100% for all six composites.

3.1.2.2 *A. punctulata* Acute SPP Evaluations

Arbacia punctulata is the most sensitive of the project SPP exposed species. Survival and normal development were quantified when it was determined that the majority of the larvae (>90%) in the laboratory controls had reached the pluteus larval stage.

Review of the data collected at the end of the unmitigated assays indicated that SPP assays prepared from all elutriate solutions had negative impacts on embryonic survival and/or development. LC50s and EC50s from SPP solutions prepared from the six composites ranged from 3 to 22% for both survival and development.

For the ammonia mitigated assays, LC50 and EC50 values were >100% for all six composites.

3.1.2.3 SPP Protocol Deviations

Review of the data collected for these assays documented minor deviations from the method protocol and/or ESI's standard procedures, as described below. These lab issues are considered to have had no impact on the outcome of the assays.

Protocol requires, and it is common laboratory procedure, that a reference toxicant assay be completed concurrently with any project assay (at a minimum frequency of once per month). However, the *A. punctulata* assay completed using mitigated sediment does not have an associated reference toxicant assay, and there are no reference toxicant data available for that lot of organisms due in part to the time of year and organism viability. This deviation had no adverse impact on the outcome of the assay as the project assay met all acceptability criteria and there were no impacts on embryonic survival or development in the elutriates.

Protocol requires that the *A. bahia* and *M. beryllina* assays be conducted at $20 \pm 2^\circ\text{C}$ and the *A. punctulata* assay be conducted at $20 \pm 1^\circ\text{C}$. Although the assays were maintained in incubators set at their target temperature, the minimum temperatures recorded during the unmitigated assays for elutriate solutions 3, 4 and 5 fell below the protocol range to a low of 17°C on day 2 of the mysid assay, a low of 14°C on day 2 of the minnow assay and a low of 18°C at the start of the urchin assay. There were no notations on the bench sheets indicating a reason for the low temperatures, therefore the drop below the threshold is likely due to the ambient laboratory temperature at the time that water quality measurements were taken. There was also an isolated exceedance of the upper threshold in the laboratory control of the unmitigated minnow assay for elutriate solutions 1, 2 and 6, which reached a maximum of 23°C on day 0. These species can tolerate temperatures within the ranges measured and this deviation did not adversely affect the outcome of the assay.

In addition, the protocol requires that the assays be conducted at a salinity of 30 ± 2 ‰. It is not uncommon for the salinity to drift upwards during assay conduct due to evaporation and exceed the protocol requirement, but the salinities are adjusted daily as needed to account for this occurrence, except at assay termination. These occurrences at test termination are not considered deviations. In one instance, the salinity in the mysid laboratory control for the mitigated assay for elutriate solutions 3, 4 and 5 was inadvertently overlooked and not adjusted down from 33 ‰ at 72 hours. This was an isolated incident and all other in-life assay measurements >32 ‰ were adjusted accordingly. This deviation did not adversely affect the outcome of the assay.

These lab issues are considered to have had no impact on the outcome of the assays.

3.2 Sediment Chemical and Toxicity Characteristics

Under the current program, bulk sediment chemistry analyses, 10-day whole sediment toxicity testing and 28-day bioaccumulation bioassays with associated tissue analyses were conducted at the proposed FNP stations. These investigations are described in further detail below.

3.2.1 Sediment Chemistry

Table 18 summarizes the results of the bulk sediment chemistry analyses conducted on the 18 samples submitted for analysis. Backup laboratory sediment chemistry data are included in Appendix C.2. In cases where values were below the laboratory reporting limit (RL), the result is considered undetected and qualified with a "U" in the data table.

An overview of findings per parameter is presented below.

3.1.2.1 Metals

Five of the metals analyzed (As, Cr, Cu, Pb, Ni) were present in all sediment samples at levels greater than the project reporting limits. Cadmium was reported as non-detect in 1 of the samples and as estimated values in 5 of the 18 samples; all at concentrations above the project reporting limit. Zinc was reported in one sample as an estimated value above the project reporting limit. Mercury was reported as non-detect in 2 of the 18 samples and was reported as an estimated value between the method detection limit (MDL) and RL in 2 samples.

3.1.2.2 Polycyclic Aromatic Hydrocarbons (PAHs)

PAH compounds were detected in all 18 samples (Table 18). In all samples, concentrations of high molecular weight (HMW) PAHs were greater than the concentrations of the low molecular weight (LMW) PAHs. The highest concentration of HMW PAHs (6,494 µg/kg) was measured at location W' and the highest concentration of LMW PAHs (1,662 µg/kg) was measured at location DS-2.

3.1.2.3 Pesticides

Pesticides were undetected in 4 of the 18 samples. 4,4' DDE, 4,4' DDD, 4,4' DDT, Endosulfan II, Oxychlordane and trans-Chlordane were the most frequently detected pesticides. Cis-Chlordane, cis-Nonachlor, gamma-BHC, Methoxychlor, and trans-Nonachlor were also detected in several of the samples. Toxaphene was not detected in any of the samples; several samples were reported as non-detects at levels above the project reporting limit.

3.1.2.4 Polychlorinated Biphenyls (PCBs)

Measurable concentrations of PCB congeners were reported in 13 of the 18 samples (Table 18). The highest concentration of Total PCBs (222 µg/kg) was measured at location DS-2 0-7.0. Several samples had non-detected PCB congeners at levels above the project reporting limits.

3.2.2 10-Day Whole Sediment Toxicity Testing

A summary of survival data from the 10-day *A. bahia* and *L. plumulosus* assays is included in Table 19. Supporting data, including copies of bench sheets, are included in Appendix D.2. Table 20 summarizes the laboratory control results and other assay acceptability criteria for the 10-day assays. Tables 21 and 22 present the water quality data for *A. bahia* and *L. plumulosus*, respectively, as measured during the 10-day bioassays. Overlying water quality data is presented for *A. bahia* and overlying and pore water quality data is presented for the *L. plumulosus* assays.

Tests were initiated with sediments that were submitted to the ammonia mitigation process (described in Section 2.2.4). This mitigation process ensured that the unionized ammonia levels in the sediment pore waters were less than 0.8 mg/L prior to test initiation. Once the pore waters were below the unionized ammonia threshold for a 24-hour period, composites were removed from their mitigation vessels and placed in clean HDPE 1-gallon buckets until all samples were ready to be loaded into test

AECOM

chambers for assay initiation. Test chambers were loaded 24-hours prior to assay initiation to allow sediments and overlying water time to settle.

For the *A. bahia* assay, test organisms were added to the test vessels on November 9, 2018. On November 9, 2018, unionized ammonia samples were collected from the overlying water and concentrations ranged from <0.0022 to 0.0684 mg/L. These levels are below the 0.6 mg/L unionized ammonia overlying water threshold for *A. bahia* test initiation.

For the *L. plumulosus* assay, unionized pore water ammonia levels in the composites were measured one day prior to the addition of test organisms and ranged from 0.1974 to 0.5615 mg/L. These levels were below the 0.8 mg/L unionized ammonia pore water threshold for *L. plumulosus* test initiation so organisms were added the following day (November 9, 2018). On November 9, 2018, unionized ammonia concentrations in the pore water ranged from <0.0104 to 0.2467 mg/L.

3.2.2.1 *A. bahia* 10-Day Solid Phase Assay

Mean mysid survival in the laboratory control sediment was 98%, and met acceptance criteria (e.g. mean survival $\geq 90\%$; $\geq 70\%$ in any replicate). Mean survival in the CLDS reference sediment was 63%. Mean survival of mysid shrimp exposed to the six New Haven Harbor sediment composites ranged from 91% (Composites 3 and 4) to 96% (Composite 6). The statistical analyses show that there were no negative effects on survival for mysids exposed to site composite samples as compared to mysids exposed to the CLDS reference sediment.

3.2.2.2 *L. plumulosus* 10-day solid phase assay

Mean amphipod survival in the laboratory control was 98% and met acceptance criteria. Mean amphipod survival among organisms exposed to CLDS reference sediment was 79%. Mean amphipod exposed to the six New Haven Harbor sediment composites ranged from 92% (Composite 4) to 99% (Composite 5), and the statistical analyses show that there were no negative effects on survival for amphipods exposed to site composite samples as compared to amphipods exposed to the CLDS reference sediments.

3.2.2.3 Whole Sediment Protocol Deviations

Review of the data collected for these assays documented a few minor deviations from the method protocol and/or ESI's standard procedures.

The CLDS reference sediment performed poorly in both the mysid and amphipod assays, achieving only 63% and 79% survival, respectively. The laboratory control and site composites achieved $\geq 90\%$ survival for both species, indicating that organisms were healthy. None of the site composites were determined to be significantly impacted as compared with the reference sediment, given this performance. Test parameters were largely within their targeted ranges, except as noted, and there were no indications that there were any issues with assay conduct. The calculated unionized ammonia levels for the CLDS reference were well below the threshold of 0.8 mg/L in both the pre-assay pore water sample and during assay conduct. There were some juvenile polychaetes found in replicates D and E of the CLDS reference sediment upon recovery of the amphipod assay. It cannot be determined if their presence adversely impacted amphipod survival in those replicates; however, it is plausible that they were a stressor. All test sediments are sieved prior to use and any native organisms present in the reference sediment would have been small enough to pass through this process. Predation within these replicates is possible, but the size of the polychaetes makes it unlikely. Furthermore, none of these polychaetes were recovered from the mysid reference sediment. Although there are no related criteria that the reference sediment must meet, this is considered an out of control event and remains an uncertainty.

Protocol requires that the *A. bahia* and *L. plumulosus* assays be conducted at $30 \pm 2\text{‰}$ and $20 \pm 2\text{‰}$, respectively. Salinity values recorded on day 9 of the *A. bahia* assay and day 10 of both assays fell below their acceptable ranges: to as low as 24.6‰ (*A. bahia*) and 17.2‰ (*L. plumulosus*). The analyst indicated that low readings were experienced with one of the salinity probes and it was subsequently recalibrated. Following recalibration, salinity measurements were generally within range; however, the out of range salinity readings for this project were not able to be recaptured and, as such, may be considered suspect readings. Salinity readings were also encountered on days 3 (*L. plumulosus*) and 7 (both species) that sporadically exceeded the target range; however, these are isolated instances of exceedance and not believed to be related to systemic causes. Mean salinity for

the assays (28.3‰ for *A. bahia* and 19.3‰ for *L. plumulosus*) were within their target ranges and the control survival met acceptance criteria demonstrating that the test organisms are tolerant of salinities within the ranges measured.

The dissolved oxygen in the *L. plumulosus* assay temporarily dropped to a low of 4.9 mg/L, which is below the threshold outlined in ESI's standard operating procedures, however the minimum percent dissolved oxygen (62%) remained above the RIM's threshold of ≥40%. This was an isolated excursion that occurred in the surrogate vessel of the laboratory control on Day 1, which may have been caused if an airline fell out of the test vessel and was subsequently replaced upon discovery.

These lab issues are considered to have had no impact on the outcome of the assays.

3.2.3 28-Day Bioaccumulation Bioassay and Tissue Analysis

To evaluate the bioaccumulation potential of dredged sediments, the clam *Macoma nasuta* and the worm *Nereis virens* were exposed to material from five of the sediment composites. Table 23 provides a summary of the *M. nasuta* and *N. virens* survival data. Table 24 summarizes the laboratory control results and other assay acceptability criteria. Tissue chemistry data and statistical results (relative to reference) are summarized in Table 25 and Table 26. As described in Section 3.2.3.3, additional statistical comparisons were conducted to evaluate PCB body-burdens in the five sediment composites and the CLDS reference site relative to the native pre-test tissue samples for *N. virens*. These results are also summarized in Table 26. Laboratory bench sheets and statistical support are included in Appendix D.3.

3.2.3.1 Survival Analysis

Mean *M. nasuta* survival was 99% for clams maintained the laboratory control and for clams exposed to the CLDS reference sediment. Mean percent survival of the bivalves exposed to harbor sediment composites ranged from 94% to 100%. The statistical evaluation of the survival data showed no significant reduction in survival for bivalves maintained in the site composites when compared to the CLDS reference sediment.

Mean *N. virens* survival was 99% in the laboratory control and 98% in the CLDS reference sediment. Mean percent survival among polychaetes exposed to harbor sediment composites ranged from 93% to 97%. The statistical evaluation of the data showed a significant reduction in survival for polychaetes maintained in Composite 5 sediment when compared to the CLDS reference sediment, however the difference in survival was <10%.

Survival of clams and worms met the established guideline criteria. Surviving organisms for both species tested provided sufficient tissue for preparation and analysis of body burdens.

3.2.3.2 Tissue Chemistry

Test organism tissues were analyzed for the full set of chemical parameters established for the program (AECOM, 2018a) to evaluate the bioaccumulative aspect of the project material. The chemical results provided in Table 25 (*M. nasuta*) and Table 26 (*N. virens*) are presented on a wet weight basis. Backup laboratory tissue chemistry data are included in Appendix C.3. Statistical comparisons of tissue body burdens are discussed in Section 2.3.2.

Review of *M. nasuta* tissue data documented that arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc were detected in *M. nasuta* tissues from all five composites and reference samples. PAHs were also detected above the MDL throughout the five composite samples and in the reference samples. Eleven of the PCB congeners were detected above the MDL at least once among the five composites. Composites 5 and 6 had fewer detections of PCB congeners and lower concentrations of the detected congeners than Composites 2, 3, and 4. PCB congeners were not detected in the CLDS Reference samples. Chlordanes (cis, trans, and oxy) and 4,4'-DDE were each detected above the MDL at least once among the five composites. 4,4'-DDE was the only pesticide detected in the CLDS Reference samples.

Review of *N. virens* tissue data documented that arsenic, cadmium, chromium, copper, lead, nickel, and zinc were detected in *N. virens* tissues from all five composites and reference samples. Mercury was detected above the MDL in Composites 3, 4, 5, and 6 but not in Composite 1 or the CLDS Reference samples. Fluoranthene and pyrene were the only PAHs detect in *N. virens* tissues. Fluoranthene and pyrene were detected in samples from Composites 2, 3, 4, and 6. PAHs were not detected in samples

from Composite 5 or the CLDS Reference. Eight of the PCB congeners were detected above the MDL at least once among the five composites. Four PCB congeners were also detected in the CLDS Reference samples. Twelve pesticides were detected in Composite 4, particularly in the replicate 2 sample. In the remaining composites, 4,4'-DDT was detected in one replicate from Composite 2 and 4,4'-DDE was detected in one replicate from Composite 3.

3.2.3.3 Tissue Body Burden Analysis

Review of *M. nasuta* tissue data document statistically significant increases in body burdens for clams maintained in the project composite sediments for two metals (cadmium in Composite 2 and lead in Composite 6), six PAHs (in multiple composites) and 4,4'-DDE (in Composites 2, 3, and 4) as compared to CLDS Reference tissue. Most notably, the PAHs primarily in Composites 2, 3, 4 and 6 tissues were detected at concentrations 5 to 16 times higher than in CLDS Reference tissue, especially fluoranthene in Composites 3, 4 and 6, and chrysene and pyrene in Composite 6 tissue, which were also detected at concentrations an order of magnitude or more greater than in reference tissue.

Review of the native pre-test clam tissue data indicates that the site composite concentration of cadmium, lead and 4,4'-DDE were only slightly higher than in native tissue, suggesting that the findings of significance may be attributable to background levels of these compounds in the native clam tissue. The same is true for five of the six PAHs detected in Composite 5 tissue. Concentrations of chemicals in native pre-test *Macoma* tissue were generally similar to or below the CLDS Reference tissues.

Review of body burden data also showed that the following chemicals of concern were detected in *M. nasuta* tissue following exposure to site composite sediment but were not detected in CLDS Reference tissue, therefore these COCs were eliminated from further evaluation: six PAHs (acenaphthene, anthracene, benzo(a)pyrene, benzo(k)fluoranthene, benzo(g,h,i)perylene and indeno(1,2,3-cd)pyrene), ten PCB congeners (8, 18, 28, 44, 52, 66, 101, 118, 138 and 153), and six pesticides (4,4'-DDD, 4,4'-DDT, alpha-chlordane, gamma-chlordane, dieldrin and oxychlordane).

The review of *N. virens* tissue data found that there were significant increases in body burdens for worms maintained in the project composite sediments for one metal (copper in Composite 6) and five PCB congeners (138, 153, 170, 180 and 187 in multiple composites), compared to CLDS Reference tissue.

Review of the native pre-test worm tissue data indicates that the site composite tissue concentrations of PCB congeners 138 and 170 were approximately equal to or less than concentrations found in native tissue, and site composite tissue concentrations of copper and PCB congeners 153, 180 and 187 were only slightly higher than in native tissue, indicating that the findings of significance may be attributable to levels occurring in worm tissue prior to testing. The concentrations of several PCB congeners in the native tissues were higher than in the CLDS Reference or composite tissue samples and these levels triggered a review of the native tissue PCB data and performance of additional statistical evaluations. This supplemental review is discussed in Section 3.2.3.3.1.

Review of body burden data also showed that the following chemicals of concern were detected in worm tissue following exposure to site composite sediment but were not detected in CLDS reference tissue, therefore these COCs were eliminated from further evaluation: mercury, two PAHs (fluoranthene and pyrene), seven PCB congeners (8, 18, 52, 101, 105, 128 and 195), and 14 pesticides (4,4'-DDE, 4,4'-DDT, aldrin, cis-nonachlor, alpha-chlordane, gamma-chlordane, dieldrin, endosulfan I, endosulfan II, gamma-BHC, heptachlor, heptachlor epoxide, hexachlorobenzene and oxychlordane).

3.2.3.3.1 *N. virens* Supplemental PCB Data Review

As discussed above, PCB congeners were detected in native pre-test *N. virens* samples. As indicated in Table 26, mean concentrations of some congeners in the native tissues were higher than those detected in the CLDS Reference or composite tissue samples. In some cases, congeners in Composites 2, 4, and 5 were statistically higher than the CLDS Reference sample results, but concentrations were lower than the native tissue result.

Therefore, additional statistics were conducted to assess whether CLDS Reference and site composite concentrations were statistically significantly higher than the native pre-test concentrations. PCB congener 52 in Composites 2 and 4 were the only congeners in the exposed treatments (CLDS Reference or site composites) that were statistically higher than in the native tissues. None of the congeners in Composites 2, 4, or 5 that were statistically greater than the CLDS reference site tissue were

AECOM

statistically above the native tissue concentrations. These results show that there are generally similar concentrations of these congeners (i.e., 138, 153, 170, 180 and 187) among Composites 2, 4, and 5 native tissues.

An additional set of statistics presented in Table 26 also shows that for several congeners, concentrations in the native tissues are statistically greater than in the exposed site sediments or the CLDS Reference sediments. These supplemental statistical comparisons support the observation that the original findings of significance relative to the CLDS Reference results, may be attributable to PCB levels occurring in worm tissue prior to testing.

A review of the sediment PCB data presented in Table 18 was also conducted. In accordance with the Work Plan, sediments (representing multiple individual samples depicted on Table 18) were combined in equal parts to generate the tested composites. As such, the averages of these samples approximate the PCB concentrations for the tested sediment in the *N. virens* assays. The estimated Total PCB concentrations for the tested composites are listed below:

- Composite 2 - 82 ug/kg
- Composite 3 - 50 ug/kg
- Composite 4 - 166 ug/kg
- Composite 5 - 32 ug/kg
- Composite 6 - 18 ug/kg

Concentrations of Total PCBs in Composites 2, 3, 4, and 5 are all between the Effects Range Low (ERL) and Effects Range Median (ERM) sediment benchmarks of 23 and 180 ug/kg, respectively (Buchman, 2008) and concentrations in Composite 6 are below the ERL. None of the concentrations were above the ERM at a level where adverse effects on the benthic community would be likely.

This supplemental review of PCB data indicates that the native pre-test *N. virens* tissues contained elevated levels of some PCB congeners. The statistical finding of significance, relative to the CLDS Reference, for PCB 138, 153, 170, 180 and 187 in some tested Composites appears to be influenced by the concentrations in the native tissues. None of the congeners were statistically higher than both the CLDS Reference and the native tissues.

3.2.3.4 28-Day Bioaccumulation Bioassay and Tissue Protocol Deviations

Review of the data collected for these assays documented minor deviations from the method protocol and/or ESI's standard procedures.

Data from daily temperature readings suggests that temperatures were generally on the low end of the acceptable range as the mean temperature of 11.4°C for the *N. virens* assay falls below the targeted limit of 14±2°C and the mean temperature of 11.6°C for the *M. nasuta* assay only meets the criterion by rounding to the precision reflected in the protocol. The mean temperature of 12.0°C calculated from the hourly data logger readings is within the acceptable range. Although slightly low, the daily temperature values are still within the normal temperature range tolerated by these species. It is the opinion of ESI's technical manager that this deviation had no adverse impact on the results of the assays.

Data from the daily salinity readings indicates that the minimum measurements fell outside of the acceptable range for both species. The excursions all occurred on November 28, 2018 (day 7 of the *M. nasuta* assay and day 8 of the *N. virens* assay) and were all within the 25-27‰ range, except for one measurement of 13.3‰ in replicate E of composite 5 for *N. virens* that is likely an erroneous reading resulting from technician error. While the exact reason for the excursions is unclear, this deviation did not adversely affect the outcome of the assay.

The temperature logger for collecting hourly data was not activated at the start of the assays, but instead was activated on November 30, 2018 (day 9 of the *M. nasuta* assay and day 10 of the *N. virens* assay). As a result, approximately one-quarter of the hourly temperature readings were not recorded. In addition, daily water quality readings are missing for replicate A of composite 6 on day 0 of the *N. virens* assay due to a multi-probe malfunction; however, water quality readings were obtained from replicates B, C, D and E for that same composite, and all measurements appear to be within reasonable proximity to each other and to the measurements collected for the other composites that day. While these deviations represent a data gap, this deviation did not adversely affect the outcome of the assay.

AECOM

As described in Section 3.2.3.2, native pre-test PCB concentrations in *N. virens* were elevated and greater than historic concentrations of PCBs noted in source organisms. The *Inland Testing Manual* (EPA/USACE, 1998) specifies that the background levels of contaminants in time-zero tissues should not be “inordinate”. In order to address the potential influence of the background PCB levels noted in exposed test organisms, additional statistical comparisons were performed as described in Section 3.2.3.3.1.

Table 14 Elutriate Chemistry Results

Analyte	NHH-CLDS	Composite 1	Composite 2	Composite 3	Composite 4	Composite 5	Composite 6
Total Metals (mg/L)

Results presented for composite samples are the mean of three replicate samples.

One-half of the sample-specific method detection limit (MDL) is used to represent non-detects in calculation of Total PCBs.

Total Polychlorinated Biphenyls (PCBs) calculated as the sum of the 18 NOAA congeners multiplied by 2.

B – Analyte found in laboratory blank.

J – Estimated value.

mg/L - Milligram per liter.

U – Not detected above the laboratory reporting limit (RL).

ug/L - Microgram per liter.

x – Congener is not one of the 18 NOAA congeners included in Total PCBs.

Due to a laboratory spiking error, all non-detected pesticide results for elutriate composite 3, 4, and 5 samples are considered unusable and the pesticide detects, PCB detects and PCB non-detects for these composites are considered as estimated with a low bias.

Composite 3	95%	100%	90%	95%	100%	96%	No	No
Composite 4	90%	95%	85%	95%	95%	92%	No	No
Composite 5	100%	100%	95%	100%	100%	99%	No	No ^a
Composite 6	90%	95%	100%	90%	95%	90%	No	No

^a The difference in survival is equal to 20% in Composite 5, however survival is improved in all the site composite samples as compared with the CLDS reference sediment.

Table 20 10-Day Whole Sediment Bioassay - Lab Control Performance and Assay Acceptability Criteria Summary

Endpoint / Measurement	Protocol Criteria	Unit	<i>A. bahia</i>	<i>L. plumulosus</i>
Mean Survival	Laboratory Control \geq 90%	%	98%	98%
		Protocol Met	Yes	Yes
Salinity	Minimum:	<i>A. bahia</i> - 28‰	24.6	17.2
		<i>L. plumulosus</i> - 18‰	Protocol Met	No ^a
	Maximum:	<i>A. bahia</i> - 32‰	32.9	23.6
		<i>L. plumulosus</i> - 22‰	Protocol Met	No ^a
Temperature	Mean: 20 \pm 1°C	Daily / Hourly °C	20.9 / 21.0	20.9 / 21.0
	Minimum: 17°C	Daily / Hourly °C	19.7 / 19.8	20.0 / 19.8
	Maximum: 23°C	Daily / Hourly °C	21.7 / 21.8	21.7 / 21.8
		Protocol Met	Yes / Yes	Yes/ Yes

^a Salinity values recorded on day 9 of the *A. bahia* assay and day 10 of both assays fell below their acceptable ranges; however, these results appear to have been related to an issue with a salinity probe. Mean salinity for the assays were within their target ranges and the control survival met acceptance criteria demonstrating that the test organisms are tolerant of salinities within the ranges measured.

Data in water quality summary are obtained from the “Surrogate” replicate of each treatment.

Ammonia levels in the sediment were mitigated prior to the addition of sediments to the test vessels. See Table 5 for the ammonia mitigation measurements.

^a In-life assay pore water monitoring.

^b Pre-assay pore water monitoring to confirm unionized ammonia levels were below 0.8 mg/L threshold for assay initiation.

Table 24 28-Day Bioaccumulation Bioassay – Lab Control Performance and Assay Acceptability Criteria Summary

Endpoint/Measurement	Protocol Criteria	Unit	<i>M. nasuta</i>	<i>N. virens</i>
Mean Survival	Laboratory control $\geq 90\%$	%	99%	96%
		Protocol Met	Yes	Yes
Tissue Mass	Sufficient for analysis	Protocol Met	Yes	Yes
Salinity	Minimum: 28‰	‰	25.7	13.3
		Protocol Met	No ^a	No ^a
	Maximum: 32‰	‰	32.0	31.1 ^c
Temperature	Mean: 12-16°C Minimum: 11°C Maximum: 17°C	Protocol Met	Yes	Yes
		Daily/Hourly	11.6 ^c / 12.0	11.4 ^b / 12.0
		Daily/Hourly	11.0 / 11.8	10.8 ^c / 11.8
		Daily/Hourly	12.4 / 12.5	12.2 / 12.5
		Protocol Met	Yes / Yes	No ^b / Yes

^a The salinity of the incoming water for the assay was below the target range on one day. The lowest recorded value of 13.3 ‰ in one replicate is likely an erroneous reading. Control survival in both assays met acceptance criteria demonstrating that the test organisms are tolerant of salinities within the ranges measured.

^b Although slightly low, the daily temperature values are still within the normal temperature range tolerated by these species.

^c This value meets the criterion when rounded to the whole number precision reflected in the protocol.

Results for CLDS Reference and Composites are presented as the mean of five replicate samples. Native tissue results are presented as the mean of three replicates.

1 - Totals calculated for informational purposes only using 1/2 MDL for non-detected values. Statistical analysis not conducted on total values and qualifiers not applied.

Statistical qualifiers -

a - Analyte not detected (below MDL) in at least one replicate; mean value was calculated using one-half the MDL for the non-detect.

b - Analyte estimated (detected below RL but above MDL) in at least one replicate; mean value calculated using estimated value.

c - Analyte was detected in the treatment tissue sample replicates at an equal or higher mean concentration than in the associated reference site tissue, however statistical analysis is not required as the analyte was not detected in any of the reference site replicates.

NS - Not Significant - mean tissue body burden was not statistically different from the associated reference site mean body burden. Statistical significance accepted at α=0.05.

S - Significant - mean tissue body burden was statistically different, greater than the associated reference site mean body burden. Statistical significance accepted at α=0.05.

Results for CLDS Reference and Composites are presented as the mean of five replicate samples. Native tissue results are presented as the mean of three replicates.

1 - Totals calculated for informational purposes only using 1/2 MDL for non-detected values. Statistical analysis not conducted on total values and qualifiers not applied.

Statistical qualifiers -

a - Analyte not detected (below MDL) in at least one replicate; mean value was calculated using one-half the MDL for the non-detect.

b - Analyte estimated (detected below RL but above MDL) in at least one replicate; mean value calculated using estimated value.

c - Analyte was detected in the treatment tissue sample replicates at an equal or higher mean concentration than in the associated reference site tissue, however statistical analysis is not required as the analyte was not detected in any of the reference site replicates.

NS - Not Significant - mean tissue body burden was not statistically different from the associated reference site mean body burden. Statistical significance accepted at $\alpha=0.05$.

S - Significant - mean tissue body burden was statistically different from the associated reference site mean body burden. Statistical significance accepted at $\alpha=0.05$.

Supplemental statistics for PCBs -

Red text - Mean tissue body burden was statistically different, greater than the mean native tissue body burden. Statistical significance accepted at $\alpha=0.05$.

Purple text - Mean native tissue body burden was significantly different, greater than the mean reference or composite tissue body burden [information in brackets identifies the associated tissue that the native tissue is statistically greater than]. Statistical significance accepted at $\alpha=0.05$.

4. Chemical Analyses QA/QC

This section provides quality control information and documents the overall quality of the analytical data upon which the project conclusions are drawn. Project QA/QC information (e.g., laboratory control survival, reference toxicant results) for the biological testing program is discussed in Sections 2 and 3.

The chemical data collected during the investigation were of sufficient quality and sensitivity to meet the project objectives. The majority of the QC results associated with the analytical parameters met the measurement objectives presented in the Work Plan (AECOM, 2018a). Specific nonconformances with those measurement objectives are presented in the laboratory report narrative, RIM Checklist and AECOM-internal validation memorandum associated with each laboratory report. A full set of QC sample findings (method blanks, duplicate precision results, laboratory control sample results, and matrix spike results) is provided in Appendix C.1, Appendix C.2, and Appendix C.3.

4.1 Deviations

Due to an initial laboratory spiking error, 18 elutriate samples required re-extraction for pesticides and PCBs for elutriate composite and blank samples 3, 4, and 5. The re-extraction was performed three weeks beyond the technical hold-time of seven days. For samples with detectable pesticide hits, there was poor reproducibility between sample replicates. The non-detected pesticide results for these 18 samples are considered unusable for project objectives. The detected results should be considered estimated with a low bias.

As noted above, the PCB congeners reported for all elutriate composite samples 3, 4, and 5 were extracted beyond the project-specific work plan hold-time; however, the current EPA guidance, Table 4-1, EPA SW846 Ch. 4 Rev 5 2012, states "None" as the hold-time for PCBs. Both detects and non-detects should be considered usable as estimated with a low bias.

Elutriate and ambient seawater samples were analyzed for arsenic and selenium by method 1632A, not method 6020B as stated in the project-specific work plan.

No other deviations relative to chemical analysis were noted. These deviations are not expected to have an impact on the usability of the data for decision making.

4.2 Analytical Sensitivity

The sensitivity of program chemical measurements can sometimes dictate the ultimate usefulness of the final data. Results that are insufficiently sensitive to detect changes can limit the final project conclusions. The New Haven Harbor project required RLs were specified in the approved Work Plan (AECOM, 2018a) to detect sedimentary contaminant considerations, ambient seawater and elutriate concentrations, and bioaccumulative tissue concerns.

The Work Plan (AECOM, 2018a) summarized the laboratory RLs and project required RLs. Nondetect chemistry results were reported at laboratory RLs since they provide greater confidence. The majority of the RLs met the QAPP specifications. Laboratory reporting limits for copper, nickel, silver, zinc, and hexavalent chromium in the elutriate samples were higher than the project required limits shown in the QAPP.

Several sediment samples had elevated RLs for PAHs due to dilutions that were required by the sample matrix. The PAH RLs for two sediment samples, TB-1 5.2-6.0 and US-2 5.0-6.0, were slightly higher than the project RLs; however, the MDLs met the project RLs. Analytes detected between the RL and the MDL were reported as estimated and qualified with a J qualifier. Several sediment samples had laboratory RLs for PCB congeners slightly higher than the project RLs due to low percent solids. In all instances there were measurable concentrations of total PCBs. Laboratory RLs for the following pesticides in several sediment samples were slightly higher than the project RLs; Heptachlor epoxide, Hexachlorobenzene, Methoxychlor, Oxychlorane, and Toxaphene.

Laboratory RLs for all PCB congeners for all tissue samples exceeded the RIM required RL (0.5 ppb); however, the MDLs met the RIM RLs, which assure the sensitivity of detected results. Analyte concentrations that were detected

between the MDL and the RL were qualified as estimated and J qualified. The laboratory RL for the pesticide Methoxychlor was slightly higher than the project RL in all tissue samples.

Sample contamination can sometimes affect sample results, particularly when measuring chemical parameters at very low concentrations. In this study, potential contamination has been monitored using equipment blank QC samples. Silver and cis-Chlordane were detected in the equipment blank associated with the water pump; trans-Chlordane, cis-Chlordane, Dieldrin, and 4,4'-DDT were detected in CLDS water equipment blank, and trans-Chlordane, chromium, copper, nickel, and selenium were detected in CLDS grab equipment blank. All were at very low levels and are not considered to have an impact on sample results. Equipment blank performance data is presented in Appendix C.1.

4.3 Data Precision

Analytical precision was measured at the laboratory level using laboratory control sample (LCS) duplicates or matrix spike duplicates.

4.3.1 Elutriate and Ambient Seawater Measurement Precision

Elutriate analysis precision was evaluated using matrix duplicates, matrix spike duplicates, and Laboratory Control Sample (LCS) duplicates. Relative Percent Difference (RPD) objectives for this project were equivalent to the sediment objectives (20 percent for metals, 30 percent for trace organic compounds). The RPD criteria were met for all elutriate/seawater parameters, with the following exceptions: the RPD criteria were not met for the LCS/LCSD for Pentachlorophenol, where the reported RPD value was 40%; the sample duplicate (NHH-CLDS) for nickel where the reported RPD value was 49%; and the sample duplicate (Composite 2 -Rep1) for chromium, lead, and zinc where the reported RPD values were 62%, 26%, and 26%, respectively. These variances are not considered to adversely affect the elutriate dataset.

4.3.2 Sediment Measurement Precision

Sediment analysis precision was evaluated using matrix duplicates, matrix spike duplicates, and Laboratory Control Sample (LCS) duplicates. Relative Percent Difference (RPD) objectives for this project were 20 percent for metals and 30 percent for trace organic compounds. The RPD criteria were not met for select congeners in the laboratory duplicates; reported RPDs range from 42-51%. These may be the result of sample non-homogeneity. These variances are not considered to adversely affect the sediment dataset.

4.3.3 Tissue Measurement Precision

Tissue analysis precision was evaluated using matrix duplicates, MSDs, and LCS duplicates. The tissue RPD objectives for this project component were also 20 percent for metals and 30 percent for trace organic compounds. The RPD criteria were not met for select congeners and Zinc in the laboratory duplicates; reported RPDs range from 26-107%. These may be the result of sample non-homogeneity. The RPD criterion was not met in the MS/MSD for PCB congener C13-BZ#18; reported RPD value 55%. The RPD criteria were not met for select pesticides in the LCS/LCSD; reported RPDs range from 31-122%. These variances are not considered to adversely affect the tissue dataset.

4.4 Data Accuracy

Accuracy was evaluated using several QC sample types by calculating the percent recovered for each parameter of interest. A recovery value of 100% corresponds to 100% accuracy in this analysis. LCS and matrix spiked samples were incorporated as accuracy QC samples. Additionally, surrogate spikes were used to evaluate the accuracy of organic measurements and standard reference materials (SRMs) were included where available.

4.4.1 Elutriate and Ambient Seawater Analysis Accuracy

The chromium and silver results in the LCSs associated with NHH-CLDS and all elutriate composite samples were reported between 0% and 6%, this would represent a low bias for detected results in the associated samples; the non-detect results would be unusable. The cadmium, copper, lead, nickel, and zinc results in the LCSs associated with NHH-CLDS and all of the elutriate composite samples 1, 2, and 6 and the copper result in the LCS associated with all of the elutriate composite samples 3, 4, and 5, were below the lower control limit of 80%. This would represent a low bias in the associated samples for these analytes. Heptachlor was reported at 39% and 37% and Aldrin was reported at 37% and 34% in the LCS/LCSD associated with all of the elutriate composite samples 3, 4, and 5. This would represent a low bias in the associated samples for these analytes.

Matrix spike results for cadmium, chromium, copper, lead, nickel, silver, and zinc and the MS/MSD results for Heptachlor and Aldrin associated with NHH-CLDS were below the low control limits. This would represent a low bias for the results in the associated sample. Matrix spike results for cadmium, chromium, copper, lead, nickel, silver, and zinc associated Composite 3-Rep 1 were below 30%. This would represent a low bias for the detected cadmium, chromium, and zinc results in the associated sample; the non-detected copper, lead, nickel, and silver results would be unusable. The MS/MSD results for mercury associated Composite 3-Rep 1 were 78% and 78%. This would represent a low bias for the results in the associated sample.

The recoveries for PCB congener surrogate, BZ-198, and pesticides surrogates DBOB and BZ-198 for Pump Blank and Core Blank were below the low control limits; results for these samples would be considered bias low. The recoveries for the pesticide surrogates, BZ-198, for CLDS-Water-EB and CLDS-Grab-EB and DBOB for CLDS-Grab-EB were below the low control limits; results for these samples would be considered bias low. The recovery of pesticide surrogate, BZ-198 for Composite 5-Rep 2 was above the upper control limit at 184%. All results were non-detected; no impact to the data. The recoveries of the pesticide surrogate BZ-198 on column B were above the upper control limit for Composite 4-Rep1 (291%), Composite 4-Rep 2 (360%), Composite 3-Rep 1 (271%), and Composite 3-Rep 2 (303%). Detected results on column B in these samples would be considered bias high.

4.4.2 Sediment analysis accuracy

Percent recovery objectives for sediment measurements were met with few exceptions. Results for individual target analytes exceeded control limits in some matrix spikes; this is generally indicative of a sample specific matrix interference. Also, Trans Nonachlor measured in the sediment SRM was outside of the certified range. None of the exceedances are considered to negatively impact data usability.

4.4.3 Tissue Analysis Accuracy

The SRMs represent an excellent measure of overall analytical accuracy. Results below criteria were reported for As, Cd, Zn, and PCB congener C13-BZ#28 in the SRMs; associated sample results for these analytes would be considered biased low.

An elevated recovery (122%) was reported for Hg in a metals LCS. Mercury was not detected in any of the associated samples. LCS recoveries were below criteria for pesticides Methoxychlor (17%) and Endosulfan II (45%); however, the LCSD recoveries for these analytes were within criteria.

Matrix spike recovery measurements were largely within work plan specified limits. An elevated recovery (193%) was reported for C13-BZ#18 in PCB congener MSD associated with sample B567PRENVA and a low recovery (49%) for C14-BZ#49 in PCB congener MS associated with sample B567PRENVA. More information can be found in the individual laboratory reports. None of the variances are considered to negatively impact data usability.

4.5 Chemical QA/QC Summary

All non-detected pesticide results for all elutriate composite 3, 4, and 5 samples are considered unusable and the pesticide detects, PCB detects and PCB non-detects for these composites are considered as estimated with a low

AECOM

bias. As noted in Section 3.1.2.1 and Table 15, the LC50 performance of the ammonia-mitigated SPP assays was >100% for all assays.

The hexavalent chromium data for NHH-CLDS, CLDS-Water-EB, and CLDS-Grab-EB Water may be used for information purposes but are considered rejected due to the holding time exceedance documented by the laboratory. Several non-detected elutriate metals are considered unusable due to LCS and MS non-conformances.

Remaining analytical results are considered usable as reported.

This Project Work Plan has been prepared by AECOM for the United States Army Corps of Engineers (USACE), New England District (NAE) in support of NAE's New Haven Harbor proposed navigation improvement project (proposed project) located in New Haven, Connecticut. USACE's (2001) Engineer Manual (EM) 200-1-3 *Requirements for the Preparation of Sampling and Analysis Plans* was referenced during the preparation of this Work Plan. The Work Plan has been prepared in accordance with the program design provided in the Performance Work Statement (PWS) entitled "*Supplemental Sampling and Testing in Support of the New Haven Harbor Navigation Improvement Project New Haven, Connecticut*" dated 25 July 2018. The PWS scope was subsequently issued to AECOM on 21 August 2018 and was further revised by NAE on 11 October, 2018. The enclosed Work Plan is comprised of a Field Sampling Plan (FSP; Work Plan Section A) and a Quality Assurance Project Plan (QAPP; Work Plan Section B).

The New Haven Harbor dredged material suitability determination field program will be completed by both NAE personnel (harbor site sampling) and individuals on the AECOM/Ocean Surveys, Inc. (OSI) Team (collectively the AECOM Field Team). Field activities to be undertaken by the AECOM Field Team include: collection and transport of sediment and water samples from the Central Long Island Sound Disposal Site (CLDS) Reference Site; as well as receipt and delivery of NAE-collected representative sediment and water samples from the proposed navigation improvement project.

Field tasks described within this Work Plan focus primarily on activities that will be undertaken by the AECOM Field Team. Sampling techniques and Standard Operating Procedures (SOPs) to be employed by NAE personnel, relative to sediment and water collection activities within the proposed New Haven Harbor navigation project are addressed in detail under separate cover.

Field Sampling Plan

Supplemental Sampling and Testing – New Haven Harbor Navigation Improvement Project, New Haven, Connecticut

A.0 Field Sampling Plan (FSP)

A.1 Project Background

The New England District (NAE) of the US Army Corps of Engineers (USACE) is currently preparing a feasibility study for improvements to the New Haven Harbor Federal navigation project (FNP). Anticipated project components include: deepening and widening the main ship channel, widening the channel bend at Southwest Ledge, straightening the channel bend downstream of the existing turning basin; and relocating and deepening the turning basin. These combined actions would require the mechanical removal of up to 4,500,000 cubic yards of sediment and up to 32,000 cubic yards of rock depending on the selected channel alignment and dimensions. Dredged sediments are expected to be a mix of poorly graded sand and fine grained material within the existing channel profile and adjacent harbor seafloor with glaciofluvial deposits at depth. To the extent practical, suitable dredged material will be beneficially reused for marsh creation, habitat restoration, and/or as cover of historic dredged material disposal mounds at the Central Long Island Sound Disposal Site (CLDS). Unsuitable material will be placed in a confined aquatic disposal (CAD) cell to be located in the inner harbor.

NAE completed a sampling and testing effort during the summer of 2017 in order to characterize the materials to be dredged. NAE later revised the alignment of the proposed channel and turning basin based on the results of ship simulation modeling. In addition, a portion of the material from the inner harbor was determined to be unsuitable for unconfined open water placement, based on the results of suspended particulate phase and whole sediment bioassays. In July 2018, NAE coordinated a supplemental sampling and analysis plan (SAP) to characterize sediment from reaches of the redesigned project that were not previously sampled, to characterize the material that would be dredged during CAD cell construction, and to further define the extent of unsuitable material in the inner harbor. The enclosed FSP was prepared in support of this New Haven Harbor SAP.

A.2 Project Organization and Responsibilities

Highly qualified individuals have been selected for each of the tasks to ensure that the project objectives are accomplished accurately and efficiently. The project organization and work breakdown is depicted in **Figure A-1**. Individual responsibilities are detailed below.

Figure A-1 Task Order Organization and Project Contact Information

M18_006

Contact	Phone	Responsibility
R. Ben Loyd	978-318-8048	NAE Technical Manager
Don Dwight	978-905-2970	AECOM Program Manager
Maura Surprenant	508-833-6960	AECOM Deputy Program Manager
Kris van Naerssen	484-678-1876	AECOM Task Order Manager
Paula Winchell	774-454-7653	AECOM Field Services Task Leader/SSHO/Chief Scientist
C.J. Nixon	203-654-1174	AECOM Transport Driver
Rich Renzi	978-905-3137	AECOM Health & Safety Officer
Debra Simmons	978-905-2399	AECOM QA Officer
Edith Hutchinson	508-524-5442	AECOM Chemistry Coordinator
Christine Archer	603-622-1556	AECOM Biology/Bioassay Laboratory Coordinator

Contact	Phone	Responsibility
Kenneth Cadmus	860-395-8112	OSI Project Manager & Vessel Captain
Morgan Barrett	860-227-1355	OSI Vessel Captain / Mate (Alternate)
Kyle Toothaker	860-227-7995	OSI Mate
Ken Simon	603-475-7654	ESI Technical Advisor
Kirk Cram	603-926-3345	ESI Laboratory Director
Liz Porta	508-822-9300	Alpha Laboratory Project Manager

NAE Technical Manager (TM)

The NAE Technical Manager, Mr. R. Ben Loyd, will be consulted during the project planning and performance phases. As the primary point of contact for NAE and this scope of work, Mr. Loyd will be in daily contact with the AECOM project team during field sampling activities and weekly contact with the AECOM team during sample preparation, chemical and biological analysis, and in regular contact, in the event that any problems are encountered.

AECOM Program Manager (PM)

Mr. Don Dwight, serving as AECOM's Program Manager (PM), will provide overall leadership in the performance of this task order with regular NAE and AECOM team communications. Mr. Dwight will verify that the right people are committed to contract tasks, that safety and quality systems are in place, regular reviews are undertaken, issues resolved without delay and contractual specifications met or exceeded.

AECOM Deputy Program Manager (DPM)

Ms. Maura Surprenant, serving as AECOM's Deputy Program Manager (DPM), will provide daily leadership in the performance of this task order with regular NAE and AECOM team communications. Ms. Surprenant will assist Mr. Dwight with daily duties including ensuring that the right people are committed to contract tasks, that safety and quality systems are in place, regular reviews are undertaken, issues resolved without delay and contractual specifications met or exceeded.

AECOM Task Order Manager

Mr. Kris van Naerssen will serve as the AECOM Task Order Manager, with the responsibility for technical, financial, and scheduling matters related to this task. Mr. van Naerssen, as the point of contact between task leads, safety and quality managers, and program management, will communicate regularly with the project team to discuss action items, schedule, financial, and technical considerations on a regular basis during the implementation of this Work Plan and will procure the subcontractor team.

Mr. van Naerssen will also oversee the preparation of the task reports to ensure they meet or exceed NAE specifications, particularly as required by NAE's Regional Implementation Manual (RIM; Environmental Protection Agency [EPA]/USACE, 2004). Raw and statistical data will be provided to fully support agency dredged material (DM) suitability decision-making. All reports will be available electronically and the water chemistry and toxicity data will be provided in electronic data deliverable (EDD) format meeting RIM requirements. Quality control (QC) summary tables will be included with each data submission.

AECOM Safety and Health Manager (SHM)

Mr. Richard Renzi, CIH is AECOM's SHM dedicated to this investigation with direct communication to the AECOM Task Order Manager and Site Safety and Health Officer (SSHO). He will prepare/ review all modifications to the project Accident Prevention Plan (APP), and any applicable Activity Hazard Analyses (AHA). Specific duties include:

- On behalf of AECOM, reviewing and approving the APP and amendments and ensuring that Engineer Manual EM 385-1-1 requirements are fully met before delivery of the APP to the NAE TM and NAE SHE Manager for approval;
- Advising the AECOM Task Order Manager on matters relating to health and safety at the site;
- Conducting accident investigations;
- Maintaining regular contact with the project team to evaluate site conditions and new information that might require modifications to the APP; and
- Overseeing the SSHO.

Project Quality Assurance (QA) Officer

Ms. Debra Simmons will serve as the Project Quality Assurance (QA) Officer and has overall responsibility for quality assurance oversight. Ms. Simmons has led quality assurance programs for more than 30 years and in this role will communicate directly to the AECOM Task Order Manager. Specific responsibilities include:

- Implementation of this Work Plan upon approval;
- Reviewing and approving QA procedures on behalf of AECOM, including any modifications to existing approved procedures;
- Ensuring that QA audits of the various phases of the project are conducted as required; and
- Providing QA technical assistance to project staff.

Field Services Task Leader, Chief Scientist & SSHO

Ms. Paula Winchell, serving as the Field Services Task Leader will provide leadership in every aspect of the field program, and implement the sediment and water collection program. Ms. Winchell will oversee the field services subcontractor (OSI) and all AECOM Field Team sample collection activities.

The Field Services Task Leader has overall responsibility for completion of all field activities in accordance with the Work Plan and is the communication link between the Program Manager and the field team. This individual also acts as the SSHO and will engage the field personnel in daily safety discussions, field safety related documentation (float plans, etc.) and will be the primary point of contact for all field related safety communications. Specific responsibilities of the Field Services Task Leader include:

- Coordinating activities in the field, and assigning specific duties to field team members;
- Collecting samples, conducting field measurements, and decontaminating equipment according to documented procedures stated in the FSP and QAPP;
- Mobilizing and demobilizing of the field team and subcontractors;
- Directing the activities of subcontractors in the field;
- Resolving any logistical problems that could potentially hinder field activities, such as equipment malfunctions or availability, personnel conflicts, or weather dependent working conditions;
- Implementing field QC including issuance and tracking of measurement and test equipment; the proper labeling, handling, storage, shipping, and chain of custody (COC) procedures used at the time of sampling; and control and collection of all field documentation;
- Ensuring that field documentation and data are complete and accurate
- Communicating any nonconformance or potential data quality issues to the DPM.
- Serving as SSHO (see Section A.3.2); and
- Preparing the Field Report.

Chemistry Coordinator

Ms. Edith Hutchinson, as the Chemistry Coordinator, will oversee the subcontractor chemical testing. Ms. Hutchinson, a Senior Chemist, will serve as the liaison between field and laboratory personnel; supervise data review activities, and author related progress reports.

Biology/Bioassay Laboratory Coordinator

Ms. Christine Archer, an Ecotoxicologist and former bioassay laboratory biologist, will serve as the Biology/Bioassay Laboratory Coordinator. Ms. Archer will coordinate with the laboratory to implement sample composite formation, preparation of elutriate samples, and performance and reporting of the SPP, 10-day bioassay results, 28-day bioaccumulation results, and all relevant statistics.

OSI Project Manager

Ocean Surveys, Inc. (OSI) of Old Saybrook, CT will provide field services and equipment for the project. OSI will be responsible for providing and maintaining the sampling vessel for the reference site sampling, vessel and equipment handling staff, appropriate field equipment for positioning the vessel and obtaining sediment and water samples at the specified sample depths provided in the PWS. Mr. Kenneth Cadmus will serve as the OSI Project Manager and will be responsible for ensuring the Work Plan boat based field sampling and program safety requirements for OSI personnel are appropriately implemented.

Mr. Ken Cadmus, or the designated alternate, will captain the sampling vessel and oversee navigational and shipboard operations. Mr. Cadmus will implement the field survey requirements specified in this Work Plan when approved.

ESI Technical Advisor

Mr. Ken Simon, EnviroSystems Inc.'s (ESI) Technical Advisor will provide overall leadership on toxicity testing aspects of this Work Plan.

ESI Laboratory Director

Mr. Kirk Cram, ESI's Laboratory Director, will oversee ESI's implementation of this Work Plan and the specifications detailed in Section B (QAPP). ESI's responsibilities include elutriate/ SPP sample preparation, toxicological testing (both 10-day testing and the 28-day bioaccumulation testing) and associated reporting. Mr. Cram will communicate with the AECOM Biological and Chemistry Laboratory Coordinators to confirm the condition of samples arriving at the laboratory, verify the COC specified sample list and testing requirements, oversee the preparation of sample composites, standard chemical elutriate and SPP preparations, and all project bioassays. He will bring any project concerns to the AECOM Biological Laboratory Coordinator without delay, and transmit EDDs and related laboratory reports, and bioassay results with corresponding statistics and reports to the AECOM Biological Laboratory and Chemistry Coordinators according to the established project schedule.

Alpha Laboratory Manager

Ms. Liz Porta, Alpha Analytical Laboratory Project Manager will oversee the implementation of the bulk sediment chemistry, elutriate chemistry and tissue analytical portions of this Work Plan, including the specifications detailed in Section B (QAPP). Alpha will be responsible for chemical laboratory activities involving the above analyses, including data analysis and reporting. She will communicate with the AECOM Laboratory and Chemistry Coordinators to confirm the condition of samples arriving at the laboratory, verify the COC specified sample list and testing requirements, oversee the preparation of sample composites, and all project analyses. Ms. Porta will bring any project concerns to the AECOM Laboratory Coordinator without delay, and transmit the chemistry EDDs and related laboratory reports to the AECOM Laboratory and Chemistry Coordinators according to the established project schedule.

A.3 Project Scope and Objectives

The objective of this work is to acquire data for the characterization of sediments proposed for navigation improvement dredging from New Haven Harbor.

A.3.1 Task Description

This New Haven Harbor dredged material suitability determination project will require the collection of discrete sediment samples from thirteen stations throughout the FNP which are representative of the material to be dredged. Samples (cores) collected by NAE from discrete locations within the proposed project footprint will be combined into six composite samples. Seawater will also be needed to evaluate potential water column impacts (i.e., the formation of chemical elutriate and suspended particulate phase (SPP) samples). In accordance with Table A-1, materials from Composite Sample 1 will be excluded from the 10-Day and 28-Day bioassays.

The proposed work involves NAE collecting sediment cores to the project design depths, plus appropriate overdepths (see **Table A-1**) from thirteen locations along a stretch within the FNP to be analyzed for parameters as defined in Tasks 5 through 10. It is anticipated that the New Haven Harbor sediment cores will be combined into six composites for analysis. The AECOM Team will collect reference site sediments from the CLDS reference site, located at latitude 41.134850 N and longitude 72.834690 W (NAD83).

New Haven Harbor water samples will be collected by NAE from a central area to each sediment core composite location. This water will be used in the preparation of dredge site elutriate samples. The AECOM Field Team will collect water samples from the CLDS reference site location, for use in preparation of SPP samples for biological analyses and for associated water chemistry analyses.

Testing results will be used to characterize the sediment in order to determine the suitable alternatives available for disposal.

General guidance for this work is found in the EPA/USACE regional protocol “Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters” (RIM, EPA/USACE, 2004). Sampling, testing, and QA/QC procedures as required and detailed in the RIM are referenced in each task of the PWS (NAE, 2018).

To accomplish the full range of project requirements, NAE has established the following tasks:

Task	Description
1	Work Plan
2	Accident Prevention Plan
3	Field Support for Dredge Site Sediment and Water Collection
4	Reference Site Sampling
5	Sediment Chemistry
6	Standard Elutriate Testing
7	Suspended Phase Acute Toxicity Testing
7.1	Suspended Phase Acute Toxicity Testing With Ammonia Reduction (Optional)
8	10-day Whole Sediment Acute Toxicity Testing
9	28-day Bioaccumulation Testing
10	Tissue Analysis
11	Reporting

A.3.2 Health and Safety

A program specific APP has been developed and was submitted to NAE, in draft form on October 12, 2018. The APP was prepared in accordance with EM-385-1-1. The APP addresses unusual or unique aspects of the proposed scope of work to be executed (e.g., working on water, etc.). A draft version of the APP was submitted electronically to the Safety and Occupational Health Office and to the NAE Technical Manager along with a draft version of this Work Plan. The final version of the APP will incorporate any pending NAE comments and will be submitted electronically prior to the commencement of field efforts.

The APP addresses AECOM-specific policies and procedures that must be followed over the course of the field program, and should be considered a “living document” that can be updated based on changing site conditions. Task-specific AHA documents have been prepared, for use in the field for each major phase of work to be completed. A major phase of work is defined as an operation involving a type of work presenting hazards not experienced in previous operations or where a new subcontractor or work crew is to perform the work. The analysis defines all activities to be performed, identifies the sequence of work, the specific hazards anticipated, and the control measures to be implemented to eliminate or reduce each hazard to an acceptable level. Prior to the commencement of any field work, the training records for all staff (AECOM and subcontractors) proposed to be utilized on this program will be reviewed to ensure that they are current.

The SSHO for this project is Ms. Paula Winchell. Ms. Winchell will be responsible for general day-to-day health and safety of AECOM field personnel and subcontractors, ensuring that all AECOM Field Team staff participate in daily tailgate/ dockside safety meetings, ensuring correct usage of personal protective equipment (PPE) by field staff, and monitoring of field activities for adherence to the APP (and Work Plan). Ms. Winchell will also be responsible for hosting a project Healthy and Safety kickoff meeting for all staff prior to mobilization.

In the event of an incident, Ms. Winchell is responsible for initial response protocols, incident management, and proper reporting. Ms. Winchell and all field staff have “Stop Work Authority” in the event an employee identifies a condition or act that is likely to cause an Imminent Danger situation.

All safety meetings/ briefings will be documented and submitted to the NAE as part of standard reporting procedures. AECOM will complete the “USACE Contractor Monthly Summary Record of Injuries/ Illness and Work Hour Exposure” log (for prime and its subcontractors) and electronically submit the completed form to the Environmental Resources Section (ERS) project manager (R. Ben Loyd) and the NAE Safety and Occupational Health Office (Sheila Harvey) no later than the 5th calendar day of the following month. This form shall be submitted during months with active field efforts.

A.3.3 Project Mobilization

Upon NAE’s approval of this Work Plan and project APP, the project team will mobilize to the field in order to:

- receive NAE-collected sediments and water samples from the New Haven Harbor dredge site; and,
- to collect surface sediment and seawater samples at the CLDS Reference Site; and,
- to deliver the harbor and reference site samples to the analytical laboratories.

Following the collection of sediment and water samples, sample compositing, sample preparation and sample analyses will commence at the selected project laboratories (i.e. at ESI [sample compositing, elutriate preparation, SPP Assays, 10-Day Toxicity Testing and 28-Day Bioaccumulation Testing] and at Alpha [bulk sediment chemistry, elutriate chemistry and tissue chemistry]).

Table A-1 New Haven Harbor (NAE Sampling Locations) – Coordinates / Estimated Penetration / Sample Quantities

TABLE A-1: SAMPLING LOCATIONS - COORDINATES / ESTIMATED PENETRATION/ SAMPLE QUANTITIES (Adapted from USACE NHH PWS)														
Sample ID	Composite ID	Latitude	Longitude	Survey Depth (FT MLLW)	Project Depth + Overdepth (FT MLLW)	Estimated Core Length (FT)	Estimated Volume Per Core (Gallons) *	Minimum Sample Volume per Location (Gallons) **	Estimated Minimum Number of Buckets / Carboys ***	Required Analyses

* Volume estimated assuming 3" inner diameter core liners for dredge area sediment samples

** Assumes 23 gallons of sediment per composite (25 gallons at QC stations) for testing and archiving unless otherwise specified. QC stations may change; however, QC samples are depicted at Stations 2 and 3 in this example. Sediment cores for bulk chemistry are not included in volume calculations.

*** 28 gallons of dredge site water will be collected from a central location in the vicinity of each composite group (37 gallons to be collected at QC stations). QC stations may change; however, QC samples are depicted at Stations 2 and 3 in this example.

Sample containers for dredge area sediments shall be 3.5 gallon food grade high density polyethylene pails with locking lids (Grainger® item numbers 49EN25 and 49EN23 or equivalent). Sample containers for dredge area water shall be 5 gallon food grade collapsible carboys (Grainger® item number 9LA45 or equivalent).

 * CLDS Reference Site locations.
 + Sediment composite and water sample volumes reflected in the PWS (NAE, 2018) have been amended to account for material volume details provided by the ESI and Alpha Project Managers on 8/30/18 and 10/15/18.
 ** Based on field conditions, QC samples may be obtained from alternate composites. Sufficient volumes for project QC obtained from Composite 2 and 3 in the above example.
 *** No 10-Day or 28-Day Sediment Toxicity to be performed on Composite 1 materials

Data gathered in the tasks described herein will be evaluated to assess the suitability of the material for unconfined open water disposal and potential risks to marine life posed by the material to be dredged:

- Aquatic life exposures** may be assessed with a chemistry screening approach, but are generally modeled using a mixture of seawater and the material to be dredged corresponding to standard chemical elutriates and SPP samples (Tasks 6, 7 and 7.1). Chemical elutriate results are used to ensure that Ambient Water Quality Criteria (AWQC) will not be exceeded at the dredged material placement site (CLDS) four hours after discharge, or outside of the site boundary at any time. SPP toxicity testing results are used to develop a Limiting Permissible Concentration (LPC), and, based on regulatory modelling by ADDAMS/ STFATE, are also used to determine Marine Protection, Research, and Sanctuaries Act (MPRSA) §103 water column compliance. SPP toxicity tests include three species: a fish, a mysid shrimp, and a sea urchin (Task 7). These species are sensitive to multiple parameters, including ammonia levels which may be elevated in the elutriates. If elevated ammonia levels are measured in the SPP tests, then these tests will be repeated with new elutriates prepared after an ammonia reduction procedure is implemented (see Section B.7.2).
- Whole sediment exposure** will be assessed with whole-sediment bioassay data (Task 8) and bioaccumulation data (Tasks 9 and 10). The RIM (EPA/ USACE, 2004) summarizes the wide range of parameters included in the assessment. The biological testing incorporates aquatic

organisms (i.e. amphipod and shrimp; clam and worm) to identify the potential impacts to sediment-associated organisms.

A.3.4 Applicable Regulations/ Standards

This project has been designed to collect environmental data needed to characterize the sediment to be dredged, and determine suitability for placement unconfined in the marine environment under MPRSA §103, detailed in the Ocean Dumping Regulations (Title 40, Code of Federal Regulations, [CFR] 220-229). As such, the work will be guided by NAE's *Regional Implementation Manual for the Evaluation of Dredged Material Proposed for Disposal in New England Waters* (RIM, EPA/ USACE, 2004), the *Evaluation of Dredged Material Proposed for Ocean Disposal – Testing Manual* (Green Book, EPA/ USACE, 1991), and the *Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S.* (Inland Testing Manual, EPA/ USACE, 1998). These regulations are adhered to within the jurisdictional area of the NAE by the RIM and the laws and regulations of Connecticut (where this proposed project is located).

A.3.5 Project Schedule

The sampling schedule is provided in **Table A-3** along with project milestones and deliverables.

A.4 Non-measurement Data Acquisition

AECOM anticipates that relevant grain size or other site information reviewed by NAE for planning purposes would be available if needed.

A.5 Field Activities

The New Haven Harbor dredged material suitability determination field program will be completed by NAE personnel and by the AECOM Field Team (AECOM and OSI personnel). AECOM Field Team activities include: collection of sediment and water samples from the CLDS Reference Site; as well as receipt and delivery of NAE-collected representative sediment and water samples from New Haven Harbor.

Field activities described herein focus primarily on AECOM Field Team activities. Sampling techniques and SOPs to be employed by NAE personnel, relative to sediment and water collection activities within the New Haven Harbor proposed navigation improvement project, are addressed in detail under separate cover (NAE Sampling and Analysis Plan).

The sampling approach selected by NAE to meet the project objectives requires the collection of the following sample types:

- New Haven Harbor sediment cores to be collected and composited by NAE (13 stations / 6 composites)
- New Haven Harbor water samples to be collected by NAE (Central location to each composite). Single- to multiple-depth seawater collection at the New Haven Harbor sampling stations (by NAE) [composite of surface, mid-depth, and bottom water (3-feet above) when overlying water depth > 30 ft. MLLW, and collection at mid-depth only for overlying water depths < 30 ft. MLLW].
- CLDS Reference Site sediment grab sampling by the AECOM Field Team
- CLDS Reference Site water sampling by the AECOM Team at near surface (3-feet below) or mid-depth prior to the collection of the sediment samples¹.

¹ In contrast to the PWS language regarding sampling depths; but, in accordance with RIM guidance and NAE Technical Manager guidance (15 October 2018). RIM Section 4.5 states "*Dilution water is used in water column toxicity tests to make up the required dilutions. It must be clean seawater, appropriately aged*

A.5.1 New Haven Harbor Proposed FNP and CLDS Reference Site Sediment

Sediment within the proposed FNP will be cored by NAE to the authorized depth (plus allowable over dredge) to fully characterize the sediment prism that requires removal/dredging. The dredge site sediments will be used in the bulk sediment chemistry, toxicity testing, bioaccumulation testing and associated analyses.

At the reference site, only the surface sediment character is relevant for comparison purposes. As such, a grab sampler is the sampling equipment of choice. The CLDS Reference Site sediments will be used in the toxicity testing, bioaccumulation testing and associated analyses.

This section details the locations, composite preparation, field and laboratory measurements, and QC sampling requirements.

A.5.1.1 Coring Collection Locations

NAE has determined that 13 sampling stations are sufficient to further characterize the proposed navigation project to be dredged. New Haven Harbor sediment core samples will be collected by NAE sampling personnel. Station positions are detailed on **Table A-1** and depicted on **Figure A-2**.

artificial seawater, or seawater collected from the disposal site reference location at near surface or mid-depth prior to collection of the sediment samples."

Table A-3 Milestones & Deliverables Schedule (With Anticipated SPP Optional Task Flow & Timing Details)

Task	Milestone ¹	Schedule*
	TASK NOTICE TO PROCEED	21 September 18
	PLANNING	
1, 2	SAP & APP preparation	24 September 18 - 15 October 18
	DRAFT SAP delivered to NAE	15 October 18
	DRAFT APP delivered to NAE	12 October 18
	NAE SAP & APP review, AECOM finalizes, NAE approves SAP & APP	19 October 18
	SAMPLE COLLECTION	
3	Field Effort: 3 day effort - NAE New Haven Harbor FNP sampling surveys	22-24 October 18
	Field Effort: 3 day effort - AECOM receives NAE-collected sediment and water samples	22-24 October 18
	Field Effort: 1-day CLDS Ref sediment and water sample collection	23 October 18
4	AECOM transport and deliver samples to ESI / ESI Initiate sample processing	23 - 25 October 18
	Submit Field Report (Incl. Sample Logs and COCs) to NAE	01 November 18
5	BULK SEDIMENT CHEMISTRY	
	Bulk Sediment Chemistry – samples by courier to Alpha	24 October 18
	Bulk Sediment Chemistry Progress Report and EDD delivered to NAE	21 November 18
6	ELUTRIATE CHEMISTRY & SUSPENDED PARTICULATE PHASE TESTING	
	Elutriate Preparation	24 & 25 October 18
	Start Elutriate Chemistry (plus ambient water) – Samples by courier to Alpha	25 & 26 October 18
	Elutriate/Site Water Progress Report and EDD delivered to NAE	27 November 18
7	SPP BIOASSAY (Prepare Elutriates)	24 & 25 October 18
	Ammonia readings / Ammonia reduction Discussions	25 & 26 October 18
	Introduce Organisms (Once Approved / Acceptable conditions met)	25 & 26 October 18
	SPP bioassay – ammonia reduction OPTION	Notify NAE within 24 hours of ammonia threshold exceedance / need for option
	Initiate Ferretti Method	26 & 27/29 October 18
	SPP progress report delivered to NAE (without statistical analysis)	Within 1 week of test completion
8	10-DAY WHOLE SEDIMENT ACUTE TOXICITY BIOASSAY	
	Samples loaded, ammonia equilibration	28 November 18
	10-day bioassay testing	05 December 18
	10-day whole sediment bioassay written progress report delivered to NAE	04 January 19
9	28-DAY BIOACCUMULATION	
	28-day Bioaccumulation testing initiation	05 December 18**
	28-day Bioaccumulation testing conclusion	02 January 19**
	28-day Bioaccumulation Progress Report delivered to NAE	30 January 19
10	TISSUE ANALYSIS	
	Tissue Analysis	04 January 19**
	Tissue Analysis Progress Report and EDD delivered to NAE	15 February 19**
	Tissue Analysis statistics complete	01 March 19
11	FINAL REPORT	
	Draft Final Report delivered to NAE	14 March 19
	Final Report delivered to NAE	Within 7 days of receipt of NAE comments

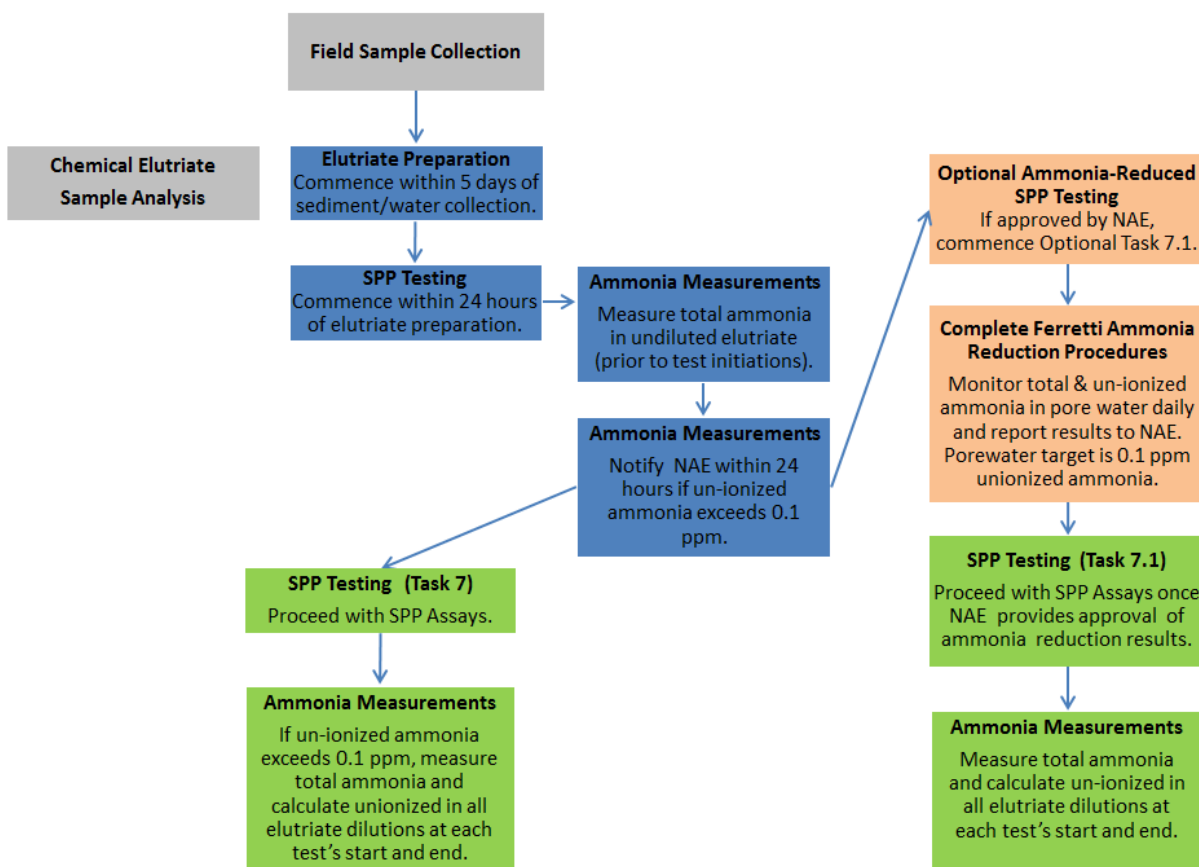

¹NAE Deliverables are bolded

* Anticipated on or before.

**Schedule as per PWS delivery schedule constraints and anticipated field sampling dates. 28-Day Assay & Tissue Analysis may need to start earlier than dates shown, in order to meet the required interim tissue report delivery date, as

Task	Milestone ¹	Schedule*
shown (assuming a 3-week standard tissue analysis TAT).		

Optional Task 7.1: Anticipated Flow and Timing Detail

Task Reporting– See Accompanying Delivery Schedule Table

Action	Sample Delivery Batch 1	Sample Delivery Batch 2
NAE Sediment Collection	Monday & Tuesday (10/22 & 10/23)	Wednesday (10/24)
NAE Dredge Site Water Collection (14 day hold)	Monday (10/22)	Monday (10/22)
CLDS Water Collection (14 day hold)	Tuesday (10/23)	Tuesday (10/23)
Sample Delivery to ESI	Wednesday Morning (Sediment & Waters: 10/24)	Thursday Morning (Sediment Only: 10/25)
Prepare Elutriates	Wednesday (10/24)	Thursday (10/25)
Alpha Chemical Elutriate Courier (Hex Cr – 24 Hr.)	Thursday (10/25)	Friday (10/26)
Ammonia Elutriate Readings	Thursday (10/25)	Friday (10/26)
Introduce SPP Organisms	Thursday (10/25)	Friday (10/26)
Ferretti Contracting Discussions/Decision	Thursday (10/25)	Friday (10/26)
Initiate Ferretti Method	Friday (10/26)	Saturday (10/27)/ Monday (10/29)

To expedite the biological assay processing and to meet the project schedule constraints outlined herein, the AECOM team anticipates completing two sample deliveries to the toxicology laboratory, as outlined above.

Receipt of the CLDS and Dredge Site waters in the first delivery will be required by the laboratory. Further, provision of waters collected on the program's sampling "Day 2" (i.e. as listed as Tuesday 10/23/18, above) will allow the greatest balance between test initiation constraints (5 days) and water hold time constraints (14 days).

Figure A-2 New Haven Harbor Proposed Navigation Project [Figure from PWS, NAE, 2018]

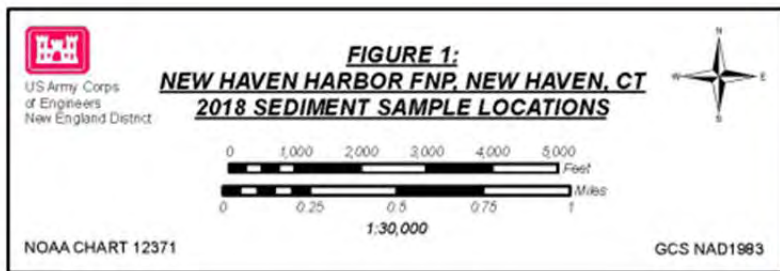

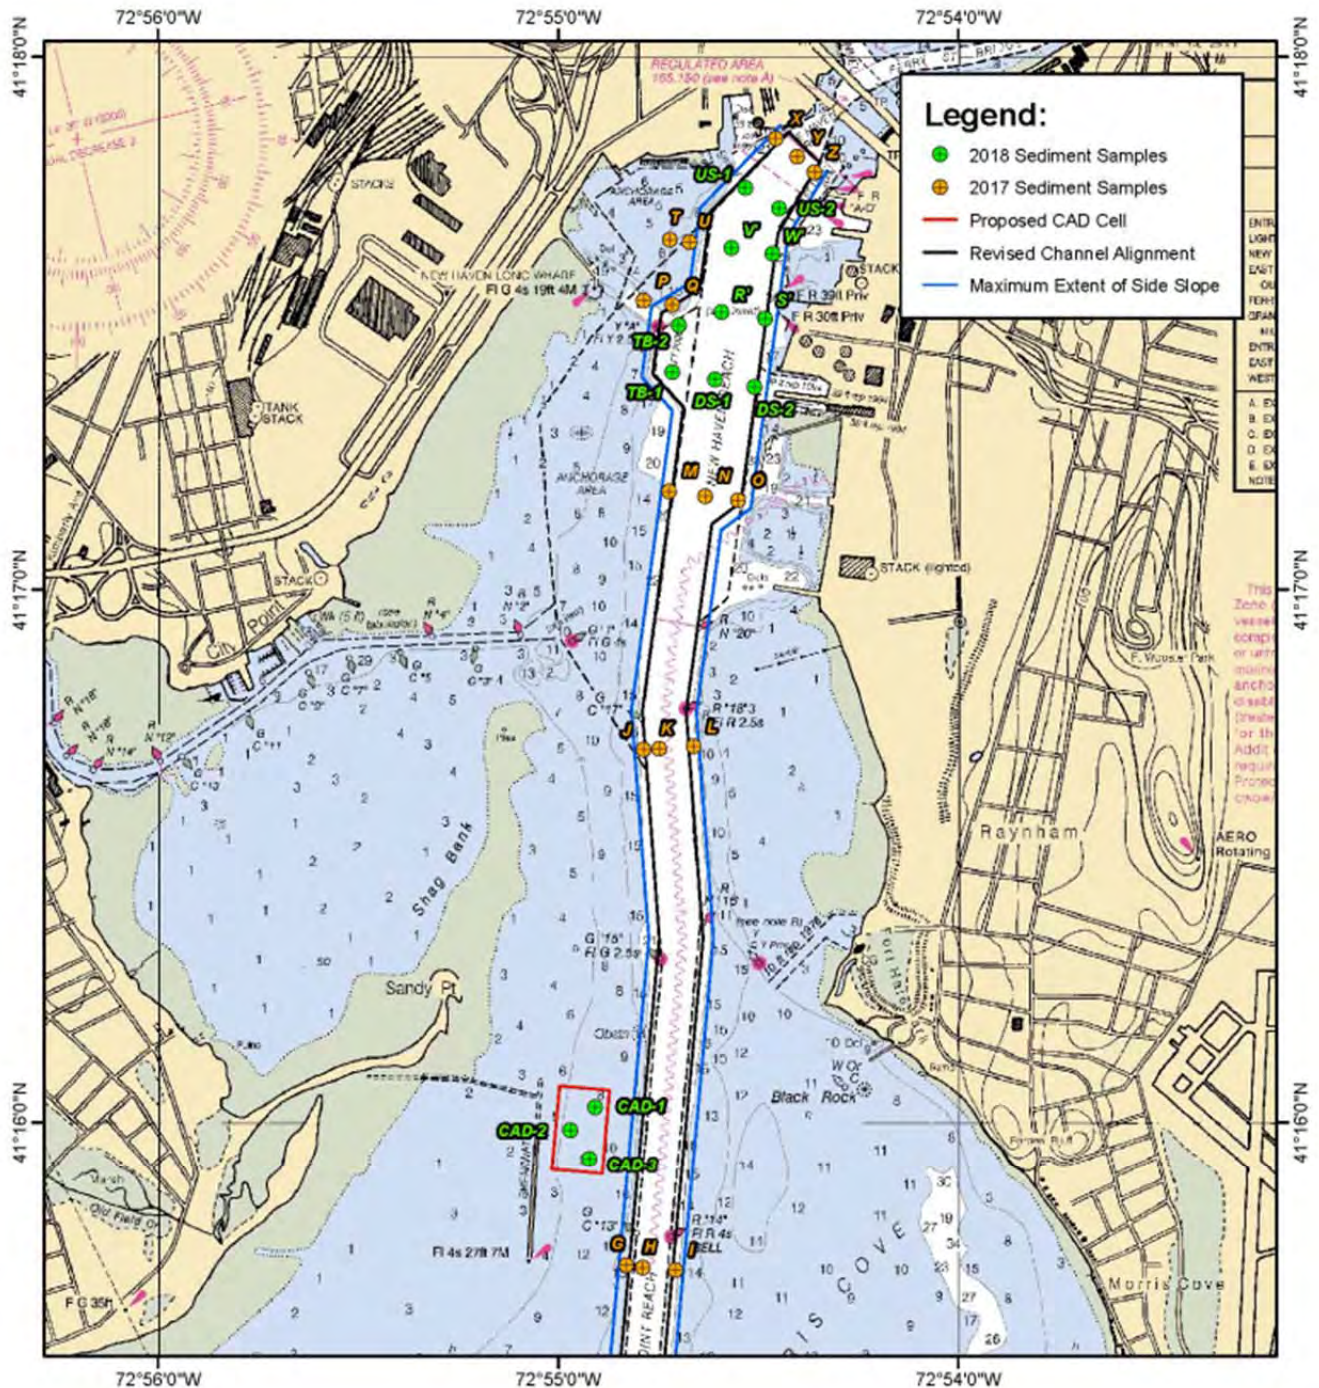

Figure A-3 CLDS Reference Site (Figure from PWS, NAE 2018)

CENTRAL LONG ISLAND SOUND DISPOSAL SITE

Description: The Central Long Island Sound Disposal Site (CLDS) is one of four regional dredged material disposal sites located in the waters of Long Island Sound. CLDS covers a 11.04 km² (3.2 nm²) area and is centered at 41° 08.950' N, 72° 52.950' W (NAD 83). It is located approximately 10.89 km (5.6 nmi) south of South End Point, East Haven, Connecticut. Since 1977, the management strategy at CLDS has entailed the controlled placement of small to moderate volumes of sediment to form individual disposal mounds on the seafloor. The authorized disposal point (within the overall disposal area) is specified for each dredging project in other project documents.

A.5.1.2 Discrete/Composite Sediment Sampling Requirements

Initially, the NAE-collected cores will be processed aboard the NAE sampling vessel (or on shore by NAE) and will be transferred to appropriate sample containers (provided by the AECOM Field Team). Sediments will be transferred from NAE to AECOM in the provided containers under chain of custody (see SOP ES-G-04). The sediment volume needed from each station and stations that will be pooled together by NAE to form composites, as detailed on **Table A-1**. Additionally, the sample volumes needed for the array of testing parameters are detailed on **Table A-4** *Sample Mass/ Volume Requirements*.

Biological laboratory composite preparation procedures are detailed in Section B of this Work Plan (QAPP).

Table A-4 Sample Mass/ Volume Requirements (minimum)

Parameter	Units	Sediment Volume		Water Volume		Prepared Elutriate Volume	
		New Haven Harbor (Per Tested Sample or Composite)	CLDS Reference Site	New Haven Harbor Dredge Site (Per Composite)	CLDS Reference Site (Total)	New Haven Harbor Dredge Site (Per Composite)	New Haven Harbor Dredge Site QC (two sets)
Chemistry Testing Parameters – Bulk Sediment							
Bulk Sediment Chemistry*****	L	0.25 (8 Oz Jars provided to NAE)	-	-	-	-	-
Chemistry Testing Parameters - Elutriate*							
Elutriate Chemistry - Prepared Elutriate**	L	12	-	48	-	21	-
Elutriate Chemistry - Prepared Elutriate for QC samples***	L	9 (18 for project)***	-	32 (64 for project)***	-	-	18 (36 for project)***
Chemistry Testing Parameters – Surface Waters							
Elutriate Blank Chemistry (Centrifuged Dredge Site Water)**	L	-	-	25	-	-	-
Reference Site Chemistry (Surface water or Mid-Depth Water)**	L	-	-	-	25 Collected in laboratory glassware	-	-
Toxicity Testing Parameters*							
SPP Toxicity Bioassay	L	4	-	16	72	8	-
SPP Toxicity Bioassay – Ammonia Reduced	L	4	-	16	72	8	-
10-Day Whole Sediment Toxicity Bioassay	L	6	6	-	-	-	-
Bioaccumulation Testing Parameters							
<i>Nereis</i> 28-Day Study	L	30	30	-	-	-	-
<i>Macoma</i> 28-Day Study	L	30	30	-	-	-	-
Total Volumes Required							
Bulk Sample Volume (L)	L	86 Per Sample [95 per QC sample]****	66 Total	106 Per Sample [137 per QC sample]****	170 Total (including above glassware)	37 Per Sample	18 Per Sample (2 for QC)
Bulk Sample Volume (Gal)	Gal	23 Per Sample [25 per QC sample]****	18 Total	28 [37 per QC sample]****	45 Total (including above glassware)	10 Per Sample	5 Per Sample (2 for QC)

Footnotes:

* In order to achieve the volumes of elutriate required for chemistry and biological (SPP) testing, the elutriate preparation methods assumes an ~50% yield of final elutriate volume.

**Elutriates, elutriate blanks and reference site waters are analyzed in triplicate. A final volume of 7-L of elutriate is required per replicate for analysis. Volume presented represents 7 L or elutriate per replicate x 3 replicates for each

composite.

***Two sets of QC samples are required for the project; each set requires one MS/Dup (all parameters: 14-L) and one MSD (Organics only: 4-L) sample. Additional volume should be prepared from two separate composites to prepare sufficient volume for QC (i.e. prepare an additional 18-L from Comp 2 and an additional 18-L from Comp 3 in this example).

****Volume in parentheses includes material required at composites with associated QC samples (two/project).

*****AECOM anticipates that NAE will collect 22 sets of bulk sediment chemistry for project analysis.

A.5.1.3 Sample Collection and Field & Laboratory Analysis

Navigation. Vessel positioning for all sediment collections will be accomplished utilizing a Differential Global Positioning System (DGPS) Integrated with HYPACK software with an accuracy of 3 meters or less according to AECOM SOP ES-G-02 (Appendix A). Local tide data will be obtained to calculate tidal height in feet above MLLW. The reference site target distance is defined as up to 250 feet from the sampling coordinate. Consultation with the Task Order Manager will be attempted prior to collection of materials from beyond this distance (if further relocation is required, based on benthic conditions). All coordinate data shall be reported in geographic NAD 83 decimal degrees. All depth data shall be reported in tenths of feet.

Care will be taken to avoid sample contamination from sampling gear, airborne dust, vessel engine exhaust, cross contamination, etc. If wind/current/ traffic conditions allow, engines will be shut off during sampling; otherwise, sampling will be performed upwind of exhaust and contamination sources. Final sample mixing will be performed in the laboratory for greater contamination control.

Collection & Analysis. The harbor locations will be cored by NAE using vibracoring equipment according to the NAE SAP/SOPs. Grab samples of the surface sediment from the CLDS Reference Site and will be collected using a Ponar, Ted Young modified Van Veen grab sampler, or equivalent, in accordance with AECOM SOP ES-S-01 (Appendix A). **Table A-5** lists the equipment intended for use during project performance and equipment calibration /checking requirements are detailed in **Table A-6**.

Table A-5 Proposed Sampling Gear for the CLDS Sampling Task

Equipment	Description	Objective
Sampling Vessel	27-foot Forward Cabin Power Boat	Reference station sampling
Refrigerated Storage Vehicle	16 foot Refrigerated Box Truck, Refrigerated Van, or equivalent	Chilled sample storage during the field program
DGPS	Sub-meter GPS with Hypack Survey Software or equivalent	Vessel positioning and data collection
Grab Sampler	Ted Young modified Van Veen (0.1 meter squared) Grab Sampler or Equivalent	Reference sediment collection
30L Niskin Bottle	Messenger activated sampling bottle for specified depths	CLDS reference site water collections

Table A-6 Field Instrument Calibration, Checking, and Corrective Action

Parameter/ Instrument	Calibration Frequency	Calibration Standards	Acceptance Criteria/ Corrective Action
Water Depths Non-contaminating weighted line. and, Lowrance X50DS Sounder (or equivalent)	Initial: Each time instrument is turned on.	Deployable metal plate and metering line	Within 10% of metering line instrument will be replaced.
Station Locations Trimble DGPS System w/ Hypack	Initial: Start of field program	Survey of benchmark	3 meter accuracy minimum or GPs to be replaced
	Check: Daily	Survey of benchmark	
Sample Temperature Refrigerated Truck Storage	Check twice daily	Alternate thermometer	Vehicle gauge within 0.5°C of the hand-held monitoring thermometer. Re-calibrate stationary thermometer as needed.

Samples will be chilled on wet ice while on board the vessel and subsequently transferred to a refrigerated box truck/van daily during field operations. The temperature in the refrigerated vehicle will be regularly monitored to ensure that the storage temperature is maintained at 4° Celsius (C) ±2° C. Upon completion of the NAE New Haven Harbor sediment coring activities, NAE will place core contents into pre-provided containers. AECOM personnel will accept custody of the harbor sediment and water from NAE at the end of each sampling day (SOP ES-G-04) and place into the refrigerated vehicle.

In addition, the AECOM driver will accept custody of the reference site sediment and water samples from the AECOM Field Team (SOP ES-G-04) and place into the refrigerated vehicle. Samples will be delivered to the toxicology laboratory at the end of two field sampling days, as specified in Table A-3. AECOM anticipates one sample deliver to occur mid-way through the program, and one sample delivery at the end of the sampling program. Chemical laboratory courier service will also be coordinated by AECOM and te project laboratories.

Sample collections will be recorded on the Daily Activity Log (Attachment 3). Project documentation requirements are provided in Section A.6.

Bulk sediment chemistry samples will be collected by NAE in the field.

Composite samples for project toxicology and elutriate analysis will be prepared at the laboratory. After the sample composites are prepared, the elutriate chemistry (metals, polychlorinated biphenyls [PCBs], pesticides, and pentachlorophenol), biological tests (SPP, 10-day whole sediment acute toxicity) and 28-Day bioaccumulation testing associated tissue chemistry will proceed. Refer to the task order QAPP (Section B) for a listing of the detailed parameters and species to be tested. The project will follow the schedule presented in **Table A-3**.

Table A-7 Sample Container, Preservations, and Holding Time Requirements

Sediment Parameters	Volume/Mass	Container	Preservation	Storage	Holding Time
Bulk Chemical/ Biological Testing Material	3.5-Gal Buckets (see Tables A-2 and A-4 for volume)	Plastic	Fill Completely	4°C dark/airtight	14 days (d) recommended, no longer than 56 days (d)

Aqueous Parameters	Volume/Mass	Container	Preservation	Storage	Holding Time
Metals	2-liter (L)	Plastic	HNO ₃ to pH<2	4±2 °C	28 d (Hg) 180 d (other metals)
Hexavalent Chromium	1-L	Plastic	Chill	4±2 °C	24 hours
Pentachlorophenol	2-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
Pesticides	2-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
PCBs	2-L	Amber Glass	Chill	4±2 °C	7 d (extract)/ 40 d (analyze)
Bulk Chemical/ Biological Testing Material	5-Gal Cubitainers (see Tables A-2 and A-4 for volume)	Plastic	Fill Completely	4°C dark/airtight	14 d

A.5.1.4 QC Samples & Frequency

Contamination control is one of the important aspects of environmental sample collection efforts. For this reason, equipment blank QC samples will be collected from all equipment that comes in contact with the sediment and surface water samples.

A total of two sediment and two water equipment blanks will be collected during the program:

- One equipment rinse blank will be collected by NAE from the New Haven Harbor site coring equipment;
- One equipment rinse blank will be collected by NAE from the New Haven Harbor site water sampling equipment;
- One equipment rinse blank will be collected by the AECOM Team from the CLDS grab sampling equipment; and
- One equipment rinse blank will be collected by the AECOM Team from the CLDS water sampling equipment.

In each case, high purity deionized water (DIW) will be poured over clean (i.e., decontaminated per SOP ES-G-03) collection equipment (e.g., surface water sampling bottle, core liners, cutters, catchers, and processing utensils or grab sampler) or run through the pump/Niskin bottle, and collected in a chemistry container set.

A standard set of laboratory QC will be included in the analytical program as defined in the QAPP, but will not require any additional volume collected during field operations beyond those mass/volumes already specified (**Table A-2** and **Table A-4**).

A.5.1.5 Sample Containers and Preservation Techniques

The sediment storage containers specified for the project are provided on **Table A-7**. Large/ bulk sediment samples will be transferred to food-grade plastic (high density polyethylene) 3.5 gallon buckets. Seawater samples will be stored in 5-gallon collapsible carboys (food-grade cubitainers). All samples will be transferred to a refrigerated storage truck / van on shore.

A.5.1.6 Decontamination Procedures

The sediment coring equipment will be decontaminated as appropriate by NAE. The grab sampler utilized by the AECOM Team will be cleaned thoroughly to remove any dust/ film before the reference sediment is collected. Level 1 decontamination procedures (SOP ES-G-03) applied to sediment collection equipment (grab sampler) corresponds to the following procedure:

- Non-phosphate soap solution wash/ brush-down;
- Thorough rinse with site water

Re-cleaning between discrete grab samples at the CLDS Reference Site will not be necessary unless the grab sampler is compromised in some way as determined by the field scientist (e.g., rinsing residual sediment from the grab using the deck-hose with reference site water). Stainless steel spoons used to homogenize the sediment will be cleaned in the same manner.

A.5.2 New Haven Harbor Proposed FNP Site and CLDS Reference Sites Water

As required by the PWS (NAE, 2018), seawater from the harbor will be used in the preparation of chemical elutriates. Water samples will be collected using either a non-contaminating pump with program dedicated tubing, or a decontaminated discrete grab water sampler per the applicable SOPs. Given the inherent purity of seawater, collection and handling procedures must follow strict contamination control procedures as discussed in this section.

Seawater from the CLDS Reference Site will be collected using a large-volume (30L) Niskin bottle and used for preparing the SPP toxicity testing dilution series (dilutions of elutriate samples with CLDS water).

A.5.2.1 Water Collection Locations

Dredge site water will be collected by NAE from a point centrally located in each composite sample area, as noted in Tables A-1 and A-2.

If possible, dredge site water collection should be completed by NAE on an incoming tide, in order to ensure appropriate salinity (25 to 30 ‰) is achieved. In the event that field testing confirms that the New Haven Harbor dredge site waters are too fresh, NAE should subsequently collect the above-noted volumes from an appropriate source of clean (salty) seawater.

CLDS Reference Site seawater will be collected by the AECOM Team for SPP dilution series preparations and for chemical analysis. CLDS Reference site water will be collected from near-surface or at mid-depth, in accordance with the RIM.

A.5.2.2 Water Sampling Requirements

As indicated above, water samples will be collected to support the required laboratory testing. To meet the range of testing requirements, an appropriate volume of seawater will be collected from the harbor and from the CLDS Reference Site, as depicted in **Table A-2** and **Table A-4**.

A.5.2.3 Sample Collection and Field & Laboratory Analysis

Navigation. The same navigation equipment and protocol used for the sediment collection effort (i.e. as outlined in Section A.5.1.3) will be used for the water collection effort (AECOM SOP ES-G-02; Appendix A).

Seawater Collection. Seawater from the harbor area (site water collected by NAE) and the reference area (water collected by the AECOM Team for SPP dilutions and chemical analysis) will be collected using a pre-cleaned large-volume Niskin bottle, at the sampling depths outlined in Section 5.1, above.

CLDS Reference Site water collections will be performed according to SOP ES-W-01 (Appendix A). The volume to be collected at each proposed location is detailed in **Table A-2** and **Table A-4**. AECOM will record reference area water collections in the field log book and on daily activity logs (Attachment 3). Pertinent field observations (turbidity, sheen, blooms, etc.) will also be recorded on the field collection log. Project documentation requirements are provided in Section A.6.

In the evening of the final water collection field day (or first thing the following day, depending upon sampling timing), all samples will be transferred to the biological laboratory (ESI) using the refrigerated storage vehicle. The off-water timing (i.e. AECOM's return to the dock) and laboratory hours of operation may require that the samples be delivered to ESI the first thing the following morning. Sample preparations may then begin, to ensure adherence to the PWS schedule constraints and the 14-day hold time for all surface water to be used in the elutriate preparation and the SPP bioassays.

A.5.2.4 QC Samples and Frequency

QC sampling of the water collection program will include collection of equipment blanks during the field effort to verify operation cleanliness. Additional information pertaining to the anticipated QC sampling is presented in Section A.5.1.4

A standard set of analytical QC samples will be included in the laboratory analysis program, but additional volume beyond that already specified (**Table A-4**) is not anticipated.

A.5.2.5 Sample Containers and Preservation Techniques

Water samples collected in the field will be contained in clean, new five gallon plastic cubitainers and placed on ice for preservation. Discrete seawater samples for rinsate blanks will be contained in smaller plastic (metals) and glass (trace organics) bottles. Water sample containerization and preservation requirements are detailed on **Table A-7**. In addition to icing immediately following collection, the water samples will be transferred to the refrigerated box truck /van upon returning to the dock.

A.5.2.6 Decontamination Procedures

The water sampler used to collect the CLDS waters will be cleaned prior to use in the following manner:

- Deionized water (DIW) rinse
- Dilute Liquinox™ rinse
- DIW rinse

A.6 Field Operations Documentation

AECOM's field documentation will include grab sampling logs, with narratives describing relative grain sizes, color, odor, and depth of penetration along with other pertinent sediment sampling observations. Seawater collection data (profile information, unique observations) will be recorded in the field logbook. Project field records will be documented and maintained in accordance with AECOM SOP ES-G-01 (Appendix A).

The full range of information to be included in field records is provided in AECOM SOP ES-G-01 (Appendix A). Field documents developed for this task are provided as Attachments.

A.6.1 Field Logbook and Field Sheets

Field logbooks will provide the means of recording the data collection activities performed during the investigation. As such, entries will be described in as much detail as possible so that persons reviewing site data can reconstruct a particular situation without reliance on memory.

Field logbooks will be bound field survey books or notebooks, and assigned to the field personnel, but will be stored in the project files when not in use. Each logbook will be identified by the project-specific document number.

The title page of each logbook will contain the following:

- Person to whom the logbook is assigned;
- The logbook number;
- Project name and number;
- Project start date; and
- End date.

Entries into the logbook will contain a variety of information. At the beginning of each entry, the date, start time, weather, names of all sampling team members present, and the signature of the person making the entry will be entered. The names of any visitors and the purpose of their visit will also be recorded in the field logbook.

Field logbooks will be supplemented by standardized forms, such as daily activity logs (Attachment 3). All measurements made and samples collected will be promptly recorded. All entries will be made in permanent ink, signed, and dated, and no erasures or obliterations will be made. If an incorrect entry is made, the information will be crossed out with a single strike mark that is initialed and dated by the sampler. Whenever a sample is collected, or a measurement is made, latitude and longitude information will be recorded. All equipment used to make measurements will be identified, along with time and date of calibration and checking.

A.6.2 Sample Documentation

The data management strategy for this task comprises the following elements:

- Assignment of unique sample codes. This code is used to track the sample from collection, through the analysis, to reporting.
- Data retention. Data will be retained in accordance with the requirements stated in Section A.6.2.4 of this Work Plan.

A.6.2.1 Sample Identification/Numbering

For each set of samples collected, the sample containers will be labeled with the following information:

- Project Name (New Haven Harbor Navigation Improvement Dredging Project Suitability Study 2018);
- Unique sample identification number
- Date and time of sample collection;
- Name or initials of collector;
- Sample preservation/storage condition; and
- Type of analysis (grain size, etc.).

QC samples will be labeled in the following manner:

- Equipment blanks: NH-EB-XXXX-mm/dd/yy where XXXX corresponds to the equipment type (either pump or grab) and mm/dd/yy corresponds to the collection date.
- Replicates: The sample identification (ID) is to be appended with “-Rep”

Water samples collected (by NAE) for preparation of elutriates will be labeled by NAE and water samples collected for chemical testing and the preparation of SPP/Elutriate dilution series mixtures (by AECOM Field Team) will be labeled MW-CLDS, as outlined in **Table A-2**.

A.6.2.2 Chain-of Custody Records

Custody is one of several factors necessary to satisfy the two major requirements for data admissibility: relevance and authenticity. Sample custody is addressed in two parts: field sample collection and laboratory analysis. Refer to AECOM SOP ES-G-04 (Appendix A) for further details.

The field team is personally responsible for the care and custody of the samples until they are transferred or dispatched properly to the laboratories. Field procedures have been designed such that as few people as possible will handle the samples.

All sample containers will be identified by the use of adhesive sample labels. Sample labels will be completed for each sample using waterproof ink unless prohibited by weather conditions. For example, a logbook notation would explain that a pencil was used to fill out the sample label because the pen would not function in wet weather.

Samples will be accompanied by properly completed COC forms. The sample codes will be listed on the COC form. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the record. This record documents the transfer of custody of samples from the sampler to another person, to a mobile laboratory, to the permanent laboratory, or to/from a secure storage location. An example COC form is attached (Attachment 4).

A.6.2.3 Field Instrument Calibration & Documentation

As discussed in Section A.5, navigational positioning will be acquired using DGPS instrumentation. Field measurements will include station position information.

Navigation instrumentation will be checked prior to the daily each day that CLDS reference site waters and sediments are sampled, and checked at the end of each sampling day, as specified on **Table A-6**. Calibration will follow the procedures detailed in SOP ES-G-02 (Appendix A).

Records of navigational accuracy and checking results will be recorded at the time of calibration or checking in the bound field logbook.

A.6.2.4 Documentation Procedures/ Data Management and Retention

Entries in field logbooks and on standardized forms will be reviewed for outliers and omissions prior to leaving the sampling site. Navigational data will be collected using DGPS integrated with computer-based navigational software. Actual survey positions will be documented at the time of sample collection on the electronic navigation charts and downloaded as survey records.

Any potential deviation from the work plan must be discussed with the Task Order Manager and NAE TM and corrective actions documented as discussed in Section A.9 and in ES-G-01 (Appendix A). If uncertainties arise, then the Field Services Task Leader may suspend activities until clarification is obtained from the task leadership (AECOM DPM, NAE TM).

Field station positions, collection dates/times, field analytical data and field observations will be included in field sampling documentation and will be appended to laboratory-submitted EDDs. Sample collection times will begin the COC record, based on unique sample IDs for discrete and composite samples, and all laboratory data will be maintained. Field and laboratory documentation will provide the source data for project progress, draft and final reports. Water chemistry and toxicity data will be provided in EDD format matching NAE's preferred format among the RIM specified formats. EDDs will be checked using the most current EDD Checker available on the RIM website. EDDs that pass the Checker without error will be submitted, along with the Checker report.

All field/ project records will be maintained in the electronic project files for a minimum of 5 years. Archived project files will include all field records as specialized log forms and measurement data, station positions, logbook photocopies, calibration records, EDDs, corrective action reports, and audit reports. The field report, final maps, progress reports, laboratory reports, and the draft and final Task Order reports will also be placed on the project website, as discussed in the QAPP Section of this Work Plan (Section B.13 Reports).

A.7 Sample Packaging and Shipping

All sample shipments will be accompanied by the COC record identifying the contents. The original record and one copy will accompany the shipment, and one copy will be retained by the sampler and placed in the project files.

Bulk samples will be transported via refrigerated truck/van; discrete samples may be properly packaged on ice at 4°C for shipment and dispatched to the laboratory for analysis according to AECOM SOP ES-G-05 (Appendix A). A separate signed COC will be enclosed in and secured to the inside top of each sample box or cooler.

All project samples will be transferred by project couriers; common carriers are not anticipated. If common carriers become necessary for discrete sample shipments, then samples will be placed in plastic coolers for storage and transfer according to procedures detailed in AECOM SOP ES-G-05. In these cases, custody seals will be attached to the front and back opposite corners of the cooler and covered with clear plastic tape after being signed by field personnel. The cooler will be strapped shut with strapping tape in at least two locations and the waybill will be retained in the project file.

A.8 Field Assessment/ Inspection

Sampling and subcontractor equipment will be checked by the Field Services Task Leader or designee during mobilization, initially before use, and at the end of each day. Furthermore, a field audit may be scheduled at the discretion of the Task Order Manager to verify the inspection process and to review methods and documentation from collection through final packaging and shipment.

Preliminary results of the audit will be reviewed with the Task Order Manager to ensure that deficiencies adversely affecting data quality are immediately corrected.

For this task, critical supplies for field activities will be tracked by the Field Services Task Leader as outlined in Table A-8.

Table A-8 Field Supplies, Equipment and Inspection Requirements

Critical Supplies and Consumables	Inspection Requirements and Acceptance Criteria
Sample Containers	Visually inspected upon receipt for cracks/ breakage/ cleanliness. Must be accompanied by certificate of analysis.
Field Equipment & Instrumentation	Functional checks to ensure proper operation and testing (echo sounder, DGPS)
Sampling Equipment	Visually inspected for obvious defects, damage, and contamination

Supplies and consumables not meeting acceptance criteria will initiate the appropriate corrective action as detailed in ES-G-01 (Appendix A). Corrective measures may include repair or replacement of measurement equipment, and/or notification of vendor and subsequent replacement of defective or inappropriate materials. All actions will be documented in the project files.

Field equipment testing activities are listed in **Table A-6** along with non-conformance corrective actions. The laboratory system of inspection and acceptance of supplies and consumable is documented in each project laboratory QA manual.

Field data will be reviewed daily by the Field Services Task Leader to ensure that the records are complete, accurate, and legible and to verify that the sampling procedures are in accordance with the protocols specified in the FSP and QAPP.

A.9 Nonconformance/Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter unacceptable procedures or poor performance that can affect data quality. Corrective action proposed and implemented should be documented in QA reports to management. Corrective action should only be implemented after approval by the Task Order Manager or designee.

Field Corrective Action

Corrective action in the field may be needed when the sample network is changed (i.e., more/ less samples, sampling locations other than those specified in the work plan, etc.), or when sampling procedures and/ or field analytical procedures require modification, etc., due to unexpected conditions. The field team may identify the need for corrective action. The DPM will notify the NAE Technical Manager who will approve the corrective measure. The Field Services Task Leader will ensure that the corrective measure is implemented by the field team.

Corrective actions will be implemented and documented in the field records (SOP ES-G-01 in Appendix A). Documentation will include:

- A description of the circumstances that initiated the corrective action;
- The action taken in response;
- The final resolution; and
- Any necessary approvals.

No staff member will initiate corrective action without prior communication of findings through the proper channels. If uncertainties arise in the field, the Chief Scientist may suspend field activities until clarification is obtained from the NAE TM.

Quality Assurance Project Plan

Sampling and Testing – New Haven Harbor Navigation Improvement Dredging Project, New Haven, Connecticut

B.0 Quality Assurance Project Plan (QAPP)

B.1 Project Laboratory Organization and Responsibilities

Two laboratories will support the environmental testing task: Alpha Analytical and ESI. The laboratory organization and work breakdown is depicted in **Figure A-1** and **Table B-1**.

Table B-1 Laboratory Roles and Responsibilities

Task	Responsibility	Management	Contact
Sample processing/composite formation, elutriate and SPP preparation, elutriate chemistry, and bioassays			
Task 6 • Elutriate Preparation	Kirk Cram, ESI Laboratory Director	Technical Advisor: Ken Simon Laboratory Director: Kirk Cram QA Officer: Catie Sasso Sample Custodian: James Provencher	EnviroSystems Inc., 1 Lafayette Rd, Hampton, NH 03842 (603) 926-3345
Task 7 • SPP Preparation and Bioassays	Kirk Cram, ESI Laboratory Director		
Task 7.1 • SPP with Ammonia Reduction (Optional)	Kirk Cram, ESI Laboratory Director		
Task 8 • 10-Day Whole Sediment Acute Toxicity Bioassays	Kirk Cram, ESI Laboratory Director		
Task 9 • 28-Day Bioaccumulation Bioassay	Kirk Cram, ESI Laboratory Director		
Task 10 • Tissue Statistical Analysis	Kirk Cram, ESI Laboratory Director		
Task 5 • Sediment Chemistry	Liz Porta, Alpha Laboratory Project Manager	Laboratory Manager: Christopher Ouellette	Alpha Analytical 320 Forbes Boulevard Mansfield, MA 02048 508 822-9300
Task 6 • Elutriate Chemistry	Liz Porta, Alpha Laboratory Project Manager	QA Officer: James Todaro	
Task 10 • Tissue Chemistry	Liz Porta, Alpha Laboratory Project Manager	Sample Custodian: Kim Bailey	

The ESI Technical Advisor is Mr. Ken Simon and the ESI Laboratory Director will be Mr. Kirk Cram. Mr. Cram will serve as the point of contact at ESI and will be responsible for technical, financial, and scheduling matters related to sample processing, chemical elutriate preparation, and bioassay testing tasks. Ms. Christine Archer, AECOM's Biology/Bioassay Laboratory Coordinator, will be the point of contact for the biology laboratory task leads and safety and quality managers.

Liz Porta will serve as the point of contact at Alpha for sediment and elutriate chemistry analysis and the tissue chemistry task. Ms. Edith Hutchinson, AECOM's Chemistry Coordinator, will also interface with the analytical laboratory task leads and safety and quality managers.

The **Laboratory Manager** is ultimately responsible for the data produced by the laboratory. Specific responsibilities include:

- Implementing and adhering to the laboratory QA manual and all corporate policies and procedures within the laboratory,
- Approving the SOPs,
- Maintaining adequate staffing documented on organization charts, and
- Implementing internal/external audit findings corrective actions.

Laboratory QA Coordinator

The Laboratory QA Coordinator reports to the Laboratory Manager. Specific responsibilities include:

- Approving SOPs;
- Assessing and maintaining the laboratory QA manual implementation within the facility operations;
- Recommending resolutions for ongoing or recurrent non-conformances within the laboratory;
- Performing QA assessments; and
- Reviewing and approving corrective action plans for non-conformances, tracking trends of non-conformances to detect systematic problems, and initiating additional corrective actions as needed.

The Laboratory Project Manager is the primary point of contact between the laboratory and the appropriate AECOM Laboratory and Chemistry Coordinator. Specific responsibilities of the Laboratory Project Manager include:

- Monitoring analytical and QA project requirements for a specified project,
- Acting as a liaison between the client and the laboratory staff,
- Reviewing project data packages for completeness and compliance to client needs, and
- Monitoring, reviewing, and evaluating the progress and performance of projects.

B.2 Data Assessment and Responsibilities

Organization of the data assessment tasks are detailed in **Table B-2**. Chemical data will be verified by the Alpha Analytical QA department to check that the laboratory tasks followed the specified methods and conform to the QAPP including measurement quality objectives (MQOs) and reporting specifications. Laboratory reports and data/EDD submittals will also be validated to check for completeness, evaluate quality control sample results and apply validation qualifiers as needed based on MQO non-compliance (e.g., blank contamination, etc.).

Similarly, the biological data will be verified by the ESI QA department to check that the laboratory tasks followed the specified methods, and conform to the QAPP specifications, including ancillary bioassay test water quality data collection.

B.3 Data Quality Objectives

The data quality objectives (DQOs) for this task have been established by EPA and USACE as documented in the RIM document (EPA/USACE, 2004). The DQO process, that is –problem statement, goal

identification and study questions, new data/analysis requirements, study boundaries, analytical approach with corresponding performance/acceptance criteria - have been incorporated into this Work Plan.

Table B-2 Data Assessments Organization and Responsibilities

Task	Data Verification Responsibility	Data Validation Responsibility
Task 5 <ul style="list-style-type: none"> Sediment Chemistry 	James Todaro, Alpha QA Officer 320 Forbes Boulevard Mansfield, MA 02048 508-822-9300	Sharon McKechnie, AECOM 250 Apollo Drive Chelmsford, MA 01824 978-905-2317
Task 6 <ul style="list-style-type: none"> Elutriate Chemistry Testing 		
Task 7 <ul style="list-style-type: none"> Standard SPP sample preparation SPP acute toxicity bioassays 	Catie Sasso, EnviroSystems Inc., 1 Lafayette Rd, Hampton, NH 03842 603-926-3345	Christine Archer, AECOM 1155 Elm Street Suite 401 Manchester, NH 03101 603-622-1556
Task 7.1 <ul style="list-style-type: none"> Suspended Phase Acute Toxicity Testing With Ammonia Reduction 		
Task 8 <ul style="list-style-type: none"> 10-day whole sediment acute toxicity bioassays 		
Task 9 <ul style="list-style-type: none"> 28-day bioaccumulation bioassay 		
Task 10 <ul style="list-style-type: none"> Tissue analysis 	James Todaro, Alpha QA Officer 320 Forbes Boulevard Mansfield, MA 02048 508-822-9300	Sharon McKechnie, AECOM 250 Apollo Drive Chelmsford, MA 01824 978-905-2317

B.3.1 Data Use Background

The assessment of dredged material typically follows a tiered testing approach. If data collected in earlier tests are insufficient to provide a basis for an environmental conclusion, then additional testing (higher level tiers) is undertaken to collect additional data. For example, if grain size data identified that the accumulated sediment to be dredged was only coarse-grained (i.e. sandy) material, then the exclusionary criteria admitting placement in the marine environment unconfined without further testing may be met. Conversely, fine-grained sediments require added testing before an impact assessment can be completed and a decision made with respect to the final dredged material placement.

Based on NAE decision-making, including prior analytical results, chemical and biological (bioassay) data will be generated concurrently during the performance of this Task Order to evaluate potential AWQC and LPC exceedances (Elutriate & SPP bioassays) and potential toxicity to sediment-associated organisms (10-day whole sediment acute toxicity bioassay with an amphipod and shrimp).

Overall, the data will be used to evaluate potential environmental impacts associated with the proposed dredging project in the New Haven Harbor proposed navigation site, but each data type will be addressed separately in the following sections.

B.3.2 Measurement Quality Objectives

MQOs for sensitivity are well established and published in the RIM document for this task. Required methods and corresponding target reporting limits are provided in the RIM document, summarized in this section, and detailed on **Table B-3** (sediment chemistry), **Table B-4** (aqueous chemistry) and **Table B-5** (tissue chemistry).

¹ RL – Reporting limit. Listed laboratory RLs correspond to clam and worm species.					

For this task, systematic checks have been included to ensure data quality. MQOs corresponding to the QC samples are detailed in **Table B-6** (Chemistry) and **Table B-7** (Bioassays) to ensure that the Data Quality Indicators (DQIs) support the task data usability quality requirements. Quantitative laboratory DQIs for accuracy are supported through the analysis of QC samples as method blanks, matrix spikes, standard reference materials, and in the case of bioassays, through the use of reference toxicants and the monitoring of controls (control survival).

DQIs for precision are supported with the analysis of QC sample spike and/or laboratory duplicates. Field blanks and in some cases field duplicates can also provide important indications of data quality and field blanks have been included in this task (refer to FSP). Completeness of targeted field and laboratory scopes is another important indicator of overall usability/quality.

Qualitative DQIs addressing representativeness and comparability will be assured to some degree through the high number of stations to be sampled, and the subsequent formation of composite samples. The use of RIM specified methods will also assure comparability of the dataset to historical data sets generated for similar purposes.

The MQOs established for the quantitative DQIs have been defined below for this task.

Precision

Precision is a measure of the degree to which two or more measurements are in agreement. Laboratory precision will be assessed through the calculation of Relative Percent Difference (RPD) for laboratory duplicate samples, either as matrix spike/ matrix spike duplicates (MS/MSDs) or as laboratory duplicates. Laboratory precision control limits are provided in **Table B-6**. Specific formulas/equations supporting these and other DQIs are provided in Section B.8 *Data Reduction/ Calculation of Data Quality Indicators*.

Accuracy

Accuracy is the degree of agreement between the observed value and an accepted reference or true value. Field accuracy will be assessed through the use of equipment rinsate blanks and through the adherence to all sample handling, preservation, and holding time requirements. Laboratory accuracy will be assessed through the analysis of MS/MSDs, standard reference materials (SRMs), laboratory control samples (LCSs), and surrogate compounds, and the subsequent determination of percent recoveries (%Rs). Accuracy control limits are provided in **Table B-6**.

Table B-6 Measurement Quality Objectives for Chemical Analytical Measurements

QC Sample	Units	GS	TOC	Pentachlorophenol	Metals	PCBs	Pest	PAHs	Corrective Action
Method Blank	Conc	-	-	<RL	<RL	<RL	<RL	<RL	1
Surrogate Spikes	% Rec	-	-	30-150	-	30-150	30-150	30-150	2
Matrix Duplicate	% RPD	-	<30	-<30	-<30	<30	<30	-<30	3
Matrix Spike	% Rec	-	-	50-120	75-125	50-120	50-120	50-120	4
MSD	% RPD	-	-	30	-	30	30	30	5
LCS	% Rec	-	-	50-120	80-120	50-120	50-120	50-120	6
SRM	% Rec		w/i limits	-	w/i limits	w/i limits	w/i limits	w/i limits	7

^aQC samples analyzed at a frequency of one per batch of 20 or fewer samples, except surrogates are added to each sample.

Corrective Action Codes:

- 1 Flag results if <5x blank concentration, re-extract or reanalyze the entire batch.
- 2 Re-extract sample, re-analyze sample or document and narrate
- 3 Flag results
- 4 Flag results
- 5 Investigate, re-analyze or flag results
- 6 Re-extract/reanalyze entire batch if all analytes are outside limits; if selected analytes affected, investigate and provide narrative.
7. Flag results

Data Qualifiers:

- J: Analyte detected < laboratory achieved detection limit (i.e., ssRL for organics and RL for metals) but above MDL.
 E: Estimate, result > highest concentration level in the calibration.
 B: Analyte concentration is <5x the level found in the procedural blank (the qualifier is only applied to the affected field samples).
 U: Not detected above laboratory achieved reporting detection limit
 Q: QC value outside the accuracy or precision criteria goal.

Table B-7 Bioassay Measurement Quality Objectives

QC Parameter	Measure or Acceptance Criteria	Corrective Action
SPP Toxicity Testing	<i>Menidia beryllina</i> : ≥90% control survival <i>Americamysis bahia</i> : ≥90% control survival <i>Arbacia punctulata</i> : ≥70% control survival	Re-run Test
10-Day Whole Sediment Acute Testing	<i>Leptocheirus plumulosus</i> ² : control ≥90% mean survival in control <i>Americamysis bahia</i> : ≥90% mean survival in control	Re-run Test
Reference Toxicity Tests (10-day and SPP)	≥90% mean survival in control (and within control chart limits)	Repeat entire test series
Suspended Phase Acute Toxicity Testing With Ammonia Reduction	<i>Menidia beryllina</i> : ≥90% control survival <i>Americamysis bahia</i> : ≥90% control survival <i>Arbacia punctulata</i> : ≥70% control survival	Re-run Test
28-day Bioaccumulation Assay	Sufficient <i>Macoma nasuta</i> and <i>Nereis virens</i> tissue for detection of target analytes	Re-run Test

Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under normal conditions. "Normal conditions" are defined as the conditions expected if the sampling plan was implemented as planned.

- Field completeness is a measure of the amount of valid samples obtained during all sampling for the project. The field completeness objective is greater than 95%.
- Laboratory completeness is a measure of the amount of valid measurements obtained from all the measurements taken in the project. The laboratory completeness objective is greater than 95%.

All analytical data that do not meet the listed MQOs will be submitted to the AECOM Laboratory and Chemistry Coordinators for review and assessment of the potential impact of the results. Affected samples may be reanalyzed at the discretion of the AECOM Task Order Manager. Data accepted outside these criteria (**Table B-5** and **Table B-6**) will be flagged with the appropriate data qualifier, and the rationale for accepting results will be thoroughly documented.

B.4 Sample Receipt, Handling, Custody, and Holding Time Requirements**B.4.1 Sample Receipt Condition Verification/Documentation**

Upon sample receipt at the laboratories, the condition of samples and associated packaging will be evaluated and documented on a sample receipt form (Attachments 6 and 7). As noted on the form, temperature, container condition, unique or unusual sample observations, labeling discrepancies, preservation status, COC completeness, etc. will be documented and a copy sent to the AECOM Laboratory Coordinator without delay.

² The PWS lists *Ampelisca abdita* as the test species for this test. However, due to availability, *Leptocheirus plumulosus* may be substituted. This potential change was documented in the proposal assumptions.

When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the COC form (Attachment 4). This record documents the transfer of custody of samples from the sampler to another person, to the permanent laboratory, or to/from a secure storage location.

B.4.2 Corrective Action for Incoming Samples

Corrective actions may in some cases be taken on incoming samples that do not meet storage requirements. All actions are to be discussed with the Task Order Manager, and may include re-containerizing samples when containers are cracked, etc.

Corrective actions will be documented in the project file. Documentation will include:

- A description of the circumstances that initiated the corrective action;
- The action taken in response;
- The final resolution; and
- Any necessary approvals.

No person will initiate corrective action without prior communication of findings through the proper channels.

B.5 Sample Preparation for Chemical & Biological Tests

Station homogenates will be prepared initially in the field by mixing the sediment within each bucket with large pre-cleaned stainless steel spoons as additional sediment is added.

Stations will be re-homogenized at the bioassay laboratory (ESI) before sample pooling commences by mixing the full volume collected from each station in a large 40-L high density polyethylene (HDPE) plastic bin. These same bins will be used to mix the station composites, one bin per composite for storage between subsampling for the Elutriate/SPP samples and the 10-day bioassay.

Composites will be prepared by mixing **equal volumes** from each station to form the final composite sample (see **Table A-1** for compositing scheme). Field sample container and storage requirements are detailed on **Table A-7**.

Tools used in sample transfer and mixing will be either stainless steel or Teflon pre-cleaned using the Level III decontamination procedure detailed in SOP ES-G-03 (Appendix A). Composite labeling will be as specified in **Table A-1** and **Table A-2**. Materials will be retained (refrigerated) until NAE accepts/approves the final project report.

B.6 Analytical Procedures– Chemical Parameters (Task 5)

B.6.1 Bulk Sediment Chemistry

Bulk sediment samples will be analyzed by sediment chemical methods (Task 5, Alpha). **Table B-3** details the methods and Reporting Limits (RLs) established as DQOs (equivalent to RIM requirements) to meet project objectives.

Total Organic Carbon (TOC) will be analyzed as detailed in Alpha SOP 17452 Total Organic Carbon and Soot in Soil, Sediment (Revision 1, July 2015). All samples will be analyzed in duplicate. Results will be reported on a dry-weight basis.

Trace Organic Parameters as PAHs, PCB Congeners and pesticides will be analyzed following Alpha SOPs 2157, Analysis of Polynuclear Aromatic Hydrocarbons and PCB Congeners by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring (Revision 14, September 2017) and 2158, Determination of Organochlorine Pesticides By Gas Chromatography/Electron Capture Detection (GC/ECD) (Revision 14, May 2018). Samples are extracted three times using appropriate solvent. Extracts

are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques.

Target compound identification will be based on dual- column analysis for GC analyses or reference mass spectral identification for GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using internal standards for both GC and GC-MS analyses.

All results will be reported in microgram per kilogram ($\mu\text{g}/\text{kg}$) dry weight.

Metals (arsenic, cadmium, chromium, copper, lead, nickel, and zinc) will be analyzed following procedures in Alpha SOP 2137, Inductively Coupled Plasma-Mass Spectrometry (Revision 15, January 2018). Sample preparation will be conducted according to the SOP An aliquot of digestate will be nebulized into a spray chamber where a stream of argon carries the sample aerosol through a quartz torch and injects it into the radio frequency inductively coupled plasma. The ions produced in the plasma are introduced to the mass spectrometer for quantification against a single point initial calibration. All results are reported in milligrams per kilogram (mg/kg) dry weight.

Mercury will be analyzed following procedures in Alpha SOP2143, Mercury Determination in Tissue and Soil/Sediment Samples by Cold Vapor Atomic Fluorescence Technique (CVAf) (Revision 8, July 2015) Sediment samples (approximately 1 g) will be digested by hot plate in an aqua regia acid solution. An aliquot of the digest will then be prepared with HCL/BrCl and hydroxylamine hydrochloride solution. Mercury in the digested sample is reduced to elemental mercury, aerated from solution and introduced into the spectrophotometer. The emission is measured and compared to a multi-level initial calibration for quantification. All results will be reported in mg/kg dry weight.

B.6.2 Elutriate/ SPP Preparation & Aqueous Analytical Procedures (Tasks 6 and 7)

The preparation of elutriate and SPP samples will utilize the sediment composites prepared as detailed above. Elutriate and other (i.e., equipment blanks and CLDS Reference Site water) aqueous samples will be analyzed for trace metals, PAHs (equipment blank only), PCBs/pesticides and pentachlorophenol (not in CLDS water equipment blanks). The samples will be prepared in glass containers. The elutriate/SPP preparation must commence no later than 14 days after seawater collection. Elutriate and SPP samples will be prepared concurrently and used within 24 hours of preparation.

The elutriate samples are prepared by placing one volume of test sediment and four volumes of dredging site water (i.e. harbor water) from the appropriate site in an eight-gallon glass container and mixing vigorously with a magnetic stir bar. Additionally, the sediment/water mixture will be hand stirred at approximately 10 minute intervals during the mixing period. At the end of the 30-minute period, the sediment/water mixture will be allowed to settle for one hour and the supernatant (elutriate) siphoned off for testing. Sufficient sediment and seawater volumes are used to prepare samples for chemical analysis of the elutriate and creation of SPP bioassay sample dilutions. If required, the SPP portion may be centrifuged (only enough to clear the water so organisms can be seen) to facilitate biological observations.

The elutriate samples will be prepared in **triplicate** for the analyses of PCBs/pesticides, pentachlorophenol, and trace metals. Elutriate samples will be centrifuged at ESI, split for metals and organic analysis, and then containerized. Elutriate blanks are defined for this project as the site water (used to prepare elutriates) that are run through the entire elutriate preparation process for background correction purposes.

Table B-4 details the list of target elutriate analytes, corresponding analytical method references, and target detection limits for the aqueous project samples.

Trace Organic Parameter elutriate and elutriate blank samples will be centrifuged at Alpha and analyzed at Alpha. Rinsate blank samples will be transferred to Alpha directly from the field. PAH (sediment equipment

blank), pentachlorophenol, PCB Congeners and pesticides will be analyzed following the Alpha SOPs 2155 (Revision 20, 11/29/17) Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS), 2157 (Revision 14, 9/28/17) Analysis of Polynuclear Aromatic Hydrocarbons and PCB Congeners by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring and 2158 (Revision 14, 5/23/18) Determination of Organochlorine Pesticides by Gas Chromatography/Electron Capture Detection (GC/ECD). Water samples will be extracted according to Alpha SOP (Revision 14, 1/15/16) Extraction of Water Samples by Separatory Funnel.

Samples are extracted three times using appropriate solvent. Extracts are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques.

Target compound identification will be based on dual-column analysis for GC analyses or reference mass spectral identification for GC/MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using external standards for GC analyses and internal standards for GC/MS analyses.

All results will be reported in microgram per liter ($\mu\text{g/L}$) units.

Metals elutriate and elutriate blank samples will be prepared by ESI and analyzed at Alpha Analytical. The reference site water samples will be transferred to ESI directly from the field. Elutriate and elutriate blank samples will be analyzed for ten metals: arsenic, cadmium, hexavalent chromium, copper, nickel, lead, silver, selenium, zinc, and mercury.

Mercury will be analyzed following procedures in Alpha SOP 2142 (Revision 8, 1/21/16), Mercury Determination in Aqueous Samples by Cold Vapor Atomic Fluorescence Technique (CVAF). Water samples will be digested in an acidic, oxidizing solution consisting of sulfuric acid, nitric acid, potassium permanganate and potassium persulfate and heated in a block digester at 90-95C for two hours to convert all forms of mercury to inorganic mercury. The CVAA technique is based on the absorption of radiation at 253.7-nm by mercury vapor. Mercury is reduced with stannous chloride to elemental mercury. The elemental mercury is aerated as mercury vapor from the digestate in a closed system where the vapor passes through a cell positioned in the light path of an atomic absorption spectrometer. The absorbance is measured as a function of mercury concentration based on the peak height measured. Arsenic, cadmium, copper, nickel, lead, selenium, silver, and zinc will be extracted from seawater according to Alpha SOP 2152 (Revision 3, 7/22/15) Seawater Extraction Procedure for Trace Metals and/or simply digested according to SOP 18716 (Revision 2, 7/27/16) Hot Block Digestion For Aqueous Samples; and analyzed according to Alpha SOP 2137 (Revision 15, 1/24/18) Inductively Coupled Plasma-Mass Spectrometry 6020.

Hexavalent chromium will be analyzed according to Alpha SOP 2204 (Revision 7, 3/28/16) Hexavalent Chromium.

All metals results will be reported in mg/L units.

B.6.3 Tissue Analytical Procedures (Task 10)

Although the 28-day bioaccumulation testing will be performed on all composite group sediment samples, chemical analyses will only be performed on tissue samples for those sediments that pass the 10-day whole sediment acute toxicity test. **Table B-5** lists the potential parameters that may be analyzed in the bioaccumulative tissue samples. If selected parameters are not detected in selected sediment composites, then those parameters may be omitted from tissue testing with NAE approval.

Trace organic tissue parameters as PAHs, PCB Congeners and Pesticides will be analyzed after preparation following Alpha SOPs 2157 (Revision 14, September 2017) Analysis of Polynuclear Aromatic

Hydrocarbons and PCB Congeners by Gas Chromatography/Mass Spectrometry with Selected Ion Monitoring and 2158, Determination of Organochlorine Pesticides By Gas Chromatography/Electron Capture Detection (GC/ECD) (Revision 14, May 2018). Samples are extracted three times using appropriate solvent. Extracts are combined, dried over sodium sulfate, and evaporatively concentrated. Concentrated extracts may require cleanup before analysis. Cleanup procedures may include copper, silica gel, florisil, sulfuric acid or other appropriate cleanup techniques.

Target compound identification will be based on dual- column analysis for GC analyses or reference mass spectral identification for GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using internal standards for both GC and GC-MS analyses.

Quantitation will be based on response factors determined from an initial 5 point calibration using external standards for GC analyses and internal standards for GC-MS analyses.

All tissue results will be reported in nanograms per gram (ng/g) on a wet weight basis.

Lipid Content in tissue samples will be determined according to NOAA Tech Memo 130, 1998. An aliquot of tissue is weighed in a tared glass vial and the lipid content of the sample is extracted using a specific ratio of solvent to water. The sample is serially extracted three times. The organic layer is removed and dried over sodium sulfate. The extract is evaporated to dryness, leaving the lipid content. Amount of residue is determined gravimetrically.

The results will be reported in % wet tissue.

Metals tissue samples will be processed according to Alpha SOP 2137 (Revision 15, January 2018) Inductively Coupled Plasma-Mass Spectrometry.

For metals other than mercury, an aliquot of the digestate will be analyzed following procedures in Alpha SOP 2137. By this procedure, the digestion solution is nebulized into a spray chamber where a stream of argon carries the sample aerosol through a quartz torch and injects it into the radio frequency inductively coupled plasma. The ions produced in the plasma will be introduced to the mass spectrometer for quantification against a single point initial calibration.

Mercury will be analyzed following procedures in Alpha SOP 2143 (Revision 8, July 2015) Mercury Determination in Tissue and Soil/Sediment Samples by Cold Vapor Atomic Fluorescence Technique. An aliquot of the digest is prepared with HCL/BrCl and hydroxylamine hydrochloride solution. Mercury in the digested sample will be reduced to elemental mercury, aerated from solution and introduced into the fluorescence detector. The fluorescence will be measured and compared to a multi-level initial calibration for quantification.

All metals results will be reported in micrograms per gram ($\mu\text{g/g}$) on a wet weight basis.

B.6.4 Preventive Maintenance

Routine testing and preventive maintenance is performed by the laboratory as part of their QA program. Details on the type of checks, frequencies, and corrective actions associated with the project measurements are included in the accompanying laboratory QA manuals.

B.6.5 Calibration Procedures & Frequency

Specific laboratory method calibration procedures and frequency requirements are detailed in NAE QC summary tables, referenced in the RIM (EPA/ USACE, 2004) and included in Appendix B.

Calibration procedures for laboratory instruments will consist of initial calibrations, initial calibration verifications, and continuing calibration verification. The SOP for each analysis performed in the laboratory describes the calibration procedures, their frequency, acceptance criteria, and the conditions that will require recalibration. This information is summarized in the laboratory QA Manuals.

The laboratory maintains documentation for each instrument which includes the following information: instrument identification, serial number, date of calibration, analyst, calibration solutions, and the samples associated with these calibrations.

Inspection/ Acceptance of Supplies and Consumables

The laboratory system of inspection and acceptance of supplies and consumable is documented in the laboratory QA Manuals.

Supplies and consumables not meeting acceptance criteria will initiate the appropriate corrective action. Corrective measures may include repair or replacement of measurement equipment, and/or notification of vendor and subsequent replacement of defective or inappropriate materials. All actions will be documented in the project files.

B.6.6 Laboratory QC Procedures

Each batch of twenty or fewer sediment samples analyzed for organic contaminants (PCB/ pesticides and PAHs) and metals will be prepared with a routine set of QC samples, including one method blank, one laboratory control sample, one matrix spike, one matrix spike duplicate, one sample duplicate, and one sediment standard reference material sample. For total organic carbon analysis, one sediment standard reference material sample will be prepared with each batch of sediment samples.

Each batch of twenty aqueous samples analyzed for organic contaminants and metals will be prepared with a set of QC samples as specified in the RIM. For organic contaminant analysis, QC samples will include one method blank, one laboratory control sample, one matrix spike, and one matrix spike duplicate. For metals analyses, QC samples will include one method blank, one laboratory control sample, one matrix spike and one matrix spike duplicate.

Each batch of twenty or fewer tissue samples analyzed for organic contaminants (PCB/ pesticides and PAHs) and metals will be prepared with a routine set of QC samples, including one method blank, one laboratory control sample, one matrix spike, one matrix spike duplicate, one sample duplicate, and one tissue standard reference material sample. For lipid content analysis, one sample duplicate will be prepared with each batch of tissue samples.

B.6.7 Performance and System Audits

The sediment analytical program includes analysis of Standard Reference Materials (SRMs), which provide an excellent way to audit the performance of laboratory procedures for sample preparation and analysis. Field and/or laboratory system audits may be performed at the discretion of the NAE TM to ensure project personnel are performing project related tasks according to the project specific Work Plan and associated field and laboratory SOPs.

Field Audit

As detailed in Section A.9 of the FSP, the AECOM Field Services Task Leader will be responsible for ensuring that the approved procedures documented in the Work Plan (FSP and QAPP) are being followed. The Task Leader will review field sampling records, field measurement results, and field instrument operating and calibration records. The Field Services Task Leader will also be responsible for monitoring procedures for sample collection, handling, and packaging procedures, QA procedures, chain-of-custody, and sample documentation, etc.

If significant deficiencies are noted in procedures outlined in the QAPP, corrective action will be implemented as discussed in Section B.6.6.

Laboratory Audit

Laboratory audits are conducted periodically by AECOM as part of their analytical subcontractor monitoring program. A typical systems audit includes review of the following areas:

- QA organization and procedures,
- Personnel training and qualifications,
- Sample log-in procedures,
- Sample storage facilities,
- Analyst technique
- Adherence to laboratory SOPs and project Work Plan,
- Compliance with QA/QC objectives,
- Instrument calibration and maintenance,
- Data recording, reduction, review, and reporting, and
- Cleanliness and housekeeping.

Preliminary results of the audit are discussed with the Laboratory Manager, Laboratory Project Manager, and Laboratory QA Coordinator. A written report that summarizes audit findings and recommends corrective actions is prepared and submitted to the Laboratory Manager for response, and to the AECOM Project Manager.

Data Package Audits

Audits of analytical data packages will be conducted for 100% of the packages received as part of the data validation process (Section B.11). The review will include an evaluation of the package to ensure that (1) all required deliverables are provided, (2) the package contains the information necessary to reproduce the reported results, and (3) the QC acceptance criteria specified in the Work Plan were met. Any deficiencies will be communicated to the laboratory and documented in the project files.

Audit Samples

Audit samples will be incorporated into the program as discussed in the Laboratory QC Procedures section above. Results for the audit/SRM samples will be reviewed by the Chemistry / Laboratory Coordinator and compared to the acceptable limits provided by the vendor. Failure to meet the acceptance criteria will result in the review of the results and supporting data by the laboratory to identify the cause of the failure. Depending on the outcome of this review, subsequent corrective actions may include the following:

- Qualification/flagging of affected data,
- Discarding affected data and re-analysis, or
- Discarding affected data, re-sampling, and re-analysis.

B.6.8 Nonconformance & Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter Work Plan specification nonconformance, unacceptable procedures, or out-of-limit QC performance that can affect data quality. Corrective action can occur during field activities, laboratory analyses, data validation, and data assessment. All corrective action proposed and implemented will be documented as detailed in Section B.13 - Reports.

Corrective action should only be implemented after approval by the AECOM Task Order Manager, or his designee. Field related corrective action is discussed in Section A.10 of the FSP.

Laboratory Corrective Action

Corrective action in the laboratory may occur prior to, during, and after initial analyses. A number of conditions such as broken sample containers, multiple phases, low/high pH readings, and potentially high concentration samples may be identified during sample log-in or analysis. Following consultation with laboratory analysts and supervisory personnel, it may be necessary for the Laboratory QA Coordinator to approve the implementation of corrective action. If the nonconformance causes project objectives not to be achieved, the AECOM Task Order Manager will be notified.

These corrective actions are performed prior to release of the data from the laboratory. The corrective action will be documented in both the laboratory's corrective action files, and in the narrative data report sent from the laboratory to the AECOM Laboratory Coordinator and the AECOM Task Order Manager. If the corrective action does not rectify the situation, the laboratory will contact the AECOM Task Order Manager who, in concert with the AECOM Laboratory Coordinator and NAE's TM, will determine the action to be taken and inform the appropriate personnel.

Chemical Measurements

The need for corrective action may be identified during either data validation or data assessment. Potential types of corrective action may include resampling by the field team or reinjection/reanalysis of samples by the laboratory. These actions are dependent upon the ability to mobilize the field team and whether the data to be collected is necessary to meet the required QA objectives. If the AECOM Laboratory identifies a corrective action situation, the AECOM Task Order Manager will be responsible for informing the appropriate personnel.

B.6.9 Corrective Action Reports to Management

QA reports will be submitted to the AECOM Task Order Manager to ensure that any problems identified during the sampling and analysis programs are investigated and the proper corrective measures taken in response. The QA reports will include:

- All results of field and laboratory audits,
- Problems noted during data validation and assessment, and
- Significant QA/QC problems, recommended corrective actions, and the outcome of corrective actions.

QA reports will be prepared by the AECOM Project QA Officer and submitted on an as-needed basis.

B.7 Analytical Procedures – Bioassays (Tasks 7, 7.1 & 8)

All toxicity testing will be conducted following protocol guidance presented in NAE's RIM (EPA/USACE, 2004) and in the Inland Testing Manual (EPA/USACE, 1998).

B.7.1 SPP Bioassays (Task 7)

SPP toxicity tests will commence no later than 24 hours after the SPP is prepared. SPP from all six of the composites will be tested at 100%, 50%, 10%, and 0% concentrations, using the CLDS Reference Site water as the dilution water. In addition, a 1% concentration may be run. Three species, *M. beryllina*, *A. bahia*, and *A. punctulata*, will be exposed to the SPP dilution series, reference site water, as well as a clean seawater control (i.e., laboratory control). All SPP tests will be conducted static, with aeration provided if dissolved oxygen falls below 40% saturation (~4 milligrams per liter [mg/L] at 20°C and 30 parts-per-thousand salinity). The *M. beryllina* and *A. bahia* tests are 96-hour duration; the *A. punctulata* larval development test is 48-72-hour duration. A reference toxicant test of the same duration, using ammonia in clean seawater, will be performed with each SPP test species on a regular basis by the laboratory. Specific test conditions for the SPP tests are provided in **Table B-7**.

To account for the potential for ammonia toxicity to adversely impact the SPP results, total ammonia in the undiluted elutriate samples will be measured prior to test initiation and the un-ionized ammonia concentration will be calculated based on additional measurements of pH, temperature, and salinity. If the calculated un-ionized ammonia concentrations are greater than the applicable WQC (or approximately 0.23 mg/L un-ionized ammonia³), the NAE will be notified within 24 hours. NAE will then provide guidance on whether to implement project-specific procedures for the preparation of additional elutriate samples treated to reduce ammonia levels and conduct additional SPP toxicity testing (see optional Task 6.1 described in Section B.7.2).

If un-ionized ammonia concentrations in the undiluted elutriate samples exceed 0.1 mg/L, then total ammonia concentrations (and calculated un-ionized ammonia concentrations) will be measured in all elutriate dilutions at the start and end of each test. If complete mortality is observed prior to the full test duration, then total ammonia (and calculated un-ionized ammonia) will be measured when the test is ended.

B.7.2 SPP Bioassays with Ammonia Reduction (Task 7.1, Optional)

The test organisms used in SPP toxicity testing are sensitive to ammonia, and excessive ammonia concentrations may cause a toxic response in the toxicity tests that is not related to other chemical contaminants present in the elutriate. Therefore, if elevated ammonia levels are identified in the undiluted elutriate samples (as described in Section B.7.1), then an ammonia reduction protocol may be implemented (at the discretion of NAE) to generate a second elutriate and to repeat SPP testing (elutriate chemistry sampling will not be repeated) for one or more composites.

When ammonia concentrations are determined to be at potentially toxic levels (as described in Section B.7.1) and NAE has provided approval, an ammonia reduction procedure (referred to as the Ferretti Ammonia Reduction Procedure; Ferretti et al., 2001) will be run to reduce the levels of ammonia in test sediments to nontoxic levels before the sediments are used to prepare the elutriate samples for the SPP tests. A thin layer of the test sediment is placed in a plastic tray and clean seawater (4 times the sediment volume) is slowly added over the top of the sediment. The tray is aerated and renewed with clean seawater once daily, being careful not to disturb the sediment. Sediment porewater shall be monitored daily for ammonia and ESI will communicate daily with AECOM regarding the ammonia reduction progress. When the un-ionized ammonia in the porewater is less than 0.1 mg/L, aeration is stopped and the sediment is used to prepare the elutriate samples with site water to use in the SPP tests.

Total and un-ionized ammonia levels will be measured in all elutriate dilutions at the start and end of each test for the ammonia reduced elutriates. If complete mortality is observed prior to the full test duration, then total ammonia (and calculated un-ionized ammonia) will be measured when the test is ended. The ammonia monitoring records and all measurement made during the assays will be included in the SPP report.

The SPP tests conducted with elutriates prepared after the ammonia reduction procedure are conducted as described in Section B.7.1. Specific test conditions for the SPP tests are provided in **Table B-7**.

³ In accordance with 10/15/18 discussion between NAE (R. Loyd) and AECOM (K. van Naerssen).

Table B-8 Suspended Particulate Phase Testing Conditions

Parameter	<i>Americamysis bahia</i>	<i>Menidia beryllina</i>	<i>Arbacia punctulata</i>
Treatments (SPP prepared from sediment composites and harbor water)*	6 Sample Composites and 1 CLDS Reference Site water	6 Sample Composites and 1 CLDS Reference Site water	6 Sample Composites and 1 CLDS Reference Site water
Replicates	5	5	5
Test population	1-5 days old	7-10 day with 24 hours variation	2 hours after fertilization
Temperature	Mean of 20 ± 1°C Maximum Deviation of 3°C	Mean of 20 ± 1°C Maximum Deviation of 3°C	Mean of 20 ± 1°C Maximum Deviation of 3°C
Dissolved Oxygen	40% Saturation	40% Saturation	NA
pH	NA	NA	NA
Salinity	25 – 30 ‰ ±10%	25 – 30 ‰ ±10%	30-32‰
Ammonia	NA	NA	NA
Feeding	Daily, <24 hour old <i>Artemia nauplii</i>	Daily, <24 hour old <i>Artemia nauplii</i>	None
Reference Toxicant	Ammonia	Ammonia	Ammonia

*Study design also includes laboratory control.

B.7.3 10-day Whole Sediment Bioassay (Task 8)

The 10-day whole sediment toxicity testing will commence no later than six weeks after the sample collection date.

Whole sediment acute toxicity testing will be performed using the marine invertebrates *Leptocheirus plumulosus* and *A. bahia*. *L. plumulosus* and *A. bahia* will be exposed to all six sample composites plus the CLDS Reference Site sediment. A laboratory control will also be run with each test. Tests with each species will be 10-day static renewal exposures with mortality as the endpoint. Depending on the concentrations of ammonia in bulk sediment and/or overlying water, the test chambers may require purging to reduce ammonia below toxic levels prior to the addition of test organisms.

The acceptable porewater ammonia concentrations for *L. plumulosus* at test initiation is 60 mg/L total ammonia and 0.8 mg/L for un-ionized ammonia (EPA, 1994, 2001). These levels are higher than the levels recommended for amphipods in the RIM (20 mg/L total and 0.4 mg/L un-ionized) but are acceptable levels for *L. plumulosus*. The acceptable overlying water ammonia concentration for *A. bahia* is 0.6 mg/L as un-ionized ammonia. The Ferretti Ammonia Reduction Procedure (Ferretti et al., 2001) described in Section B.7.2 will be used to purge ammonia from the sediments, if needed. Overlying and porewater ammonia will be monitored each day during the purging period. Once acceptable porewater ammonia concentrations are reached, the 10-day whole sediment bioassay can begin. It is anticipated that the ammonia purging procedures for the 10-day test whole sediment bioassay will be conducted concurrent with the Task 7.1 SPP assays, if the Task 7.1 option is executed. Sediments for the 10-day test whole sediment bioassay will be containerized and refrigerated at 4°C after they meet the acceptable porewater ammonia concentration for *L. plumulosus*. The ammonia reduced sediments will be added to test vessels and allowed to equilibrate with overlying water under test conditions for at least 24 hours prior to the addition of test organisms. Porewater and overlying ammonia will be measured at least 24 hours prior to the addition of test organisms to confirm that ammonia levels are at acceptable levels.

For both test species, organisms (20 per chamber) will be introduced to the test chambers once ammonia levels are within acceptable levels. Overlying water will be monitored on Days 0, 3, and 10 of the test, per the guidance in Appendix F of the Inland Testing Manual (Day 0, 10 monitoring) and NAE (intermediate Day 3 monitoring). Porewater ammonia will be monitored in the amphipod test on Day 0, 3 and 10 as well.

The static-renewal test conditions of one exchange per day should ensure that ammonia remains within acceptable range. However, if the Day 3 monitoring results show that ammonia was above the acceptable range, the static-renewal frequency will be increased to up to two exchanges per day. Other water quality parameters (temperature, pH, dissolved oxygen, and salinity) will be measured in all replicates at test initiation, in one replicate per day during the test, and again in all replicates at test termination.

Reference toxicant assays will be conducted by the laboratory on a regular basis for each test species. The bioassay tests will also include a 96-h, water-only, reference toxicant test using ammonia to assess the sensitivity of *L. plumulosus* and *A. bahia*. Specific test conditions for the whole sediment toxicity tests are provided in **Table B-8**.

Table B-9 10-day Whole Sediment Test Conditions

Parameter	<i>Leptocheirus plumulosus</i>	<i>Americamysis bahia</i>
Treatments*	6 Sample Composites and 1 CLDS Reference Site Control	6 Sample Composites and 1 CLDS Reference Site Control
Replicates	5	5
Test population	Sub-adult (3-5 mm)	1-5 days old
Temperature	Mean of 20± 1°C Maximum Deviation of 3°C	Mean of 20 ± 1°C Maximum Deviation of 3°C
Dissolved Oxygen	>40% Saturation	40% Saturation
pH	NA	NA
Salinity	20 – 30‰ ±10%	25 – 30‰ ±10%
Ammonia	Porewater un-ionized ammonia <0.8 mg/L	Overlying water un-ionized ammonia <0.6 mg/L
Feeding	None	Daily, <24 hour old <i>Artemia nauplii</i>
Reference Toxicant	Ammonia	Ammonia

*Study design also includes laboratory control.

B.7.4 28-day Bioaccumulation Bioassay (Task 8)

Project bioaccumulation tests will commence within six weeks of sample collection. Chemical analyses will only be performed on tissue samples for sediments that pass the 10-day whole sediment acute toxicity test. Bioaccumulation tests will be performed by ESI according to the NAE Regional Guidance (EPA/USACE 1998, 2004).

Macoma nasuta and *Nereis virens* will be exposed to the six sample composites, plus the CLDS Reference Site sediment, and native control sediments (i.e., negative laboratory control), for 28 days under flow-through conditions. *M. nasuta* and *N. virens* will be tested in separate 10-gallon aquaria, with five replicate aquaria per treatment. Twenty organisms will be introduced into each replicate aquaria⁴.

Water quality parameters (temperature, dissolved oxygen, pH, and salinity) will be measured in all replicates at test initiation, in at least one replicate per treatment daily, and in all replicates at test termination. Flow rates into individual aquaria are measured daily and adjusted as necessary from Days 0 through 27 of the bioaccumulation test. If necessary, aeration will be provided to all test chambers to maintain dissolved oxygen >40% saturation.

⁴ The PWS identified a minimum of 30 *M. nasuta* per replicate; however, the toxicity testing laboratory has indicated that sufficient test mass will be achieved with 20 organisms per replicate.

At the end of the 28-day testing period, *M. nasuta* and *N. virens* will depurate in clean seawater for 24 hours. Specific test conditions for the 28-day bioaccumulation test are provided in **Table B-9**.

Table B-10 28-Day Bioaccumulation Bioassay Test Conditions

Parameter	<i>Macoma nasuta</i>	<i>Nereis virens</i>
Treatments*	6 Sample Composites and 1 CLDS Reference Site Control	6 Sample Composites and 1 CLDS Reference Site Control
Replicates	5	5
Test population	Adult clam	Adult Polychaete; 3-15 grams
Temperature	Mean of 12 ±2°C Maximum Deviation of 3°C	Mean of 12 ± 2°C Maximum Deviation of 3°C
Dissolved Oxygen	>40% Saturation	>40% Saturation
pH	NA	NA
Salinity	25 – 30‰ ±10%	25 – 30‰ ±10%
Ammonia	NA	NA
Feeding	None	None
Reference Toxicant	NA	NA

*Study design also includes laboratory control.

B.7.5 Tissue Analysis (Task 10)

Following depuration, organism tissues will be homogenized, transferred into the appropriate chemistry jars for tissue chemistry analyses and stored frozen (<20°C) until analysis. Tissue sample container and storage requirements are detailed in **Table B-11** and Attachment 5.

Table B-4 Sample Container, Preservation, and Holding Time Requirements for Tissue Samples

Tissue Parameters	Mass (g)	Container	Preservation	Storage	Holding Time
Lipids	0	N/A – lipid content obtained from organic analysis			
Moisture	2-10	Glass	Freeze	-20°C	14 d (1yr if frozen)
Organic Chemistry (PAHs/PCBs/Pesticides)	40	Glass	Freeze	-20°C	14 d or 1yr if frozen (extract)/ 40 d (analyze) when thawed
Metals Chemistry	10	Glass	Freeze	-20°C	28 d (Hg), 180 d or 1yr if frozen (other metals) when thawed

B.7.6 Preventive Maintenance

Routine testing and preventive maintenance of instrumentation needed to carry out bioassay test chamber monitoring is performed by the laboratory as part of their QA program. Details on the type of checks, frequencies, and corrective actions associated with the project measurements are included in the accompanying laboratory QA manuals.

B.7.7 Calibration Procedures & Frequency

Calibration of bioassay monitoring instrumentation will be guided by the procedures detailed in the laboratory QA manual.

Ammonia and pH measurement probes will be calibrated immediately before (daily) use and at the finish of (daily) monitoring activities. Thermometers and temperature recording devices will be checked daily and are calibrated annually against a calibrated NIST standard thermometer. Dissolved oxygen probes will also be checked before (daily) use.

B.7.8 Laboratory QC Procedures

All bioassays will include a negative control, and a water-only, reference toxicant test to assess the sensitivity of each test population. The reference toxicant assays will be conducted by the laboratory on a regular basis for each test species.

Additionally, the biological QC elements detailed in the NAE QC summary tables, referenced in the RIM (EPA/USACE, 2004) and included in Appendix B will be adhered to, including test species age/health, control abnormality and mortality acceptance criteria and test-specific acceptability requirements.

B.7.9 Performance and System Audits

Bioassay programs include the use of reference toxicants to audit the performance of bioassay laboratory procedures. Laboratory system audits may be performed at the discretion of the NAE TM to ensure project personnel are performing project related tasks according to the project specific Work Plan and associated field and laboratory SOPs.

Laboratory Audit

ESI laboratory audits are conducted periodically by AECOM as part of their analytical subcontractor monitoring program. A typical systems audit includes review of the following areas:

- QA organization and procedures,
- Personnel training and qualifications,
- Sample log-in procedures,
- Sample storage facilities,
- Analyst technique
- Adherence to laboratory SOPs and project Work Plan,
- Compliance with QA/QC objectives,
- Equipment calibration and maintenance,
- Data recording, reduction, review, and reporting, and
- Cleanliness and housekeeping.

Preliminary results of the audit are discussed with the Laboratory Manager, Laboratory Project Manager, and Laboratory QA Coordinator. A written report that summarizes audit findings and recommends corrective actions is prepared and submitted to the Laboratory Manager for response, and to the AECOM Project Manager.

Data Package Audits

Audits of bioassay reports will be conducted for 100% of the packages received as part of the data review process. The review will include an evaluation of the package to ensure that (1) all required deliverables are provided, (2) the package contains the information necessary to reproduce the reported results, and (3) the

QC acceptance criteria specified in the Work Plan were met. Any deficiencies will be communicated to the laboratory and documented in the project files.

Audit Samples

Audit samples will be incorporated into the program as discussed in the Laboratory QC Procedures section above. Reference toxicant results will be reviewed by the Biology/Bioassay Laboratory Coordinator and compared to the acceptable limits provided by the vendor. Failure to meet the acceptance criteria will result in the review of the results and supporting data by the laboratory to identify the cause of the failure. Depending on the outcome of this review, subsequent corrective actions may include the following:

- Qualification/flagging of affected data,
- Discarding affected data and re-analysis, or
- Discarding affected data, re-sampling, and re-analysis.

B.7.10 Nonconformance & Corrective Actions

Corrective action is the process of identifying, recommending, approving, and implementing measures to counter Work Plan specification nonconformance, unacceptable procedures, or out-of-limit QC performance that can affect data quality. All corrective action proposed and implemented will be documented as detailed in Section B.13 Reports.

Corrective action should only be implemented after approval by the AECOM Task Order Manager, or her designee.

Biological Laboratory Corrective Action

Corrective action in the laboratory may occur prior to, during, and after initial analyses. A number of conditions such as low/high water quality readings may be identified. Following consultation with laboratory personnel, it may be necessary for the Laboratory QA Coordinator to approve the implementation of corrective action. If the nonconformance causes project objectives not to be achieved, the AECOM Task Order Manager will be notified.

These corrective actions are performed prior to release of the reports from the laboratory. The corrective action will be documented in both the laboratory's corrective action files, and in the narrative report sent from the laboratory to the AECOM Biology/Bioassay Laboratory Coordinator and the AECOM Task Order Manager. If the corrective action does not rectify the situation, the laboratory will contact the AECOM Task Order manager who, in concert with the AECOM Biology/Bioassay Laboratory Coordinator and NAE's TM, will determine the action to be taken and inform the appropriate personnel.

B.8 Data Reduction/ Calculation of Data Quality Indicators

In addition to measurement sensitivity discussed previously, data usability will depend on the measurement accuracy and precision, as indicated by the corresponding accuracy and precision QC samples (i.e., method & equipment blanks, matrix spike samples, laboratory control samples (LCSs), standard reference materials (SRMs), and replicates). The field and laboratory data collected during this investigation will be used to achieve the objectives identified in this QAPP. The QC results associated with each analytical parameter for each matrix will be compared to the measurement objectives presented herein.

This section details the calculation of these DQIs.

B.8.1 Accuracy Assessment

One measure of accuracy will be R, which is calculated for matrix spikes, surrogates, LCSs, and SRMs. Percent recoveries for matrix spike results will be determined according to the following equation:

$$\%R = \frac{(Amount\ in\ Spiked\ Sample - Amount\ in\ Sample)}{Known\ Amount\ Added} \times 100$$

Percent recoveries for LCS, SRM, and surrogate compound results will be determined according to the following equation:

$$\%R = \frac{Experimental\ Concentration}{Known\ Amount\ Added} \times 100$$

An additional measure of accuracy is blank contamination. The blanks associated with this project include laboratory method blanks and equipment rinsate blanks. The results of the laboratory and field blanks will be compared to the objectives in stated Section B.3.2 of the QAPP. Failure to meet these objectives may indicate a systematic laboratory or field problem that should be investigated and resolved immediately. Associated data may have limitations placed on its use, depending on the magnitude of the problem.

B.8.2 Precision Assessment

The RPD between sample replicates is calculated to compare to precision objectives. The RPD will be calculated according to the following formula.

$$RPD = \frac{(Amount\ in\ Sample\ 1 - Amount\ in\ Sample\ 2)}{0.5(Amount\ in\ Sample\ 1 + Amount\ in\ Sample\ 2)} \times 100$$

Failure to achieve precision objectives may result in the associated data having limitations placed upon its use.

Completeness Assessment

Completeness is the ratio of the number of valid sample results to the total number of samples analyzed with a specific matrix and/or analysis. Following completion of the analytical testing, the percent completeness will be calculated by the following equation:

$$Completeness = \frac{(number\ of\ valid\ measurements)}{(number\ of\ measurements\ planned)} \times 100$$

Failure to meet the completeness objective will require an assessment to determine if the missing or invalid data are critical to achieving the project objectives. Corrective actions may include re-sampling or re-analysis, depending on the type of problem, logistical constraints, etc.

B.8.3 Comparison to Project Objectives

In addition, the data obtained will be both qualitatively and quantitatively assessed on a project-wide, matrix-specific, and parameter-specific basis. Factors to be considered in this assessment of field and laboratory data will include, but not necessarily be limited to, the following:

- Conformance to the field methodologies proposed in the FSP and QAPP,
- Conformance to the analytical methodologies provided in the QAPP,
- Adherence to proposed sampling strategy,

- Presence of elevated detection limits due to matrix interferences or contaminants present at high concentrations,
- Unusable data sets based on the data review results,
- Data sets identified as usable for limited purposes based on the data review results,
- Status of all issues requiring corrective action, as presented in the QA reports to management,
- Effect of nonconformance (procedures or requirements) on project objectives,
- Adequacy of the data as a whole in meeting the project objectives, and
- Identification of any remaining data gaps and need to reevaluate project decision rules.

This assessment will be performed by the technical team, in conjunction with the Project QA Officer, and the results presented in the final report.

B.9 Laboratory Operations Documentation

Laboratory data reduction procedures will be performed according to the following protocol. All information related to analysis will be documented in controlled laboratory logbooks, instrument printouts, or other approved forms. All entries that are not generated by an automated data system will be made neatly and legibly in permanent, waterproof ink.

Information will not be erased or obliterated. Corrections will be made by drawing a single line through the error and entering the correct information adjacent to the cross-out. All changes will be initialed, dated, and, if appropriate, accompanied by a brief explanation. Unused pages or portions of pages will be crossed out to prevent future data entry. Analytical laboratory records will be reviewed by the supervisory personnel on a regular basis, and by the Laboratory QA Coordinator periodically, to verify adherence to documentation requirements.

Data and report deliverables will be provided within the turnaround time specified in **Table A-3** of the FSP. The laboratory will provide at least one report in a printed document format (PDF) and one EDD to the Chemistry Coordinator. Upon approval of this Work Plan, the required format of the EDD will be provided (per the RIM). The hard copy data package will include the information summarized below:

- Case narrative (see description below);
- Cross reference of field sample IDs and laboratory IDs;
- Method summary;
- COC documentation;
- Dates of sample extraction and analysis;
- Description of any data qualifiers used;
- Sample results, including units;
- Sample preparation information;
- Results for MS/MSDs, method or preparation/calibration blanks, LCSs, surrogate spikes, and laboratory duplicates; and
- Matrix-specific method detection limits (MDLs) and reporting limits (RLs).

The case narrative will include the client name, project name and number, date of issuance, and a discussion of any deviations from analytical strategy, technical problems, and QC failures or non-conformances. The report will be signed by the Laboratory Project Manager.

All laboratory reports will be maintained on the project website (along with all project related/generated information) with access only to designated AECOM and NAE personnel for a minimum period of five years.

B.10 Data Assessment Procedures

All data generated through field activities or through the analytical program will be reviewed prior to reporting. No data will be disseminated by AECOM until it has been subjected to the procedures summarized below.

B.10.1 Internal Laboratory Review

Prior to the release of any data from the laboratories, the data will be reviewed and approved by laboratory personnel. The review will consist of a tiered approach that will include reviews by the person performing the work, by a qualified peer, and by supervisory and/or QA personnel.

B.10.2 Validation of Analytical Data

Validation of the laboratory deliverables will be performed by AECOM. The laboratory data will be reviewed for the following, as appropriate to the method:

- Completeness of deliverable;
- Technical holding times;
- Laboratory and field blank contamination;
- Surrogate spike recoveries;
- MS/MSD recoveries and RPDs;
- Laboratory duplicate RPDs;
- LCS recoveries; and
- Field duplicate.

The evaluation will consist of a review of the data package narrative and QC result. If data are considered usable, no data qualification will occur. In the event that serious deficiencies in data quality are noted, the data may be rejected and considered unusable.

B.11 Verification and Validation Methods

B.11.1 Field Data Verification

Field records will be reviewed by the Field Services Task Leader to ensure that:

- Logbooks and standardized forms have been filled out completely and that the information recorded accurately reflects the activities that were performed.
- Records are legible and in accordance with good recordkeeping practices, i.e., entries are signed and dated, data are not obliterated, changes are initialed, dated, and explained.
- Sample collection, handling, preservation, and storage procedures were conducted in accordance with the protocols described in the FSP and QAPP, and that any deviations were documented and approved by the appropriate personnel.

B.11.2 Laboratory Data Verification

Prior to being released as final, laboratory data will proceed through a tiered review process. Data verification starts with the analyst who performs a 100% review of the data to ensure the work was done correctly the first time. The data reduction and initial verification process must ensure that:

- Sample preparation and analysis information is correct and complete,
- Analytical results are correct and complete,
- The appropriate SOPs have been followed and are identified in the project records,
- Proper documentation procedures have been followed, and
- All non-conformances have been documented.

Following the completion of the initial verification by the analyst performing the data reduction, a systematic check of the data will be performed by an experienced peer or supervisor. This check will be performed to ensure that initial review has been completed correctly and thoroughly and will include a review of

- Adherence to the requested analytical method SOP;
- Correct interpretation of chromatograms, mass spectra, etc.;
- Correctness of numerical input when computer programs are used (checked randomly);
- Correct identification and quantitation of constituents with appropriate qualifiers;
- Numerical correctness of calculations and formulas (checked randomly);
- Acceptability of QC data;
- Documentation that instruments were operating according to method specifications (calibrations, performance checks, etc.);
- Documentation of dilution factors, standard concentrations, etc.; and
- Sample holding time assessment.

A third-level review will be performed by the Laboratory Project Manager before results are submitted to clients. This review serves to verify the completeness of the data report and to ensure that project requirements are met for the analyses performed. A narrative to accompany the final report will be prepared by the Laboratory Project Manager.

B.11.3 Validation of Laboratory Deliverables

Data will be reviewed as described in Sections B.11 of the QAPP. Upon completion of the validation, a brief report will be prepared discussing the acceptability of the data.

B.11.4 Verification during Data Management

All manually entered data (e.g., field data) will be proofed 100% against the original. Electronic data will be checked 100% after loading against laboratory data sheets for completeness and spot checked for accuracy.

B.12 Reconciliation with User Requirements

The field and laboratory data collected during this investigation will be used to achieve the objectives identified in this QAPP. The QC results associated with each analytical parameter for each matrix will be compared to the measurement objectives presented in this QAPP.

B.13 Reports

In addition to any potential audit and/or corrective action reports, several progress reports are scheduled to be delivered prior to submission of the project draft and final reports. The scheduled reports are as follows:

Bulk Sediment Chemistry Progress Report

A written progress report will be provided immediately upon the receipt of laboratory results (anticipated within four weeks of the start analyses) to properly inform the decision-making process. Chemistry data will be provided in the NAE EDD spreadsheet format. A completeness checklist and Quality Control Summary sheets as prescribed in the RIM will be filled out and submitted with the progress report for all data reported.

Elutriate Chemistry Progress Report

A written progress report will be provided within five weeks of the start of elutriate preparation to properly inform the decision-making process. Chemistry data will be provided in the NAE EDD spreadsheet format. A completeness checklist and Quality Control Summary sheets as prescribed in the RIM will be filled out and submitted with the progress report for all data reported.

SPP Toxicity Test Progress Report

A written progress report, without statistical analysis, will be provided within one week from the SPP test completion. If the ammonia reduction SPP test option is implemented (Task 6.1), then those results will be included in the progress report, which will be provided within one week of Task 6.1 test completion. The report will include summaries of all procedures and present tabulated data for each test series and organism analyzed.

Statistical analysis will be performed upon approval from NAE of the written progress report. Statistical analyses will be performed following Appendix D2 of the Inland Testing Manual (EPA/USACE, 1998). In addition to the written report all data will be submitted in electronic transmittable spreadsheets.

Whole Sediment Acute Toxicity Test Progress Report

A written progress report for toxicity and bioassay testing, without statistical analysis, will be provided within two weeks from test initiation. The report will include summaries of all procedures and present tabulated data for each test series and organism analyzed.

Statistical analysis will be performed upon approval from NAE of the written progress report. Statistical analyses will be performed following Appendix D2 of the Inland Testing Manual. In addition to the written report all data will be submitted in electronic transmittable spreadsheets.

28-day Bioaccumulation Bioassay Progress Report

A written progress report for toxicity and bioassay testing, without statistical analysis, will be provided within eight weeks from test initiation. The report will include summaries of all procedures and present tabulated data for each test series and organism analyzed. In addition to the written report all data will be submitted in electronic transmittable spreadsheets.

Tissue Analysis Progress Report

A written progress report, without statistical analysis, will be provided within six weeks from the start of the task. Chemistry data will be reported in approved EDD spreadsheet formats (once the Work Plan is approved). A completeness checklist and Quality Control Summary sheets as prescribed in the RIM will be filled out and submitted with the progress report for all data reported.

Draft and Final Reports

A draft report will be prepared to allow NAE an opportunity to review and comment on the document before finalizing. In each case, the draft and final reports will be transmitted to NAE within the established schedule (FSP **Table A-3**) containing the following elements:

- Cover sheet, which includes contract number, statement of data authenticity, and official signature of release.
- Table of contents.

- Case narrative which shall include analytical methods used, field sample and laboratory number correlations, data qualifier definitions, and deviations from established QA/QC procedures with associated corrective action.
- Summary tables of chemical analyses and biological tests.
- Complete field report, which includes sampling procedures and any problems or deviations from the Work Plan encountered.
- Biological testing results (toxicity).
- Sample documentation which includes original Chain of Custody record, shipping documents, and cooler receipt forms.
- QA/QC information which shall include method detection limits for each analyte, spike recoveries including surrogate recoveries, measures of precision, and all control limits for accuracy and precision. The QA/QC samples analyzed for each batch of samples (maximum of 20 samples to a batch) consist of:
 - Method blank.
 - Laboratory Control Sample (LCS).
 - Matrix Duplicate (using sample from project).
 - Matrix Spike/Matrix Spike Duplicate (using sample from project).
 - SRM (if available with analyte concentrations comparable to the project).
- The water chemistry and toxicity data will also be presented in an EDD according to <http://www.nae.usace.army.mil/reg/rim.htm> under Data Reporting Requirements/Sediment Evaluation/EDD.
- Completion of the Completeness Checklist Table II-1 located under Appendix II of the RIM (Appendix B).

Delivery dates for all reports are provided on **Table A-3**. Project reports, along with all relevant project records will also be maintained on AECOMs project files with for a minimum period of five years.

Standard Operating Procedure Field Records

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for documentation of field activities conducted under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program including sample collection events, field measurements, and site visits. Appropriate documentation of field activities provides an accurate and comprehensive record of the work performed, sufficient for a technical peer to reconstruct the day's activities and determine that necessary requirements were met. Field records also provide evidence and support technical interpretations and judgments. The procedures and systems defined in this SOP help ensure that the records are identifiable (reference the project task/activity), legible, retrievable, and protected from loss or damage. Specific information regarding field records to be kept can be found in the associated task order-specific Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP).
- 1.2 Field data may be recorded electronically or in field logbooks, standardized forms, annotated maps, or photos. This SOP provides general guidance on field recordkeeping; additional details for specific procedures (for example, chain of custody, sample collection) are provided in the SOPs for the individual task.
- 1.3 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Deviations from this SOP will be documented in the field records. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 Although record keeping itself does not generally pose significant health and safety risks, the tasks being implemented in the vicinity of individuals keeping records may require attention to safety practices. Project-related physical, chemical and biological hazards are addressed in the Accident Prevention Plan (APP).
- 2.2 Daily safety briefings will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risks of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are remedied to the satisfaction of the SSO.

3.0 Interferences

Not Applicable

Standard Operating Procedure Field Records

4.0 Equipment and Materials

The following equipment list contains materials that may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Bound field logbook
- Standardized field data sheets (refer to Section 5.3)
- Black ballpoint pen, Rite-in-Rain® pen, or black Sharpie® (or equivalent)
- Site maps
- Clipboard
- Three-ring binder or equivalent
- Camera (optional)
- Time piece
- Hand-held electronic recording device (optional) with EQUIS Data Gathering Engine (EDGE)™ software from Earthsoft, Intelligent Data Entry Form® (IDEF) software or equivalent
- Laptop, tablet or other portable electronic recording device (optional)

5.0 Procedures

5.1 General requirements

- 5.1.1** The field records will contain sufficient detail so that the collection effort can be reconstructed without reliance on the collector's memory.
- 5.1.2** Pertinent field information will be recorded legibly in a logbook and/or an appropriate standardized form (as described herein), or directly onto a portable electronic device, as described in Section 5.6. It is recommended that entries made by hand be made in black ballpoint pen.
- 5.1.3** Entries will be signed and dated. No erasures or obliterations will be made. A single line will be drawn through incorrect entries and the corrected entry written next to the original strikeout. Strikeouts are to be initialed and dated by the originator.
- 5.1.4** If a ballpoint pen cannot be used because of adverse weather conditions (rain or freezing temperatures), fine-point Sharpie® or Rite-in-Rain® pens are acceptable substitutes. If conditions are such that only pencil can be used, an explanation will be included in the logbook and the affected data will be photocopied, signed as verified copy, and maintained in the project files as documentation that the information has not been changed.

Standard Operating Procedure Field Records

- 5.1.5 Entries will be factual and observational (i.e., no speculation or opinion), and will not contain any personal information or non-project-related entries. Abbreviations and acronyms will be defined.
- 5.1.6 Field information will be recorded without delay – information recorded significantly after the fact will be dated as such.
- 5.1.7 Field activities and other events pertinent to the field activities will be documented in chronological order. Times will be recorded using Eastern Standard Time (EST) or Eastern Daylight Savings Time (EDT) notation for each entry.

5.2 Field logbooks

- 5.2.1 Field logbooks will be bound waterproof field books. Logbooks will be dedicated to the project and will not be used for any other project or purpose. Separate and dedicated logbooks will be kept for different operations running concurrently (e.g., sample collection on board the vessel, core processing, surface water collection on-board a vessel, surface water collection from the shore); individual tasks making up each operation will be maintained in the same logbook, if possible.
- 5.2.2 The cover and binding of each logbook will be labeled to identify the operation and dates included with the logbook; each page in the logbook will be consecutively numbered. Pages will not be removed or torn out of the logbook.
- 5.2.3 The title page of each logbook will contain the following:
 - AECOM contact, AECOM office location, and phone number;
 - A unique logbook number (assigned at the time the logbook is signed out)
 - Project name and AECOM project number; and
 - Start and end dates of work covered by the logbook.
- 5.2.4 To assist in the return of a field logbook in the event it is lost, the following will also be included on the title page: "\$25 Reward if found and returned to AECOM, 250 Apollo Drive, Chelmsford, Massachusetts 01824".
- 5.2.5 At the front of each logbook will be a page cross-referencing each author's printed name, signature, and initials.
- 5.2.6 A page header will appear on the first page of each day's notes in the logbook, and activities for each day will be recorded on a new page. The page header will include:
 - Name of author and other personnel on site (and affiliated organization if applicable);
 - Date;
 - Time of arrival (military time);

Standard Operating Procedure Field Records

- Proposed activity (task); and
- Current weather and tidal conditions, and weather forecast for the day.

5.2.7 An abbreviated header, containing at least the date, will appear at the top of each additional page for the active date.

5.2.8 The field logbook will provide a chronology of events. At a minimum, documentation in a logbook will include the following (unless documented on a standard form):

- Names of visitor(s), including time of arrival and departure, the visitor's affiliation, and reason for visit;
- Summary of project-related communications, including names of people involved and time;
- Time daily work commences and ceases;
- Start and stop times of new tasks;
- Start and stop times of significant stand-by time (work interruptions);
- Safety or other monitoring data, including units with each measurement;
- Deviations from approved scope of work, including the necessary approvals;
- Progress updates;
- Problems/delays encountered;
- Unusual events; and
- Signature or initials of author on every page.

Additional detail on the contents of the field logbook is provided in Table 1.

5.2.9 The logbook will cross-reference the field forms if necessary; however, whenever possible, details recorded on the standardized forms will not be replicated in the logbook.

5.2.10 If there are additional lines on the page at the end of the day's activities, a line will be drawn through the empty space, and initialed and dated, leaving no room for additional entries.

5.3 Standardized forms

5.3.1 Standard forms for field data are provided with each SOP. The Daily Activity Log is attached to this SOP (Attachment 1). This form will be completed each day of active work and transmitted to the Task Order Manager or his/her designee. Refer to the appropriate SOP (e.g., core processing) for the forms specific to that task.

5.3.2 The information collected on any field form may alternately be collected electronically by laptop/handheld as appropriate.

Standard Operating Procedure Field Records

5.3.3 The following rules apply to the standardized forms:

- Each form will be signed and dated by the person completing the form.
- There will be no blank spaces on the form – unused spaces will have “not applicable” or “not available” explanations.

5.4 Maps and drawings

5.4.1 Pre-existing maps and drawings that include notations made in the field (for example, relocating of sample locations) will be referenced in the logbook and, like all field records, include the project/task name and number, site identification, and be signed/dated by the person that prepared them.

5.4.2 Maps and drawings will include compass orientation and scale. Sketches will include points of reference and distances to the reference points.

5.5 Photographs and other photo documentation

Photographs or videos may be taken by the field team to help document site conditions, sample locations, or sample characteristics. Photographs and videos will be identified in the logbook or on the standard form by a unique numbering system. If photographs are collected by a digital camera, the file number as well as the photograph number will accompany the description of the photograph in the logbook. At a minimum, the date/time the photograph was taken, the general location, a brief description, and the photographer’s name will be recorded. For photographs taken with a cellular phone, the photo should be documented either by including an additional photo of information identifying the photograph, or by sending via text or email to another phone with appropriate information included. Additional information may include Differential Global Positioning System (DGPS) coordinates, direction the photographer was facing, and/or weather conditions. If necessary, an object will be included to indicate the scale of the object in the photograph.

5.6 Electronic files

5.6.1 Electronic recording devices may include data logging systems, laptops, or tablet computers.

5.6.2 Sufficient backup systems will be in place to protect against electronic data loss. Information will be saved to a disk or backed up immediately upon completion. The backup disk or other media (CD, flash drive) will then be stored in a secure location separate from the laptop or tablet.

5.6.3 Files will be uniquely identified and will be stored in the project files on the network in accordance with the FSPs . An unedited version of the file will be maintained and all subsequent manipulations tracked.

Standard Operating Procedure Field Records

6.0 Quality Assurance/Quality Control

- 6.1 Entries in the field forms will be double-checked by the field team members to verify the information is correct.
- 6.2 Completed field forms will be reviewed by the Field Services Task Leader and/or his/her designee to verify that the requirements are being met. At a minimum, this should occur at the end of each day. When the review is complete, the reviewer will append his/her initials and date to the pages reviewed for documentation purposes.
- 6.3 If information recorded in the field is transcribed to another format, the original record will be retained for comparison purposes.

7.0 Data and Records Management

- 7.1 Deviations to the procedures detailed in the SOP or approved plans will be noted in the field logbook or other appropriate field form at the time of occurrence and summarized on the Daily Activity Log (Attachment 1).
- 7.2 Proposed modifications to the SOPs or approved plans will be documented on a Field Corrective Action Form. An example Field Corrective Action Form is presented as Attachment 2.
- 7.3 Logbooks that are taken offsite from the field will be photocopied or scanned and filed at the end of each day to mitigate against the loss of historical entries should the logbook be lost in the field.
- 7.4 Field data forms and chain of custody will be filed in the office facility once they have been completed and distributed (if necessary), or at the end of each field day. These documents will be maintained in labeled three-ring binders or contained in some other organized manner that prevents loss.
- 7.5 Distribution of daily forms will be performed according to the needs of the project team and at the direction of the Field Services Task Leader or designee.

8.0 Personnel Qualifications and Training

- 8.1 Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP, FSPs, and QAPP). No specialized training is required. Nonetheless, these activities should be reviewed by the Field Services Task Leader, as described below.
- 8.2 The Field Services Task Leader is responsible for reviewing and approving the field records for accuracy, completeness, and conformance to the procedures in this SOP. The Field Services Task Leader is also responsible for ensuring that the field records are distributed to the appropriate personnel during field activities, ensuring that records are maintained properly on site, and for archiving the records upon completion of field activities.

Table 1 Summary of Typical Field Information

General Information	Applicable Record¹
Project/task name/general location	All
Personnel on site (AECOM, clients, site contacts, regulators, oversight personnel, subcontractors, general public)	A, B
Results of phone calls, conversations (See FSPs) for project contact information)	B
Chronology of activities, including mobilization, investigatory activities, and demobilization	B
Weather conditions (initial and any changes; temperature, barometric pressure, wind conditions, precipitation)	B
Tidal and atmospheric information (if applicable)	B
Subcontractors, description of services to be provided, and any issues (equipment problems, corrective action, stand by time)	A, B
Health and safety (H&S) tailgate meetings, H&S monitoring	Refer to APP
Description of major equipment (survey vessels, sampling platforms, sampling devices) and any problems or conditions that might impact performance or data quality	A, B, F
Equipment decontamination	B
Any pertinent field observations such as difficulties in sampling or conducting measurements or unusual circumstances that could affect data quality (instrument problems, contamination sources)	B, D, F
Deviations from approved plan (schedule, relocation/elimination of locations, change orders), including rationale and approval	A, B, F
Sample collection and transfer summary, custody information from collection through analysis	C
Field measurements	
Description of Instruments (make, model, serial number) and inspection	B
Measurement date, time, location/station, results (units, any correction factors applied, calculations (if applicable)	D, E
Identity of person performing the measurements	D, E
Sampling information	
Equipment description and inspection	B, D, E
Sample selection criteria/rationale (if different from plan)	A, B, D, E
Sample location (GPS coordinates, depth, compass/distance from fixed points)	D, E
Sample description (recovery, moisture, color, odor, texture, general sediment profile/stratigraphy, artifacts)	D, E
Sample manipulations (homogenization, compositing, filtering, preservation)	D, E
Sample ID, segment/interval, date, time, and sampler identity	B, D, E
Sample parameters, containers (size/type), preservation	
Field and QC sample ID, storage container and conditions for each (sub)sample/parameter set	B, C, D, E

¹ Locations for this information may include but are not limited to: A: Daily Activity Log; B: Field Notebook; C: COC Form; D: Field Coring Log; E: Grab Collection Form; F: Field Corrective Action Form

Standard Operating Procedure Navigation/Positioning

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for positioning vessels under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. Positioning will be conducted to locate the vessel(s) with sufficient accuracy and precision to meet project objectives during sampling or measurement activities. Specific information regarding proposed sampling and/or measurement locations is provided in the task order-specific Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP).
- 1.2 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and the AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 The health and safety (H&S) considerations for the work associated with this SOP, including physical, chemical, and biological hazards, are addressed in the task order-specific Accident Prevention Plan (APP). The major H&S considerations for the work associated with navigating/positioning are the marine/on-water safety aspects of the program.
- 2.2 Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risks of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are remedied to the satisfaction of the SSO.

3.0 Interferences

Differential global positioning system (DGPS) signal interferences/blockage can occur from time to time by bridges or other structures. These interferences can prevent system function until satellite signals are re-established. If insufficient satellite coverage occurs for proper function, the user will be alerted by the HYPACK system. In these cases the vessel will be repositioned to obtain better satellite coverage.

Standard Operating Procedure Navigation/Positioning

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP;
- Sampling vessel(s) adequately sized and equipped for the task and expected conditions, including high frequency (VHF) radio, ground tackle, and required U.S. Coast Guard safety gear;
- Navigation charts and sampling/measurement locations figure;
- Electronic navigation charts with pre-loaded waypoints for all sampling and measurement locations - refer to the FSP;
- DGPS Receiver with an accuracy of \pm one foot;
- DGPS External Antennas;
- Field laptop computer with HYPACK survey software;
- Equipment user manuals;
- Table of target sampling/measurement location coordinates;
- Assorted nautical equipment (e.g., anchors, lines, personal flotation devices);
- Logbook and ballpoint pen;
- Sample collection forms; and
- RTK DGPS positioning system with an accuracy of \pm 2 centimeters horizontal and 3 centimeters (optional).

5.0 Procedures

Sampling and measurement activities will be conducted from a vessel. In accordance with procedures outlined below, these vessels must be properly positioned and their position recorded before each activity can begin. The following describes the procedures that will be performed to accurately position sampling vessels at a designated sampling location, and the pertinent observations that will be recorded in the appropriate field notebook and/or data sheet.

Positioning will be achieved by using a DGPS integrated with HYPACK survey software in order to obtain the real time position of the vessel, in relation to planned sampling stations, displayed on an electronic nautical chart. Survey personnel will follow the appropriate sections of equipment user's manuals to ensure proper equipment operation and system performance..

Standard Operating Procedure Navigation/Positioning

5.1 Positioning the Vessel

This section gives the step-by-step procedures for vessel positioning. Observations made during vessel positioning will be recorded on the sample collection forms, other standardized forms, and/or logbook, as appropriate.

A DGPS will be used to establish locations during implementation of activities specified in the FSP. While this SOP provides general guidance and procedural steps, personnel performing positioning activities also will follow the appropriate sections of equipment user's manuals and have the manuals available for reference while operating the equipment.

The following procedures describe the steps to establish position at a location, as well as the steps to adjust the positioning if necessary to collect additional samples.

- 5.1.1** Obtain the appropriate form(s). Initiate the Daily Activity Log provided in SOP ES-G-01 (Field Records).
- 5.1.2** Obtain the target sampling/measurement locations. These locations will have been selected prior to commencement of field activities, as described in the FSP. The location of each target sampling location will be established in the local State Plane Coordinate System with respect to the North American Datum of 1983 (NAD83).
- 5.1.3** Enter the coordinates for each sampling location as a waypoint into the HYPACK software package. Confirm accuracy of each entry against the coordinates established in the corresponding FSP.
- 5.1.4** Configure the HYPACK system for the survey, including setting the survey grid to the local State Plane Coordinate System with respect to the North American Datum of 1983 (NAD83 - feet), and setting the "target ring" or maximum allowable offset based on task specific requirements listed in the FSP.
- 5.1.5** If less than sub-meter accuracy is required, a DGPS base station will be established over a shore-based marker prior to sampling or measurement operations. The operation and horizontal/vertical accuracy of the vessel mounted DGPS will be verified at another shore-based marker by recording observed horizontal and vertical (XYZ) data and comparing these data to the published XYZ data for a given point. After initial DGPS system verification, a temporary benchmark may be established at a location convenient to the vessel to facilitate daily DGPS system performance verification. DGPS system performance verification will be conducted twice per day and documented in the logbook and vessel data logger. The horizontal and vertical accuracy will be compared to shore-based markers to verify performance. Elevations will be recorded in North American Vertical Datum of 1988 (NAVD88) with an accuracy of +/- one foot.
- 5.1.6** Install the DGPS antennae in a safe location which accurately represents the actual sample or measurement collection point; (e.g., immediately adjacent to a coring well, or mounted to the A-frame).
- 5.1.7** Identify and approach actual sampling/measurement locations by using data from the DGPS/HYPACK system in the navigation mode (while observing other navigational "Rules of the Road"). The navigation mode provides information on heading, distance remaining,

Standard Operating Procedure Navigation/Positioning

and time remaining. This information is based on the selected waypoint location and the present location of the vessel.

- 5.1.8** For sediment sampling, the vessel will be secured by lowering spud poles once in position within the station "target radius". In water depths that preclude the use of spud poles, maneuver the vessel approximately 60 feet up-current (or up-wind in slack conditions) of the target, drop the anchor, and pay out anchor line until the vessel drifts within the "target radius". A second anchor set may be required to increase lateral stability under certain conditions.
- 5.1.9** For water column sampling, the vessel will be positioned over each sampling/measurement location with no contact with the bottom. The operator will utilize the onboard navigation system to attempt to maintain positioning of the vessel within 10 feet of the sampling/measurement location.
- 5.1.10** Once the vessel is on location (and secured as appropriate, for sediment sampling), note the coordinates from the DGPS unit and check the coordinates to verify that the vessel is within the pre-determined range of the target location as defined in the FSP. If not acceptable, adjust the vessel's location, and recheck the position. Repeat this process until the vessel's position is within acceptable range of the target. Record the actual sampling coordinates electronically (using HYPACK).
- 5.1.11** Once the coordinates are acceptable, perform the sampling or measurement activity at the location. Record final location coordinates on the appropriate form. For sediment sampling, final location coordinates will be recorded once the sampling device has penetrated the sediment to the target depth or refusal and prior to retrieval. For surface water sampling, final location coordinate will be recorded once the sample is being collected. Plot locations onto a master chart or use computer-based, real-time software to verify location.
- 5.1.12** To adjust the vessel's position to repeat an attempt at sediment sampling, the vessel will be moved by allowing it to rotate around the spud pole or by adjusting an anchor line until the new position for the sampling device has been established. Record the new position.
- 5.1.13** At the end of the sampling day, check the data loaded onto the DGPS units to verify the existence of locations where data were collected. Spot check the location data for accuracy. Download HYPACK navigation files to a portable data storage device and transfer data to an applicable secure project directory.

5.2 Elevation Measurements

- 5.2.1** In order to establish the elevation of the sediment surface at locations within a body of water, a system will be established whereby the water level of that water body is continuously monitored and recorded for use as a local reference (e.g., local NOAA station).

5.3 Calibration, Maintenance, and Use of Field Instruments

5.3.1 Poor DGPS Reception or System Failure

If insufficient satellite coverage occurs for proper function, the user will be alerted by the HYPACK® system or the DGPS unit. In these cases, the Field Services Task Leader will

Standard Operating Procedure Navigation/Positioning

be notified that verification of the field position of the vessel or sampler on foot at the target location cannot be performed. The Field Task Manager will review the situation with respect to available reference resources and may provide the field team with alternate locations, as required by the FSP. The selection of alternate sampling locations will be made jointly through discussions with the Field Services Task Leader, sampling personnel and/or the Task Order Manager.

When satellite reception is insufficient to meet system accuracy requirements, system error codes will appear on the output screen. Nonetheless, proper operation of the DGPS / HYPACK navigation system can be verified by checking the displayed position on the electronic base map against surrounding geographic features. This activity will be undertaken at the start of each day after start-up as a quick check to verify proper system function. Note: system function errors will be obvious and rigorous checking of the system is not necessary.

5.3.2 Maintenance

Prior to use, the DGPS units will be inspected for functionality. Maintenance and use of DGPS units will follow the appropriate sections of the equipment user's manual. Field personnel will have the manual available for reference. Equipment maintenance will be recorded in the field logbook, including the reason for the maintenance (routine or because of a problem), actions taken, and final resolution (e.g., correction of the problem, replacement of the instrument).

6.0 Quality Assurance/Quality Control

- 6.1 Actual sampling/measurement locations will be verified as being within the FSP-specified radius/tolerance surrounding the target coordinates specified in the FSP. Using a navigational software system allows the user to see the real time position of the sampling vessel in relation to the designated position of the sampling/measurement station and the user defined "target radius" surrounding each station. This visual confirmation on the electronic chart is also complemented by a data display that indicates the actual distance to target. Using these two features ensures proper vessel positioning.
- 6.2 DGPS system performance will be verified by confirming the accuracy of the initial navigational software configuration (i.e., geographic reference) and by regular system checks during the course of the day.
- 6.3 The quality of the data provided by the DGPS unit is monitored by the navigational software as another control feature built into the system. In the event there is degradation in DGPS signal quality, either by a reduced number of available satellites or satellite geometry, the navigational software system will alert the operator of the reduced quality of horizontal and vertical precision levels.
- 6.4 Data recorded manually and electronically (see Section 7.2) will be cross-checked for accuracy

Standard Operating Procedure Navigation/Positioning

7.0 Data and Records Management

- 7.1** Field records will be generated as outlined in SOP ES-G-01 (Field Records). This document provides specifics on recording data for field activities. At a minimum, sample position information (x, y, and z), verification of DGPS system performance, and any positioning-related problems encountered will be recorded. Additional information may be required for sample collection or measurement activities and are outlined in the relevant SOPs.
- 7.2** Position data will be saved electronically at the time of sampling within HYPACK and recorded manually on the sample collection/measurement forms. The electronic record represents the primary record and the sample collection/measurement form information will serve as a backup to the electronic file.
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). Proposed modifications to this SOP will be recorded on a Field Corrective Action Form (refer to SOP ES-G-01 – Field Records), including reason and impact on the program, and will be submitted to the AECOM Task Order Manager for approval.
- 7.4** All records (electronic and hard copy) associated with the activities described in this SOP will be maintained in accordance with the FSP.

8.0 Personnel Qualifications and Training

The individuals executing these procedures must have read, and be familiar with, the requirements of this SOP and the corresponding project plans (e.g., APP, FSP, and QAPP). Vessel navigation and positioning by vessel will only be performed by experienced RTK DGPS / HYPACK operators from the vessel subcontractors

Standard Operating Procedure Equipment Decontamination

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for decontamination of equipment, instruments, and other materials used during implementation of field tasks under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. Decontamination is the process of neutralizing, washing, and rinsing exposed surfaces of equipment to minimize the potential for contaminant migration and/or cross-contamination. Specific information regarding equipment that will be used and necessary decontamination can be found in the associated task order-specific Quality Assurance Project Plan (QAPP) and, Field Sampling Plan (FSP). This procedure does not apply to personnel decontamination which is described in the task order-specific Accident Prevention Plan (APP).
- 1.2 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications to this SOP may be warranted depending upon field conditions, equipment limitations, or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 The health and safety considerations for the work associated with this SOP, including physical, chemical and biological hazards, are addressed in the APP.
- 2.2 Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risks of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1 Equipment decontamination should be performed in an area that does not interfere with sampling activities, but sufficiently close to maintain an efficient working environment. Whenever possible, decontamination activities will be performed in a location that is not subject to potential sources of contamination (for example, generators and other combustion engines). Where decontamination is required on a boat, the vessel's engines must be turned off during decontamination. Ideally, boat engines and/or generators should be shut off during collection of equipment blanks, consistent with collection of surface water samples. If this is not possible, then the sampling platform should be positioned upwind from any running combustion engines.

Standard Operating Procedure Equipment Decontamination

3.2 Equipment that is improperly or inadequately decontaminated may result in biased sample results. To avoid sample contamination, the procedures and equipment specified in this SOP are to be followed. Specifically:

- The decontamination materials, including detergent, water, and solvents will meet the specifications of the SOP;
- Buckets and other containers holding decontamination solutions will be labeled to segregate containers holding “dirty” from “clean” solutions, and brushes will be dedicated to a particular step in the decontamination process; and,
- Decontaminated equipment that is not immediately reused will be covered/wrapped in plastic or aluminum foil and marked to indicate it is clean.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- personal protective equipment (PPE) and other safety equipment, as required by the APP;
- bristle brushes;
- plastic wash/rinse buckets or tubs;
- phosphate-free biodegradable detergent (e.g. Liquinox®);
- acetone wipes or similar (for oily residues);
- deionized "analyte-free" water (DIW);
- stainless steel bowls or pans (labeled as needed);
- squeeze or spray bottles (Teflon® for solvent);
- aluminum foil;
- plastic sheeting;
- zipper-lock bags;
- tap water (from any treated municipal water supply);
- sample container(s) for equipment rinsate blank, if collected;
- temporary storage containers for investigation-derived waste (IDW) storage containers (if needed); and
- field logbook and standardized forms as needed.

Standard Operating Procedure Equipment Decontamination

5.0 Procedures

Non-dedicated sampling equipment that comes into contact with the media to be sampled will be decontaminated prior to use in the field to eliminate or minimize cross-contamination. The frequency of decontamination is provided in the task-specific SOPs (for example, surface water sampling, grab sampling, sediment core collection, core processing). Sufficient decontaminated equipment will be available to be dedicated to the sampling locations planned for each day, where feasible. Equipment will be decontaminated in the area designated for decontamination.

Sampling equipment will be decontaminated as described in Section 5.0 below. Decontamination of the sampling equipment will be commensurate with the analyses to be performed.

Not all sampling equipment will require full decontamination procedures. Three levels of decontamination (i.e., solvent, soap and water, or ambient water decontamination) will be performed based on the usage of the sampling equipment as defined below.

5.1 General preparation

Inspect equipment needed for sample collection to ensure that it is in good working order and establish an equipment decontamination area that includes a collection basin that can be placed beneath the equipment to collect decontamination fluids, brushes, and a series of wash bottles for each of the solutions specified in the following sections.

5.2 Level I (Decontamination with Ambient Water): The following steps will be used to decontaminate sampling and support vessels, vessel anchors, lines, ropes, and buoy marker weights associated with sediment sampling:

- 5.2.1 Personnel will dress in suitable PPE to reduce exposure to contaminants (refer to the APP).
- 5.2.2 Equipment will be rinsed with site surface water onboard the sampling vessel.
- 5.2.3 Rinse water will not be contained.
- 5.2.4 Daily decontamination of the decks of the vessels will consist of a surface water washing as soon as possible after concluding work. Further wash-down with tap water at the marina is at the discretion of the boat's captain.

5.3 Level II (Decontamination with Soap and Water): The following steps will be used to decontaminate non-dedicated sampling equipment that is used to collect samples for chemical analysis:

- 5.3.1 Personnel will dress in suitable PPE to reduce exposure to contaminants (refer to the APP).
- 5.3.2 Residual sediment, as appropriate, will be scraped off and the equipment rinsed with site surface water (on the sampling vessel while on site).
- 5.3.3 Residual sediment on equipment will be discharged overboard upon completion of sampling at a location.
- 5.3.4 Equipment may be rinsed with tap water if needed to further remove gross contamination.
- 5.3.5 Equipment will be placed in a wash tub or bucket (if size allows) containing Liquinox® (or other phosphate-free detergent) along with tap water, and scrubbed with a bristle brush or similar utensil.

Standard Operating Procedure Equipment Decontamination

- 5.3.6 Equipment will be rinsed twice with tap water over a bucket using a squeeze bottle or pressure washer.
 - 5.3.7 Following decontamination, equipment will be placed in a dedicated clean area or will be protected from re-contamination by covering with plastic or wrapping in foil.
 - 5.3.8 Rinse water and detergent water will be replaced frequently. Residual decontamination water used on the boat will be held in 5-gallon buckets and discharged overboard upon completion at a station.
- 5.4 Level III (Decontamination with Solvents): The following steps will be used to decontaminate small sampling equipment that comes into contact with sediment or surface water with oily residues designated for chemical analysis. This sampling equipment may include such items as stainless steel trowels, spoons and bowls, stainless steel core cutters and catchers, plastic caps for the core tubes, and trigger-activated bottle samples. Sampling devices will be decontaminated between collection of samples at different depths and different times at the same sampling location. Details of when equipment is decontaminated is provided in the activity-specific SOPs.
- 5.4.1 Personnel will dress in suitable PPE to reduce exposure to chemicals and contaminants (refer to the APP).
 - 5.4.2 Any residual sediment will be scraped off and the equipment rinsed with site surface water (on the vessel while on site).
 - 5.4.3 Equipment may be brushed and rinsed with tap water if needed to further remove gross contamination.
 - 5.4.4 Equipment will be placed in a wash tub or bucket containing Liquinox (or other phosphate-free detergent) along with tap water, and scrubbed with a bristle brush or similar utensil. Equipment will be rinsed with tap water over a second wash tub or bucket, using a squeeze bottle or pressure sprayer, followed by cleaning with an acetone wipe.
 - 5.4.5 Following decontamination, equipment will be placed in a clean area on clean aluminum foil or plastic sheeting and allowed to air dry. Following air drying, the equipment will be wrapped in aluminum foil or placed in a zipper-lock bag, if not immediately re-used for sample collection. Larger equipment may be wrapped in clean plastic sheeting. Equipment that may be used immediately (i.e., before fully air dried) may be reused providing obvious water has been shaken off. Clean equipment should be marked in some way to indicate that it is clean.
 - 5.4.6 Used decontamination non-solvent solutions and associated materials will be collected in 5-gallon buckets and discharged overboard upon completion at a station.
 - 5.4.7 Acetone wipes will be placed in an open container and allowed to air-day as practical. Dried acetone wipes will be disposed of with PPE.
- 5.5 Field instrumentation should be cleaned according to the manufacturer's instructions. Care will be taken to prevent damage to equipment. Field instruments such as water quality meters will be rinsed daily during field operations at the end of each workday with tap or Site water at a minimum, or more rigorously according to the manufacturer's instructions. When possible, instruments which are difficult to decontaminate, such as cameras and data logging instruments, may be protectively wrapped to reduce or eliminate the need for decontamination.
- 5.6 Peristaltic pumps used for surface water sampling will be rinsed with tap water prior to and following each day of use. Decontamination of the pump between wells, stations or between depths is not

Standard Operating Procedure Equipment Decontamination

required. Decontamination of other pumps (e.g., bladder pumps, diaphragm pumps) between stations and depths is required.

- 5.7** Submersible pumps, if needed, will be decontaminated using Level II procedures.
- 5.8** Tubing, bladder pump bladders, and bailers will be dedicated to sample locations and will not require decontamination in the field.
- 5.9** Other sampling equipment that might be used and that has had direct contact with sediments or wastes will initially be decontaminated at a designated area prior to leaving the Site. If the above decontamination procedures are not applicable or feasible, the decontamination procedure will be as follows:
- 5.9.1** Equipment will be wrapped or draped in plastic or placed in the plastic-lined cargo area of a truck for transport to the area designated for decontamination.
 - 5.9.2** Equipment will first be washed with a hot water, high-pressure spray or steam-cleaned.
 - 5.9.3** Equipment will then be rinsed, by hose or high pressure spray, with tap water.
 - 5.9.4** Decontamination rinse and wash water generated between surface water or sediment sample locations will be discharged overboard upon completion at a station.
- 5.10** Equipment leaving the Site upon the completion of on-site investigation activities will be decontaminated according to Sections 5.2, 5.3, 5.4, 5.5, or 5.6, above.
- 5.11** Equipment rinsate blanks will be collected to assess the adequacy of equipment decontamination procedures. Equipment rinsate blanks will be submitted for testing at the frequency specified in the QAPP. The equipment rinsate blank collection procedures are included in the SOPs for the individual tasks (e.g., surface water sampling, sediment sampling, core processing, groundwater sampling, etc.).

6.0 Quality Assurance/Quality Control

- 6.1** Decontamination quality assurance/quality control (QA/QC) procedures described in Section 5.0 will be performed to assess the adequacy of equipment decontamination procedures. Equipment rinsate blanks will be collected at the frequency specified in the QAPP.
- 6.2** It is the responsibility of the Field Services Task Leader to periodically check/ensure that the equipment decontamination procedures are in conformance with those stated in this SOP.

7.0 Data and Records Management

- 7.1** Documentation of decontamination procedures will be contained in the field logbook or recorded on the appropriate task-specific standardized form and should include:
- a list of equipment being decontaminated along with the date and time;
 - a brief description of the procedure and materials used during the process (e.g., Level I/ambient water rinse; Level II/soap and water rinse; Level III/solvent rinse);
 - the names of the project staff performing the decontamination; and,

Standard Operating Procedure Equipment Decontamination

- documentation of equipment rinsate blanks including sample ID, date and time, the equipment rinsed, collector, and parameters.

7.2 Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). Proposed modifications to this SOP will be recorded on a Field Corrective Action Form (refer to SOP ES-G-01 – Field Records), including reason and impact on the program, and will be submitted to the AECOM Task Order Manager for approval.

7.3 All records associated with the activities described in this SOP will be ultimately maintained in accordance with the QAPP.

8.0 Personnel Qualifications and Training

8.1 Individuals executing these procedures will have read, and be familiar with, the requirements of this SOP and the corresponding plans (e.g., APP, FSPs and QAPP). Decontamination of field equipment is a relatively simple procedure; no specialized training is needed. However, execution of these activities will initially be supervised by more experienced personnel.

8.2 The Field Services Task Leader is responsible for ensuring the procedures for decontamination in this SOP are followed.

Attachment 1 Example Chain-of-Custody Form

Standard Operating Procedure

Sample Custody

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for the chain-of-custody (COC) procedures associated with samples collected under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. The objective of COC procedures is to provide sufficient evidence of sample integrity to satisfy data defensibility requirements. Samples may include sediment or water collected or generated for chemical, biological, and/or physical analyses, and associated quality control (QC) analysis. Specific information regarding samples collected can be found in the associated task order-specific Quality Assurance Project Plan (QAPP), and Field Sampling Plan (FSP). This SOP is intended to be complete enough that: 1) the steps which could affect tracking, documentation, or integrity of samples are explained in sufficient detail and 2) different sampling personnel following these procedures will deliver samples to the laboratory which are equally reliable and consistent.
- 1.2 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and the AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 Although COC activities do not generally pose significant health and safety risks, sample exposure via external container residues may occur and much of the work going on in the vicinity of sample custodians requires attention to safety practices. Project-related physical, chemical and biological hazards are addressed in the Accident Prevention Plan (APP).
- 2.2 Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risks of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are remedied to the satisfaction of the SSO.

3.0 Interferences

Not applicable.

Standard Operating Procedure

Sample Custody

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP;
- Sample containers as specified in the Quality Assurance Project Plan (QAPP) Addendum;
- Sample labels;
- COC forms;
- Custody tape or seals;
- Field logbook;
- Ballpoint pen or fine-tipped marker (e.g., Sharpie®); and
- Clear plastic sealing tape.

5.0 Procedures

5.1 General requirements

5.1.1 As few people as possible should handle the samples.

5.1.2 Sampling personnel should be able to testify that tampering of the samples could not occur without their knowledge.

5.2 Sample identification

Each sample, including field samples and QC samples (e.g., equipment rinse blanks, field duplicates) will be assigned a unique identification. Refer to the QAPP and FSP for the sample identification protocol.

5.3 Sample labeling

5.3.1 A label will be attached to each bottle used for sampling. Waterproof, adhesive labels are preferred. Labels will be applied to the container, not the lid, whenever possible.

5.3.2 The project identification, sample matrix, laboratory designation/analyses requested, field sample identification code, and preservation will be typed or printed onto the label before sampling. The label will be protected from water and solvents with clear packing tape, except in cases where not appropriate.

5.3.3 Completion of the sample labels (including the sampler's initials and the date and time of sample collection) will occur at the time of sample collection. Labels will be completed in waterproof, indelible ink.

Standard Operating Procedure

Sample Custody

5.4 Sample tracking

- 5.4.1** From the time of collection through transportation, the handling of samples will follow COC procedures. A representative from each sampling team will be assigned as the field sample custodian. This individual will be responsible for the custody of the samples from collection until release for processing or shipment to the laboratories. The field sample custodian will provide a sample transfer/custody form and the completed and electronic versions of the sample collection forms (refer to task-specific SOPs) when relinquishing the collected samples for sample processing or shipment. The samples will be verified against the sample transfer/custody form. An example standard COC form is provided in Attachment 1.
- 5.4.2** A sample is considered under a person's custody if one or more of the criteria are met:
- Sample is in the person's possession;
 - Sample is in the person's view after being in person's possession;
 - Sample was in the person's possession and then was locked up to prevent tampering; or
 - Sample is in a designated secure area.
- 5.4.3** Samples collected for analysis will be continuously tracked and while in transit to the laboratory by use of the following procedures below.
- 5.4.4** Individual sample bottles will be properly labeled and securely sealed before being placed in the container for shipment to the laboratory.
- 5.4.5** Pertinent information will be entered on the COC form (Attachment 1) and will include:
- Project identification
 - Signatures of samplers;
 - Sample identification code. This code should be unique to the sampling event and to the program and must agree exactly with the field sample identification code recorded on the bottle label;
 - Date and time of sample collection,
 - Sample matrix (sediment, water, etc.);
 - Analyses requested;
 - Number of sample containers;
 - Preservative;
 - Grab or composite sample designation (if applicable);
 - Sampler's remarks (optional). These comments may serve to alert the laboratory to highly contaminated samples or identify QC sample requirements.
 - Signatures of individuals involved in sample transfer;
 - Destination (e.g., laboratory name and location);

Standard Operating Procedure Sample Custody

- Page number (for example: 1 of 2, 2 of 2);
- If applicable, COC tape numbers (example provided in Attachment 2); and
- If applicable, the air bill or other shipping number.

This information is consistent with guidance in SW 846, Test Methods for Evaluating Solid Waste (USEPA, 2017).

- 5.4.6** The COC will be manually filled out completely and legibly in indelible ink. COCs may be pre-printed with known information (project identification, parameters to be analyzed, etc.) or may be hand-written on pre-printed forms. Corrections will be made, if necessary, by drawing a single line through and initialing and dating the error. The correct information will then be recorded with indelible ink. There should be no unexplained blank spaces. Blank lines will be lined out and initialed and dated.
- 5.4.7** Each COC will be cooler-specific (i.e., list only the samples packed in the cooler). Information on the COC must agree exactly with that recorded on the sample containers. Discrepancies may result in the samples being incorrectly logged into the laboratory or delays in initiating sample analysis.
- 5.4.8** The completed COC form will be signed, dated, enclosed in a sealable plastic bag, and placed in the container prior to shipment/ transfer to a courier. A copy of the COC will be retained by field personnel and stored in a dedicated binder or file. Additional copies will be distributed via email or fax as follows:
- Project Chemist/Laboratory Coordinator or his/her designee;
 - Data Manager or his/her designee; and
 - Laboratory project manager at each laboratory being used.
- 5.4.9** If samples are to be shipped by commercial overnight carrier, COC seals must be used and the COC seal numbers recorded on the COC form. Refer to SOP ES-G-05 – Sample Packaging and Shipping for specific packaging procedures. Representatives of commercial carriers are not required to sign the COC form.
- 5.4.10** If samples are hand carried to a laboratory, custody will be maintained and documented on the COC form through the process (e.g., from the person packing the cooler to the person transporting the samples to the laboratory).
- 5.4.11** If samples are transmitted to the laboratory by courier, the procedures described in either Section 5.4.9 or 5.4.10 will be followed, depending on whether the courier is a commercial courier or laboratory representative, and whether the cooler has been secured by COC seals prior to pick up by a laboratory courier.
- 5.4.12** Upon receipt at the laboratory, the designated laboratory sample custodian will sign the COC form indicating receipt of the incoming field samples. The samples will be checked against the COC form upon arrival at the laboratory. The receiving personnel will enter all arriving samples into the laboratory system. Any discrepancies between the samples and the COC form(s), or any evidence of tampering with the shipping container or the custody seal will be immediately reported to the Project Chemist. The laboratory sample custodian will check the

Standard Operating Procedure Sample Custody

temperature of the cooler upon arrival at the laboratory and record the measured temperature on the COC and/or appropriate sample/cooler receipt forms. The Project Chemist will be immediately notified of any sample preservation issues, including temperature exceedances.

- 5.4.13** A completed copy of the COC form will be distributed via email or fax to the Project Chemist within 24 hours of sample receipt at the laboratory. The original will be retained by the laboratory.

6.0 Quality Assurance/Quality Control

- 6.1** Completed COCs will be reviewed by the individuals preparing the samples for shipment for completeness, accuracy, and legibility. Specifically, the samples and COC record will be compared to ensure agreement between the sample labels and the COC, and to verify the number of sample containers.
- 6.2** These records are subjected to periodic review by the Field Services Task Leader to verify adherence to the procedures outlined in this SOP.

7.0 Data and Records Management

- 7.1** The records associated with the custody process (transfer forms, COC records, air bills, etc.) will be maintained in an organized and contained manner.
- 7.2** COC records will be distributed to the appropriate personnel as described in the FSP and QAPP.
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). Proposed modifications to this SOP will be recorded on a Field Corrective Action Form (refer to SOP ES-G-01 – Field Records), including reason and impact on the program, and will be submitted to the AECOM Project Manager for approval.

8.0 Personnel Qualifications and Training

- 8.1** Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP, FSP and QAPP). No specialized training is required; however, execution of these activities will initially be supervised by more experienced personnel.

Standard Operating Procedure Sample Packaging and Shipping

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for packaging and shipping samples collected under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. Sample packaging and shipment generally involves the placement of individual sample containers into a cooler or other similar shipping container and placement of packing materials and coolant in such a manner as to isolate the samples, maintain the required temperature, and to limit the potential for damage to sample containers when the cooler is transported. Specific information regarding samples to be collected sampling can be found in the associated task order-specific Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP).
- 1.2 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and the AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records. The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 Although packaging activities do not generally pose significant health and safety risks, sample exposure via external container residues may occur and much of the work going on in the vicinity of sample custodians requires attention to safety practices. Project-related physical, chemical and biological hazards are addressed in the task order Accident Prevention Plan (APP).
- 2.2 Sample packaging and shipping involves potential physical hazards primarily associated with handling of occasional broken sample containers and lifting of heavy objects. Adequate precautions will be taken, including minimizing the weight of individual coolers, using hand carts to transport coolers, and using the buddy system to lift coolers into and out of vehicles.
- 2.3 Daily safety briefs will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risks of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are remedied to the satisfaction of the SSO.

3.0 Interferences

Improper sample storage or inadequate protection against breakage and cross-contamination could potentially affect sample results. The field team will follow this SOP to minimize these effects.

Standard Operating Procedure

Sample Packaging and Shipping

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Personal protective equipment (PPE) and other safety equipment, as required by the APP;
- Inert packing material (e.g., foam peanuts, vermiculite, cardboard, bubble wrap, etc.);
- Sample containers as specified in the FSP and QAPP;
- Sample labels;
- Chain of custody (COC) forms;
- Insulated coolers;
- Custody tape or seals;
- Indelible marking pens;
- Shipping tape;
- Sealable plastic bags;
- Temperature blanks (provided by the laboratory);
- Field logbook;
- Ice or similar chilling source;
- Ballpoint pen or fine-tipped marker (e.g., Sharpie®); and
- Clear plastic sealing tape.

5.0 Procedures

5.1 General requirements

- 5.1.1 Vehicular sample transport will adhere to normal/applicable Department of Transportation (DOT) regulations. DOT regulations/guidelines related to sample shipments can be viewed on AECOM's Safety, Health & Environment (SH&E) intranet web page.
- 5.1.2 An area for storing unused sample containers/coolers and a clean area for sample handling, packaging, and shipment will be identified.
- 5.1.3 Laboratories will often re-use coolers. The interior and exterior of each cooler received at a project location should be inspected for cleanliness before using it. Any coolers that have cracked interior or exterior linings/panels or hinges should be discarded. Any coolers missing one or both handles should also be discarded if replacement handles (i.e., knotted rope handles) cannot be fashioned in the field.

Standard Operating Procedure Sample Packaging and Shipping

- 5.1.4** Excess strapping tape and old shipping labels should be removed. If the cooler interior exhibits visible contamination or odors it should be decontaminated in accordance with ES-G-03 – Equipment Decontamination prior to use.
- 5.1.5** The Field Services Task Leader or designee will notify the laboratory(ies) of the number, type and approximate collection and shipment dates for the samples in advance of any sample transfers and communicate any delays. The laboratory(ies) will provide courier service for all sample shipments.
- 5.2** Sample packaging and shipping will be done in accordance with applicable regulations, as described below:

 - 5.2.1** After filling a sample container, affix cap. For sediment/solids containers, secure the cap with clear tape; the use of plastic tape to secure the cap is not required for aqueous containers. Complete the sample label. Apply the label to the sample container and cover with clear tape.
 - 5.2.2** Clean the outside of each sample container by wiping it off with a clean paper towel. Verify that residual sediment has been removed from the outside of the container, and from the area under and around the cap.
 - 5.2.3** Place each glass sample bottle into an individual bubble bag sleeve provided by the lab or wrap each glass bottle/jar individually using bubble wrap secured with tape or rubber bands
 - 5.2.4** Seal each sample container inside a sealable plastic bag.
 - 5.2.5** For those samples that require thermal preservation, place on ice or similar chilling source immediately after collection.
 - 5.2.6** Place plastic bubble wrap matting in the bottom of each cooler or shipping container as needed.
 - 5.2.7** Transfer the samples to the plastic-lined cooler. Place bottles upright into the cooler. If a combination of plastic and glass sample containers are to be packed, alternate them within the cooler to further protect the glass. Use inert packaging material (e.g., cardboard, etc.) to cushion the samples and minimize the potential for breakage by placing additional packing material throughout the voids between sample containers and between any layers within each cooler to a level which meets the approximate top of the sample containers. Packing material may require tamping by hand to reduce the potential for settling. Seal the drains on the ice chest (if present) with shipping tape or plug the drains with silicone sealant or a similar inert substance.
 - 5.2.8** Conduct an inventory of sample numbers, fractions and containers when placing samples into the coolers, and check the inventory against the corresponding COC form before sealing the cooler (SOP ES-G-04 – Sample Custody).
 - 5.2.9** For those samples requiring thermal preservation, ice or similar chilling sources sufficient to maintain a temperature of $4^{\circ} \pm 2^{\circ}$ Celsius ($^{\circ}\text{C}$) will be placed inside the cooler during transport. Double bag cubed ice in heavy duty Ziploc type plastic bags to prevent leakage, close the bags, and distribute the packages in a layer over the top of the samples. If sample bottles are bubble wrapped, it is also permissible to insert double bagged ice packages between the sample bottles. Never place un-bagged loose ice directly into a cooler. Use

Standard Operating Procedure Sample Packaging and Shipping

sufficient ice to accommodate reasonable delays in shipment. A temperature blank provided by the analytical laboratory with each cooler will be included in the shipment.

- 5.2.10 If required, obtain two custody seals and enter the seal numbers on the COC form. Complete sample tracking documentation as described in SOP ES-G-04 (Sample Custody), and place the documents in a sealable plastic bag inside the ice chest, taped to the inside of the lid.
- 5.2.11 Secure chest lid with shipping tape by covering the entire seal with tape. Sign and date the two custody seals, affix the custody seals on opposing corners of the cooler lid and cover the seals with clear plastic tape.
- 5.2.12 Repeat the above steps for each cooler or shipping container. If more than one cooler is being delivered to a laboratory, mark each cooler as "1 of 2", "2 of 2", etc.
- 5.2.13 Transport the shipping container directly to the laboratory or the laboratory courier. Samples will be shipped by close of the same day, whenever possible.

6.0 Quality Assurance/Quality Control

- 6.1 Completed COCs will be reviewed by the individuals preparing the samples for shipment for completeness, accuracy, and legibility. Specifically, the samples and COC record will be compared to ensure agreement between the sample labels and the COC, and to verify the number of sample containers.
- 6.2 The laboratory will notify the Project Chemist within 24 hours of receipt in the event that samples are received broken, that there are sample preservation concerns or holding time exceedances, or there are discrepancies between the custody paperwork and the sample containers.
- 6.3 The procedures and records associated with sample packaging and shipping are subjected to periodic inspection and review by the Field Services Task Leader to verify adherence to the procedures outlined in this SOP.

7.0 Data and Records Management

- 7.1 The records associated with the shipment process (COC records, etc.) will be maintained in an organized and contained manner. Field notes will be kept during sampling activities in accordance with SOP ES-G-01 - Field Records.
- 7.2 COC records will be distributed to the appropriate personnel as described in SOP the QAPP and FSP.
- 7.3 Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). Proposed modifications to this SOP will be recorded on a Field Corrective Action Form (refer to SOP ES-G-01 – Field Records), including reason and impact on the program, and will be submitted to the AECOM Task Order Manager for approval.

Standard Operating Procedure Sample Packaging and Shipping

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP, FSP and QAPP). No specialized training is required; however, execution of these activities will initially be supervised by more experienced personnel.

Attachment 1 Example Of Grab Collection Form

Attachment 2 Equipment Rinsate Blank Collection Procedure

Standard Operating Procedure

Sediment Grab Sampling

1.0 Scope and Applicability

- 1.1 The purpose of this document is to define the standard operating procedure (SOP) for collecting sediment grab samples using a grab sampler deployed from a boat or other sampling platform under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. Surface sediment samples will be collected for a variety of chemical, physical, and biological parameters. Grab samplers can include Van Veen grab samplers (including Ted Young modified), ponar grab samplers, power grab samplers, and box corers. This SOP describes the equipment, field procedures, materials, and documentation procedures necessary to collect grab samples. Specific information regarding grab sampling can be found in the associated task order specific Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP). This SOP is based on United States Environmental Protection Agency (USEPA) guidance document Methods for Collection, Storage, and Manipulation of Sediments for Chemical and Toxicological Analyses: Technical Manual (USEPA, 2001).
- 1.2 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted based on field conditions, equipment limitations, or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project Quality Assurance (QA) Officer and the AECOM Task Order Manager. Deviations from this SOP will be documented in the field records and on a field corrective action form (SOP ES-G-01 – Field Records) including the reason for the deviation(s). The ultimate procedure employed will be documented in the report summarizing the results of the sampling event or field activity.

2.0 Health and Safety Considerations

- 2.1 The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the task order specific Accident Prevention Plan (APP).
- 2.2 The health and safety considerations for the work associated with grab sampling include:
- The physical hazards of handling heavy equipment,
 - Pinch hazards associated with the grab or box core sampler,
 - Overhead lifting hazards using boat based winches and A-frames,
 - Marine safety aspects of the program, and
 - The specific chemical hazards related to the sediments.
- 2.3 Daily safety briefings will be conducted at the start of each working day before any work commences. These daily briefs will be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

Standard Operating Procedure Sediment Grab Sampling

3.0 Interferences

Grab sampler collection issues generally include mechanical failures, over penetration, or surface sediment loss. Each of these will affect the quality/representativeness of the resulting data. Any sampler that did not trigger properly, or did not completely close will be rejected. Samplers that are either over-filled or appear to have lost surface fines will also be rejected. These details are further discussed in Section 5 (Procedures).

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, pending field conditions.

- Coring/sampling vessel, including the necessary navigational, communication, and grab deployment equipment;
- Marine VHF radio;
- Van Veen (or Ted Young modified Van Veen) grab sampler;
- Ponar grab sampler;
- Stainless-steel power grab sampler with pneumatic ram and stainless steel guide;
- Box corer;
- Stand (cradle) on which to place the grab or box core while not in deployment;
- Siphon tubing and bucket or pipette;
- Source of running water (optional);
- Water pump and hoses (optional);
- First aid kit and personal protective equipment (PPE) (refer to APP);
- Approved plans, including target sampling locations;
- Sample containers (refer to the task order specific QAPP);
- Stainless steel bowls/trays and spoons/spatulas (or equivalent);
- Insulated coolers with wet ice;
- Sample labels;
- Waterproof paper and pen;
- Field notebook, Grab Collection Form, and other standardized forms (as needed);
- Ruler and tape measure;
- Digital camera (optional);

Standard Operating Procedure Sediment Grab Sampling

- Chain-of-custody forms and seals;
- Decontamination supplies (refer to SOP ES-G-03 – Equipment Decontamination).

5.0 Procedures

This section gives the step-by-step procedures for collecting grab samples using a grab sampler (Van Veen, Ted Young modified Van Veen, or power grab) or box corer. Observations made during sediment grab sample collection will be recorded on the Grab Collection Form (Attachment 1), and/or a logbook (SOP ES-G-01 - Field Records).

5.1 Equipment decontamination

The grab sampler or box corer, stainless steel bowls/containers, and stainless steel spoons/spatulas will be cleaned prior to initial use and between each station following the procedures in SOP ES-G-03 and documented in the field notebook. A sufficient supply of pre-decontaminated small equipment will be mobilized to the sampling locations to minimize the need for performing field decontamination. Larger equipment, such as a grab or box core, will, however, require field decontamination on the vessel between sampling stations. Note: grabs or box corers will not require decontamination between deployments at the same station; only between sampling stations, unless sticky or tar-like materials are encountered.

5.2 Equipment rinsate blanks

Equipment rinsate blanks will be collected at the frequency specified in the task order specific QAPP after the sampling gear is decontaminated. The procedure for collecting equipment rinsate blanks and related sample containerization requirements are detailed in Attachment 2.

5.3 Positioning

5.3.1 The sediment sampling schedule for the day will be established prior to vessel departure, and sufficient equipment to complete the work will be on-board the sampling/coring vessel. Grab samples are anticipated to be collected adjacent to core collection locations.

5.3.2 The sampling/coring vessel will move to a grab/coring location in accordance with SOP ES-G-02 (Navigation Positioning).

5.4 Sampling preparation

The associated QAPP summarizes the parameters that require collection at each station, and list the sample mass, container type, preservatives, and storage conditions required for each sample.

5.5 Sampler Deployment and Retrieval

5.5.1 Don PPE as required by the APP.

5.5.2 Attach the sampler (grab sampler or box corer) to the end of the winch cable with a shackle and tighten the pin.

Standard Operating Procedure

Sediment Grab Sampling

- 5.5.3** Attach any needed weights to achieve the needed penetration or pads (boards) for stabilization. Arm the grab/box corer.
- 5.5.4** Lower the sampler through the water column until the cable slackens. Nearing the bottom travel time will not exceed 1 m/sec to minimize bow wave disturbance. Record the station location (HYPACK system) and water depth (echo sounder or weighted line) on the Grab Collection Form (Attachment 1).
- 5.5.5** Retrieve the sampler and place it on the stand.
- 5.5.6** Open the sampler and examine it for acceptability:
- The sediment surface should be basically level and intact over the surface area of the grab, with no sign of channeling or sample washout
 - Penetration depth should be sufficient (as measured from the center of the grab) to meet the project requirements
 - The jaws of the sampler should be tightly closed and water should not be substantially leaking from the sampler
 - The surface appears intact (shell hash or coarse material visible on the surface is acceptable as long as the first two criteria are met and the jaws of the grab are tightly closed and not leaking).
 - Grabs that are only partially filled, or obviously slumped or pitched due to the sampler hitting at an angle are not considered acceptable. In addition, sediments should not be in contact with the underside of the sampler access doors. Drain overlying water from the sampler (by siphoning, not decanting) until only a thin film remains.
- 5.5.7** Describe the sample surface (color, texture, odor, etc.) on the Grab Collection Form (Attachment 1); continue to describe the sample during sample processing.
- 5.5.8** Collect the sample as described below. Future deployments will be adjusted for local sediment conditions by either adding/removing weight or pads to the grab frame to control the penetration depth.
- 5.5.9** Repeat steps 5.5.4 through 5.5.9 until sufficient grab samples are collected to meet the sample volume requirements for the full set of parameters as specified in the FSP and QAPP. Care will be taken to ensure that the precise collection interval/horizon specified in the corresponding FSP is collected. Slight adjustments/relocation of the vessel on-station between sampler deployments will be performed according to SOP ES-G-02.
- 5.6** Shipboard sample collection
- 5.6.1** Siphon off the overlying water (or remove via pipette) to the sediment/water interface without substantially disturbing the soft surface sediment. This will be performed by gently allowing the water to drain to one corner of the sampler for siphoning-off.
- 5.6.2** Sediment to be homogenized (for non-discrete sample parameters) will be placed in a covered plastic bucket (e.g., 3 ½ gallon bucket) provided by the laboratory.
- 5.6.3** Store the sample containers in an insulated cooler containing wet ice to keep samples cold while on the vessel until they can be transported to shore for further processing or shipment to the corresponding analytical laboratory as described in SOP ES-G-05 (Sample Packaging and Shipping).

Standard Operating Procedure Sediment Grab Sampling

- 5.6.4** Clean the grab sampler or box corer in accordance with the procedures in SOP ES-G-03 between stations.

6.0 Quality Assurance/Quality Control

- 6.1** Completing the Grab Collection Form (Attachment 1) will document that the process is being followed and that pertinent information is being collected and recorded in accordance with the procedures outlined in this SOP.
- 6.2** Entries on the forms and in the field logbook will be double-checked by the samplers to verify the information is correct. Completed forms and field logbook will be reviewed periodically by the Field Services Task Leader to verify that the requirements are being met.
- 6.3** High sediment moisture content, which can impact the achievable reporting/detection limits and sample representativeness, will be evaluated. Samples collected with a high water content will be discussed with the Field Services Task Leader to evaluate the need to collect additional sample or to take additional action that would reduce the water content (e.g., allowing the sediment slurry to settle in a bucket followed by siphoning the overlying water).
- 6.4** Data quality evaluations will be based on quality control (QC) sample results. QC samples may include field duplicates and equipment rinseate blanks; collection requirements are tabulated in the associated task order specific QAPP.
- 6.5** The task order specific QAPP lists the proper sediment sample containerization, preservation, and storage conditions required to maintain sample integrity.

7.0 Data and Records Management

- 7.1** Field notes will be kept during sampling activities in accordance with SOP ES-G-01 - Field Records.
- 7.2** Field data will be distributed to the appropriate personnel as described in the task order specific FSP.
- 7.3** Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). A field corrective action form, including reason and impact on the program, will be submitted to the Task Order Manager and Project QA Officer for approval.

8.0 Personnel Qualifications and Training

- 8.1** Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding plans (e.g., APP, FSP, QAPP). Inexperienced personnel performing these activities will be initially supervised by the Field Services Task Leader or his/her designee.

Standard Operating Procedure Sediment Grab Sampling

Attachment 2 Equipment Rinsate Blank Collection Procedure

1. Decontaminate the sample handling equipment (e.g., grab, box corer, utensils and basins/bowls) according to the procedures detailed in SOP ES-G-03 – Equipment Decontamination.
2. Rinse the utensils with de-ionized water (DIW), collect the rinse water in the decontaminated basin/bowl, and pour it into laboratory-provided containers. Note that equipment rinsate blanks for dioxins/furans will substitute hexane for the DIW. Sample volume, container type, preservatives, and storage details are provided in the task order specific QAPP. QC sample blank containers will be pre-preserved by the laboratory that provides them. Note: equipment blanks may not be appropriate for each parameter
3. Label each container with the sample ID, date and time of collection, and the analytical parameters, cover the label with clear packing tape and fill out the custody form (refer to SOP ES-G-04 – Sample Custody).
4. Store the samples in a cooler on ice until they are transported to the field facility, under the Field Custody and Transfer Form (refer to SOP ES-G-04 – Sample Custody), for shipment to the corresponding analytical laboratory following SOP ES-G-05 – Sample Packaging and Shipping.

Standard Operating Procedure

Surface Water Sampling

1.0 Scope and Applicability

- 1.1 This project Standard Operating Procedure (SOP) defines the operating procedures for the collection of bulk and discrete water samples under the United States Army Corps of Engineers New England District (NAE) Environmental Services (ES) Program. Water samples are collected either using a bottle-type sampler, or with the aid of a peristaltic (or other equivalent) water pump.
- 1.2 Samples will be collected using a pre-cleaned peristaltic pump and CFLEX™ (or equivalent) tubing system. If needed, a Niskin bottle may be utilized. Samples may be analyzed for chemical, biological and physical analyses. Analytes and water depths for samples for a particular program are specified in the task order specific Quality Assurance Project Plan (QAPP) and Field Sampling Plan (FSP).
- 1.3 It is fully expected that the procedures outlined in this SOP will be followed. Procedural modifications may be warranted depending upon field conditions or limitations imposed by the procedure. Substantive modification to this SOP will be approved in advance by the AECOM Project QA Officer and the AECOM Task Order Manager and communicated to the client. Deviations from this SOP will be documented in the field records.

2.0 Health and Safety Considerations

- 2.1 The health and safety considerations for the work associated with this SOP, including physical, chemical, and biological hazards are addressed in the task order specific Accident Prevention Plan. The major health and safety considerations for the work are the near and on-water safety aspects of the sample collection.
- 2.2 Daily safety briefings are to be conducted at the start of each working day before any work commences. These daily briefs are to be facilitated by the Site Safety Officer (SSO) or his/her designee to discuss the day's events and any potential health risk areas covering every aspect of the work to be completed. Weather conditions are often part of these discussions. As detailed in the APP, everyone on the field team has the authority to stop work if an unsafe condition is perceived until the conditions are fully remedied to the satisfaction of the SSO.

3.0 Interferences

- 3.1 Cross-contaminations of samples may result if sample handling equipment is inadequately or improperly decontaminated.
- 3.2 Contamination of samples may result if samples are exposed to certain environmental conditions. Exposure to potential sources of contamination (e.g., exhaust fumes) will be minimized.
- 3.3 Care must be taken to avoid disturbing the bed sediment during sampling. Re-suspended bed sediments may contaminate/ artificially bias the surface water samples.
- 3.4 Inappropriate sampling equipment, such as that manufactured from non-inert plastics, may contaminate samples. Using Teflon, polymer, or stainless steel sampling equipment will minimize contamination during sample collection activities.

Standard Operating Procedure Surface Water Sampling

- 3.5 Purging of the pump system with a minimum of three volumes of site water prior to sample collection will ensure a representative sample.

4.0 Equipment and Materials

The following equipment list contains materials which may be needed in carrying out the procedures contained in this SOP. Not all equipment listed below may be necessary for a specific activity. Additional equipment may be required, depending on the field conditions encountered:

- Peristaltic or equivalent water pump, variable speed
- 12-volt battery (as needed)
- CFLEX or equivalent polymer tubing (typical configuration requires 3/8 in. Inner Diameter [ID])
- Silicone tubing (typical configuration requires 1/4 in. ID) for peristaltic pump head
- Niskin or equivalent sampling bottle
- Sample containers as specified in the QAPP
- Connective (serial) cabling
- Zip ties
- Weight bearing line/cable
- Field computer (if applicable)
- Project specific field log book
- Chemical-free wipes
- Disinfectant wipes
- Approved plans, including target sampling locations
- Insulated coolers with wet ice
- Field notebook, pen, standardized forms (as needed)
- Chain-of-custody forms and seals
- Replacement batteries
- GPS
- Safety gear (APP specified PPE)
- Nitrile gloves
- Gauntlet gloves
- Storage bags
- Survey vessel fitted with differential global positioning system (DGPS) navigational equipment (SOP ES-G-02) and fathometer

Standard Operating Procedure

Surface Water Sampling

SOP No.: ES-W-01
Revision: 0
Date: September 2017
Page 3 of 6

- Multi-parameter datasonde, calibrated daily according to manufacturer's instructions
- Dry storage cooler

5.0 Procedures

5.1 Water Pump/Tubing Set-up

- 5.1.1** Fasten the CFLEX™ tubing to the datasonde (YSI or equivalent) that will be used to conduct water column profiling with plastic tape if water quality parameters are needed. Avoid causing any obstruction to the turbidity sensor. Attach the datasonde and the tubing inlet to the weighted deployment line at approximately 3 feet above the anchor weight. The tubing and the sensor cable should then be fastened (with plastic tape or similar) to the weighted deployment line at regular intervals over the entire length.
- 5.1.2** Connect the pump to a 12-volt battery or directly to the vessel's 12-volt electrical system using appropriate electrical connections. The water pumps and associated tubing should be new and dedicated to the project. Water pumps should be rinsed with tap water before and after each sampling day but between-station (or between sampling depth) rinsing is not generally required for major component sampling/analysis. However, the internal volume of water carried in the system (pump inlet to pump outlet) should be purged with a least three volumes of river water prior to sample collection to ensure that a representative sample is collected. The tubing should be sealed in a bag when not in use; open tube ends should also be covered and protected when not in use, including between stations. The number of minutes required to purge the pump and tubing will be calculated as follows:

$$(((\pi r^2 \times l)/10)/f) \times 3 = \text{minutes to purge the pump}$$

Where:

π = pi

r = half the inner diameter of the tubing (centimeters)

l = length of tubing used on station (meters)

f = flow rate of the pump (liters/minute)

5.2 Field Data and Sample Collections

- 5.2.1** Navigate to sampling stations per SOP ES-G-02, Navigation/Positioning; sample locations are described in the task order specific FSP. Estimate and record the depth of the water. Water depth may be recorded using a weighted line with 0.1 ft increments marked.
- 5.2.2** Deploy the datasonde and attached sampling tube and begin water column profiling as outlined in the FSP.

At the station of interest, the datasonde (and sampling tubing) should be lowered through the water column until it is at the correct depth according to the FSP. Turbidity will be monitored real time during the descent and caution taken to avoid contact with the bottom. In the event of bottom contact during sampling, as determined by operator "feel" or sporadically high real-time turbidity readings, sampling should be delayed until the turbidity plume has dissipated.

Standard Operating Procedure Surface Water Sampling

SOP No.: ES-W-01
Revision: 0
Date: September 2017
Page 4 of 6

Water quality measurements will be recorded as required by the task order specific FSP. After completion of an initial water column profile by instrument retrieval, water collections will then be made by returning the instrument package to the desired depth.

Following the purging procedure, water sampled from the pump outlet will be collected directly into the appropriate sample containers for laboratory analysis per the task order specific FSP and QAPP. Fill each sample container while avoiding contact between the sampling tube and the bottle.

- 5.2.3 In areas and for parameters that allow grab sampling, the Niskin or equivalent sampler is lowered to the desired depth. The trigger mechanism is activated to close the sampler and the sampler is retrieved to the boat. Water from the sampler may be poured directly in the sample containers. Place the capped container on ice in a cooler.
- 5.2.4 The samples will be numbered and labeled as described in the FSP. Samples will be placed in coolers and stored on ice until shipment or transfer to the laboratory.
- 5.2.5 All discrete water samples should be collected and stored/transferred to laboratories according to the procedures described in SOP ES-G-05 - Packaging and Shipping.

6.0 Quality Assurance / Quality Control

- 6.1 It is the responsibility of the Field Services Team Leader to check the calibration information, to spot check instrument operations, and to check the documentation accuracy of all field staff.
- 6.2 Quality control (QC) samples may include equipment blanks, field and laboratory duplicates as specified in the task order specific QAPP.

6.2.1 Equipment blanks

Equipment blanks will be collected at the frequency specified in the QAPP, and from each set of sampling gear (e.g., tubing, tubing outfitted with a filter, and bottle sampler with tubing, etc.), after the sampling gear is decontaminated per SOP ES-G-03 – Equipment Decontamination.

Equipment blanks may be collected if required by the task order specific QAPP for pumped samples by flushing the collection tube with deionized water and filling a set of containers with deionized water that has been pumped through the system.

If required, bottle blanks may be used to evaluate potential contamination associated with the direct grab sampling technique. In this case, bottles may be filled directly with deionized, capped, bagged, and stored on ice for transfer to the laboratory.

7.0 Data and Records Management

- 7.1 Field notes will be kept during coring activities in accordance with SOP ES-G-01 – Field Records. The information pertinent to coring activities includes chronology of events, sample locations (x,y,z), time/date, sampler name, methods, sampler penetration and acceptability, sample observations, and the times and type of equipment decontamination. This information will be recorded in the field logbook.

Standard Operating Procedure Surface Water Sampling

SOP No.: ES-W-01
Revision: 0
Date: September 2017
Page 5 of 6

- 7.2 Field data will be distributed to the appropriate personnel as described in the task order specific QAPP and FSP.
- 7.3 Deviations to the procedures detailed in the SOP will be recorded in the field logbook at the time of occurrence and reported on the Daily Activity Log (refer to SOP ES-G-01 – Field Records). Proposed modifications to this SOP will be recorded on a Field Corrective Action Form (refer to SOP ES-G-01 – Field Records), including reason and impact on the program, and will be submitted to the AECOM Task Order Manager for approval.

All records associated with the activities described in this SOP will be ultimately maintained in accordance with the task order specific QAPP.

8.0 Personnel Qualifications and Training

Individuals executing these procedures will have read and be familiar with the requirements of this SOP and the corresponding project plans (e.g., APP, FSP, and QAPP). Inexperienced personnel performing these activities will be initially supervised by the Field Services Task Leader or his/her designee. Surface water sampling procedures are relatively simple and can be implemented by personnel without specialized training. However, it is recommended that initial sampling activities be supervised by more experienced personnel.

Appendix B

RIM QC Summary Tables

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	
3. If not, were deviations documented?	
4. Was the SAP approved by the New England District?	
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	
7. Were the correct stations sampled (include the precision of the navigation method used)?	
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	
9. Were the samples properly labeled?	
10. Were all the requested data included?	
11. Were the reporting limits met?	
12. Were the chain-of-custody forms properly processed?	
13. Were the method blanks run and were the concentration below the acceptance criteria?	
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	
15. Were the SRM/CRM analyses within acceptance criteria?	

Table II-1 (continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	
19. Were surrogate recoveries within the required acceptance criteria?	
20. Were corrective action forms provided for all non-conforming data?	
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270C

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package

1. Introduction

The New Haven Harbor dredged material suitability determination field program was completed by both U.S. Army Corps of Engineers (USACE), New England District (NAE) personnel (harbor site sampling) and individuals on the AECOM and Ocean Surveys Inc. (OSI) Field Team (collectively the AECOM Field Team). Field activities undertaken by the AECOM Field Team included collection and transport of sediment and water samples from the Central Long Island Sound Disposal Site (CLDS) Reference Site, as well as receipt and delivery of NAE-collected representative sediment and water samples from proposed maintenance and improvement dredging areas within the New Haven Harbor Federal Navigation Project (FNP).

Tasks described within this Field Report focus primarily on activities undertaken by the AECOM Field Team. Sampling techniques employed by NAE personnel, relative to sediment and water collection activities within New Haven Harbor, are addressed under separate cover.

2. New Haven Harbor / CLDS Reference Site Sampling Field Summary

The project field effort commenced on October 22, 2018 and was completed on October 26, 2018. The AECOM Field Team program was divided into four subtasks:

- The AECOM Field Team's collection of sediment and water samples at the CLDS Reference Site on October 23, 2018;
- AECOM's receipt of New Haven Harbor sediment and water samples which were collected by NAE (samples collected by NAE on October 22 through 25, 2018) and received by AECOM on October 23 through 25, 2018;
- AECOM's delivery of samples to the project toxicology laboratory, EnviroSystems, Inc. (ESI) on October 24, 2018 and two deliveries to ESI on October 25, 2018; and,
- AECOM's delivery of samples directly to the project chemistry laboratory, Alpha Analytical, Inc. (Alpha) or to the Alpha courier on October 24 and 25, 2018.

CLDS Reference Site samples (sediment/water) were collected by the AECOM Field Team from OSI's sampling platform, the survey vessel R/V Willing II. Table 1 summarizes the activities accomplished during the field effort. Daily Activity Logs are provided in Attachment 1.

3. Health and Safety

The New Haven Harbor dredged material suitability determination efforts and the associated CLDS sampling activities were completed safely and without incident. AECOM Team participants took an active part during the daily project safety briefings. The AECOM Deputy Program Manager and the USACE Task Order Manager were notified at the completion of the on-water field activities. Documentation of the daily safety briefings is included in Attachment 2. The Float Plan and Tailgate meeting forms covering boating activities and task order safety protocols are included in Attachment 2.

4. Sediment Collection

New Haven Harbor sediments were collected by NAE using vibracore methodology. NAE collected vibrocore samples from thirteen representative harbor locations to be composited into six composites, as detailed in Table A-1 of the Project Work Plan¹. These NAE-collected sediment samples were containerized by NAE and transferred to AECOM under chain of custody (COC) during, and at the conclusion of, the USACE sampling efforts.

CLDS Reference Site sediments were collected by the AECOM Field Team using a modified Van Veen grab sampler as outlined in, and in accordance with, the Project Work Plan.

¹ AECOM, 2018. *Supplemental Sampling and Testing in Support of the New Haven Harbor Navigation Improvement Project: Project Work Plan - New Haven Harbor Navigation Improvement Project New Haven, Connecticut* USACE Contract No. W912WJ-17-D-003. Delivery Order No. W912WJ18F0109. October, 2018. The Project Work Plan is comprised of the Field Sampling Plan (FSP) and the Quality Assurance Project Plan (QAPP).

New Haven Harbor samples and the CLDS Reference Site samples were held in a temperature-controlled refrigerated truck unit in accordance with the project Work Plan until delivery to ESI and/or Alpha.

4.1 Vessel Positioning

Vessel positioning was accomplished utilizing a Differential Global Positioning System (DGPS) unit and associated Hypack vessel positioning software. The local National Oceanic and Atmospheric Administration (NOAA) tide data were obtained from the appropriate local stations.

4.2 Grab Sample Handling

Grab sampling at the CLDS Reference Site was accomplished as outlined in the Work Plan, using a modified Van Veen grab sampler. Multiple deployments of the grab sampler were required to obtain the minimum volume of reference site sediments required for testing (18-gallons). For each grab, the sample was examined, key features were recorded and the sample was transferred with stainless steel spoons into food-grade polyethylene buckets. These samples were placed on ice for preservation until return to the dock.

The buckets of sediment collected at the reference site were transferred from the vessel and placed into a locked refrigerated truck set to 2.2 degrees Celsius (°C) upon return to the dock. These sediment samples were transported under COC and signed over to the biological laboratory, as detailed in Table 1.

Before and after sediment collection, the sampling gear was decontaminated as outlined in the Project Work Plan.

5. Water Collection

Water samples from the harbor area (site water) were collected by NAE from representative harbor locations on October 24, 2018, and composited into six samples as detailed in Table A-1 of the Work Plan. These water samples were transferred to AECOM under COC during the NAE field sampling efforts.

Water from the CLDS reference site was collected by the AECOM Team on 23 October, 2018 for chemical analysis and for use as SPP dilution water.

The CLDS reference site water samples were collected using a large volume Niskin bottle system as described in the Work Plan. The reference site water samples were collected from mid-depth in the water column. The seawater was transferred directly into new 5-gallon plastic cubitainers and into Alpha-supplied sample bottles. These samples were placed on ice for preservation until return to the dock.

Water samples collected by the AECOM Field Team were transferred to the refrigerated truck upon return to the dock.

Before and after water collection, the sampling gear was decontaminated as outlined in the Work Plan.

6. Field QA/QC Procedures

Equipment blanks were collected (by USACE personnel) on October 24, 2018 from the field sampling equipment used by NAE in New Haven Harbor (i.e. the core sampler and pump and tubing system). Equipment blanks were collected (by the AECOM Field Team) on October 23, 2018 from the field sampling equipment used by the AECOM Field Team (sediment and water grab samplers) for the CLDS Reference Site sampling.

Equipment blanks were iced for transport to the dock, and transferred to the locked refrigerated truck upon return to the dock. All samples were held under COC, and signed for during ownership transfer (Attachment 3).

7. Difficulties Encountered

There are two notes of interest relative to the New Haven Harbor / CLDS field sample collection effort:

- During the CLDS Reference Site field sampling operations, sea conditions picked up with larger wave action than was forecast for the day (i.e. approx.. 4' seas intermittently). During the water sample collection efforts,

the captain and AECOM Field Team determined that it was unsafe and inadvisable to attempt to fill the laboratory glassware with CLDS waters while offshore, due to the wave action. All of the equipment blanks and large volume cube containers had been filled with reference site waters when this decision was made. The CLDS Reference Site laboratory waters which were collected while at sea, were temporarily containerized in spare large volume cube containers and subsequently transported back to the dock for final containerization into the laboratory-provided glassware. No project work plan deviations were incurred as a result of this change, which was made for Health and Safety reasons. No associated project implications are anticipated.

- The Project Work Plan indicates that *“Samples will be chilled on wet ice while on board the vessel and subsequently transferred to a refrigerated box truck/van daily during field operations. The temperature in the refrigerated vehicle will be regularly monitored to ensure that the storage temperature is maintained at 4° Celsius (C) ±2° C”*. During sample transport, AECOM continuously monitored the conditions within the refrigerated van unit as prescribed. In addition, and as a precaution against the potential of malfunctioning refrigeration equipment, AECOM packed the samples with wet-ice during the sample transport to the project toxicology laboratory. During two discrete periods (approximately 20 minutes prior to sample delivery at the project toxicology laboratory on 25-October-18; and again later that same day), the AECOM transport driver noticed an intermittent malfunction of the refrigerated van’s compressor unit. Upon investigation, the driver determined that the refrigeration compressor was displaying an error code and subsequently notified the AECOM Project Manager, the refrigerated van provider and the NAE Task Manager. Throughout the sample transport operations, and upon sample check-ins at the project toxicology laboratory, AECOM confirmed that cargo area holding temperatures were within or below the work plan prescribed temperature range. Accordingly, and as the samples were also transported on ice, no Project Work Plan “deviation” is noted here. Additional details regarding temperatures within the refrigerated van are presented in Attachment 4.

Project logbook entries and grab sample logs are included in Attachment 4. Neither of the above items represented a deviation from the approved work plan. As such no corrective action forms have been prepared.

Table 1 New Haven Harbor / CLDS Field Survey Activity Summary

Date	AECOM Field Activities	Equipment	Platform
October 22, 2018	Project Mobilization. NAE Field Sampling coordination, AECOM on stand-by.	Refrigerated Truck	Refrigerated Truck
October 23, 2018	CLDS Reference Site water and sediment grab sampling. Equipment blank collection (for CLDS sampling equipment).	Van Veen Grab Sampler, Niskin Bottle, Refrigerated Truck	R/V Willing II Refrigerated Truck
	New Haven Harbor sediment receipt from NAE and subsequent storage/transport to ESI and Alpha Analytical	Refrigerated Truck	Refrigerated Truck

Figure 1 CLDS Reference Site Sediment and Water Sampling Location – New Haven Harbor Sediment Characterization Study (Figure from PWS, NAE 2018)

CENTRAL LONG ISLAND SOUND DISPOSAL SITE

Description: The Central Long Island Sound Disposal Site (CLDS) is one of four regional dredged material disposal sites located in the waters of Long Island Sound. CLDS covers a 11.04 km² (3.2 nm²) area and is centered at 41° 08.950' N, 72° 52.950' W (NAD 83). It is located approximately 10.89 km (5.8 nmi) south of South End Point, East Haven, Connecticut. Since 1977, the management strategy at CLDS has entailed the controlled placement of small to moderate volumes of sediment to form individual disposal mounds on the seafloor. The authorized disposal point (within the overall disposal area) is specified for each dredging project in other project documents.

(NOTE: This cross is not intended for use in navigation)

Boat Safety Checklist

Date: 10/23/18

Keep this page with your boat, ready for inspection. By using this checklist, or one fine-tuned by yourself, you'll be sure that everything is on board and in good working order. Your passengers will appreciate knowing you're concerned about boating safety.

- Float plan: let someone landside know when you're leaving, where you're going, when you expect to return, what to do if you don't, and a description of your boat
- Registration certificate or documentation
- Personal Flotation Devices (wearable and throwable): USCG approved, good condition, readily accessible, assigned and fitted
- Fire Extinguishers: right number, size, and class for boat; charged, not corroded, nozzle clear, bracketed, readily accessible
- Visual Distress Signals: current dates on flares, proper number, batteries good if lights or EF
- Anchors and Line: adequate anchor for bottom, adequate line for water depth
- Bilge device: bilge pump operable, alternative bailing device available
- Watch or clock: operable
- Bright flashlight or searchlight
- Navigation lights: tested and operable, spare bulbs
- Batteries: fully charged, encased in plastic boxes or terminals covered, securely fastened to
- Sound-producing device: horn, whistle appropriate for boat
- Alternate propulsion: paddle or oar
- First Aid Kit
- Tools, spare outboard prop and lock nut
- Compass
- Sunscreen
- Weather Radio

INSPECTION ITEMS				N/A	YES	NO	DATE CORRECTED
Has this equipment been properly inspected by a CMV competent person and ensured to be in a safe operating condition?					✓		
Are seat belts readily available and operational? Is the horn in working condition?					✓		
Is the overall body condition of the vehicle satisfactory? Properly placarded?					✓		
Is the steering mechanism operational? Are instrument lights fully functional?					✓		
Are all required mirrors present, clean, and adjusted for the CMV operator?					✓		
Do tires meet manufacturer's operational criteria (pressure, tread, spare, etc.)?					✓		
Are back-up alarms installed as required and operational?				✓			
Are service brakes, including trailer brake connections, and parking (hand) brake functional?					✓		
Are turn signals visible and operational?					✓		
Are headlights (low/high beam) operational?					✓		
Are brake lights, tail lights and back-up lights visible and operable?					✓		
Is all cab glass intact and free of distortion? Are wipers, including wiper fluid, operational? As applicable, is an ice scraper available?					✓		
Have all fluids been checked and comply with operations manual criteria?					✓		
Is there a functional fire extinguisher and stocked first aid kit accessible?				✓			
Are there at least three stopped vehicle reflective triangles and a reflective vest?				✓	✓		
If load lines/straps are in use have they been inspected?							
a. Used in accordance with manufacturer's operational guidelines and with regulatory cargo securement requirements?				✓			
b. Rated and approved for this type of load?							
Have all coupling devices been inspected and secured?				✓			
Is the vehicle equipped with the appropriate equipment (e.g. wheel wrench, jack, tire chains)?					✓		
Does the engine and exhaust system appear to be functioning properly?				✓			
Is applicable documentation valid, current and immediately accessible (e.g. insurance, registration, driver medical certificate, CDL, shipping documents, etc.)?				✓			
Driver's Signature/ Inspection Date:		10/25/18

	Negligible	M	L	L	L	L
Notes: (Field Notes, Review Comments, etc.)	Step 1: Review each "Hazard" with identified safety "Controls" and determine RAC (See above)					
	"Probability" is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom or Unlikely.				RAC Chart	
	"Severity" is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible				E = Extremely High Risk	
					H = High Risk	
	Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.				M = Moderate Risk	
				L = Low Risk		

Job Steps	Hazards	Controls	RAC
Boat Travel – Travel to Sampling Locations on Water	Environment	<ul style="list-style-type: none"> • Establish safe work practices such as avoiding working on-deck while vessel is underway, avoid leaning over side rails, work in pairs, and avoid moving parts and lines/cables with tension. • Monitor weather conditions • Be aware of tidal levels and proximity to shallow water. • Be aware of underwater debris near site and shoreline. • Personal Flotation Devices, lifejackets, or Mustang Suits shall be worn by all workers who are exposed to the danger of drowning in water deep enough for the lifejacket to be effective. • Whenever there exists the possibility of falling into water, personnel must be attired in a USCG approved Type III or Type V work vest. The vest must be properly sized for the individual and must be secured at all times. • Waders shall never be worn aboard a watercraft of any kind. 	M
	Slip/trip/fall (Rocking of boat, rough waters, unsteady surface while aboard vessel)	<ul style="list-style-type: none"> • Use handrails, trekking poles or other aid to reduce stress on legs and prevent falls. Identify and avoid steep slopes, slippery areas, and wet conditions. • Evaluate work area and access routes for locations where fall prevention may be beneficial to field staff. Install low or zero-impact fall protection (e.g., stake-supported railings, cable, or ropes) as appropriate to provide handholds. 	M
	Man overboard	<ul style="list-style-type: none"> • Cover in tailgate meeting each day procedures for man overboard scenario. • Proper PFDs always required on boat. • A throwable rescue device (Type IV flotation aid) along with whatever equipment (i.e., ladders, lifting gear, or rescue boat) necessary shall be immediately available to recover an individual from the water. • Wear USGS approved cold water immersion suit (a.k.a. Mustang suit) if water temperatures are less than 55°F 	M
	General Boating	<ul style="list-style-type: none"> • Operate vessel in accordance with USCG and local, safe boating practice 	M

Job Steps	Hazards	Controls	RAC
		<ul style="list-style-type: none"> • Only qualified personnel shall operate vessels • Be aware of the location of onboard fire extinguishers, VHF radio, throwable life ring, signaling devices, and first aid kit • Operate vessel only where safe navigation practice allows • Communicate written or verbal "Float Plan" to shore side entity, e.g. onsite project manager 	
	Vessel Collisions / Other Vessel Hazards	<ul style="list-style-type: none"> • Operate vessel in accordance with USCG and local, safe boating practice • Only qualified personnel shall operate vessels • Be aware of the location of onboard fire extinguishers, VHF radio, throwable life ring, signaling devices, and first aid kit • Employ Man Overboard Controls (Above) • Wear USGS approved cold water immersion suit (a.k.a. Mustang suit) if water temperatures are less than 55°F • Wear Hearing protection as appropriate (i.e. if talking above normal levels is not possible) • Have First Aid and CPR trained individuals aboard and be familiar with contents of first aid kits 	M
	Cold/Heat Stress	<ul style="list-style-type: none"> • Provide drinking water and first aid kit. • Wear appropriate clothing for weather conditions, dress in layers. • Buddy system; cold stress monitoring; cold stress control plan (including Mustang Suits, work rotation, methods of warming) as appropriate • Review prevention, symptoms and treatment guidance. 	L

Job Steps	Hazards	Controls	RAC
Near-shore Activities	Slips, Trips, Falls	<ul style="list-style-type: none"> • Practice good housekeeping to keep the ground around the sampling location clear of obstructions, equipment and other tripping hazards. • Wear appropriate foot protection to prevent slips and trips. Use caution when working on uneven and wet ground surfaces. • If workers have the potential to get stuck in mud or fluidized sediment, air injection equipment designed to free workers feet/legs may need to be available onsite. At a minimum, a safety line should be available to be deployed from safe ground. If a worker does get stuck, they should not struggle as this causes further sinking. Use a pole to conduct sediment probing to assess water depths, the stability of shoreline terrain, and the bearing capacity of bottom sediments ahead of the chosen path. • Take special care on slippery rocks along shorelines, lakeshores, riverbanks, and creeks. Always look ahead at the ground when walking around the water's edge and avoid stepping on stones that have algal growth. • Waders may not be worn when working along, over, or in moving waters; or in waters influenced by tides or acted upon by waves when water depths exceed knee height unless specifically approved by the SH&E Manager. Waders may be worn in still waters in water depths up to the waist if bottom conditions are firm and well understood. • Waders shall never be worn aboard a watercraft of any kind. 	M
	Biological Hazards	<ul style="list-style-type: none"> • Assess work area for poisonous plants and animals and communicate observations to avoid them. • If hazardous insects or plants such as ticks, poison oaks are identified or suspected in a work area, controls including the use of disposable (Tyvek) coveralls, insect repellent (23.8% DEET or similar), light colored clothing, barrier creams, frequent tick checks should be implemented. • Additionally, all field clothing and equipment should be thoroughly cleaned, removed and/or segregated from clean clothing, equipment and supplies to avoid transfer of hazardous plants/insects. • All employees should bath immediately following fieldwork and 	L

Job Steps	Hazards	Controls	RAC
		use soaps/ cleansers designed to remove oils associated with poison oak, and conduct a full body tick check using a mirror.	
	Adverse Weather	<ul style="list-style-type: none"> • Be aware of changing weather condition and provide appropriate weather gear. • When work is halted due to inclement weather, personnel are to seek shelter in vehicles or building designated Shelter in Place (SIP) 	M

Chemical Hazards and Monitoring Procedures

Applicable HASP Section(s):	
Monitoring Instrument(s):	

Additional Safety Considerations
<ul style="list-style-type: none"> • Ensure all personnel have read the Accident Prevention Plan (APP) • Ensure all equipment is equipped with necessary fire extinguishers (min 5 lbs BC). • Follow safe driving procedures. Plan your travel path ahead of time. Use maps and known construction zones to make your selection. Consult with the other team members before making any changes to travel path. • Use an equipment checklist to verify you have the appropriate equipment/tools for your tasks. Consult appropriate AHAs or SOPs. • Stow all materials in vehicle properly, use appropriate cases and bags. Secure equipment in bed of truck with netting or straps. Do not leave any equipment loose in the cab or bed of the truck. It can cause property damage or serious injuries by falling from vehicle. • When securing equipment, watch for pinch points. Straps and netting can get caught on objects and snap back as well as trap a finger if hand placement is not correct. Use a buddy to help secure equipment when possible. • Maintain good housekeeping practices. When possible, use mechanical equipment to perform lifting of heavy objects. When lifting, follow safe lifting practices. Use the buddy system when lifting. • Wear nitrile gloves to avoid dermal contact with potential contaminants. Be observant for tripping hazards, holes, stickups, vines, old fence wire, etc.

Verify your vehicle is equipped to travel in poor weather. Have supplies on hand in the event that you become stranded, including a communication device to call for help. 	L
	Fatigue	<ul style="list-style-type: none"> • Buddy system. Rotation of shifts. Frequent breaks. • Limit work day to 12 hours, including driving time 	L

Job Steps	Hazards	Controls	RAC
Loading / Offloading Equipment	Lifting Heavy Equipment	<ul style="list-style-type: none"> • Use proper lifting techniques by bending and lifting with legs and not back, and do not over extend or twist. Do not lift over 49 lbs. without assistance • Wear work gloves to aid in gripping objects while moving • Use dollies, cart, come-alongs, or rollers whenever possible rather than unassisted lifting by employees 	M
	Pinch Points	<ul style="list-style-type: none"> • Locate potential pinch points and guard as needed. • Warn others prior to closing doors and tailgates 	
	Unstable Equipment	<ul style="list-style-type: none"> • Ensure equipment is being offloaded onto stable, even ground. • Move all offloaded equipment out of direct travel to avoid trips 	L
	Slips/Trips/Falls	<ul style="list-style-type: none"> • Wear safety-toed boots with good tread • Keep walking paths and heavy use work areas clear of obstructions and trip hazards • Use caution if work areas are wet or slippery 	L

Chemical Hazards and Monitoring Procedures	
Chemical Hazard(s) (list):	
Applicable HASP Section(s):	
Monitoring Instrument(s):	

Additional Safety Considerations

1. Ensure all personnel have read the Accident Prevention Plan (APP).
2. Ensure all equipment is equipped with necessary fire extinguishers (min 5 lbs BC).
3. Follow safe driving procedures. Always use the buddy system when moving vehicles. Plan your travel path ahead of time. Use maps and known construction zones to make your selection. Consult with the other team members before making any changes to travel path.
4. Use an equipment checklist to verify you have the appropriate equipment/tools for your tasks. Consult appropriate AHAs or SOPs.
5. Stow all materials in vehicle properly, use appropriate cases and bags. Secure equipment in bed of truck with netting or straps. Do not leave any equipment loose in the cab or bed of the truck. It can cause property damage or serious injuries by falling from vehicle.
6. When securing equipment, watch for pinch points. Straps and netting can get caught on objects and snap back as well as trap a finger if hand placement is not correct. Use a buddy to help secure equipment when possible.
7. Maintain good housekeeping practices. When possible, use mechanical equipment to perform lifting of heavy objects. When lifting, follow safe lifting practices. Use the buddy system when lifting.
8. Wear nitrile gloves when collecting samples in soil to avoid dermal contact with potential contaminants. Be observant for tripping hazards, holes, stickups, vines, old fence wire, etc.

Additional Operational Safety Procedures		PPE
S3NA-002-PR1	Stop Work Authority	<ul style="list-style-type: none"> • ANSI approved hard hat • ANSI approved safety glasses • Shirts with sleeves and full-length pants. • ANSI approved steel safety-toe boots or approved equivalent. • Nitrile Gloves • Leather work gloves • First aid kit

Acknowledgement

All employees, subcontractors, and visitors must sign the Acknowledgement form, in this section, before conducting field activities at this site.

By signing this form, AECOM employees agree that:

- I have read this Accident Hazard Analysis and I understand the requirements of the AHA.
- I will conduct work at this site in accordance with the requirements of the AHA.

By signing this form, subcontractors and visitors agree that:

- I have read and understood the potential hazards associated with the site.
- I will ensure compliance with my company's policies on health and safety.

Activity Hazard Analysis (AHA)

Activity/Work Task: Sample Storage/Shipping	Overall Risk Assessment Code (RAC) (Use highest code)	M
Project Location: New Haven Harbor, Connecticut	Risk Assessment Code (RAC) Matrix	
Contract Number: W912WJ-17-D-0003	Severity	Probability
Date Prepared: 10/9/2018		Frequent Likely Occasional Seldom Unlikely
Prepared by (Name/Title): Angela Hinkle /Scientist	Catastrophic	E E H H M
	Critical	E H H M L
Reviewed by (Name/Title): Kris van Naerssen / Task Order Manager	Marginal	H M M L L
	Negligible	M L L L L
Notes: (Field Notes, Review Comments, etc.)	Step 1: Review each “ Hazard ” with identified safety “ Controls ” and determine RAC (See above)	
	“ Probability ” is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom or Unlikely.	RAC Chart
	“ Severity ” is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible	E = Extremely High Risk
	Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each “Hazard” on AHA. Annotate the overall highest RAC at the top of AHA.	H = High Risk
		M = Moderate Risk
		L = Low Risk
Recommended PPE:		
<input checked="" type="checkbox"/> Safety Glasses With Sideshields <input checked="" type="checkbox"/> Steel-Toed Boots <input checked="" type="checkbox"/> Hard Hat <input checked="" type="checkbox"/> Nitrile Gloves <input checked="" type="checkbox"/> Leather Gloves <input checked="" type="checkbox"/> Hearing Protection <input type="checkbox"/> Flame Retardant Clothing		

Job Steps	Hazards	Controls	RAC
Sample Collection	Chemical hazards associated with sediment contact	<ul style="list-style-type: none"> • Chemical protective gloves shall be worn for handling sediments and equipment that has come in contact with impacted sediments and surface water. • Safety glasses, goggles, or a face shield shall be worn when handling sediments and surface water. • Personal hygiene facilities shall be maintained for crew members to wash face and hands before eating and before taking breaks. • Food shall be consumed in designated clean areas • Exercise caution handling and opening preserved glassware containers and use appropriate PPE (chemically resistant gloves and appropriate eyewear) 	M
	Decontamination	<ul style="list-style-type: none"> • Wear appropriate PPE (Nitrile gloves, eye protection) • Have eyewash station accessible 	L
Packing and Carrying Equipment	Lifting Heavy Equipment	<ul style="list-style-type: none"> • Use proper lifting techniques by bending and lifting with legs and not back, and do not over extend or twist. 2000 RETURN HAWAII / END

10.23.18 New Haven Harbor Sed. Sampling
tasks: Pick up samples for delivery to New Hampshire
Driver: CJ Nixon (CJN)
Weather: Clear 60s

1245: CJN performs pre-trip safety check
of van.

CJN arrives at Branford boat launch at 1315.

Reefer unit not working. CJN calls Cool Fox, who
will deliver identical replacement van to West Haven
boat launch around 1700 10/23. CJN informs
Kris Van Naerssen.

Cool Fox ~~same~~ driver arrives at West Haven at 1545.
Joe noted that driver would arrive at 1700, CJN has
driver go to Branford River launch to drop off van.

Van is dropped at Branford launch and confirmed to be in operating
condition.

CJN ~~drop~~ loads samples and departs for West Haven at 1715,
arrives at West Haven at 1735. Thermostat set to 30°F.

Samples are loaded onto van, CJ sets thermostat to 30°F, confirms
30°F with second thermometer.

CJN departs west haven at 1815, arrives home at 1845. Van
plugged in and set to 30°F for the night. Temp
confirmed at 32° on aux. thermometer. Ice purchased at
grocery store to further cool samples (20 20 lb bags).

* all temp checks performed with auxiliary thermometer

10.24.18

Task - deliver samples to New Hampshire, return to West Haven for pickup

Weather: Clear, 40s

Driver: CJN

0530 CJN completes vehicle inspection, prepares Alpha samples for courier pickup

0630 CJN ~~to~~ checks temp of cargo area (29°F), departs for New Hampshire

0730 Reefer unit starts displaying warning light and stops cooling. CJN stops, restarts reefer, re-checks temperature (30°F), continues on route

1000 CJN arrives at EGI in New Hampshire, confirms cargo box temp at 30°F , unloads samples

1045 CJN departs New Hampshire for West Haven

1315 CJN forgot to relinquish Alpha chain, meets Alpha Courier at Rocky Hill to relinquish samples to courier

1445 CJN departs Rocky Hill for West Haven

1530 CJN arrives at West Haven boat ramp. Samples are loaded, covered in bagged ice, and thermostat is confirmed at 30°F . Temp is confirmed with aux. thermometer.

1600 CJN departs for home, arrives at 1630, Van plugged in for overnight standby. 30°F confirmed in cargo box.

* All temp checks performed with auxiliary thermometer

1025.18

Task: deliver samples to New Hampshire, pickup at West Haven, deliver to New Hampshire

Weather: clear, 30s

Driver: CJN

0415 CJN inspects vehicle, confirms cargo box at 29°F ,
departs for New Hampshire at 0430

-- Per discussion with Alpha Labs, CJN will stop
at Alpha in Westborough, MA

0630 CJN arrives at Alpha Labs, Reefer unit malfunctioning.
CJN attempts restart, unit turns back on, CJN completes
sample drop off and departs for New Hampshire at 0645

0800 Reefer unit malfunctions again. CJN stops and attempts
restart, but fails. Temp is confirmed at 30°F , CJN continues
to ESI.

0822 CJN arrives at ESI. Temp is checked and is at 35°F .

Samples unloaded, chain and received samples do not match.

Ben Loyd notes he made a mistake on the COC, he will note
changes to lab via e-mail

0900 CJN departs for West Haven

0945 after failure of reefer unit to turn on, CJN pulls over
to call and inform Kris van Naebergen and Joe Fuchs (Cool Fox),
CJN will continue on route and ice samples in lieu of running
reefer unit.

1345 CJN arrives at West Haven. Reefer unit turned back on about 1315, CJN checked cargo box temp which is 34°F upon arrival at West Haven. Samples are iced and thermostat set for 30°F .

1400 CJN departs for New Hampshire. Reefer unit working intermittently.

Temp checks: 1505 30°F (checked with ax thermometer)
1642 34°F
1712 35°F
1758 36°F

1800 CJN arrives at New Hampshire, Cargo box measured at 36°F .

Samples unloaded, reefer unit turned off.

1830 CJN departs for home

1030 CJN arrives home

10/26

0900 CJN cleans van, hoses out cargo box, calls Cool Fox to take van off rent

10/24-10/25 reefer unit issues

On both 10/24 and 10/25, the reefer unit on the van malfunctioned. On 10/24, the unit was re-started once and continued running. The reefer unit also worked without fail when on electric standby.

On 10/25, the reefer unit failed again about 0800. CJN attempted to restart the unit, but failed. Per discussion with Kris van Naerssen, the samples were iced down and temperature was checked periodically. Temps in the cargo box climbed but did not exceed 40°F.

The second trip on 10/25 would use ice in lieu of reefer unit per conversation with Kris van Naerssen.

CJN did get the reefer unit to turn on about 1/2 hour from West Haven on 10/25. Reefer unit continued working for approx 1/2 hour, and failed. Temp was checked periodically, noted in daily logs. Ice was used to chill samples.

Lab Number: L1843374
Report Date: 11/15/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843374
Report Date: 11/15/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Pesticides

L1843374-02: The surrogate recoveries were outside the acceptance criteria for bz198 (29%/29%); however, the criteria were achieved upon re-extraction outside of holding time. The results of both extractions are reported; however, all associated compounds are considered to have a potential bias.

L1843374-03: The surrogate recoveries were outside the acceptance criteria for dbob (26%) and bz198 (24%/23%); however, the criteria were achieved upon re-extraction outside of holding time. The results of both extractions are reported; however, all associated compounds are considered to have a potential bias.

The WG1173904-5 MS recoveries, performed on L1843374-01, are outside the acceptance criteria for several compounds; however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially low bias for heptachlor (37%), aldrin (33%) and toxaphene (0%).

The WG1173904-6 MSD recoveries, performed on L1843374-01, are outside the acceptance criteria for several compounds; however, the associated LCS/LCSD recoveries are within overall method allowances. The results of the native sample are considered to have a potentially high bias for heptachlor epoxide (142%) and a potentially low bias for heptachlor (49%), aldrin (44%) and toxaphene (0%).

Total Metals

The WG1176966-1 Method Blank, associated with L1843374-01, has a concentration above the reporting limit for zinc. Since the sample was non-detect to the RL for this target analyte, no further actions were taken. The results of the original analysis are reported.

The WG1176966-2 LCS recoveries, associated with L1843374-01, were below the acceptance criteria for cadmium (16%), chromium (5.6%), copper (13%), lead (17%), nickel (12%), silver (1.3%) and zinc (16%); the sample was rerun and gave similar results. The results of the original analyses are reported; however, all results are considered to have a potentially low bias for these analytes.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843374
Report Date: 11/15/18

Case Narrative (continued)

The WG1176966-3 MS recoveries, performed on L1843374-01, are below the acceptance criteria for cadmium (15%), chromium (1.3%), copper (13%), lead (17%), nickel (12%), silver (2%) and zinc (15%). The results of the native sample are considered to have a potentially low bias for these analytes.

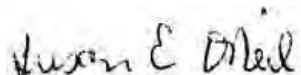

The WG1176966-4 Laboratory Duplicate RPD for nickel (49%), performed on L1843374-01, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Hexavalent Chromium

L1843374-01, -02, and -03 were analyzed with the method required holding time exceeded.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843374
Report Date: 11/15/18

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843374

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	No – see narrative
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	N/A
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – see narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – see narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	No	Pentachlorophenol 27.3%	Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	WG1174496-1: cis-nonachlor (18.1%D A channel), hexachlorobenzene (17.3%D B channel), heptachlor (16.1%D B channel), chloropyrifus (18.8%D B channel), 4,4'-DDT (18.8%D B channel), WG1174496-2: cis-nonachlor (19.7% B channel)	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	L1843374-02: BZ198 29%/29% L1843374-03: BZ198 24%/23%, DBOB 26% column B	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV associated with all samples: C12-BZ#8 @ 16%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A		Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	No	WG1176966-1 Zn	In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	No	WG1176966-3 MS Cd(15%), Cr(1%), Cu(13%), Pb(17%), Ni(12%), Ag(2%), Zn(15%)	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	WG1176966-4 Ni(49%)	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Report Date: 11/12/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Lab Number: L1843524
Report Date: 11/12/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

PCBs

L1843524-01: The surrogate recovery is outside the individual acceptance criteria for bz 198 (22%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

L1843524-02: The surrogate recovery is outside the individual acceptance criteria for bz 198 (26%), but within the overall method allowances. The results of the original analysis are reported; however, all associated compounds are considered to have a potential bias.

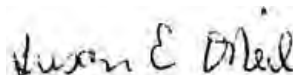

Pesticides

L1843524-01: The surrogate recoveries were outside the acceptance criteria for dbob (20%/17%) and bz 198 (19%/16%); however, the criteria were achieved upon re-extraction outside of holding time. The results of both extractions are reported; however, all associated compounds are considered to have a potential bias.

L1843524-02: The surrogate recoveries were outside the acceptance criteria for dbob (20%/20%) and bz 198 (21%/20%); however, the criteria were achieved upon re-extraction outside of holding time. The results of both extractions are reported; however, all associated compounds are considered to have a potential bias.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843524
Report Date: 11/12/18

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	Yes
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	Yes
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	Yes
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – see narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	no	Pentachlorophenol 27.3%	Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	NA		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	WG1174496-1: cis-nonachlor (18.1%D A channel), hexachlorobenzene (17.3%D B channel), heptachlor (16.1%D B channel), chloropyrifus (18.8%D B channel), 4,4'-DDT (18.8%D B channel), WG1174496-2: cis-nonachlor (19.7% B channel)	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	NA		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	L1843524-01: DBOB (17% and 20%), BZ 198 (18% and 19%) L1843524-02: DBOB (20% and 20%), BZ 198 (20% and 21%)	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV associated with all samples: C12-BZ#8 @ 16%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	NA		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	L1843524-01: BZ198 @ 22% L1843524-02: BZ198 @ 26%	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A		Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	N/A		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843759
Report Date: 11/20/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843759
Report Date: 11/20/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L1843759-09 : A sample identified as "COMPOSITE 6 ELUTRIATE BLANK-REP3" was received but not listed on the Chain of Custody. At the client's request, this sample was analyzed.

Total Metals

The WG1177004-2 LCS recoveries, associated with L1843759-01 through -18, were below the acceptance criteria for cadmium (75%), chromium (1.5%), copper (60%), lead (73%), nickel (53%), silver (5.4%) and zinc (69%); however, a rerun produced similar results. The results of the original analyses are reported; however, all results are considered to have a potentially low bias for these analytes.

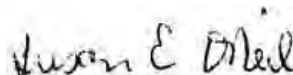

The WG1177004-3 MS recoveries, performed on L1843759-13, are below the acceptance criteria for cadmium (50%), chromium (23%), copper (42%), lead (48%), nickel (27%), silver (22%) and zinc (41%). The results of the native sample are considered to have a potentially low bias for these analytes.

The WG1180829-3 MS recovery for arsenic (74%), performed on L1843759-13, does not apply because the sample concentration is greater than four times the spike amount added.

The WG1177004-5 Laboratory Duplicate RPDs for chromium (62%), lead (26%) and zinc (26%), performed on L1843759-13, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Number: 60588790 TASK 6.0

Lab Number: L1843759
Report Date: 11/20/18

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1843759
Report Date: 11/20/18

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	Yes
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – see narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	Yes

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	No	Pentachlorophenol 27.3%	Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV associated with all field samples: C14-BZ#77 @ 17%, C15-BZ#126 @ 16%,	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A		Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	No	WG1180829-3 MS As(74%) WG1144004-3 MS Cd(50%), Cr(23%), Cu(42%), Pb(48%), Ni(27%), Ag(22%) and Zn(41%)	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	WG1177004-5 RPD Cr(62%), Pb(26%), Zn(26%)	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Number: 60588790 TASK 6.0

Lab Number: L1844003
Report Date: 11/28/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1844003
Report Date: 11/28/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Semivolatile Organics

The WG1175119-2/-3 LCS/LCSD RPD, associated with L1844003-01 through -18, is above the acceptance criteria for pentachlorophenol (40%).

PCBs and Pesticides: L1844003 had the original extraction batch compromised in the laboratory and was re-extracted with the method required holding time exceeded. Only the re-extract could be reported.

Pesticides

L1844003-11: The surrogate recovery is outside the individual acceptance criteria for bz198 (184%), but within the overall method allowances.

L1844003-13: The surrogate recovery is outside the individual acceptance criteria for bz198 (291%), but within the overall method allowances.

L1844003-14: The surrogate recovery is outside the individual acceptance criteria for bz198 (360%), but within the overall method allowances.

L1844003-16: The surrogate recovery is outside the individual acceptance criteria for bz198 (271%), but within the overall method allowances.

L1844003-17: The surrogate recovery is outside the individual acceptance criteria for bz98 (303%), but within the overall method allowances.

The WG1182113-2/-3 recoveries for heptachlor (39%/37%) and aldrin (37%/34%) are below the acceptance criteria; however, the associated MS/MSD recoveries within overall method allowances. No further action was taken.

Total Metals

The WG1177006-2 LCS recoveries, associated with L1844003-01 through -18, were below the acceptance

Case Narrative (continued)

criteria for chromium (1%), copper (79%) and silver (0%); a second prep and run were also evaluated giving similar results; however, all results are considered to have a potentially low bias for these analytes.

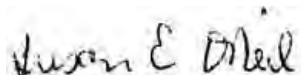

The WG1177006-3 MS recoveries, performed on L1844003-16, are below the acceptance criteria for cadmium (24%), chromium (12%), copper (0%), lead (7%), nickel (0%), silver (0%) and zinc (22%). The results of the native sample are considered to have a potentially low bias for these analytes.

Total Mercury

The WG1180588-3/-4 MS/MSD recovery, performed on L1844003-16, is outside the acceptance criteria for mercury (78%/78%); however, the associated LCS recovery is within overall method allowances. No further action was required.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1844003
Report Date: 11/28/18

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 6.0

Lab Number: L1844003
Report Date: 11/28/18

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	Yes
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	Yes
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	No – see narrative

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	No	Pentachlorophenol 27.3%	Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	No	L1844003-11: BZ198 on column 2 @ 184% L1844003-13: BZ198 on column 2 @ 291% L1844003-14: BZ198 on column 2 @ 360% L1844003-16: BZ198 on column 2 @ 2711%	In Data Package

			L1844003-17: BZ198 on column 2 @ 303%	
--	--	--	---------------------------------------	--

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No	CCV associated with Blank, LCS, LCSD: C12-BZ#8 @ 18%, C13-BZ#18 @ 18%, C13-BZ#28 @ 18%, C14-BZ#44 @ 17%, C14-BZ#66 @ 18%, C14-BZ#77 @ 19% CCV associated with all field samples: C12-BZ#8 @ 18%, C13-BZ#18 @ 18%, C14-BZ#49 @ 20%, C14-BZ#77 @ 17%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	NA		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	NA		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A		Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	No	WG1177006-3 MS Cd(0%), Cr(12%), Cu(0%), Pb(7%), Ni(0%), Ag(0%), Zn(22%) WG1180588-3/4 MS/MSD Hg(78%/78%)	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 5.0

Lab Number: L1843305
Report Date: 04/05/19

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 5.0

Lab Number: L1843305
Report Date: 04/05/19

Case Narrative (continued)

Report Reissue

This report replaces the report issued on November 19, 2018. The PCB data has been revised.

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

L1843305: Samples were frozen upon receipt in order to arrest the holding time.

L1843305-02: The collection date and time on the chain of custody was 22-OCT-18 17:20; however, the collection date/time on the container label was 22-OCT-18 17:15. At the client's request, the collection date/time is reported as 22-OCT-18 17:15.

L1843305-03: The collection date and time on the chain of custody was 22-OCT-18 17:20; however, the collection date/time on the container label was 22-OCT-18 15:17. At the client's request, the collection date/time is reported as 22-OCT-18 15:17.

L1843305-05: The collection date and time on the chain of custody was 23-OCT-18 10:25; however, the collection date/time on the container label was 23-OCT-18 10:30. At the client's request, the collection date/time is reported as 23-OCT-18 10:30.

L1843305-06: The collection date and time on the chain of custody was 23-OCT-18 11:43; however, the collection date/time on the container label was 23-OCT-18 11:10. At the client's request, the collection date/time is reported as 23-OCT-18 11:10.

L1843305-07: The collection date and time on the chain of custody was 23-OCT-18 12:37; however, the collection date/time on the container label was 23-OCT-18 12:24. At the client's request, the collection date/time is reported as 23-OCT-18 12:24.

L1843305-08: The collection date and time on the chain of custody was 23-OCT-18 13:47; however, the collection date/time on the container label was 23-OCT-18 13:10. At the client's request, the collection date/time is reported as 23-OCT-18 13:10.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 5.0

Lab Number: L1843305
Report Date: 04/05/19

Case Narrative (continued)

L1843305-09: The collection date and time on the chain of custody was 23-OCT-18 14:15; however, the collection date/time on the container label was 23-OCT-18 14:20. At the client's request, the collection date/time is reported as 23-OCT-18 14:20.

L1843305-15: The collection date and time on the chain of custody was 23-OCT-18 15:58; however, the collection date/time on the container label was 23-OCT-18 16:34. At the client's request, the collection date/time is reported as 23-OCT-18 16:34

L1843305-17: The collection date and time on the chain of custody was 23-OCT-18 17:00; however, the collection date/time on the container label was 23-OCT-18 16:45. At the client's request, the collection date/time is reported as 23-OCT-18 16:15.

L1843305-18: The collection date and time on the chain of custody was 23-OCT-18 17:38; however, the collection date/time on the container label was 23-OCT-18 17:35. At the client's request, the collection date/time is reported as 23-OCT-18 17:35.

Semivolatile Organics

PCB Congeners for samples L1843305-01, -02, -04, -06, -07, -08, -10, -11, -12, -13, -15, -17 and -18 do not meet required detection limits due to moisture content of the samples.

PAHs for samples L1843305-01, -02, -04, -06, -07, -08, -10, -11, -12, -13, -15, -17, and -18 have elevated detection limits due to the dilution required by the sample matrix.

The WG1218700-4 Laboratory Duplicate RPDs for Cl5-BZ#101 (42%), Cl5-BZ#118 (46%), Cl6-BZ#138 (51%) and Cl6-BZ#153 (45%), performed on L1843305-07, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.

Pesticides

The WG1173137-7 MSD recoveries, performed on L1843305-07, are outside the acceptance criteria for endosulfan II (145%) and 4,4'-DDT (127%).

The SRM WG1173137-4 recovery for trans-Nonachlor (486%) is above the acceptance criteria.

Case Narrative (continued)

Total Metals

The WG1178831-3/-4 MS/MSD recovery, performed on L1843305-07, is outside the acceptance criteria for copper (70%/65%) and zinc (72%/72%). A post digestion spike was performed and was within acceptance criteria.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

DL	- Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the limit of quantitation (LOQ). The DL includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LOD	- Limit of Detection: This value represents the level to which a target analyte can reliably be detected for a specific analyte in a specific matrix by a specific method. The LOD includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
LOQ	- Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.) Limit of Quantitation: The value at which an instrument can accurately measure an analyte at a specific concentration. The LOQ includes any adjustments from dilutions, concentrations or moisture content, where applicable. (DoD report formats only.)
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. For Method 332.0, the spike recovery is calculated using the native concentration, including estimated values.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 5.0

Lab Number: L1843305
Report Date: 04/05/19

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1.8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

PFAS Total: With respect to PFAS analyses, the 'PFAS, Total (5)' result is defined as the summation of results for: PFHpA, PFHxS, PFOA, PFNA and PFOS. If a 'Total' result is requested, the results of its individual components will also be reported.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene,1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene,1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO2, NO3.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT,SM9222D.**

Non-Potable Water

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	No, see narrative
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No, see narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No, see narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No, see narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	Yes

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	Trans-Nonachlor @486%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	No	L1843305-07MSD: 4.4'-DDT @ 127%, endosulfan II @ 145%	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	Cl5-BZ#101 (42%), Cl5-BZ#118 (46%), Cl6-BZ#138 (51%) and Cl6-BZ#153 (45%)	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	N/A		Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	No	WG1178831-3 MS Cu (70%), Zn(72%); WG1178831-4 MSD Cu (65%), Zn(72%)	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853052
Report Date: 01/24/19

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853052
Report Date: 01/24/19

Case Narrative (continued)

eportaReport Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

The samples were received at the laboratory below the required temperature range. The samples were transported to the laboratory in a cooler with ice and were noted to be frozen.

Semivolatile Organics

PCB Congeners did not achieve the requested regulatory limits due to the current lab RL, however results were reported to the MDL.

The WG1194647-5 Laboratory Duplicate RPD for Cl3-BZ#18 (43%), performed on L1853052-22, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

Pesticides

Methoxychlor did not achieve the requested regulatory limits due to the current lab RL, however results were reported to the MDL.

Total Metals

The WG1194805-8 SRM recoveries, associated with L1853052-01, -02, -03, -11, -12, -13, -14, -15, -16, -17, -18, -19, and -20, are above the acceptance criteria for arsenic (60%), cadmium (66%) and zinc (58%); however, the associated LCS recoveries are within criteria. No further action was taken.

The WG1194857-8 SRM recoveries, associated with L1853052-21-40, are outside the acceptance criteria for arsenic (60%), cadmium (66%) and zinc (60%); however, the associated LCS recoveries are within criteria. No further action was taken.

Lab Number: L1853052
Report Date: 01/24/19

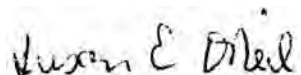

Case Narrative (continued)

Total Mercury

The WG1194808-2 LCS recovery, associated with L1853052-01, -02, -03, -11, -12, -13, -14, -15, -16, -17, -18, -19, and -20, is above the acceptance criteria for mercury (122%); however, the associated samples are non-detect to the RL for this target analyte. The results of the original analysis are reported.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853052
Report Date: 01/24/19

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	No – See case narrative.
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No – See case narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	Yes
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – See case narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	Yes

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No All within SOP criteria	<p>CCV: associated with L1853052-01 through -03, 11 through -20: Hexachlorobenzene @ 17% on column B</p> <p>CCV: associated with L1853052-21 through -31: Column A: Methoxychlor @ 16% Column B: 4,4'-DDT @ 16%, Methoxychlor @ 19%</p> <p>CCV: associated with L1853052-34 through -40: Column A: Methoxychlor @ 18% Column B: cis-Nonachlor @ 17%, 4,4'-DDT @ 19%, Methoxychlor @ 18%</p> <p>CCV: associated with L1853052-32 and -33: Column A: Methoxychlor @ 17% Column B: cis-Nonachlor @ 17%, 4,4'-DDT @ 16%, Methoxychlor @ 18%</p>	Retained at Lab

*QC Summary Tables
US Army Corps of Engineers*

Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No All within SOP criteria	CCV associated with Batch QCs: C17-BZ#170 @ 18%, C16-BZ#126 @ 17%, C19-BZ#206 @ 18%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	L1853052-22Dup: C13-BZ#18 @ 43%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	No	Annual	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	WG1194805-8 As(60%), Cd(66%), Zn(58%) WG1194857-8 As(60%), Cd(66%), Zn(60%)	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853059
Report Date: 01/25/19

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively.

When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances, the specific failure is not narrated but noted in the associated QC Outlier Summary Report, located directly after the Case Narrative. QC information is also incorporated in the Data Usability Assessment table (Format 11) of our Data Merger tool, where it can be reviewed in conjunction with the sample result, associated regulatory criteria and any associated data usability implications.

Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

HOLD POLICY - For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Alpha Project Manager and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Project Management at 800-624-9220 with any questions.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853059
Report Date: 01/25/19

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

Sample Receipt

The samples were received at the laboratory below the required temperature range. The samples were transported to the laboratory in a cooler with ice and were noted to be frozen.

Semivolatile Organics

L1853059: PCB Congeners did not achieve the requested regulatory limits due to the current lab RL, however results were reported to the MDL.

The WG1194727-4 MS recovery, performed on L1853059-01, is outside the acceptance criteria for cl4-bz#49 (49%); however, the associated LCS/LCSD recoveries are within overall method allowances. No further action was required.

The WG1194727-5 MSD recovery, performed on L1853059-01, is outside the acceptance criteria for cl3-bz#18 (193%); however, the associated LCS/LCSD recoveries are within overall method allowances. No further action was required.

The WG1194727-4/-5 MS/MSD RPD for cl3-bz#18 (55%), performed on L1853059-12, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1194727-6 Laboratory Duplicate RPDs for cl6-bz#153 (32%), cl7-bz#180 (35%), and cl7-bz#187 (39%), performed on L1853059-02, are outside the acceptance criteria. The elevated RPDs have been attributed to the non-homogeneous nature of the native sample.

The WG1194731-7 Standard Reference Material is outside the QC limits for Cl3-BZ#28 (35%).

Pesticides

L1853059: Methoxychlor did not achieve the requested regulatory limits due to the current lab RL, however

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853059
Report Date: 01/25/19

Case Narrative (continued)

results were reported to the MDL.

The WG1194728-2 LCS recoveries, associated with L1853059-01, -02, -03, -11, -12, -13, 14, -15, -16, -17, -18, -19, and -20, are outside the acceptance criteria for methoxychlor (17%) and endosulfan II (45%); however, the LCSD/MS/MSD recoveries are within the method criteria. The results of the associated samples are reported.

The WG1194728-2/-3 LCS/LCSD RPD(s), associated with L1853059-01, -02, -03, -11, -12, -13, -14, -15, -16, -17, -18, -19, and -20, are above the acceptance criteria for endosulfan i (31%), endrin (40%), methoxychlor (122%) and endosulfan II (52%).

Total Metals

The WG1195377-5 Laboratory Duplicate RPD for zinc (26%), performed on L1853059-02, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1195380-5 Laboratory Duplicate RPD for zinc (107%), performed on L1853059-22, is outside the acceptance criteria. The elevated RPD has been attributed to the non-homogeneous nature of the native sample.

The WG1195377-6 SRM recoveries, associated with L1853059-01 through -03, -11 through -20 and -38 through -40 are outside the acceptance criteria for arsenic (55%), cadmium (61%) and zinc (54%); however, the associated LCS recovery is within criteria. No further action was taken.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853059
Report Date: 01/25/19

SAMPLE RESULTS

Lab ID: L1853059-40
 Client ID: B567S05NVE
 Sample Location: NEW HAVEN, CT

Date Collected: 12/20/18 10:45
 Date Received: 12/26/18
 Field Prep: Not Specified

Sample Depth:

Matrix: Nereis
 Analytical Method: 105,8270D-SIM/680(M)
 Analytical Date: 01/24/19 21:29
 Analyst: GP
 Percent Solids: Results reported on an 'AS RECEIVED' basis.

Extraction Method: EPA 3570
 Extraction Date: 01/04/19 12:12
 Cleanup Method: EPA 3611B
 Cleanup Date: 01/09/18

Lab Number: L1853059
Report Date: 01/25/19

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EMPC	- Estimated Maximum Possible Concentration: The concentration that results from the signal present at the retention time of an analyte when the ions meet all of the identification criteria except the ion abundance ratio criteria. An EMPC is a worst-case estimate of the concentration.
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TEF	- Toxic Equivalency Factors: The values assigned to each dioxin and furan to evaluate their toxicity relative to 2,3,7,8-TCDD.
TEQ	- Toxic Equivalent: The measure of a sample's toxicity derived by multiplying each dioxin and furan by its corresponding TEF and then summing the resulting values.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Report Format: DU Report with 'J' Qualifiers

Project Name: NEW HAVEN HARBOR SUPPLEMENTAL
Project Number: 60588790 TASK 10.0

Lab Number: L1853059
Report Date: 01/25/19

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedances are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624/624.1: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.

EPA 6860: SCM: Perchlorate

SM4500: NPW: Amenable Cyanide; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **SM4500P-E, SM4500P-B, E, SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D, EPA 300:** Chloride, Sulfate, Nitrate.

EPA 624.1: Volatile Halocarbons & Aromatics,

EPA 608.3: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625.1: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, EPA 1600, EPA 1603.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Cd, Cr, Cu, Fe, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**
EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Fe, Pb, Mn, Ni, K, Se, Ag, Na, TL, Zn.

EPA 245.1 Hg.

SM2340B

For a complete listing of analytes and methods, please contact your Alpha Project Manager.

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	N/A
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	No – see case narrative
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	Yes
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	Yes
15. Were the SRM/CRM analyses within acceptance criteria?	No – see case narrative
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	No – see case narrative
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	No – see case narrative
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	Yes
19. Were surrogate recoveries within the required acceptance criteria?	Yes

Table II-1 (Continued): Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
20. Were corrective action forms provided for all non-conforming data?	Yes
21. Were all the species-specific test conditions in Appendix V met?	
22. Were the test-specific age requirements met for each test species?	
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	

Table II-2: Quality Control Summary for Analyses of Polyaromatic Hydrocarbons (PAHs) and other base-neutrals in Sediment and Tissue Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package
Internal Standard Areas	Within 50 to 200% of internal standards in continuing calibration check	Yes		Retained at Lab

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-3: Quality Control Summary for the Analyses of Pesticides in Sediment, Tissue, and Water Matrices

Method Reference Number: 8081B

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No All within SOP criteria	CCV associated with L1853059-01 through -03, -11 through -20: Column B: cis-Nonachlor @ 19%, 4,4'-DDT @ 18%, Methoxychlor @ 17%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	Yes		In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	Yes		In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-4: Quality Control Summary for Analyses of Polychlorinated Biphenyls (PCB Congeners) in Sediment, Tissue, and Water Matrices

Method Reference Number: 8270D

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)	Yes		Retained at Lab
Continuing Calibration	Every 20 injections ($\pm 15\%$ D)	No All within SOP limits	CCV associated with batch QC: C13-BZ#18 @ 16%, C14-BZ#52 @ 18% CCV associated with L1853059-01 through -03, 11 through -21: C14-BZ#52 @ 17% CCV associated with L1853059-22 through -40: C14-BZ#52 @ 16%	Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	C13-BZ#28 @ 35%	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)	No	L1853059-01MS: C14-BZ#49 @ 49% L1853059-01MSD: C13-BZ#18 @ 193% %RPD: C13-BZ#18 @ 55%	In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	L1853059-02D: C16-BZ#153 @ 32%, C17-BZ#180 @ 35%, C17-BZ#187 @ 39%	In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)	Yes		In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-5: Quality Control Summary for Analyses of Metals in Sediments, Tissue, and Water Matrices

Method Reference Numbers: Various Reference Numbers

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Linear Range Determination for ICP	Performed Quarterly	No	Annually	Retained at Lab
Initial Calibration for AA, Hg	Performed Daily (Correlation Coefficient ≥ 0.995)	Yes		Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)	Yes		Retained at Lab and On file at USACoE-NED
Initial Calibration Verification/ Continuing Calibration Verification	Hg: 80 to 120% recovery Other metals: 90 to 110% recovery	Yes		Retained at Lab
Initial Calibration Blank/ Continuing Calibration Blank	No target analytes > Instrument Detection Limit (IDL)	Yes		Retained at Lab
Standard Reference Materials	Within the limits provided by vendor	No	WG1195377-6 As(55%), Cd(61%), Zn(54%)	In Data Package
Method Blank	No target analytes > RL	Yes		In Data Package
Sample Spike/ Sample Duplicate	One set per group of field samples. Must contain all target analytes. Recovery Limits (75 to 125%; RPD < 20% or < 35%)	Yes		In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)	No	L1853059-02D: Zn (26%) L1853059-22D: Zn (107%)	In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-6: Quality Control Summary for Analyses of other Organic Chemicals not listed in Sediment, Tissue, and Water Matrices

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Initial Calibration	Must be performed prior to the analysis of any QC sample or field sample (<20 % RSD for each compound)			Retained at Lab
Calculation of Method Detection Limits (MDLs)	For each matrix, analyzed once per 12 month period (see Section 5.2 for MDL procedure)			In Data Package
Calibration Verification (Second Source)	Once, after initial calibration (80 to 120% recovery of each compound)			Retained at Lab
Continuing Calibration	At the beginning of every 12 hour shift ($\pm 15\%$ D)			Retained at Lab
Standard Reference Materials	Within the limits provided by vendor			In Data Package
Method Blank	No target analytes > RL			In Data Package
Matrix Spike/Matrix Spike Duplicate (MS/MSD)	One set (MS/MSD) per group of field samples. Must contain all target analytes. (Recovery Limits 50 to 120%; RPD <30%)			In Data Package
Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 30%)			In Data Package
Surrogate Recoveries	Calculate % recovery (30 to 150% recovery)			In Data Package
Internal Standard Areas (if applicable)	Within 50 to 200% of internal standards in continuing calibration check			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-7: Quality Control Summary for Analyses of Sediment Grain Size and Total Organic Carbon

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Grain Size: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD < 25%)			In Data Package
Total Organic Carbon: Standard Reference Materials	Within the limits provided by vendor			In Data Package
Total Organic Carbon: Analytical Replicates	Analyze one sample in duplicate for each group of field samples (RPD <30%)			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species			In Data Package
Test species age	Age/health within guidelines for each species (Appendix V)			In Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No			In Data Package
Water column toxicity test: Control mortality Control abnormality	< 10% mean < 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae			In Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	< 10% mean (no chamber >20%) See EPA (1994a) Section 9; Table 11.3			In Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

LABORATORY STANDARDS STATEMENT

This study was performed by EnviroSystems, an affiliate of Enthalpy Analytical LLC, at its facility in Hampton, New Hampshire. EnviroSystems' laboratory is accredited by the State of New Hampshire under the National Environmental Laboratory Accreditation (NELAC) program. Additionally, ESI is accredited under the Department of Defense (DoD) ELAP program, ISO/IEC 17025:2005, Certificate Number L2340. All testing conducted by EnviroSystems as part of this program was compliant with NELAC guidelines and standards. Additionally, this study was conducted in accordance with guidelines presented in the 2004 version of the New England District's *Regional Implementation Manual for Evaluation of Dredged Material Proposed for Disposal In New England Waters* (RIM) with relevant updates. Any deviations from specific elements of the RIM are detailed in the Protocol Deviation section of this report.

Suspended Particulate Phase Evaluation

1.0 INTRODUCTION

As part of a comprehensive plan to reduce adverse environmental impacts of ocean dumping, Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 specifies that all sediments to be discharged into ocean waters must be evaluated to define their potential impact on existing benthic communities. The United States Environmental Protection Agency (US EPA) has determined that the most effective means to make such an assessment is through the use of bioassay tests, which provide a relatively direct estimate of potential impact.

This project was designed to evaluate the potential toxicity of sediments from the area of dredging proposed for the New Haven Harbor 2018 Federal Navigation Project (FNP) located in New Haven, Connecticut. Placement of dredge materials is proposed at the Central Long Island Sound Disposal Site (CLDS).

Testing involved conduct of Suspended Particulate Phase (SPP) assays using the mysid, *Americamysis bahia*, inland silverside minnow, *Menidia beryllina*, and larvae of the sea urchin, *Arbacia punctulata*. Testing followed procedures established by the US EPA and the US Army Corps of Engineers (US ACE) for testing of dredged material, including *Regional Implementation Manual for Evaluation of Dredged Material Proposed for Disposal in New England Waters* (US EPA, CENAE 2004), *Evaluation of Dredged Material Proposed for Ocean Disposal - Testing Manual* (US EPA, US ACE 1991) and *Evaluation of Dredged Material Proposed for Discharge in Waters of the US - Testing Manual* (US EPA, US ACE 1998).

2.0 MATERIALS AND METHODS

2.1 Sample Collection, Preservation and Storage

Sediment cores for toxicological analysis were collected by the US ACE New England District (CENAE) using vibracoring equipment from locations identified in the dredge footprint specified in the project Work Plan (AECOM, 2018). Site water samples were also collected by the CENAE. Samples were received from AECOM, Chelmsford, Massachusetts under chain of custody in 3.5 gallon polyethylene buckets for sediment and in 5 gallon cubitainers for water. Sediment samples were composited based on the compositing scheme outlined in the Work Plan. Reference sediment and water samples were collected by the AECOM field team from the CLDS. Upon arrival at the laboratory, all samples received an internal sample control number and were logged into the project sample control system. Prior to testing, samples were placed in a secure refrigerator and stored at a temperature of $4 \pm 2^\circ\text{C}$ until test initiation. Sample identification, collection and receipt information is summarized in Table 1. Sample compositing information is provided in Table 2.

Water for the internal laboratory control is pumped in daily from the Hampton-Seabrook Estuary and stored in holding tanks. Seawater is obtained through a filter system located on the bottom of the

estuary at a point approximately 1 mile from the open ocean. The estuary receives no direct industrial discharges. Laboratory water is aerated through the collection system and in individual storage containers and test chambers. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. The laboratory control (0%) was included to verify the health of the test organisms, and as a relative benchmark for reference site toxicity.

2.2 Sediment Preparation

Sediments were press sieved through a 2-mm stainless steel screen to remove large stones, sticks, roots, man-made material and indigenous organisms. Once sieved, a portion of each sample was used to initiate elutriate sample preparation for use in “unmitigated” assays. Unionized ammonia levels were determined in the undiluted “unmitigated” elutriate samples prior to test initiation. CENAE was notified that the unionized ammonia concentrations were greater than 0.1 mg/L and ESI was authorized to prepare additional elutriate samples from sediments treated to reduce ammonia levels and conduct additional SPP toxicity testing for all six composites.

The process for treating the sediments to reduce ammonia levels followed the Ferretti method (Ferretti et al, 2000), which involved loading a portion of each composite sediment sample into clean HDPE vessels to a depth of 7-11 mm and adding clean overlying water in a 1:3 ratio of sediment to water. A thin piece of plastic was placed over the sediment prior to adding the overlying water in an effort to keep the sediment from becoming suspended during the addition. The thin piece of plastic was slowly removed after the overlying water was added. Each mitigation vessel was aerated and the temperature, pH, specific conductivity, salinity and dissolved oxygen were recorded daily prior to siphoning off the overlying water.

A small sub-sample was removed daily from each sediment composite and centrifuged to extract pore water. Temperature, pH and salinity of the extract were recorded and the pore water was subsequently analyzed for total ammonia. These data were used to calculate the pore water unionized ammonia levels daily. When the daily value of any composite was below the target threshold of 0.1 mg/L unionized ammonia (AECOM, 2018), composites were removed from their mitigation vessels, placed in clean HDPE 1-gallon buckets and refrigerated prior to preparing elutriate solutions for use in “mitigated” assays. A summary of the pore water quality and ammonia data generated during the mitigation phase is provided in Table 3 and in Appendix A.

2.3 Elutriate Sample Preparation

Elutriate samples were prepared by placing one volume of test sediment and four volumes of overlying site water in a stainless steel container and mixing with a mechanical stirring blade, both made of inert materials, for 30 minutes. Speed of the stirring motor was set so that the sample did not cavitate, entrain air, and oxidize the sample, while at the same time keeping the sediment in suspension. After mixing, the sediment and water mixture was allowed to settle for an hour. The resulting supernatant solution was then removed by siphon and centrifuged for up to 20 minutes at 3,000 rpm for the SPP evaluation and at 5,000 rpm for chemical analysis. A summary of the elutriate preparation is provided in Table 4, and original elutriate preparation forms are provided in Appendix A.

Test concentrations were mixed by diluting the respective elutriate samples with overlying water collected from the CLDS reference site with one exception as described in Section 3.3.2, dilutions for an *A. punctulata* re-test were mixed using laboratory control seawater in lieu of CLDS reference water, which had exceeded its hold time. Test concentrations for all assays were 0% (laboratory control), 0% (CLDS reference water) except as noted for the *A. punctulata* re-test, 1%, 10%, 50% and 100% (undiluted) elutriate.

2.4 Test Species

A. bahia were ≤ 5 days old and were obtained from cultures maintained by Aquatic Research Organisms (ARO), Hampton, New Hampshire. *M. beryllina* were 9-14 days old at the start of the assay and

were also obtained from ARO. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. Organisms were transferred to test vessels using a large bore pipet to minimize the amount of water added to test solutions.

Adult *A. punctulata* were from cultures maintained by ESI, and original stock was obtained from ARO. Adult sea urchins are maintained in the laboratory for as long as they are viable. Male and female urchins are maintained in separate chambers at a temperature of approximately $12\pm 3^{\circ}\text{C}$ after spawning.

2.5 Suspended Particulate Phase Assays

Two sets of SPP assays were completed using the unmitigated and mitigated sediment prepared as described in Section 2.2, each with their own paired laboratory control and CLDS reference. The ammonia mitigated assays were run as a result of observed toxicity in the unmitigated studies, as determined by CENAE. Conduct of these assays, and implementation of the Ferretti method for ammonia mitigation in the sediments, is driven by the high probability that observed effects in the unmitigated studies are a function of test solution ammonia content. Other than the different sediment preparations, assay conduct for both the unmitigated and mitigated sediment was the same. In addition, the unmitigated assays were completed in two batches, each with their own paired laboratory control and CLDS reference with elutriate solutions 1, 2 and 6 included in the first batch and elutriate solutions 3, 4 and 5 included in the second batch. The mitigated assays were completed using all six elutriate solutions, one shared laboratory control and one shared CLDS reference for each species.

2.5.1 SPP Evaluations - *A. bahia* and *M. beryllina*

The 96 hour static acute toxicity tests were conducted at $20\pm 2^{\circ}\text{C}$ with a photoperiod of 16:8 hours light:dark. Test chambers were 250 mL beakers containing 200 mL of test solution in each of 5 replicates with 10 organisms/replicate. Survival in all test replicates was recorded after 1, 24, 48, 72, and 96 hours of exposure. Dissolved oxygen, pH, temperature and salinity were measured daily in one replicate of each treatment. *A. bahia* and *M. beryllina* were fed twice daily throughout testing. Salinity was checked daily and adjusted down as needed using de-ionized water.

2.5.2 Embryo Survival and Development SPP Evaluation - *A. punctulata*

The *A. punctulata* embryo survival and development assays were conducted at $20\pm 1^{\circ}\text{C}$ with a photoperiod of 16:8 hours light:dark. Test chambers for the acute assays were 250 mL glass beakers containing 200 mL test solution in each of 5 replicates. Dissolved oxygen, pH, temperature and salinity were measured in one replicate of each treatment at the start and end of the test. Gametes were obtained by potassium chloride injection to induce spawning. Gametes were collected and diluted with filtered laboratory seawater to yield approximate stock concentrations. Measured aliquots of gamete stock solutions were combined, fertilization success was monitored 15 minutes later, and the density of embryos was calculated. Sufficient embryos were removed from the stock solution and added to each test vessel to achieve a final concentration of approximately 20 to 30 embryos/mL of solution (US EPA Region 1, CENAE, 2004). Prior to transferring embryos from the holding vessel to the individual test vessels, the embryo stock solution was thoroughly homogenized to ensure even distribution. Embryo counts in three surrogate vessels were conducted just after the addition of the embryos for comparison with the actual embryo concentrations in the final elutriate solutions.

Observations in surrogate vessels were used to evaluate test completion. The test is terminated when approximately 90% of the fertilized embryos have reached the pluteus larval stage in the controls (between 48 and 96 hours). On termination, 5 mL aliquots of each test replicate were preserved with 10% buffered formalin solution. All larvae in the 5 mL aliquot were counted to determine survival and normal development. The period of assay conduct is presented in Table 5.

2.6 Data Analysis

Survival and development data were analyzed using CETIS™ (Comprehensive Environmental Toxicity Information System) v1.9.3.0 software to calculate the concentration that elicited a response in 50% of the test population, referred to as the median lethal concentration (LC-50) and/or effect concentration (EC-50). These point estimates were calculated using the non-parametric Spearman-Kärber method when a response was observed in 50% or more of the tested organisms. In situations where less than 50% of the tested population was affected, point estimates were calculated by linear interpolation.

2.7 Quality Control

As part of the laboratory quality control program, standard reference toxicant assays are conducted on a regular basis for each test species. These results provide relative health and response data while allowing for comparison with historic data sets. Summaries of reference toxicant assays conducted in support of this study are provided in Table 6.

3.0 RESULTS AND DISCUSSION

A summary of assay acceptability and laboratory control performance for the unmitigated and mitigated assays is provided in Tables 7 and 8, respectively, and calculated endpoints for each species are provided in Table 9. Water quality characteristics for the unmitigated and mitigated assays are summarized in Tables 10 and 11. Laboratory bench sheets, water quality data, and associated statistical support data are included in Appendix A.

3.1 SPP Evaluations - *A. bahia*

3.1.1 Unmitigated Sediment

At the end of the 96 hour exposure period, *A. bahia* survival was 100% in the laboratory control and 100% in the CLDS reference water treatment for both batches of unmitigated assays completed. These assays meet the minimum test acceptability criterion of $\geq 90\%$ survival in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Review of data generated at the end of the assays documented that the mysid LC-50s were $>100\%$ following exposure to elutriate solutions 1, 2, 4 and 6, however there were significant negative effects on mysid survival after exposure to elutriate solutions 3 and 5, which were prepared using unmitigated sediment. LC-50s for these elutriate solutions were 74% and 73%, respectively.

3.1.2 Mitigated Sediment

At the end of the 96 hour exposure period, *A. bahia* survival was 100% in the laboratory control and 100% in the CLDS reference water treatment. This assay meets the minimum test acceptability criterion of $\geq 90\%$ survival in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Review of data generated at the end of the assays documented that the mysid LC-50s were $>100\%$ for all the elutriate solutions prepared using mitigated sediments.

3.2 SPP Evaluations - *M. beryllina*

3.2.1 Unmitigated Sediment

The first batch of *M. beryllina* assays conducted using unmitigated sediment for elutriate solutions

1, 2 and 6 demonstrated poor performance in the laboratory control within 24 hours, therefore that assay was terminated and re-started using the same elutriate sample (within hold time) and lot of test organisms. The bench sheets for the terminated (failed) assay are included in Appendix A.

At the end of the 96 hour exposure period, *M. beryllina* survival was 96% in the laboratory control and 98% in the CLDS reference water treatment for the assays completed on elutriate solutions 1, 2 and 6. *M. beryllina* survival was 90% in the laboratory control and 98% in the CLDS reference water treatment for the assays completed on elutriate solutions 3, 4 and 5. These assays meet the minimum test acceptability criterion of $\geq 90\%$ survival in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Review of data generated at the end of the assays documented that there were significant negative effects on minnow survival from elutriate solutions 1, 2, 3, 4 and 5, which were prepared using unmitigated sediments. LC-50s for these elutriate solutions ranged from 56% to 69%. The minnow LC-50 was $>100\%$ for elutriate solution 6.

3.2.2 Mitigated Sediment

At the end of the 96 hour exposure period, *M. beryllina* survival was 90% in the laboratory control and 92% in the CLDS reference water treatment. This assay meets the minimum test acceptability criterion of $\geq 90\%$ survival in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Review of data generated at the end of the assays documented that the minnow LC-50s were $>100\%$ for all the elutriate solutions prepared using mitigated sediments.

3.3 SPP Evaluations - *A. punctulata*

3.3.1 Unmitigated Sediment

Counts made in the laboratory control surrogate test vessels at the initiation of the *A. punctulata* assay for elutriate solutions 1, 2 and 6 indicated an average initial embryo concentration of 121 embryos/5mL, equal to approximately 24 embryos/mL. The assay was terminated after 90 hours exposure when it was determined that the majority of the larvae ($>90\%$) in the surrogate chambers had reached the pluteus larval stage. Embryo counts in the laboratory control treatment showed 78% of the embryos survived at the end of the assay. Of the original embryos, 77% were normally developed pluteus larvae. This meets the minimum test acceptability criteria of $\geq 70\%$ embryo survival and $\geq 70\%$ normal development in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Counts made in the laboratory control surrogate test vessels at the initiation of the *A. punctulata* assay for elutriate solutions 3, 4 and 5 indicated an average initial embryo concentration of 132 embryos/5mL, equal to approximately 26 embryos/mL. The assay was terminated after 74 hours exposure when it was determined that the majority of the larvae ($>90\%$) in the surrogate chambers had reached the pluteus larval stage. Embryo counts in the laboratory control treatment showed 86% of the embryos survived at the end of the assay. Of the original embryos, 85% were normally developed pluteus larvae. This meets the minimum test acceptability criteria of $\geq 70\%$ embryo survival and $\geq 70\%$ normal development in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

Review of the data generated at the end of the assays indicate that all the elutriate solutions prepared using unmitigated sediment had significant negative impacts on urchin embryonic survival and/or development, with LC-50s and EC-50s based on Spearman-Kärber calculation ranging from 3-22% for both

survival and development.

3.3.2 Mitigated Sediment

The *A. punctulata* assay initiated on October 31, 2018 using the same elutriate sample as the *A. bahia* and *M. beryllina* assays failed to meet test acceptability in the laboratory control. A passing assay was initiated on November 21, 2018 using a different lot of test organisms and a second set of elutriate samples generated using a new site water sample because the original sample had exceeded its hold time. The dilutions for the SPP were mixed using laboratory control seawater in lieu of CLDS reference water, which had also exceeded its hold time. Refer to Appendix A for a copy of the email communication regarding use of laboratory water to mix the dilutions for this assay.

Counts made in the laboratory control surrogate test vessels at the initiation of the *A. punctulata* assay indicated an average initial embryo concentration of 105 embryos/5mL, equal to approximately 21 embryos/mL. The assay was terminated after 68 hours exposure when it was determined that the majority of the larvae (>90%) in the surrogate chambers had reached the pluteus larval stage. Embryo counts in the laboratory control treatment showed 76% of the embryos survived at the end of the assay. Of the original embryos, 74% were normally developed pluteus larvae. This meets the minimum test acceptability criteria of $\geq 70\%$ embryo survival and $\geq 70\%$ normal development in the laboratory control indicating that the test organisms were healthy and not stressed by handling. These data are considered valid for evaluating impacts associated with the elutriate samples.

The EC-50s for development and LC-50s for survival generated from the urchin assay data were >100% in all the elutriate solutions prepared using mitigated sediment.

3.4 Water Quality Data

3.4.1 Unmitigated Sediment

Temperature data collected during daily water quality observations documented values ranging from 14°C to 23°C, salinity levels ranging from 28 to 33‰ and dissolved oxygen levels ranging from 5.5 to 10.1 mg/L (Table 7). Test acceptability criteria requires a mean temperature of $20 \pm 2^\circ\text{C}$ ($20 \pm 1^\circ\text{C}$ for *A. punctulata*), salinity within a range of $30 \pm 2\text{‰}$ and dissolved oxygen of $\geq 40\%$ (approximately equal to 3.3 mg/L for assays maintained at 20°C, 30‰ and a barometric pressure of 760 inches Hg). Please see section 3.5 for a discussion of protocol deviations related to salinity and temperature.

Total ammonia levels were elevated (12 to 37 mg/L) at the start of the assays in all six elutriate solutions prepared using unmitigated sediment, which is equivalent to calculated unionized ammonia levels of 0.35 to 0.53 mg/L depending on sample pH and temperature (Table 10). These levels are higher than the target threshold of 0.1 mg/L unionized ammonia for assay initiation. Total ammonia levels decreased somewhat throughout the life of the assays, but because the pH drifted upwards of approximately 8 SU in the composite elutriate solutions this resulted in higher unionized ammonia levels at assay end (generally >0.8 mg/L in the undiluted elutriate). Ammonia was not detected in either the laboratory control or CLDS reference water at the start, and while it was detected by assay end the calculated unionized ammonia levels remained ≤ 0.03 mg/L in the controls.

US EPA guidance suggests ammonia, generally in the unionized form, can be a source of toxicity when total ammonia values are >5 mg/l (USEPA 2002). US EPA Ambient Water Quality Criteria (AWQC) for unionized ammonia in saltwater references LC-50 values for two of the species tested: *A. bahia* (1.04 mg/L) and *M. beryllina* (0.88 mg/L) (USEPA 1989). AWQC for unionized ammonia in saltwater are not available for *A. punctulata*, however effects levels are available in the literature for urchin species ranging from 0.06 mg/L for an EC-50 for development (Maguire Group Inc., 2003) to approximately 0.336 mg/L for a 96-hour LC-50 (Chang-Hoon Lee et al., 2013). Based on the calculated unionized ammonia levels, it seems likely that the total and/or unionized ammonia content contributed to the observed toxicity.

3.4.2 Mitigated Sediment

Temperature data collected during daily water quality observations documented values ranging from 19°C to 22°C, salinity levels ranging from 28 to 34‰ (values >32‰ only at assay end) and dissolved oxygen levels ranging from 5.6 to 8.7 mg/L (Table 8). Test acceptability criteria requires a mean temperature of 20±2°C (20±1°C for *A. punctulata*), salinity within a range of 30±2‰ and dissolved oxygen of ≥40% (approximately equal to 3.3 mg/L for assays maintained at 20°C, 30‰ and a barometric pressure of 760 inches Hg). There are no water quality deviations noted for any of the assays using mitigated sediment.

Total ammonia levels ranged from 1.1 to 3.4 mg/L at the start of the assays in all six elutriate solutions prepared using mitigated sediment, which is equivalent to calculated unionized ammonia levels of 0.022 to 0.090 mg/L depending on sample pH and temperature. These levels are below the target threshold of 0.1 mg/L for assay initiation. Total ammonia levels remained fairly level and in some cases slightly increased throughout the life of the assays, but pH levels generally remained level in the elutriate solutions and therefore unionized ammonia levels only slightly increased to a maximum of 0.12 mg/L (elutriate solution 5) by assay end.

3.5 Protocol Deviations

Review of the data collected for these assays documented the following deviations from the method protocol and/or ESI's standard procedures:

Protocol requires, and it is common laboratory procedure, that a reference toxicant assay be completed concurrently with any project assay (at a minimum frequency of once per month). However, the *A. punctulata* assay completed using mitigated sediment (study 31291) does not have an associated reference toxicant assay, and there are no reference toxicant data available for that lot of organisms due in part to the time of year and organism viability. While this remains a data gap, it is the opinion of ESI's technical manager that this deviation had no adverse impact on the outcome of the assay as the project assay met all acceptability criteria and there were no impacts on embryonic survival or development in the project elutriates. There are reference toxicant data available that are concurrent with the unmitigated assay (study 31248) started approximately one month prior, however these data were generated using a different lot of organisms.

Protocol requires that the *A. bahia* and *M. beryllina* assays be conducted at 20±2°C, and the *A. punctulata* assay be conducted at 20±1°C. Although the assays were maintained in incubators set at their target temperature, the minimum temperatures recorded during the unmitigated assays for elutriate solutions 3, 4 and 5 fell below the protocol range to a low of 17°C on day 2 of the mysid assay, a low of 14°C on day 2 of the minnow assay and a low of 18°C at the start of the urchin assay. There were no notations on the bench sheets indicating a reason for the low temperatures, therefore the drop below the threshold is likely due to the ambient laboratory temperature at the time that water quality measurements were taken. There was also an isolated exceedence of the upper threshold in the laboratory control of the unmitigated minnow assay for elutriate solutions 1, 2 and 6, which reached a maximum of 23°C on day 0. These species can tolerate temperatures within the ranges measured. It is the opinion of ESI's technical manager that these deviations had no adverse impact on the outcome of the assay.

In addition, the protocol requires that the assays be conducted at 30±2‰. It is not uncommon for the salinity to drift upwards during assay conduct due to evaporation and exceed the protocol requirement, but the salinities are adjusted daily as needed to account for this occurrence, except at assay termination. These occurrences at test termination are not considered deviations. In one instance the salinity in the mysid laboratory control for the mitigated assay for elutriate solutions 3, 4 and 5 was inadvertently overlooked and not adjusted down from 33 ppt at 72 hours. This was an isolated incident and all other in-life assay measurements >32 ppt were adjusted accordingly. It is the opinion of ESI's technical manager that this deviation had no adverse impact on the outcome of the assay.

3.6 Summary

This program utilized protocols developed by the US EPA and the CENAE to assess the potential impact that the proposed dredge material collected from the New Haven Harbor FNP would have on the marine environment. Impacts were evaluated using two different sediment preparations to address residual ammonia in the elutriate solutions, and results are presented for both unmitigated and mitigated sediment.

Review of the data indicates that there were significant negative effects on all three species from exposure to elutriate solutions that were prepared using unmitigated sediment from composites 3 and 5, and significant negative effects on both the minnow and urchin from most/all of the elutriate solutions prepared using unmitigated sediment. Total ammonia levels in the elutriate solutions prepared using unmitigated sediment measured ≥ 12 mg/L (equivalent to approximately ≥ 0.35 mg/L unionized ammonia) at the start of the assays and levels rose to a maximum of 31 mg/L total ammonia (2.8 mg/L unionized ammonia) by assay end. These ammonia levels likely contributed to the observed toxicity.

In contrast, there were no negative effects on any species following exposure to any of the elutriate solutions prepared using mitigated sediments, with measured total ammonia levels of up to 3.3 mg/L (equivalent to 0.090 mg/L unionized ammonia) at assay start and up to 3.7 mg/L at assay end (the maximum unionized ammonia level of 0.12 mg/L was calculated for a different sample in which the pH level increased during the life of the assay).

Notes:

Ap = *Arbacia punctulata*

^a Adjustments were made, as needed, to bring salinity values back within the acceptable range and values reported herein represent the adjusted value, except for final readings at 96 hours that typically are not adjusted and are not considered a deviation.

^b The range of values provided is inclusive of both laboratory controls and reference samples associated with the two batches of unmitigated assays that were completed.

^c Refer to Section 3.5 for a discussion of the deviation.

^d Dissolved oxygen measurements were collected in mg/L, rather than % saturation. The minimum requirement of ≥40% is approximately equal to 3.3 mg/L for assays maintained at 20°C, 30‰ and a barometric pressure of 760 inches Hg.

Notes:

Ap = *Arbacia punctulata*

^a Adjustments were made, as needed, to bring salinity values back within the acceptable range and values reported herein represent the adjusted value, except for final readings at 96 hours that typically are not adjusted and are not considered a deviation.

^b The CLDS reference was not included with the *A. punctulata* re-test because the sample had exceeded its hold time.

^c Dissolved oxygen measurements were collected in mg/L, rather than % saturation. The minimum requirement of ≥40% is approximately equal to 3.3 mg/L for assays maintained at 20°C, 30‰ and a barometric pressure of 760 inches Hg.

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 31242
 SDG No:
 Project: New Haven
 Delivered via: Client
 Date and Time Received: 10/24/18 1015 Date and Time Logged into Lab: 10/31/18 1630
 Received By: BG Logged into Lab by: BG
 Air bill / Way bill: No Air bill included in folder if received? NA
 Cooler on ice/packs: Yes Custody Seals present? NA
 Cooler Blank Temp (C) at arrival: 5 Custody Seals intact? NA
 Number of COC Pages: 2
 COC Serial Number(s): 02668
 COC Complete: Yes Does the info on the COC match the samples? Yes
 Sampled Date: Yes Were samples received within holding time? Yes
 Field ID complete: Yes Were all samples properly labeled? Yes
 Sampled Time: Yes Were proper sample containers used? Yes
 Analysis request: Yes Were samples received intact? (none broken or leaking) Yes
 COC Signed and dated: Yes Were sample volumes sufficient for requested analysis? Yes
 Were all samples received? Yes Were VOC vials free of headspace? NA
 Client notification/authorization: Not required pH Test strip ID number: NA
