Nancy Roka <nancy.roka@enthalpy.com>

RE: New Haven SPP Effort & Milford 28-Day Studies

Van Naerssen, Kris <Kris.VanNaerssen@aecom.com>

Thu, Nov 15, 2018 at 11:10 PM

To: James Provencher <james.provencher@enthalpy.com>, Kirk Cram <kirk.cram@enthalpy.com>, "Surprenant, Maura" <Maura.Surprenant@aecom.com>

Cc: "Archer, Christine" <Christine.Archer@aecom.com>, Nancy Roka <nroka@envirosystems.com>

Thanks much Jim –

Will include this COC in our submittal to NAE.

Please note that I connected with Ben tonight – please do plan to proceed as noted below:

- Use of the provided NHH waters to create the elutriates for the SPP re-dos
- Use of the New Hampshire lab water as their dilutant

Thanks much & let us know if any additional questions or concerns.

Best, Kris

From: James Provencher [mailto:james.provencher@enthalpy.com]

Project:	New Haven	Client:	AECOM

Composites 1, 2, & 6

Summary of Test Conditions

Exposure	Species Used
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours	(Check box for all that apply) <input checked="" type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)

Water Quality Parameters

Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 2 ppt (E) NR 11/21/18	Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C 20 ± 1 °C (E) NR 11/21/18
pH: 7.8 ± 0.5	Photoperiod: 16 hour light, 8 hour dark

Test Chamber	Solution Volume
(Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL Tumbler (P)	(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____

Replicate Information

<i>A. bahia</i> and <i>M. beryllina</i> : • 5 Reps per treatment • 10 organisms per chamber	<i>Arbacia</i> : • 5 Reps per treatment • 20-30 embryos/mL
---	--

Cleaning	Treatments
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).	Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)

Feeding

<i>A. bahia</i> : Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day	<i>M. beryllina</i> : Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day
<i>Arbacia</i> : NONE

SUSPENDED PARTICULATE PHASE ACUTE BIOASSAY			
Study #:	31248	Incubator ID:	2 10
Project:	New Haven	Client:	AECOM
Composites 3, 4 & 5			
Summary of Test Conditions			
Exposure		Species Used	
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours		(Check box for all that apply) <input checked="" type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)	
Water Quality Parameters			
Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 2 ppt (E3) NR 11/2/18		Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C 20 ± 1 °C (E3) NR 11/2/18	
pH: 7.8 ± 0.5		Photoperiod: 16 hour light, 8 hour dark	
Test Chamber		Solution Volume	
(Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL Tumbler/Beaker		(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____	
Replicate Information			
<i>A. bahia</i> and <i>M. beryllina</i> : • 5 Reps per treatment • 10 organisms per chamber		<i>Arbacia</i> : • 5 Reps per treatment • 20-30 embryos/mL	
Cleaning		Treatments	
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).		Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)	
Feeding			
<i>A. bahia</i> : Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day		<i>M. beryllina</i> : Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day	
<i>Arbacia</i> : NONE			
Date: 10/26/18		Initial: BK

Summary of Test Conditions

Exposure	Species Used
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours	(Check box for all that apply) <input checked="" type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)

Water Quality Parameters

Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 1 ppt 2 (E3) JTP 12/07/18 pH: 7.8 ± 0.5	Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C 20 ± 1 °C (E3) JTP 12/07/18 Photoperiod: 16 hour light, 8 hour dark
--	---

Test Chamber	Solution Volume
(Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL Tumbler	(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____

Replicate Information

<i>A. bahia</i> and <i>M. beryllina</i>: <ul style="list-style-type: none"> • 5 Reps per treatment • 10 organisms per chamber 	<i>Arbacia</i>: <ul style="list-style-type: none"> • 5 Reps per treatment • 20-30 embryos/mL
--	---

Cleaning	Treatments
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).	Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)

Feeding

<i>A. bahia</i>: Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day	<i>M. beryllina</i>: Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day
<i>Arbacia</i>: NONE

Unmitigated Assays

SUSPENDED PARTICULATE PHASE ACUTE BIOASSAY			
Study #:	31248	Incubator ID:	2
Project:	New Haven	Client:	AECOM
Composites 1, 2 & 6			
Summary of Test Conditions			
Exposure		Species Used	
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours		(Check box for all that apply) <input type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input checked="" type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)	
Water Quality Parameters			
Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 3 ppt 2 (3) NR 11/2/18		Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C 20 ± 1 °C (3) NR 11/2/18	
pH: 7.8 ± 0.5		Photoperiod: 16 hour light, 8 hour dark	
Test Chamber		Solution Volume	
(Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL tumbler		(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____	
Replicate Information			
<i>A. bahia</i> and <i>M. beryllina</i> : • 5 Reps per treatment • 10 organisms per chamber		<i>Arbacia</i> : • 5 Reps per treatment • 20-30 embryos/mL	
Cleaning		Treatments	
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).		Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)	
Feeding			
<i>A. bahia</i> : Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day		<i>M. beryllina</i> : Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day	
<i>Arbacia</i> : NONE			
Date: 10/26/18		Initial: BS

Mitigated Assays

SUSPENDED PARTICULATE PHASE ACUTE BIOASSAY			
Study #:	31291	Incubator ID:	20
Project:	New Haven	Client:	AECOM
Composites 1, 2, 3, 4, 5 & 6			
Summary of Test Conditions			
Exposure		Species Used	
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours		(Check box for all that apply) <input checked="" type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input checked="" type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)	
Water Quality Parameters			
Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 2 ppt pH: 7.8 ± 0.5		Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C 20 ± 1 °C Photoperiod: 16 hour light, 8 hour dark	
Test Chamber (Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL fumbler		Solution Volume (Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____	
Replicate Information			
<i>A. bahia</i> and <i>M. beryllina</i> : • 5 Reps per treatment • 10 organisms per chamber		<i>Arbacia</i> : • 5 Reps per treatment • 20-30 embryos/mL	
Cleaning		Treatments	
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).		Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)	
Feeding			
<i>A. bahia</i> : Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day		<i>M. beryllina</i> : Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day	
<i>Arbacia</i> : NONE			
Date: 10/31/18		Initial: [Signature]	

Aquatic Research Organisms

DATA SHEET

I. Organism History

Species MENIDIA BERYLLINA
 Source: Lab reared Hatchery reared _____ Field collected _____
 Hatch date 10-21-18 Receipt date _____
 Lot number 101818MB Strain _____
 Brood origination CAPE COD MA

II. Water Quality

Temperature 25 °C Salinity ≈28 ppt D.O. _____ ppm
 pH 7.8 su Hardness _____ ppm Alkalinity _____ ppm

III. Culture Conditions

Freshwater _____ Saltwater Other _____
 Recirculating Flow through _____ Static renewal _____
 DIET: Flake food Phytoplankton _____ Trout chow _____
 Artemia Rotifers YCT _____ Other ENCAP SHRIMP DIET
 Prophylactic treatments: _____
 Comments: _____

EMBRYO WORKSHEET

DATE: '10/25/18

ESI STUDY: 31248

CLIENT: AECOM

PROJECT: New Haven

Eggs Collected @: 153020 ^{EGS 10/25} Pre-assay fertilization check: 96% ANALYST: GRS

Sperm Collected @: 152030 ^{SPS 10/25} *A mated subsample of egg+sperm must achieve ≥90% fertilization in order to be used in testing.*

Egg Stock Suspension Count:

Take 1mL of egg stock suspension and using a glass graduated cylinder dilute with seawater to a final volume of 100 mL. Count a subsample of the diluted suspension to get an estimate of the egg concentration. The diluted suspension should have 40 - 50 eggs/mL, (which would represent an egg concentration of 4,000 - 5,000 in the stock suspension.)

Egg Count (per mL) of diluted suspension: 47

Sperm Stock Suspension Count:

Once added to the egg stock, the final sperm concentration should be $1 \times 10^5 - 1 \times 10^7$ in solution E.

1. Hemocytometer Count (E):	<u>110</u>		
2. Hemocytometer Count (E):	<u>106</u>		
Average Count (E):	<u>108</u>	X10 ⁴	= sperm solution E = <u>1.08×10^6</u>
Sperm Concentrations:	Solution E X 40	=	Solution B = <u>4.32×10^7</u>
	Solution E X 20	=	Solution C = <u>2.16×10^7</u>
	Solution E X 5	=	Solution D = <u>5.40×10^6</u>

Sperm Count (per mL): 1.08×10^6

mL of Eggs to Add: 175

mL of Sperm to Add: 25

Gametes mixed @: 1555

Gametes must be mixed within 1 hour of collection.

Calculated Embryo Stock Concentration (per mL): 0.875

The test concentration should be 20 - 30 embryos per mL.

Calculated Embryo Stock (mL) needed per chamber: 1.36

Add calculated amount of embryo stock to a surrogate chamber, gently mix, then count a 5mL aliquot.

Embryo Concentration Check: 113

If the check concentration is acceptable, then proceed with embryo addition to the test.

Volume Embryo Stock (mL) added to test solutions: 0.680

Embryos Added to Test Solutions @: 1735

INITIAL COUNTS:	Embryos/ 5 mL
SURROGATE A	<u>113</u>
SURROGATE B	<u>130</u>
SURROGATE C	<u>119</u>
Mean:	<u>121</u>

EMBRYO WORKSHEET

DATE: 10/25/18 ²¹ ^{CF} ^{12/13} ESI STUDY: 31248

CLIENT: AECOM PROJECT: New Haven

Eggs Collected @: 1145 Pre-assay fertilization check: 44% ANALYST: CF
^{CF} ^{12/13} 44%
 Sperm Collected @: 1143 *A mated subsample of egg+sperm must achieve ≥90% fertilization in order to be used in testing.*

Egg Stock Suspension Count:

Take 1mL of egg stock suspension and using a glass graduated cylinder dilute with seawater to a final volume of 100 mL. Count a subsample of the diluted suspension to get an estimate of the egg concentration. The diluted suspension should have 40 - 50 eggs/mL, (which would represent an egg concentration of 4,000 - 5,000 in the stock suspension.)

Egg Count (per mL) of diluted suspension: 50

Sperm Stock Suspension Count:

1. Hemocytometer Count (E): 153
 2. Hemocytometer Count (E): 150
 Average Count (E): 152 X10⁴ = sperm solution E = 1.52 x 10⁶
 Sperm Concentrations: Solution E X 40 = Solution B = 6.08 x 10⁷
 Solution E X 20 = Solution C = 3.04 x 10⁷
 Solution E X 5 = Solution D = 7.6 x 10⁶
 Sperm Count (per mL): 1.52 x 10⁶

Once added to the egg stock, the final sperm concentration should be 1x10⁵ - 1x10⁷ in solution E.

mL of Eggs to Add: 100 mL
 mL of Sperm to Add: 20 mL Gametes mixed @: 1235
Gametes must be mixed within 1 hour of collection.

Calculated Embryo Stock Concentration (per mL): 0.833
 Calculated Embryo Stock (mL) needed per chamber: 1.2 mL
The test concentration should be 20 - 30 embryos per mL.

Add calculated amount of embryo stock to a surrogate chamber, gently mix, then count a 5mL aliquot.

Embryo Concentration Check: 128 *If the check concentration is acceptable, then proceed with embryo addition to the test.*

Volume Embryo Stock (mL) added to test solutions: 0.55 mL Embryos Added to Test Solutions @: 1330

INITIAL COUNTS:	Embryos/ 5 mL
SURROGATE A	<u>131</u>
SURROGATE B	<u>126</u>
SURROGATE C	<u>133</u>
Mean:	<u>132</u>

Organism Lot ID: 99ApAR0080118
 Mean per mL: 26

Arbacia punctulata
Suspended Particulate Phase

Bench Sheets

Mitigated Assays

SUSPENDED PARTICULATE PHASE ACUTE BIOASSAY

Study #: 312191 ^{12/13} ¹¹⁰² Incubator ID: 142 ¹¹⁰²
 Project: New Haven Harbor 2018 Client: AECOM

Composites 1, 2, 3, 4, 5 & 6

Summary of Test Conditions

Exposure	Species Used
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours	(Check box for all that apply) <input type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input type="checkbox"/> Silverside Minnow (<i>Menidia beryllina</i>) <input checked="" type="checkbox"/> Sea Urchin (<i>Arbacia</i>)

Water Quality Parameters

Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 2 ppt ^{② JTP} 2 12/27/18 pH: 7.8 ± 0.5	Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C ^{② JTP} 20 ± 1 °C 12/27/18 Photoperiod: 16 hour light, 8 hour dark
--	---

Test Chamber	Solution Volume
(Check box for all that apply) <input checked="" type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input type="checkbox"/> other _____	(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____

Replicate Information

<i>A. bahia</i> and <i>M. beryllina</i> : • 5 Reps per treatment • 10 organisms per chamber	<i>Arbacia</i> : • 5 Reps per treatment • 20-30 embryos/mL
---	--

Cleaning	Treatments
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).	Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)

Feeding

<i>A. bahia</i> : Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day	<i>M. beryllina</i> : Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day
<i>Arbacia</i> : NONE

EMBRYO WORKSHEET

DATE: 11/21/18 ESI STUDY: ^{91 @ 06 1213} 31246
 CLIENT: AECOM PROJECT: New Haven Harbor

Eggs Collected @: 1000 Pre-assay fertilization check: 92% ANALYST: GRS
 Sperm Collected @: 1000 *A mated subsample of egg+sperm must achieve ≥90% fertilization in order to be used in testing.*

Egg Stock Suspension Count:

Take 1mL of egg stock suspension and using a glass graduated cylinder dilute with seawater to a final volume of 100 mL. Count a subsample of the diluted suspension to get an estimate of the egg concentration. The diluted suspension should have 40 - 50 eggs/mL, (which would represent an egg concentration of 4,000 - 5,000 in the stock suspension.)

Egg Count (per mL) of diluted suspension: 4000

Sperm Stock Suspension Count:

1. Hemocytometer Count (E): <u>143</u> 2. Hemocytometer Count (E): <u>130</u> Average Count (E): <u>137</u> Sperm Concentrations:	<p style="text-align: center;"><i>Once added to the egg stock, the final sperm concentration should be $1 \times 10^5 - 1 \times 10^7$ in solution E.</i></p> $\text{X}10^4 = \text{spm solution E} = \frac{1.37 \times 10^6}{100} = 1.37 \times 10^4$ $\text{Solution B} = \frac{5.48 \times 10^7}{100} = 5.48 \times 10^5$ $\text{Solution C} = \frac{2.74 \times 10^7}{100} = 2.74 \times 10^5$ $\text{Solution D} = \frac{6.85 \times 10^6}{100} = 6.85 \times 10^4$ <p style="text-align: right;">Sperm Count (per mL): <u>1.37×10^6</u></p>
--	--

mL of Eggs to Add: 200
 mL of Sperm to Add: 30 Gametes mixed @: 1040
Gametes must be mixed within 1 hour of collection.

Calculated Embryo Stock Concentration (per mL): ^{34.80} 3480 *The test concentration should be 20 - 30 embryos per mL.*
 Calculated Embryo Stock (mL) needed per chamber: 1.42

Add calculated amount of embryo stock to a surrogate chamber, gently mix, then count a 5mL aliquot.

Embryo Concentration Check: 105 *If the check concentration is acceptable, then proceed with embryo addition to the test.*

Volume Embryo Stock (mL) added to test solutions: 1.5 mL Embryos Added to Test Solutions @: 1310

INITIAL COUNTS:

SURROGATE	Embryos/ 5 mL
SURROGATE A	<u>105</u>
SURROGATE B	<u>101</u>
SURROGATE C	<u>109</u>
Mean:	<u>21</u> 105

Organism Lot ID: 99APAR00910618
 Mean per mL: 21

Suspended Particulate Phase

Failed Assays

SUSPENDED PARTICULATE PHASE ACUTE BIOASSAY

Study #:	31248	Incubator ID:	20
Project:	New Haven	Client:	AECOM

Composites 1, 2, 6

Summary of Test Conditions

Exposure	Species Used
Test Mode: Static, non-renewal Length of Assay: <i>A. bahia</i> and <i>M. beryllina</i> : 96 hours <i>Arbacia</i> : 48- 72 hours	(Check box for all that apply) <input type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input checked="" type="checkbox"/> Silverside Minnow (<i>Menidia. beryllina</i>) <input type="checkbox"/> Sea Urchin (<i>Arbacia</i>)

Water Quality Parameters

Salinity: <i>A. bahia</i> and <i>M. beryllina</i> : 30 ± 2 ppt <i>Arbacia</i> : 30 ± 1 ppt (E3) JTP 12/07/18 2	Temperature: <i>A. bahia</i> and <i>M. beryllina</i> : 20 ± 2 °C <i>Arbacia</i> : 16 ± 2 °C (E3) JTP 12/07/18 20 ± 1 °C
pH: 7.8 ± 0.5	Photoperiod: 16 hour light, 8 hour dark

Test Chamber	Solution Volume
(Check box for all that apply) <input type="checkbox"/> 250 mL beaker <input type="checkbox"/> 600 mL beaker <input checked="" type="checkbox"/> other 200 mL Tumbler	(Check box for all that apply) <input checked="" type="checkbox"/> 200 mL/replicate <input type="checkbox"/> 400 mL/replicate <input type="checkbox"/> other _____

Replicate Information

<i>A. bahia</i> and <i>M. beryllina</i>: <ul style="list-style-type: none"> 5 Reps per treatment 10 organisms per chamber 	<i>Arbacia</i>: <ul style="list-style-type: none"> 5 Reps per treatment 20-30 embryos/mL
--	---

Cleaning	Treatments
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed and rinsed with deionized water (EPA 2002).	Laboratory Control, disposal site reference water, undiluted elutriate solution (100%) and diluted elutriate solutions (concentrations 50%, 10%, 1%)

Feeding

<i>A. bahia</i>: Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i> - 0.2mL/day	<i>M. beryllina</i>: Fed newly hatched, <24 hour old <i>Artemia nauplii</i> after 48 hrs - 0.2mL/day
<i>Arbacia</i>: NONE

EMBRYO WORKSHEET

DATE: 10/31/18

ESI STUDY: 31291

CLIENT: AECOM

PROJECT: New Haven

Eggs Collected @: 1617

Pre-assay fertilization check: 92%

ANALYST: CFS

Sperm Collected @: 1632

A mated subsample of egg+sperm must achieve >90% fertilization in order to be used in testing.

Egg Stock Suspension Count:

Take 1mL of egg stock suspension and using a glass graduated cylinder dilute with seawater to a final volume of 100 mL. Count a subsample of the diluted suspension to get an estimate of the egg concentration. The diluted suspension should have 40 - 50 eggs/mL, (which would represent an egg concentration of 4,000 - 5,000 in the stock suspension.)

Egg Count (per mL) of diluted suspension: 4300

Sperm Stock Suspension Count:

- 1. Hemocytometer Count (E): 120
- 2. Hemocytometer Count (E): 125
- Average Count (E): 122
- Sperm Concentrations: Solution E X 40 =
- Solution E X 20 =
- Solution E X 5 =

Once added to the egg stock, the final sperm concentration should be $1 \times 10^5 - 1 \times 10^7$ in solution E.

$1.22 \times 10^4 \times 10^4 = \text{spm solution E} = 4.88 \times 10^6$

Solution B = 4.88×10^7

Solution C = 2.44×10^7

Solution D = 6.1×10^6

Sperm Count (per mL): 1.22×10^6

mL of Eggs to Add: 175 mL

mL of Sperm to Add: 30 mL

Gametes mixed @: 1725

Gametes must be mixed within 1 hour of collection.

Calculated Embryo Stock Concentration (per mL): 0.854 @CFS 10/31
0.692 mL

The test concentration should be 20 - 30 embryos per mL.

Calculated Embryo Stock (mL) needed per chamber: 1.17 mL

Add calculated amount of embryo stock to a surrogate chamber, gently mix, then count a 5mL aliquot.

Embryo Concentration Check: 124

If the check concentration is acceptable, then proceed with embryo addition to the test.

Volume Embryo Stock (mL) added to test solutions: 0.692 mL

Embryos Added to Test Solutions @: 1820

INITIAL COUNTS:	Embryos/ 5 mL
SURROGATE A	<u>143</u>
SURROGATE B	<u>131</u>
SURROGATE C	<u>135</u>
Mean:	<u>138</u>

Organism Lot ID: 99ApAR0080118

Mean per mL: 28

STUDY: 31291
CLIENT: AECOM
PROJECT: New Haven Harbor FNP 2018
ASSAY: Suspended Particulate Phase
TASK: Elutriate/SPP Ammonia - Mitigated Sediment
METHOD: SM 4500-NH3 G

Attachment 2 - Formulas Used to Derive Un-Ionized Ammonia (UIA) Fractions and
 Consistent with USEPA AWQC (1989) and Whitfield (1974). Differs from Colt (2004) ar

Where: I = Ionic Strength $(19.9273 \times N_{11}) / (1000 - 1.005109 \times N_{11})$

pKa = ionization constant of ammonium ion in aqueous saline solution (+9.:

FNH3 = fraction of UIA $(+1 / (1 + 10^{(R11 + 0.0324 \times (298 - P11)) + ((0.0415 \times 1) / P1$

Tot NH3 = total ammonia, or QLimit if ND

pressure in FNH3 assumed to be 1 atm

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	NA
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	NA
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA
20. Were corrective action forms provided for all non-conforming data?	NA
21. Were all the species-specific test conditions in Appendix V met?	Yes, except as noted for temperature and salinity
22. Were the test-specific age requirements met for each test species?	Yes
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	Yes
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	Yes
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	Yes

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species	Yes, except as noted for temperature and salinity	Sections 3.3, 3.4 and 3.5, Tables 6 and 7, and Appendix A	Data Package
Test species age	Age/health within guidelines for each species (Appendix V)	Yes		Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No	Yes		Data Package (separate cover)
Water column toxicity test: Control mortality Control abnormality	$\leq 10\%$ mean $\leq 30\%$ mussel/oyster; $< 40\%$ clam larvae, $< 30\%$ sea urchin larvae	Yes		Data Package
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	$\leq 10\%$ mean (no chamber $> 20\%$) See EPA (1994a) Section 9; Table 11.3	NA		

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

LABORATORY STANDARDS STATEMENT

This study was performed by EnviroSystems, an affiliate of Enthalpy Analytical LLC, at its facility in Hampton, New Hampshire. EnviroSystems' laboratory is accredited by the State of New Hampshire under the National Environmental Laboratory Accreditation (NELAC) program. Additionally, ESI is accredited under the Department of Defense (DoD) ELAP program, ISO/IEC 17025:2005, Certificate Number L2340. All testing conducted by EnviroSystems as part of this program was compliant with NELAC guidelines and standards. Additionally, this study was conducted in accordance with guidelines presented in the 2004 version of the New England District's *Regional Implementation Manual for Evaluation of Dredged Material Proposed for Disposal In New England Waters* (RIM) with relevant updates. Any deviations from specific elements of the RIM are detailed in the Protocol Deviation section of this report.

TOXICOLOGICAL EVALUATION OF A PROPOSED DREDGE SEDIMENT:

New Haven Harbor 2018 Federal Navigation Project
Tier III Sediment Evaluation
New Haven, Connecticut

New England District Corps of Engineers
Contract No. W912WJ-17-D-0003 TO#5
Delivery Order No.: W912WJ18F0109

10 Day Solid Phase Evaluation

1.0 INTRODUCTION

As part of a comprehensive plan to reduce adverse environmental impacts of ocean dumping, Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 specifies that all sediments to be discharged into ocean waters must be evaluated to define their potential impact on existing benthic communities. The United States Environmental Protection Agency (US EPA) has determined that the most effective means to make such an assessment is through the use of bioassay tests, which provide a relatively direct estimate of potential impact.

This project was designed to evaluate the potential toxicity of sediments from the area of dredging proposed for the New Haven Harbor 2018 Federal Navigation Project (FNP) located in New Haven, Connecticut. Placement of dredge materials is proposed at the Central Long Island Sound Disposal Site (CLDS).

Testing involved conduct of acute exposure 10 day solid phase assays using the mysid, *Americamysis bahia*, and the amphipod, *Leptocheirus plumulosus*. Testing followed procedures established by the US EPA and the United States Army Corps of Engineers (US ACE) for testing of dredged material. Procedures are presented in *Evaluation of Dredged Material Proposed for Ocean Disposal* (US EPA, US ACE 1991), *Evaluation of Dredged Material Proposed for Discharge in Waters of the US - Testing Manual* (US EPA, US ACE 1998), and the *Regional Implementation Manual for Evaluation of Dredged Material Proposed for Disposal in New England Waters* (US EPA, CENAE, 2004). All biological testing and chemical analyses completed in support of the 10 day solid phase evaluation were performed at EnviroSystems (ESI), an affiliate of Enthalpy Analytical LLC, Hampton, New Hampshire.

2.0 MATERIALS AND METHODS

2.1 Sample Collection, Preservation and Storage

Sediment cores for toxicological analysis were collected by the US ACE New England District (CENAE) using vibracoring equipment from locations identified in the dredge footprint specified in the project Work Plan (AECOM, 2018). Sediment samples were received from AECOM, Chelmsford, Massachusetts under chain of custody in 3.5 gallon polyethylene buckets and were composited based on the compositing scheme outlined in the Work Plan. Reference sediment samples were collected by the AECOM field team from the CLDS. Upon arrival at the laboratory, all samples received an internal sample control number and were logged into the project sample control system. Prior to testing, samples were placed in a secure refrigerator and stored at a temperature of $4 \pm 2^\circ\text{C}$ until test preparation. Sample identification, collection and receipt information is summarized in Table 1. Sample compositing information is provided in Table 2.

New Haven Harbor 2018 FNP Tier III Sediment Evaluation. 10 day Solid Phase Evaluation.
US ACE New England District. ESI Studies 31244 & 31245. November 2018.

Sediment for the laboratory control treatment was collected from the Hampton Estuary, Hampton, New Hampshire. The area is not known to receive any direct industrial inputs and has been used as laboratory reference sediment in the testing of marine sediments for over 30 years. Overlying seawater is pumped in daily from the Hampton Estuary and stored in holding tanks. Seawater is obtained through a filter system located on the bottom of the estuary at a point approximately 1 mile from the open ocean. Laboratory water is aerated through the collection system and in individual storage containers and test chambers. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. The Hampton Estuary laboratory control was included to verify the health of the test organisms, and as a relative benchmark for reference site toxicity.

2.2 Sediment Preparation

Prior to testing, samples were press sieved through a 2-mm stainless steel screen for both *A. bahia* and *L. plumulosus* to remove large stones, sticks, roots, man-made material and indigenous organisms. Once sieved, individual composites were loaded into clean HDPE vessels to begin the ammonia mitigation phase based on the Ferretti (Ferretti et al, 2000) method. Sediments were loaded to a depth of 7-11mm in the vessels and clean overlying water was added in a 1:3 ratio of sediment to water. A thin piece of plastic was placed over the sediment prior to adding the overlying water in an effort to keep the sediment from becoming suspended during the addition. The thin piece of plastic was slowly removed after the overlying water was added. Each mitigation vessel was aerated and the temperature, pH, specific conductivity, salinity and dissolved oxygen were recorded daily prior to siphoning off the overlying water. A small sub-sample from each composite was removed daily and centrifuged to extract pore water. Temperature, pH and salinity of the extract were recorded and the pore water was subsequently analyzed for total ammonia. These values were used to calculate the pore water unionized ammonia levels daily. If the daily value of any composite was below the target threshold of 0.8 mg/L unionized ammonia (AECOM, 2018), two additional sub-samples were collected and analyzed to confirm the ammonia levels. Once below the unionized ammonia threshold for a 24-hour period, composites were removed from their mitigation vessels and placed in clean HDPE 1-gallon buckets until all samples were ready to be loaded into test chambers for assay initiation. Test chambers were loaded 24-hours prior to assay initiation to allow sediments and overlying water time to settle.

2.3 Bioassay Procedures

2.3.1 *A. bahia* 10 Day Solid Phase Evaluation

The 10 day exposure toxicity test was completed using *A. bahia* obtained from Aquatic Research Organisms (ARO) of Hampton, New Hampshire. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *A. bahia* used in the assay were ≤ 5 days old at the start of the test.

The assay was conducted in a static renewal mode. Test chambers were 1 liter beakers modified for static renewal testing. Each beaker contained approximately 175 mL of sediment and was filled with 725 mL of seawater. A total of 20 organisms were randomly selected from the lot received and added to each replicate by groups of 10. All treatment groups included 5 replicates. Each day during the test, chambers received 1 volume of new seawater having similar salinity and temperature as the overlying water in the vessels. This results in an approximate 50% renewal of overlying water. Water temperature was $20 \pm 1^\circ\text{C}$, and the salinity regimen was established at $30 \pm 2\text{‰}$. The photoperiod was set at 16:8 hours light:dark.

Dissolved oxygen, pH, salinity, specific conductivity and temperature were measured daily in one replicate of each treatment and in all replicates on days 0 and 10 using a YSI multi-parameter probe that captures the data electronically following a pre-determined sample reading order. Data are downloaded using YSI Data Manager software and formatted into tables; there are no raw data sheets. Ammonia levels were measured in the overlying water of a representative test chamber on days 0, 3 and 10. All test

chambers were aerated throughout the assay and dissolved oxygen levels were maintained at ≥ 6.0 mg/L per ESI's protocol ($\geq 40\%$ saturation following RIM protocol). Water quality measurements were completed prior to water renewals. Test chambers were observed daily to ensure proper aeration and to note any test or treatment abnormalities. Any such observations were recorded on data sheets. Mysids were fed ≤ 24 hour old *Artemia* nauplii twice daily. After 10 days of exposure, the organisms were recovered for survival counts.

2.3.2 *L. plumulosus* 10 Day Solid Phase Evaluation

L. plumulosus were obtained from cultures maintained by ARO. Prior to use, test organisms were held for a minimum of 2 hours under temperature, salinity, and photoperiod conditions similar to those used in the assay. *L. plumulosus* were 2-4 mm in size and of mixed sex.

The assay was conducted in a static renewal mode. Test chambers were 1 liter beakers modified for static renewal testing. Each beaker contained approximately 175 mL of sediment and was filled with 725 mL of seawater. A total of 20 organisms were randomly selected from the lot received and added to each replicate by groups of 10. Each treatment group included 5 replicates and a surrogate test chamber that was used to obtain water qualities during the assay without disturbing the test animals. The surrogate chamber was treated the same as actual test chambers with the addition of animals, but was not used to determine endpoint data. Each day during the test, chambers received 1 volume of new seawater having similar salinity and temperature as the overlying water in the vessels. This results in an approximate 50% renewal of overlying water. Water temperature was 20 ± 1 °C, and the salinity regimen was established at 20 ± 2 ‰. The photoperiod was set at 16:8 hours light:dark.

Dissolved oxygen, pH, salinity, specific conductivity and temperature were measured daily in the surrogate replicate of each treatment and in all replicates on days 0 and 10 using a YSI multi-parameter probe that captures the data electronically following a pre-determined sample reading order. Data are downloaded using YSI Data Manager software and formatted into tables; there are no raw data sheets. Ammonia levels were measured in the overlying and pore water of the surrogate test chamber on days 0, 3 and 10. All test chambers were aerated throughout the assay and dissolved oxygen levels were maintained at ≥ 6.0 mg/L per ESI's protocol ($\geq 40\%$ saturation following RIM protocol). Water quality measurements were completed prior to water renewals. Test chambers were observed daily to ensure proper aeration and to note any test or treatment abnormalities. Any such observations were recorded on data sheets. After 10 days of exposure, the organisms were recovered for survival counts.

2.4 Statistical Analysis

Survival data were analyzed using CETIS™ (Comprehensive Environmental Toxicity Information System) v1.9.3.0 software to determine significant differences between the project sediments and the CLDS reference site. Survival data were evaluated to determine homogeneity of sample variances and normality of distribution using appropriate statistics. Data sets were subsequently evaluated using the appropriate parametric or non-parametric Analysis of Variance (ANOVA) statistic. Pair-wise comparisons were made using one-way unpaired t-tests (equal or unequal variance t two-sample tests) or other appropriate statistical test as needed. Statistical difference was evaluated at $\alpha = 0.05$.

2.5 Quality Control

As part of the laboratory quality control program, standard reference toxicant assays are conducted on a regular basis for each test species. These results provide relative health and response data while allowing for comparison with historic data sets. Summaries of acute exposure reference toxicant assays conducted in support of this study are provided in Table 3.

3.0 RESULTS AND DISCUSSION

Table 4 provides a summary of assay acceptability and laboratory control performance. Tables 5 and 6 summarize the results of the statistical analysis for *A. bahia* and *L. plumulosus*, respectively. Tables 7 through 9 summarize water quality data collected during the *A. bahia* and *L. plumulosus* assays. Laboratory bench sheets, water quality data, and associated statistical support data are included in Appendix A.

3.1 *A. bahia* 10 Day Solid Phase Evaluation

Mean mysid survival in the laboratory control sediment was 98% with a coefficient of variation (CV) of 5%. Assay protocol requires that mean control survival be $\geq 90\%$. Based on this, the mysids were considered healthy and the overlying water was determined to have had no adverse impact on the outcome of the assay. Mean mysid survival in the CLDS reference sediment was 63% with an associated CV of 65%. See Section 3.3 for a discussion of this out of control event for the CLDS reference sediment.

Mean mysid survival in the site composites ranged from 91% (Composites 3 and 4) to 96% (Composite 6). The statistical analyses show that there were no negative effects on mysid survival following exposure to any of the site composite samples as compared the CLDS reference sediment.

Temperature data collected during the daily water quality observations documented a mean value of 20.9°C with a range of 19.7 to 21.7°C. Confirmation temperature data collected on an hourly basis from a data logger documented a mean value of 21.0°C with a range of 19.8 to 21.8°C. Salinity levels ranged from 24.6 to 32.9‰ with a mean value of 28.3‰. Test acceptability criteria requires a mean temperature of $20 \pm 1^\circ\text{C}$ with maximum temporary fluctuations of $20 \pm 3^\circ\text{C}$, and salinity within a range of $30 \pm 2\text{‰}$. Please see section 3.3 for a discussion of the salinity deviations.

3.2 *L. plumulosus* 10 Day Solid Phase Evaluation

Mean amphipod survival in the laboratory control sediment was 98% with a CV of 3%. Assay protocol requires that mean control survival be $\geq 90\%$. Based on this, the amphipods were considered healthy and the overlying water was determined to have had no adverse impact on the outcome of the assay. Mean amphipod survival in the CLDS reference sediments was 79% with an associated CV of 46%. See Section 3.3 for a discussion of this out of control event for the CLDS reference sediment.

Mean amphipod survival in the site composites ranged from 92% (Composite 4) to 99% (Composite 5). The statistical analyses show that there were no negative effects on amphipod survival following exposure to any of the site composite samples as compared the CLDS reference sediment.

Temperature data collected during the daily water quality observations documented a mean value of 20.9°C with a range of 20.0 to 21.7°C. Confirmation temperature data collected on an hourly basis from a data logger documented a mean value of 21.0°C with a range of 19.8 to 21.8°C. Salinity levels ranged from 17.2 to 23.6‰ with a mean value of 19.3‰. Test acceptability criteria requires a mean temperature of $20 \pm 1^\circ\text{C}$ with maximum temporary fluctuations of $20 \pm 3^\circ\text{C}$, and salinity within a range of $20 \pm 2\text{‰}$. Please see section 3.3 for a discussion of the salinity deviations.

3.3 Out of Control Event and Protocol Deviations

Review of data collected as part of the biological evaluation documented the following out of control event and deviations from the protocol and/or ESI's Standard Operating Procedures:

The CLDS reference sediment performed poorly in both the mysid and amphipod assays, achieving only 63% and 79% survival, respectively. The laboratory control and site composites achieved $\geq 90\%$

survival for both species, indicating that organisms were healthy. None of the site composites were determined to be significantly impacted as compared with the reference sediment, given this performance. Test parameters were largely within their targeted ranges, except as noted, and there were no indications that there were any issues with assay conduct. The calculated unionized ammonia levels for the CLDS reference were well below the threshold of 0.8 mg/L in both the pre-assay pore water sample and during assay conduct. There were some juvenile polychaetes found in replicates D and E of the CLDS reference sediment upon recovery of the amphipod assay. It cannot be determined if their presence adversely impacted amphipod survival in those replicates, however it is plausible that they were a stressor. All test sediments are sieved prior to use and any native organisms present in the reference sediment would have been small enough to pass through this process. Predation within these replicates is possible but the size of the polychaetes makes it unlikely. Furthermore, none of these polychaetes were recovered from the mysid reference sediment. Although there are no criteria that the reference sediment must meet, this is considered an out of control event and remains an uncertainty.

Protocol requires that the *A. bahia* and *L. plumulosus* assays be conducted at $30\pm 2\%$ and $20\pm 2\%$, respectively, and salinity values recorded on day 9 of the *A. bahia* assay and day 10 of both assays fell below their acceptable ranges to as low as 24.6‰ (*A. bahia*) and 17.2‰ (*L. plumulosus*). The analyst indicated they were experiencing low readings with one of the salinity probes and it was subsequently recalibrated. Following recalibration, measurements were generally within range however the out of range readings for this project were not able to be recaptured and may be suspect. There were also sporadic readings on days 3 (*L. plumulosus*) and 7 (both species) that exceeded the target range, however these are isolated instances and not believed to be related to any systemic causes. Mean salinity for the assays (28.3‰ for *A. bahia* and 19.3‰ for *L. plumulosus*) were within their target ranges and control survival met acceptance criteria demonstrating that the test organisms are tolerant of salinities within the ranges measured. It is the opinion of ESI's technical manager that these deviations had no adverse impact on the outcome of either assay.

The dissolved oxygen in the *L. plumulosus* assay dropped to a low of 4.9 mg/L, which is below the threshold outlined in ESI's standard operating procedures, however the minimum percent dissolved oxygen (62%) remained above the RIM's threshold of $\geq 40\%$. This was an isolated excursion that occurred in the surrogate vessel of the laboratory control on day 1, which may have resulted if an airline fell out of the test vessel and was replaced on discovery. It is the opinion of ESI's technical manager that this deviation did not adversely affect the outcome of the assay.

Due to technician oversight, no water daily water quality measurements were collected for replicates A through E for the laboratory control or the CLDS reference on day 10 of the *L. plumulosus* assay, however there were measurements collected from the surrogate vessels. While these represent data gaps, it is the opinion of ESI's technical manager that these deviations had no adverse affect on the outcome of the assay.

4.0 SUMMARY

This program utilized protocols developed by the US EPA and the CENAE to assess the potential impact the proposed dredge material collected for the New Haven Harbor 2018 FNP would have on the marine environment. Review of the data presented in Tables 5 and 6 documents that there were no significant impacts on survival for either organism tested as compared with the CLDS reference sediment. Although survival in the CLDS reference for both organisms was low, all of the site composites achieved $\geq 90\%$ survival for both species.

Note:

^a This sample was not included in the 10 day solid phase evaluation.

Table 3. Summary of Reference Toxicant Data Summary. 10 Day Solid Phase Evaluation. New Haven Harbor FNP. New Haven, Connecticut. November 2018.

Date	Organism Lot	Endpoint	Value	Historic Mean/ Central Tendency	Acceptable Range	Reference Toxicant
<i>Americamysis bahia</i>						
11/09/18	03AbARO110818	96Hr LC-50	90.8 ^a	62.2	34.6 - 89.8	NH4Cl (mg/L)
<i>Leptocheirus plumulosus</i>						
11/09/18	19LpARO110818	96Hr LC-50	225.0	183.1 ^b	84.6 - 281.6 ^b	Ammonia (mg/L)

Notes:

Means and Acceptable Ranges based on the most recent 20 reference toxicant assays unless otherwise noted.

^a Normal Acceptance Limits set at ± 2 Std Dev of historic mean; maximum limits are ± 3 Std of historic mean. The ± 3 limit is acceptable, but considered high.

^b Means and acceptable ranges are based on the results of 9 assays.

Table 4. Summary of Laboratory Control Performance. 10 Day Solid Phase Evaluation. New Haven Harbor FNP. New Haven, Connecticut. November 2018.

Endpoint / Measurement	Protocol Criteria	Unit	<i>A. bahia</i>	<i>L. plumulosus</i>
Mean Survival	Laboratory Control $\geq 90\%$	%	98%	98%
		Protocol Met	Yes	Yes
Salinity	Minimum	<i>A. bahia</i> - 28ppt	24.6	17.2
		<i>L. plumulosus</i> - 18ppt	No ^a	No ^a
	Maximum	<i>A. bahia</i> - 32ppt	32.9	23.6
		<i>L. plumulosus</i> - 22ppt	No ^a	No ^a
Temperature	Mean: $20 \pm 1^\circ\text{C}$	Daily / Hourly $^\circ\text{C}$	20.9 / 21.0	20.9 / 21.0
	Minimum: 17°C	Daily / Hourly $^\circ\text{C}$	19.7 / 19.8	20.0 / 19.8
	Maximum: 23°C	Daily / Hourly $^\circ\text{C}$	21.7 / 21.8	21.7 / 21.8
		Protocol Met	Yes / Yes	Yes / Yes
Dissolved Oxygen	≥ 6.0 mg/L (ESI)	Minimum mg/L	6.2	4.9
		Protocol Met	Yes	No ^a
	$\geq 40\%$ Saturation (RIM)	Minimum %	85%	62%
		Protocol Met	Yes	Yes

Notes:

^a Refer to Section 3.3 for a discussion of the deviation.

^b Values meets the criterion when rounded to the whole number precision reflected in the protocol.

Table 5. Summary of Survival Data: *A. bahia*. 10 Day Solid Phase Evaluation. New Haven Harbor FNP. New Haven, Connecticut. November 2018.

Day 10 Proportion Survived Summary

Sample ID	ESI Code	Reps	Mean	Minimum	Maximum	CV
Laboratory Control	31245-000	5	98%	90%	100%	5%
CLDS Reference Site	31242-008	5	63%	10%	100%	65%
Composite 2	31243-101	5	92%	85%	95%	5%
Composite 3	31243-102	5	91%	85%	100%	7%
Composite 4	31243-103	5	91%	85%	95%	5%
Composite 5	31243-104	5	95%	90%	100%	5%
Composite 6	31243-105	5	96%	90%	100%	6%

Day 10 Survival Statistical Analysis

Sample ID	ESI Code	Mean	Significantly "<" as Compared to: CLDS (31242-008)	Difference in Survival >20% as Compared to: CLDS (31242-008)
CLDS Reference Site	31242-008	63%	-	-
Composite 2	31243-101	92%	No	No ^a -29%
Composite 3	31243-102	91%	No	No ^a -28%
Composite 4	31243-103	91%	No	No ^a -28%
Composite 5	31243-104	95%	No	No ^a -32%
Composite 6	31243-105	96%	No	No ^a -33%

Note:

^a The difference in survival is >20%, however survival is improved in the site composite samples as compared with the CLDS reference sediment.

Table 6. Summary of Survival Data: *L. plumulosus*. 10 Day Solid Phase Evaluation. New Haven Harbor FNP. New Haven, Connecticut. November 2018.

Day 10 Proportion Survived Summary

Sample ID	ESI Code	Reps	Mean	Minimum	Maximum	CV
Laboratory Control	31244-000	5	98%	95%	100%	3%
CLDS Reference Site	31242-008	5	79%	15%	100%	46%
Composite 2	31243-101	5	94%	90%	100%	6%
Composite 3	31243-102	5	96%	90%	100%	4%
Composite 4	31243-103	5	92%	85%	95%	5%
Composite 5	31243-104	5	99%	95%	100%	2%
Composite 6	31243-105	5	94%	90%	100%	4%

Day 10 Survival Statistical Analysis

Sample ID	ESI Code	Mean	Significantly "<" as Compared to: CLDS (31242-008)	Difference in Survival >20% as Compared to: CLDS (31242-008)
CLDS Reference Site	31242-008	79%	-	-
Composite 2	31243-101	94%	No/No	No -15%
Composite 3	31243-102	96%	No/No	No -17%
Composite 4	31243-103	92%	No/No	No -13%
Composite 5	31243-104	99%	No/No	No ^a -20%
Composite 6	31243-105	94%	No/No	No -15%

Note:

No/No indicates that there was no difference in outcome when an outlier was excluded from the statistical analysis (refer to Appendix A).

^a The difference in survival is equal to 20% in Composite 5, however survival is improved in all the site composite samples as compared with the CLDS reference sediment.

10 DAY SEDIMENT ASSAY

Study #:	31245	Water Bath ID	6
Project:	New Haven Harbor	Client:	AECOM

Summary of Test Conditions

Exposure	Species Used
<p>Test Mode: In-Life: Static renewal 1 volume replacement daily</p> <p>Length of Assay: 10 days</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>)</p> <p><input type="checkbox"/> Marine Amphipod (<i>Leptocheirus plumulosus</i>)</p>

Water Quality Parameters

<p>Salinity: <i>A. bahia</i>: 30 ± 2 ppt <i>L. plumulosus</i>: 20 ± 2 ppt</p> <p>pH: 7.8 ± 0.5</p>	<p>Photoperiod: 16 hour light, 8 hour dark</p> <p>Temperature: 20 ± 1 °C</p>
--	--

Test Chamber	Solution & Sediment Volume
<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> 1000 mL beaker</p> <p><input type="checkbox"/> other _____</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> 2 cm (~175mL) homogenized sediment</p> <p><input type="checkbox"/> ~800 mL overlying water</p> <p><input checked="" type="checkbox"/> other <u>725mL OW</u></p>

Replicate Information

- A. bahia* and *L. plumulosus*:
- 5 Reps per treatment for survival endpoint
 - 20 organisms per chamber
 - 1 surrogate replicate for water quality (*Lp* only)
 - Continuous aeration from start

Cleaning	Treatments
<p>Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed then rinsed with deionized water (EPA 2002).</p>	<p>Laboratory Control, Reference Site, and Site Sediments</p>

Feeding

<p style="text-align: center;"><i>A. bahia</i>:</p> <p>Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i></p>	<p style="text-align: center;"><i>L. plumulosus</i>:</p> <p style="text-align: center;">NONE</p>

* On Day 0 and Day 10 water quality parameters were performed on all beakers.

¹ Mysid were fed < 24 hour old brine shrimp twice daily.

² Organisms were monitored daily. Due to the study design and the nature of each sample matrix it maybe difficult to achieve accurate counts until termination. If organisms appear to be active in the water column they are likely in good health (N=normal) unless otherwise noted.

 PROJECT: New Haven Harbor FNP - 2018
 ASSAY: *Americamysis bahia* 10 Day Solid Phase Evaluation

TASK: Overlying Water Ammonia Summary
 METHOD: SM 4500-NH3 G

Attachment 2 - Formulas Used to Derive Un-Ionized Ammonia (UIA) Fractions and USEPA Am
 Consistent with USEPA AWQC (1989) and Whitfield (1974). Differs from Colt (2004) and FLDEP (20
 Where: I = Ionic Strength $(19.9273 \cdot N_{11}) / (1000 - 1.005109 \cdot N_{11})$
 pK_a = ionization constant of ammonium ion in aqueous saline solution $(+9.245 + 0.116 \cdot Q$
 F_{NH_3} = fraction of UIA $(+1 / (1 + 10^{(R_{11} + 0.0324 \cdot (298 - P_{11}) + (0.0415 \cdot I) / (P_{11} - M_{11}))))$
 Tot NH3 = total ammonia, or QLimit if ND
 pressure in F_{NH_3} assumed to be 1 atm

10 DAY SEDIMENT ASSAY

Study #:	31244	Water Bath ID	6
Project:	New Haven Harbor	Client:	AECOM

Summary of Test Conditions

Exposure	Species Used
Test Mode: In-Life: Static renewal 1 volume replacement daily Length of Assay: 10 days	(Check box for all that apply) <input type="checkbox"/> Mysid Shrimp (<i>Americamysis bahia</i>) <input checked="" type="checkbox"/> Marine Amphipod (<i>Leptocheirus plumulosus</i>)

Water Quality Parameters

Salinity: <i>A. bahia</i> : 30 ± 2 ppt <i>L. plumulosus</i> : 20 ± 2 ppt pH: 7.8 ± 0.5	Photoperiod: 16 hour light, 8 hour dark Temperature: 20 ± 1 °C
---	--

Test Chamber	Solution & Sediment Volume
(Check box for all that apply) <input checked="" type="checkbox"/> 1000 mL beaker <input type="checkbox"/> other _____	(Check box for all that apply) <input checked="" type="checkbox"/> 2 cm (~175mL) homogenized sediment <input type="checkbox"/> ~800 mL overlying water <input checked="" type="checkbox"/> other <u>725 mL OW</u>

Replicate Information

A. bahia and *L. plumulosus*:

- 5 Reps per treatment for survival endpoint
- 1 surrogate replicate for water quality (*Lp* only)
- 20 organisms per chamber
- Continuous aeration from start

Cleaning	Treatments
Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed then rinsed with deionized water (EPA 2002).	Laboratory Control, Reference Site, and Site Sediments

Feeding

<i>A. bahia</i>: Daily feedings (2x) of newly hatched, <24 hour old <i>Artemia nauplii</i>	<i>L. plumulosus</i>: NONE
--	--

Date: 11/09/18

Aquatic Research Organisms

DATA SHEET

I. Organism History

Species Leptocleirus plumulosus

Source: Lab reared Hatchery reared _____ Field collected _____

Hatch date 10/20/18 Receipt date _____

Lot number 11 08 18 LP Strain A, 20

Brood origination Chesapeake Bay, VA

II. Water Quality

Temperature 24 °C Salinity ~20 ppt D.O. SAT ppm

pH ~8.0 su Hardness — ppm Alkalinity — ppm

III. Culture Conditions

Freshwater _____ Saltwater Other _____

Recirculating _____ Flow through _____ Static renewal

DIET: Flake food Phytoplankton _____ Trout chow

Artemia _____ Rotifers _____ YCT _____ Other "GORG"

Prophylactic treatments: _____

Comments: 2-4 mm long

IV. Shipping Information

Client: ESI # of Organisms 11000

Carrier: Pick-up Date shipped 11/8/18

Biologist: [Signature]

PO BOX 1271 HAMPTON NH 03843-1271 (603) 926-1650 AROFISH@AOL.COM

DAY10 Sediment Assay Data Summary

STUDY #: 31244 WATER BATH ID: 6
 CLIENT: AECOM PROJECT: New Haven Harbor

INITIATION RECORD			
Species:	Leptocheirus plumulosus	Counted by:	JTP
Organism Lot ID:	19LPAR0110818	Added by:	JTP
Number of Organisms added to each vessel:	20	Temp Data Logger No:	010015860

DAILY LOG

10*	11/19/18 MS	✓	N	MS

*On Day 0 and Day 10 water quality parameters were performed on all beakers.

²Organisms were monitored daily. Due to the study design and the nature of each sample matrix it may be difficult to achieve accurate counts until termination. Healthy vessels (N=normal) are characterized by an abundance of burrow-openings on the sediment surface and turbid water from amphipod activity, unless otherwise noted.

Leptocheirus 10-d Survival and Reburial Sediment Test **EnviroSystems, Inc.**

Batch ID: 11-4202-1754	Test Type: Survival-Reburial	Analyst: Nancy Roka
Start Date: 09 Nov-18 12:00	Protocol: EPA/600/R-94/025 (1994)	Diluent: Not Applicable
Ending Date: 19 Nov-18 12:00	Species: Leptocheirus plumulosus	Brine: Not Applicable
Duration: 10d 0h	Source: ARO - Aquatic Research Organisms, NH	Age:

Table II-1: Completeness Checklist

Quality Assurance/Quality Control Questions	Yes/No? Comments?
1. Was the report signed by the responsible applicant approved representative?	Yes
2. Were the methods for sampling, chemical and biological testing described in the Sampling and Analysis Plan (SAP) and the Laboratory QA Plan (LQAP) followed?	Yes
3. If not, were deviations documented?	NA
4. Was the SAP approved by the New England District?	Yes
5. Did the applicant use a laboratory with a LQAP on file at the New England District?	Yes
6. Did the samples adequately represent the physical/chemical variability in the dredging area?	Yes
7. Were the correct stations sampled (include the precision of the navigation method used)?	Yes
8. Were the preservation and storage requirements in Chapter 8 of the EPA/Corps QA/QC Manual (EPA/USACE 1995) and EPA (2001d) followed?	Yes
9. Were the samples properly labeled?	Yes
10. Were all the requested data included?	Yes
11. Were the reporting limits met?	Yes
12. Were the chain-of-custody forms properly processed?	Yes
13. Were the method blanks run and were the concentration below the acceptance criteria?	NA
14. Was the MDL study performed on each matrix (with this data submission) or within the last 12 months?	NA
15. Were the SRM/CRM analyses within acceptance criteria?	NA
16. Were the matrix spike/matrix spike duplicates run at the required frequency and was the percent recovery/RPD within the acceptance criteria?	NA
17. Were the duplicate samples analyzed and were the RPDs within the required acceptance criteria?	NA
18. For each analytical fraction of organic compounds, were recoveries for the internal standard within the acceptance criteria?	NA
19. Were surrogate recoveries within the required acceptance criteria?	NA
20. Were corrective action forms provided for all non-conforming data?	NA
21. Were all the species-specific test conditions in Appendix V met?	Yes, except as noted for salinity and dissolved oxygen
22. Were the test-specific age requirements met for each test species?	Yes
23. Was the bulk physical/chemical testing performed on the sediments/composites that were biologically tested?	Yes
24. Were the mortality acceptance criteria met for the water column and sediment toxicity tests?	Yes
25. Were the test performance requirements in Table 11.3 of EPA (1994a) met?	Yes

Table II-8: Quality Control Summary for Biological Toxicity Testing only

Method Reference Numbers:

Quality Control (QC) Element	Acceptance Criteria*	Criteria Met? Yes/No	List results outside criteria (Cross-reference results table in data report)	Location of Results (Retained at Lab or in Data Package)
Test condition requirements for each species: Temperature, Salinity, pH, D.O., Ammonia (Total, Un-ionized)	Test conditions within the requirements specified for each species	Yes, except as noted for salinity and dissolved oxygen	Salinity outside limits, dissolved oxygen below ESI's SOP limit but with RIM target limit (Section 3.3, Table 4, Appendix A)	Data Package
Test species age	Age/health within guidelines for each species (Appendix V)	Yes		Data Package
Bulk physical/chemical analyses (If required by the Sampling plan)	Required? If so, performed? Yes or No	Yes		Data Package (separate cover)
Water column toxicity test: Control mortality Control abnormality	≤ 10% mean ≤ 30% mussel/oyster; < 40% clam larvae, < 30% sea urchin larvae	NA		
Sediment toxicity test: Control mortality Compliance with applicable test acceptability requirements in Table 11.3 (EPA 1994a)	≤ 10% mean (no chamber > 20%) See EPA (1994a) Section 9; Table 11.3	Yes		Data Package

* The Quality Control Acceptance Criteria are general guidelines. If alternate criteria are used, they must be documented in this table.

LABORATORY STANDARDS STATEMENT

This study was performed by EnviroSystems, an affiliate of Enthalpy Analytical LLC, at its facility in Hampton, New Hampshire. EnviroSystems' laboratory is accredited by the State of New Hampshire under the National Environmental Laboratory Accreditation (NELAC) program. Additionally, ESI is accredited under the Department of Defense (DoD) ELAP program, ISO/IEC 17025:2005, Certificate Number L2340. ESI also has an approved Laboratory Quality Assurance Plan (LQAP) covering all portions of this project. All testing conducted by EnviroSystems as part of this program was compliant with NELAC guidelines and standards. Additionally, this study was conducted in accordance with guidelines presented in the 2004 version of the New England District's Regional Implementation Manual (RIM) for Evaluation of Dredged Material Proposed for Disposal In New England Waters with additional direction provided by the CENAE in an email dated March 30, 2018. Any deviations from specific elements of the RIM are detailed in the Protocol Deviation section of this report.

TOXICOLOGICAL EVALUATION OF A PROPOSED DREDGE SEDIMENT:

New Haven Harbor 2018 Federal Navigation Project
Tier III Sediment Evaluation
New Haven, Connecticut

New England District Corps of Engineers
Contract No. W912WJ-17-D-0003 TO#5
Delivery Order No.: W912WJ18F0109

28 Day Bioaccumulation Evaluation

1.0 INTRODUCTION

As part of a comprehensive plan to reduce adverse environmental impacts of ocean dumping, Section 103 of the Marine Protection, Research and Sanctuaries Act of 1972 specifies that all sediments to be discharged into ocean waters must be evaluated to define their potential impact on existing benthic communities. The United States Environmental Protection Agency (US EPA) has determined that the most effective means to make such an assessment is through the use of bioassay tests that provide a relatively direct estimate of potential impact.

This project was designed to evaluate the potential toxicity of sediments from the area of dredging proposed for the New Haven Harbor 2018 Federal Navigation Project (FNP) located in New Haven, Connecticut. Placement of dredge materials is proposed at the Central Long Island Sound Disposal Site (CLDS).

Testing involved conduct of 28-day bioaccumulation evaluations using *Macoma nasuta* (bivalve clam) and *Nereis virens* (polychaete worm). Testing followed procedures established by the US EPA, US Army Corps of Engineers and the New England District Army Corps of Engineers (CENAE) for testing of dredged material. Procedures are presented in *Evaluation of Dredged Material Proposed for Ocean Disposal* (US EPA, US ACE 1991), *Evaluation of Dredged Material Proposed for Discharge in Waters of the U.S. - Testing Manual* (US EPA, US ACE 1998) and the *Regional Implementation Manual [RIM] for Evaluation of Dredged Material Proposed for Disposal in New England Waters* (US EPA, CENAE, 2004), with additional direction provided by the CENAE in an email dated March 30, 2018 (Appendix A). All biological testing completed in support of the 28 day bioaccumulation evaluation were performed at EnviroSystems (ESI), an affiliate of Enthalpy Analytical LLC, Hampton, New Hampshire. All chemical analyses of surviving tissues were analyzed by Alpha Analytical Laboratory. Subsequent statistical analyses of the body burden data were completed by ESI.

2.0 METHODS AND MATERIALS

2.1 Sample Collection, Preservation and Storage

Sediment cores for toxicological analysis were collected by the US ACE New England District (CENAE) using vibracoring equipment from locations identified in the dredge footprint specified in the project Work Plan (AECOM, 2018). Sediment samples were received from AECOM, Chelmsford, Massachusetts under chain of custody in 3.5 gallon polyethylene buckets, and were composited based on the compositing scheme outlined in the Work Plan. Reference sediment samples were collected by the AECOM field team from the CLDS. Upon arrival at the laboratory, all samples received an internal sample control number and were logged into the project sample control system. Prior to testing, samples were placed in a secure refrigerator and stored at a temperature of $4 \pm 2^\circ\text{C}$ until test initiation. Sample identification, collection and receipt information is summarized in Table 1. Sample compositing information is provided in Table 2.

Sediment for the laboratory control treatment was collected from the Hampton-Seabrook Estuary, Hampton, New Hampshire. The area is not known to receive any direct industrial inputs and has been used as laboratory reference sediment in the testing of marine sediments for over 30 years. Overlying seawater is pumped in daily from the estuary and stored in holding tanks. Seawater is obtained through a filter system located on the bottom of the estuary at a point approximately 1 mile from the open ocean. Laboratory water is aerated through the collection system and in individual storage containers and test chambers. Water from the estuary has been used for the culture and maintenance of test organisms at ESI since 1978. The laboratory control was included to verify the health of the test organisms, and as a relative benchmark for reference site toxicity.

2.2 Test Organisms

M. nasuta were obtained from Aquatic Research Organisms (ARO), Hampton, New Hampshire. Organisms were field collected along the Washington coast and shipped to ARO via overnight delivery. At ESI, the clams were placed in clean holding sediment with flowing seawater and monitored for at least 24 hours prior to use. Damaged bivalves and those that would not close when prodded or did not burrow into sediment were not used for testing. Clams used for the assay were approximately 28-45 mm total length.

Adult *N. virens* were also obtained from ARO. Worms were collected in the field from the Damariscotta River in Boothbay Harbor, Maine and delivered to ARO. If not used the same day, worms were refrigerated overnight in seaweed. Damaged and inactive worms were not used in the assay.

2.3 Bioaccumulation Evaluation

The assays were started by placing approximately 6 L of sediment (control, reference or site sediment) into 10 gallon aquaria designed for flow-through testing. Overlying water was then added to each aquarium. The volume of the overlying water in these chambers was 20-30 L. Water flow was adjusted to provide approximately 6 volume additions of water/day to each aquarium. Flow into each aquarium was set so that incoming water mixed throughout the tank and did not stratify as a surface layer.

M. nasuta and *N. virens* were indiscriminately selected from the pool of organisms and randomly added to the aquaria. A total of 20 worms and 20 clams were added by groups of 10 to each of 5 replicates; species were tested in separate test chambers. Animals that did not burrow within the first 24 hours were removed and replaced with new test organisms. Temperature was maintained at 12-16°C with no readings exceeding $\pm 3^\circ\text{C}$. Salinity was maintained at $30 \pm 2\text{‰}$. The photoperiod was set at 16:8 hours light:dark. Dissolved oxygen levels were maintained at a minimum level of $\geq 60\%$ saturation by providing aeration to all tanks from the start of the assay. Organisms were not fed during the exposure period.

Dissolved oxygen, pH, temperature, specific conductance and salinity were measured daily in all aquaria using a YSI[®] multi-parameter probe that captures the data electronically following a pre-determined sample reading order. Data were downloaded using YSI Data Manager[®] software and formatted into tables.

After 28 days exposure, *M. nasuta* and *N. virens* were recovered from the test sediments and counted. Survival counts were used for statistical analysis. All living organisms were transferred to clean test vessels and maintained in clean seawater for 24 hours to allow for removal of sediment from the animals' digestive tracts. After the depuration period, organisms were transferred to 4 ounce glass jars and frozen. Tissues were subsequently processed (ground up and homogenized) and frozen for delivery to Alpha Analytical for chemical analysis of total metals, PAH, PCB congeners, pesticides and lipids analysis. Tissue chains of custody are provided in Appendix A.

2.4 Tissue Analysis

Methods used by Alpha Analytical in the analyses of tissues generated from the bioaccumulation tests followed protocols recommended in Table 8 of the New England District RIM document with

appropriate updates related to current methods. Tissues were prepared using USEPA Method 3051A for inorganics and USEPA 3570 for organics. Trace metals were evaluated using EPA Method 6020B, Inductively Coupled Plasma - Mass Spectrometry (ICP-MS), and mercury was evaluated using EPA Method 7474, Atomic Fluorescence Spectrometry. PAH compounds and PCB congeners were analyzed by EPA Method SW 846 8082/EPA 680 (modified), and pesticides were analyzed by SW 846 8081B. Reporting Limits and/or Method Detection Limits met RIM requirements with the exception of PCB congeners. The complete tissue chemistry and quality assurance analytical report is provided under separate cover by Alpha Analytical. Summaries of the tissue chemistry results used for the statistical analysis of body burden data are provided in Appendix A.

2.5 Data Analysis

The statistical analyses of survival and body burden data were completed at ESI using CETIS™ ver. 1.9.3.0 (Comprehensive Environmental Toxicity Information System) software to determine significant differences between the reference tissue and the site composite tissues. Data were evaluated to determine homogeneity of sample variances and normality of distribution using appropriate statistics. Data sets were subsequently evaluated using the appropriate parametric or non-parametric Analysis of Variance (ANOVA) statistic. Statistical difference was evaluated at $\alpha = 0.05$. Per RIM guidelines and direction provided by the CENAE in an email dated March 30, 2018 (Appendix A), one-half the MDL is used in instances when a compound of concern (COC) is not detected for purposes of calculating a mean tissue concentration and total concentrations for PAHs, PCBs, and pesticides. MDLs used in statistical computations may differ due to differences in tissue mass and final extract volumes used in the analysis for each sample.

All mean body burden concentrations presented in the narrative report tables, CETIS™ reports and the CENAE EDD spreadsheet for each composite are calculated from the same source of tissue chemistry data generated by Alpha Analytical and provided by AECOM on January 30, 2019. Reported concentrations are presented to a precision of 2 significant figures (3 significant figures for metals ≥ 10.0 $\mu\text{g/g}$). Slight differences in the mean concentrations are attributable to the ability and limitations of each software package to capture significant figures. The values agree within reason by rounding and represent the magnitude of the average concentration of the COC detected in tissue.

Following CENAE protocol, the statistical analyses were completed for all COCs identified in the Sampling and Analysis Plan and are included in Appendix A, however the findings of significance presented in the report focus only on those COCs detected in the reference sample.

2.6 Reference Toxicant Evaluation

As part of the laboratory quality control program, standard reference toxicant assays are conducted on a regular basis for each test species. These results provide relative health and response data while allowing for comparison with historic data sets. Summaries of acute exposure reference toxicant assays conducted in support of this study are provided in Table 3.

3.0 RESULTS

Table 4 provides a summary of laboratory control performance and test acceptability criteria. Tables 5 and 6 provide a summary of *M. nasuta* and *N. virens* survival data and statistical analyses, respectively. Tables 7 and 8 provide summaries of body burden data for *M. nasuta* and *N. virens*, respectively. Table 9 provides a supplemental statistical evaluation of PCB congeners in *N. virens* native tissue, and Table 10 summarizes the findings of significant uptake in clam and worm tissue as compared with the CLDS. The number of significant figures for mean concentrations presented in Tables 7 and 8 and those used in the statistical analysis may also vary. Laboratory bench sheets, detailed summaries of survival, body burden data and associated support data are included in Appendix A.

3.1 *Macoma nasuta*

3.1.1 Survival

Mean *M. nasuta* survival in both the laboratory control and CLDS reference samples was 99% with a coefficient of variation (CV) of 2%. Surviving organisms from the control, reference and site composite samples provided sufficient tissue for preparation and analysis of body burdens. The endpoints met and/or exceeded requirements specified in the current version of the RIM.

After 28 days exposure, mean survival of bivalves in the site composite samples ranged from 94% (Composite 5) to 100% (Composite 2). The statistical evaluation of the data showed no significant reductions in survival for bivalves maintained in any of the site composite samples when compared to the CLDS reference sediment.

3.1.2 Water Quality Summary

Daily water quality data collected during the assay documented a mean temperature of 11.6°C with a range of 11.0 to 12.4°C. The target test temperature for the assay was 14±2°C with acceptable limits of 11 to 17°C. Temperature data were also collected on an hourly basis starting on day 9 (11/30/18). The mean hourly temperature value was 12.0°C and ranged from 11.8°C to 12.5°C during the course of the assay. Additional daily water quality data documented salinity levels during the assay varied from 25.7 to 32.0‰ with a mean value of 29.5‰. Dissolved oxygen levels ranged from 58% to 106% with a mean level of 98% while pH ranged from 7.14 to 8.00 SU. Review of the data documented that the salinity fell outside limits specified by ESI's protocol, the New England District's RIM and/or the Inland Testing Manual. See Section 3.3 for a discussion of the deviation and missing hourly temperature data.

3.1.3 Body Burden Analysis

Based on CENAE criteria, there were significant increases in body burdens for clams maintained in the project composite sediments for two metals (cadmium and lead), 6 PAHs and 4,4'-DDE as compared to CLDS reference tissue. Most notably, the PAHs primarily in composites 2, 3, 4 and 6 tissues were detected at concentrations 5 to 16 times higher than in CLDS reference tissue, especially fluoranthene in composites 3, 4 and 6, and chrysene and pyrene in composite 6 tissue, which were also detected at concentrations an order of magnitude or more greater than in reference tissue.

Review of the native clam tissue data indicates that the site composite concentration of cadmium, lead and 4,4'-DDE were only slightly higher than in native tissue, suggesting that a certain percentage of the findings of significance may be attributable to levels occurring in pre-test clam tissue. The same is true for 5 of the 6 PAHs detected in composite 5 tissue. Test organisms were obtained from suppliers routinely used and are indigenous, therefore there is an inherent level of uncertainty and variability in concentrations of COCs present in individual organisms used in respective test treatments.

Review of body burden data also showed that the following COCs were detected in clam tissue following exposure to site composite sediment but were not detected in CLDS reference tissue, therefore these COCs were eliminated from further evaluation: 6 PAHs (acenaphthene, anthracene, benzo(a)pyrene, benzo(k)fluoranthene, benzo(g,h,i)perylene and indeno(1,2,3-cd)pyrene), 10 PCB congeners (8, 18, 28, 44, 52, 66, 101, 118, 138 and 153), and 6 pesticides (4,4'-DDD, 4,4'-DDT, alpha-chlordane, gamma-chlordane, dieldrin and oxychlordane).

3.2 *Nereis virens*

3.2.1 Survival

Mean *N. virens* survival in the laboratory control sediment was 96% with a coefficient of variation (CV) of 4%. Mean survival in the CLDS reference sediment was 98% with a CV of 3%. Surviving

organisms from the control, reference and site composite samples provided sufficient tissue for preparation and analysis of body burdens. The endpoints met and/or exceeded requirements specified in the current version of the RIM.

After 28 days exposure, mean survival of polychaetes in the site composite samples ranged from 93% (Composite 5) to 97% (Composites 3 and 4). The statistical evaluation of the data showed a significant reduction in survival for polychaetes maintained in composite 5 sediment when compared to the CLDS reference sediment, however the difference in survival was <10%.

3.2.2 Water Quality Summary

Daily water quality data collected during the assay documented a mean temperature of 11.4°C with a range of 10.8 to 12.2°C. The target test temperature for the assay was 14±2°C with acceptable limits of 11 to 17°C. Temperature data were also collected on an hourly basis starting on day 10 (11/30/18). The mean hourly temperature value was 12.0°C and ranged from 11.8°C to 12.5°C during the course of the assay. Additional daily water quality data documented salinity levels during the assay varied from 13.3 to 32.1‰ with a mean value of 29.5‰. Dissolved oxygen levels ranged from 41% to 105% with a mean level of 96% while pH ranged from 7.32 to 8.02 SU. Review of the data documented that the temperature and salinity fell outside limits specified by ESI's protocol, the New England District's RIM and/or the Inland Testing Manual. See Section 3.3 for a discussion of the deviation and missing hourly temperature data.

3.2.3 Body Burden Analysis

Based on CENAE criteria, there were significant increases in body burdens for worms maintained in the project composite sediments for only 1 metal (copper) and 5 PCB congeners (138, 153, 170, 180 and 187) as compared to CLDS reference tissue.

Review of the native worm tissue data indicates that the site tissue concentration of PCB congeners 138 and 170 were approximately equal to or less than concentrations found in native tissue, and site tissue concentrations of copper and PCB congeners 153, 180 and 187 were only slightly higher than in native tissue, indicating that the findings of significance may be attributable to levels present in pre-test worm tissue. Test organisms were obtained from suppliers routinely used and are indigenous, therefore there is an inherent level of uncertainty and variability in concentrations of COCs present in individual organisms used in respective test treatments.

Following this finding, a supplemental statistical evaluation of PCBs in native worm tissue was completed to identify where the concentrations in native tissue were either significantly *greater than* CLDS reference or composite tissue, and also where concentrations in native worm tissues were significantly *less than* CLDS reference or composite tissue. The findings of this evaluation are presented in Table 9 and Appendix A. There were no instances where PCB concentrations in CLDS reference tissues were significantly higher than native tissue, and only 2 instances for PCB 52 where the composite tissue was significantly higher than native tissue (composites 2 and 4). In the latter scenario, PCB 52 was not detected in CLDS reference tissue, therefore was not evaluated further. Conversely, certain PCBs (e.g., PCBs 138, 153, 170, 180 and 187) in composites 2, 4 and 5 worm tissue that were significantly higher as compared with CLDS reference sediment were also significantly higher in native tissue as compared with the CLDS reference tissue, which is further evidence of the similarity among composites 2, 4 and 5 tissue and native tissue concentrations of PCBs. It was also noted that the concentrations of these congeners in composite tissue were not significantly greater than in native tissue.

Review of body burden data also showed that the following COCs were detected in worm tissue following exposure to site composite sediment but were not detected in CLDS reference tissue, therefore these COCs were eliminated from further evaluation: mercury, 2 PAHs (fluoranthene and pyrene), 7 PCB congeners (8, 18, 52, 101, 105, 128 and 195), and 14 pesticides (4,4'-DDE, 4,4'-DDT, aldrin, cis-nonachlor, alpha-chlordane, gamma-chlordane, dieldrin endosulfan I, endosulfan II, gamma-BHC, heptachlor, heptachlor epoxide, hexachlorobenzene and oxychlordane).

3.3 Protocol Deviations

Review of the assay data revealed the following deviations from the method and/or ESI's protocol:

Data from daily temperature readings suggests that temperatures were generally on the low end of the acceptable range as the mean temperature of 11.4°C for the *N. virens* assay falls below the targeted limit of 14±2°C and the mean temperature of 11.6°C for the *M. nasuta* assay only meets the criterion by rounding to the precision reflected in the protocol. The mean temperature of 12.0°C calculated from the hourly data logger readings is within the acceptable range. Although slightly low, the daily temperature values are still within the normal temperature range tolerated by these species. It is the opinion of ESI's technical manager that this deviation had no adverse impact on the results of the assays.

Data from the daily salinity readings indicates that the minimum measurements fell outside of the acceptable range for both species. The excursions all occurred on November 28, 2018 (day 7 of the *M. nasuta* assay and day 8 of the *N. virens* assay) and were all within the 25-27‰ range, except for one measurement of 13.3‰ in replicate E of composite 5 for *N. virens* that is likely an erroneous reading resulting from technician error. While the exact reason for the excursions is unclear, it is the opinion of ESI technical manager that these deviations had no adverse impact on the outcome of the assay.

The temperature logger for collecting hourly data was not activated at the start of the assays, but instead was activated on November 30, 2018 (day 9 of the *M. nasuta* assay and day 10 of the *N. virens* assay). As a result, approximately one-quarter of the hourly temperature readings were not recorded. In addition, daily water quality readings are missing for replicate A of composite 6 on day 0 of the *N. virens* assay due to a multi-probe malfunction, however water quality readings were obtained from replicates B, C, D and E for that same composite, and all measurements appear to be within reasonable proximity to each other and to the measurements collected for the other composites that day. While these deviations represent a data gap, it is the opinion of ESI's technical manager that this deviation did not adversely affect the outcome of the assay.

3.4 Summary

This program utilized protocols developed by the US EPA and the CENAE to assess the potential impact that the proposed dredge material collected from New Haven Harbor 2018 FNP would have on the marine environment. Results of the 28 day toxicity evaluation indicate that the composite 5 sediment demonstrated significant negative effects on *N. virens* (worm) survival as compared with the CLDS reference site, however the difference in survival was <10%. There were no significant effects on worm survival for any of the other composites, or for *M. nasuta* when compared against the CLDS reference sediment.

Results of body burden data generated from both *M. nasuta* and *N. virens* tissue showed that exposure to the site composite sediment samples resulted in significant uptake of several COCs when compared to organisms maintained in the CLDS reference sediment. Significant uptake was demonstrated for cadmium, lead, 6 PAHs and 4,4'-DDE by *M. nasuta* and for copper and 5 PCB congeners by *N. virens*. Most notable were PAHs that were detected in clam tissues at levels 5 to 16 times higher than in reference tissue, primarily from composites 2 (R',S'), 3 (US 1-2), 4 (DS 1-2) and 6 (CAD 1-3). The concentrations of the metals, PCBs and 4,4'-DDE in site tissues were only slightly higher than in reference tissue and, in the case of PCBs in composites 2, 4 and 5 worm tissue, were found to be similar to levels in native worm tissue.

Notes:

a = Analyte not detected in at least one replicate; mean value was calculated using one-half of the project specific MDL for non-detected values.

b = Analyte estimated (detected below RL but above MDL) in at least one replicate; mean value calculated using estimated value.

c = Statistical analysis is not required as the analyte was not detected in any of the reference site replicates.

^d Native tissue represents the mean of three replicates, whereas the CLDS and site composites represent a mean of 5 replicates.

Mean composite tissue body burden was significantly greater than the mean CLDS tissue body burden ($\alpha=0.05$) (C<T).

Mean composite tissue body burden was significantly greater than the mean native tissue body burden ($\alpha=0.05$) (C<T).

Mean **native tissue** body burden was significantly greater than the mean CLDS (C<T) or composite tissue (C>T) body burdens ($\alpha=0.05$).

PCB 180							S				
PCB 187									S		
Pesticides (ng/g wet weight)											
4,4'-DDE		S	S	S							

Note: "S" Indicates a finding of significance.

" " Indicates there was not a finding of significance.

Green shading indicates concentration in native tissue is greater than concentration in composite tissue.

Orange shading indicates concentration in composite tissue is 5 to 10 times higher than in CLDS reference tissue.

Red shading indicates concentration in composite tissue is ≥10 times higher than in CLDS reference tissue.

APPENDIX A:
RAW DATA & STATISTICAL SUPPORT

CONTENTS	Number of Pages
Study Number Record	1
Chain of Custody Records and Sample Receipt Logs	11
Laboratory Composite Preparation Documentation	7
<i>Macoma nasuta</i> 28-Day Evaluation	
Bench Sheets - Organism Culture, Daily Observations, Day 28 Recoveries	10
Daily Water Quality Measurements	25
Survival Statistical Analysis	12
<i>Nereis virens</i> 28-Day Evaluation	
Bench Sheets - Organism Culture, Daily Observations, Day 28 Recoveries	10
Daily Water Quality Measurements	24
Survival Statistical Analysis	9
Tissue Chemistry COCs/Sample Login	9
Email from CENAE Regarding Tissue Reporting for Non-Detected COCs	2
Body Burden Evaluation - Analytical Reports	
<i>M. nasuta</i> Body Burden Data and Statistical Analysis Reports - Trace Metals	56

28 DAY BIOACCUMULATION ASSAY

Project: New Haven Harbor 2018	Client: AECOM	
Study #: 31249	Reference: CLDS	Water Bath: TCR
Sample(s): Comps 2, 3, 4, 5 and 6	Start: 11/21/2018	End: 12/19/2018

Summary of Test Conditions

Exposure	Species Used
<p>Test Mode: Flow Through (6 volume additions per day)</p> <p>Length of Assay: 28 days</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input type="checkbox"/> Polychaete (<i>Nereis virens</i>)</p> <p><input checked="" type="checkbox"/> Bivalve Clam (<i>Macoma nasuta</i>)</p>

Water Quality Parameters

<p>Salinity: 30 ± 2 ppt</p> <p>Photoperiod: 16 hour light, 8 hour dark</p>	<p>Temperature: 12-16°C with no readings to exceed ±3°C</p>
--	--

Test Chamber	Solution & Sediment Volume
<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> 38L (10 gallon) Aquaria</p> <p><input type="checkbox"/> other _____</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> ~6L per vessel of homogenized sediment</p> <p><input checked="" type="checkbox"/> 20-30L overlying water</p> <p><input type="checkbox"/> other _____</p>

Replicate Information

N. virens and *M. nasuta*:

- 5 Reps per sample site and reference site
- 20 organisms per chamber
- 5 Reps for Laboratory Control

Cleaning	Treatments
<p>Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed then rinsed with deionized water (EPA 2002).</p>	<p>Laboratory Control, Reference Site, and Site Sediments</p>

Feeding

28 day Bioaccumulation Evaluation
Bench Data

28 DAY BIOACCUMULATION ASSAY

Project: New Haven Harbor 2018	Client: AECOM	
Study #: 31250	Reference: CLDS	Water Bath: TCR
Sample(s): Comps 2, 3, 4, 5 and 6	Start: 11/20/2018	End: 12/18/2018

Summary of Test Conditions

Exposure	Species Used
<p>Test Mode: Flow Through (6 volume additions per day)</p> <p>Length of Assay: 28 days</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> Polychaete (<i>Nereis virens</i>)</p> <p><input type="checkbox"/> Bivalve Clam (<i>Macoma nasuta</i>)</p>

Water Quality Parameters

<p>Salinity: 30 ± 2 ppt</p> <p>Photoperiod: 16 hour light, 8 hour dark</p>	<p>Temperature: 12-16°C with no readings to exceed ±3°C</p>
--	--

Test Chamber	Solution & Sediment Volume
<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> 38L (10 gallon) Aquaria</p> <p><input type="checkbox"/> other _____</p>	<p style="text-align: center;">(Check box for all that apply)</p> <p><input checked="" type="checkbox"/> ~6L per vessel of homogenized sediment</p> <p><input checked="" type="checkbox"/> 20-30L overlying water</p> <p><input type="checkbox"/> other _____</p>

Replicate Information

N. virens and *M. nasuta*:

- 5 Reps per sample site and reference site
- 5 Reps for Laboratory Control
- 20 organisms per chamber

Cleaning	Treatments
<p>Prior to test initiation, all test vessels were washed using lab safe detergent, acid washed then rinsed with deionized water (EPA 2002).</p>	<p>Laboratory Control, Reference Site, and Site Sediments</p>

Feeding

<i>N. virens</i> :	<i>M. nasuta</i> :

Aquatic Research Organisms

DATA SHEET/ CUSTODY CHAIN

I. Organism History

Species Neanthes (Neries) virens

Source: Lab reared _____ Hatchery reared _____ Field collected X

Hatch date Mixed aged adults Receipt date 11/20/18

Lot number 112018NW Strain Wild

Brood origination: Damariscotta River, Boothbay Harbor, Maine

II. Water Quality

Temperature 12 °C Salinity 28-32 ppt D.O. Saturated ppm

pH 8.0-8.4 su Hardness N.A. ppm Alkalinity N.A. ppm

III. Culture Conditions

Freshwater _____ Saltwater X Other _____

Recirculating _____ Flow through _____ Static _____

DIET: Flake food _____ Phytoplankton _____ Trout chow _____

Artemia _____ Rotifers _____ YCT _____ Other Not fed

Prophylactic treatments: _____

Comments: Held at 4C on moist seaweed. Shipped with gel ice packs to keep cool

IV. Shipping Information

Client: ESI # of Organisms 1100+

Carrier: FedEx Pick Up Date shipped 11/20/18

Tracking # N/A # of boxes 10

/Tissue Reporting

Fri, Mar 30, 2018 at 10:17 AM

To: Nancy Roka <nroka@envirosystems.com>, "Kirk Cram (kirk.cram@enthalpy.com)" <kirk.cram@enthalpy.com>, "nancy.roka@enthalpy.com" <nancy.roka@enthalpy.com>

Good morning Nancy -

Please see the below confirmation just received from NAE regarding the handling of statistics under their recently requested "totals" calculation protocol. Please proceed using the below guidance and let us know if any questions etc

Best

Kris

Subject: RE: /Tissue Reporting

Hey there Maura,

I agree with ESI's recommendation to use 1/2 MDL for non-detects for both the computation of totals and for statistical analysis. It took a little while to get you an answer because I was waiting on a call back from our regulatory office to make sure they were ok with that methodology as well. In future ESI should follow the proposed protocol for both federal and private projects.

Thanks,

Ben

Subject: [Non-DoD Source] /Tissue Reporting

Ben,

Based on the recent directive regarding reporting on non-detects and summation of totals, we have some further questions regarding statistical evaluation. The issue, paraphrased from ESI is as follows:

"Historically the Bioaccumulation EDD, where totals for PCBs etc are provided, uses the MDL when a value is a non-detect "ND" and the statistical analysis on the individual compounds are run using the MDL in place of the ND. Going forward, as per direction from USACE, we will use 1/2 of the MDL to compute the "Total" concentration for specified compounds. Under this scenario what number should be incorporated into the statistical analysis program, the 1/2 MDL or the MDL? As indicated, the "Total" numbers have not been included in the statistical analysis historically. However, a potential issue arises if the stats were run using the MDL then a review of the full data package differs shows different numbers which could potentially lead to some level of confusion. ESI's suggestion would be to use the 1/2 MDL for the computation of totals and for the statistical analysis, for those groups where total are generated, PCBs, Pesticides and PAHs.

Do you concur with ESI's recommendation?

Thanks Ben,

Maura

Subject: RE: Draft Report

Hello Kris,

I realize that the reporting methods we requested are in conflict with the guidance of the RIM and the 2009 errata. The 2009 errata is the most recent RIM update. Please stick to the guidance we gave you in our last conference call, which is summarized below:

- Please continue to report NDs as the full RL. We are in the process of changing our methods to report NDs as the full MDL, but this change might not take place in the near future.

- For totals calculations (PCBs, DDT, PAHs) please use 1/2 the MDL for NDs. Please remember that PCB totals are calculated using only the NOAA 18 congeners. Also, despite what the errata guidance, please continue to calculate PCB totals for sediment chemistry.

Thanks,

Ben
