**HYDROLOGIC AND HYDRAULIC CALCULATIONS  
FOR TEMPORARY DIVERSION SWALES ALONG THE**

**CONNECTICUT PIPELINE EXPANSION PROJECT**

**CONNECTICUT LOOP**

Submitted by:

Tennessee Gas Pipeline Company, L.L.C.  
1001 Louisiana St, Suite 1000  
Houston, TX 77002

**APRIL 2015**

The attached hydrologic and hydraulic calculations were performed for all temporary diversion swales proposed to be installed by the Connecticut Pipeline Extension (Project) Hartford County Connecticut. The Project would consist of installing approximately 13.3 miles of pipeline looping: 1.4 Miles of 36-inch Pipeline Loop in Albany County, New York (“NY Loop”) 3.8 Miles of 36-inch Pipeline Loop in Berkshire County, Massachusetts (“MA Loop”). 8.15 Miles of 24-inch Pipeline Loop in Hampden County, Massachusetts and Hartford County, Connecticut (“CT Loop”).

The primary objective of the attached calculations is to evaluate the amount of stormwater runoff contributary to the proposed temporary diversion swales in order to confirm the diversion swale size and lining are adequate for the anticipated flow rates. A typical temporary diversion swale will consist of a graded trapezoidal channel with erosion control blankets installed to protect bare soils until permanent vegetation becomes established.

## DESIGN CRITERIA AND METHODOLOGY

---

The following design criteria and methodology was used to perform the calculations:

### 1. Hydrologic Calculation Methodology

Hydrologic calculations were performed using the Rational Method with HydroCAD v.10.0. The specific method used to calculate the design flows for each watershed varied based on parameters such as the watershed size and slope, and ground cover type (e.g. pasture, forest, urban).

#### a. Rational Method: $Q=CIA$

- $Q$  = flow (cubic feet per second - cfs)  
 $C$  = runoff coefficient  
 $A$  = drainage area (acres – ac)  
 $I$  = rainfall intensity (inches per hour – in/hr)
- This method was used for drainage areas up to 200 acres in size
- NOAA Technical Memorandum NWS Hydro-35 was used to determine “I” in Connecticut County of Hartford.
- The following Runoff Coefficients were used:

Cover Type	Slope Range (%)	Hydrologic Soil Group*	Runoff Coefficient
Pasture	0% - 6%	D	0.20
Forest	0% – 20 %	D	0.32
Forest	> 20 %	D	0.38

\*Hydrologic Soil Group D was used for a conservative approach.

- Time of Concentrations were calculated using the following:
  - **Sheet Flow:**  
Manning’s Kinematic Solution  
Maximum (max) sheet flow length of 150ft

- **Shallow Concentrated Flow**

The travel time for shallow concentrated flow was calculated by dividing the travel path length by a calculated velocity. The velocity for specific cover types were calculated using Manning's equation.

- **Channel Flow**

As upstream channel morphology is not constant, the travel time for Channel flow was calculated by assuming a channel velocity of 15.00 ft/s and applying it to the shallow concentrated flow formula.

**b. Design Frequency:**

The design frequency utilized in the design varied based on the U.S. Weather Bureau Technical Paper 40. A 2-year, a 5-year, and a 10-year storm event were analyzed for each watershed.

**2. Hydraulic Calculation Methodology**

The temporary diversion swales were sized using Manning's equation. To simplify the construction documents, a consistent swale size was selected. The swale has a 2 foot bottom width, a 6 foot top width, and a 1 foot depth. North American Green's Erosion Control Materials Design Software was utilized to perform hydraulic calculations for each swale. The swale design flow rate, geometry, slope, and lining are provided as inputs to the software. The software calculates the swale capacity and shear stress for the design flow with the unvegetated temporary erosion control blanket scenario, and the vegetated scenario. The software performs calculations in accordance with FHWA Hydraulic Engineering Circular #15 (HEC-15) and the USDA Agricultural Handbook No. 667.

**3. Summary and Results**

The temporary diversion swales are sized appropriately for the analyzed storm events. The erosion control blankets selected will protect the bare soils from erosion while vegetation is being established, and once established the vegetation will protect the swales from erosion. The following table summarizes the results of the analysis and design.
