1.0 INTRODUCTION

The US Army Corps of Engineers (USACE) is conducting baseline efforts to formulate alternatives for the management of dredged material in Long Island Sound. As part of that effort, Woods Hole Group, Inc. was contracted to develop an environmental data update for Long Island Sound. Volume I of this report describes the environmental update project. An accompanying database of environmental data sources was developed to further summarize the data and provide references and contact information for all data described herein.

This volume (Volume II) includes the annotated database developed for the Environmental Data Update. The database is in a Microsoft Excel workbook and is provided electronically with this report, on an accompanying DVD+R. The Microsoft Excel workbook "LIS_DMMP_EnvDataUpdateTable.xls" includes a formatted copy of the database spreadsheet and lists of all selection menus for fields with limited data entry. Table 1 provides a Key Sheet that describes all fields in the Environmental Data Update database.

This report also includes an abridged version of the database, provided as an attachment to facilitate the review of the database. Fields highlighted in the Key Sheet (Table 1) constitute the abridged version of the database.

Entries in the Environmental Data Update spreadsheet and the abridged version of the database are sorted by relevance, then by study locations, and then by topic.

2.0 DESCRIPTION OF ENVIRONMENTAL DATA UPDATE DATABASE

The LIS DMMP Environmental Data Update database is modeled after the format of the 1999 Long Island Sound Dredged Material Disposal Database prepared for the US Army Corps of Engineers New England District (USACE, 1999). All of the fields in this database were replicated in the Environmental Data Update database. The fields are listed and defined in Table 1, the Key Sheet.

The following is a listing of the definitions of category terms that are highly relevant to analyses of the Environmental Data Update database. Topic definitions were imported verbatim (aside from notes on nomenclature) from the 1999 database (USACE, 1999). Study location categories were revised from the 1999 Database (USACE, 1999), in consultation with USACE-NAE, to address the specific needs of the Environmental Data Update.

Topics

Benthic (macro-invertebrate) resource - Information on the presence of benthic resources in Long Island Sound, at and outside of the existing and historic disposal sites. Information on recolonization and species assemblages as an indicator of toxicity. Information on biodiversity.

Coastal Management - Information on coastal management approaches, policies. Erosion control. Shoreline uses.

Ecology, Habitats and Species - Information on specific habitats/species.

Economic data and Analysis - Information on economic data and reports or studies on navigation traffic, usage and economic benefits of waterborne commerce in the Sound and its value as a commercial waterway by canvassing and interviewing marine trades associations, port authorities, harbor associations, fishermen's group and regional recreational boating groups and interests.

Environmental evaluation and economics of disposal options - Information and studies on dredged material disposal costs for alternative disposal methods and sites, costs of dredged material testing and evaluation. Information on environmental evaluation of management options available for such alternative sites and methodologies.

Fisheries/shellfisheries - Information on the presence of fish and shellfish including spawning, nursery (larvae) and migration, particularly information based on trawl and similar sampling efforts. Presence and extent of fishing and shellfishing grounds and areas and aquaculture within the Long Island Sound Region, whether natural or managed, commercial or recreational. Information on the economic value of fisheries and shellfisheries, including catch/effort and locations for lobster. Location and evaluation of essential fisheries habitat areas and presence, extent and value of submerged aquatic vegetation.

Fishing Activities and Human Health Risks - Contamination of fish catch, biomagnification of contaminants and consumption, particularly from disposal site vicinity. Human health effects of LIS caught seafood consumption. Information on the incidence and location of past blooms of nuisance and toxic phytoplankton species. Information on State Health advisories in the Sound including locations, incidences, contaminants, and species.

General Interest – Articles published in large circulation newspapers (or in newsletters and websites) that do not align with any other topic category described herein.

Geology and Geomorphology - Information on geological structure of Long Island Sound and coastlines. History of the geological features. Geochemistry.

Historic disposal activities and dump sites - Information on past dredged material disposal activities. Information on effects of disposal and capping at disposal sites. (Note: appropriate nomenclature for this category is “Historic disposal activities and disposal sites,” however historic nomenclature is preserved in the database to facilitate merging with prior databases and future querying.)

Historic, cultural and archaeological resources - Location of known and potentially significant cultural, historic and archaeological resources in the LIS region.

Marine Wildlife and Endangered Species - Information on presence and geographical extent of marine wildlife, Federal and State listed species and critical habitats.

Physical Impact of Fishing Activities - Locations of fishing grounds, particularly for draggers. Effect of dragging activity on disposal mound integrity and benthic recolonization.

Physical oceanographic - Hydrography (detailed bathymetry), waves and wind fetch, currents and water circulation information, and storm frequency and their effect on disposal sites.

Erosion/deposition data and sediment transport information for disposal sites and the Sound as a whole.

Public parklands, beaches and sanctuaries - Location of public parks and beaches and other public waterfront uses potentially affected adversely by dredging and the disposal of dredged material. Location/identification of sanctuaries potentially adversely affected by dredging and the disposal of dredged material. Also includes information on valuable habitats such as tidal marshes.

Sediment - Sediment information and mapping, including side scan data, particularly in formats useful in developing maps of the Sound. Also sediment chemistry data and analysis.

State Dredged Material Disposal Guidance - Information and guidance developed by the states of Connecticut and New York, and where appropriate, Rhode Island, to regulate dredged material disposal and disposal site identification, screening, use, monitoring and management.

Water quality - Water column chemistry data and investigations. Measurement and variability of water quality data throughout the Sound. Nutrients.

Meteorology - Information on meteorological and climatic conditions.

Locations

Entire LIS – Long Island Sound. Bounded on the west by the line between Throgs Neck (NY) and Willets Point (NY), and on the east by the line between Sandy Point (RI) and Orient Point (NY) through the chain of islands including Fishers, Plum and the Gulls.

Western LIS – Western Basin of Long Island Sound. Bounded on the west by the line between Throgs Neck (NY) and Willets Point (NY), and on the east by the line between Stratford Point (CT) and Port Jefferson (NY) along Stratford Shoal.

Central LIS - Central Basin of Long Island Sound. Bounded on the west by the line between Stratford Point (CT) and Port Jefferson (NY) along Stratford Shoal, and on the east by the line between Mulberry Point (CT) and Mattituck Point (NY) along the Mattituck Sill.

Eastern LIS - Eastern Basin of Long Island Sound. Bounded on the west by the line between Mulberry Point (CT) and Mattituck Point (NY) along the Mattituck Sill, and on the east by the line between Sandy Point (RI) and Orient Point (NY) through the chain of islands including Fishers, Plum and the Gulls.

Block Island Sound – Waters east of Long Island Sound and south of Washington County, Rhode Island. Bounded on the west by a line between Sandy Point (RI) and Orient Point (NY) (through the chain of islands including Fishers, Plum and the Gulls) and continuing to the midpoint of Montauk Point (NY) (through Gardiners Island). Bounded on the east by a line from Montauk Point (NY) through Block Island (RI) to Point Judith (RI). This area is referred to as Rhode Island Sound in the 1999 database (USACE, 1999).

Gardiners & Peconic Bays – A complex of bays between the forks of Long Island that is bounded on the seaward side by a line from midway out Montauk Point (NY), through Gardiners Island, to Orient Point (NY).

Shoreline (CT) - Coastal lands adjacent to Long Island Sound located in Connecticut.

Shoreline (NY) - Coastal lands adjacent to Long Island Sound located in New York.

Shoreline (RI) - Coastal lands adjacent to Long Island Sound located in Rhode Island.

Upland (CT) – Lands in Connecticut that are in the Long Island Sound watershed above the first major change in terrain features after the shoreline area.

Upland (NY) - Lands in New York that are in the Long Island Sound watershed above the first major change in terrain features after the shoreline area.

Upland (RI) - Lands in Rhode Island that are in the Long Island Sound watershed above the first major change in terrain features after the shoreline area.

320	Vaudrey, J.M.P.	Establishing Restoration Objectives for Eelgrass in Long Island Sound; Part I: Review of the Seagrass Literature Relevant to Long Island Sound	2008	Report (final, published)	Review	Entire LIS	The aim of this report was to summarize the literature regarding the factors affecting the growth and distribution of Zostera marina relevant to Long Island Sound and identify levels for water quality standards and habitat guidelines that would be protective of Zostera marina. The most important factor governing both the distribution and growth of Zostera marina is the availability of light. If the light attenuated by epiphytes is taken into account, the minimum light required by Zostera marina should be around 15% of the surface light. Other factors affecting eelgrass include temperature, nutrients, physical aspects of the sites, sediment characteristics, and water column characteristics. Vascular Flora of Caumsett State Historic Park, Lloyd Neck, Long Island, New York, with Notes on the Vegetation	2005	Journal Paper	Directory	Shoreline (NY)	Five classes of habitats are found within the park, each with many types of plant communities. These are I. upland forests, mature forest and also extensive areas undergoing succession; II. freshwater swamps, marshes and ponds, dominated by flood tolerant trees, shrubs, forbs or graminoids; III. gravel and sand deposits, dominated by drought tolerant shrubs, forbs and grasses; IV. tidal wetlands, dominated by salt tolerant grasses, shrubs and, locally, forbs; and V. disturbed habitats, mainly lawns and dry meadows, dominated by grasses and composites. Species lists are included.	Low	Brooklyn Botanic Garden, Department of Science
